Detection of Sulphates in the Presence of Ferric Salts. FRIEDRICH L. HAHN (*Ber.*, 1923, **56**, [*B*], 1733).—It is shown that the delicacy of the barium reaction for sulphates is much impaired in the presence of ferric salts, but that reduction of the latter by means of hydrazine or hydroxylamine enables the detection of the sulphate-ion to be made with certainty. Without reduction, it is impossible to detect less than 0·1% SO_3 in 0·4—0·8 g. Fe_2O_3, but with preliminary reduction, as little as 0·02% may be detected. Neither aluminium nor chromium salts affect noticeably the delicacy of the test for sulphates. H. H.

Estimation of Persulphuric Acids. R. WOLFFENSTEIN and V. MAKOW (*Ber.*, 1923, **56**, [*B*], 1768—1771).—A method for the estimation of hydrogen peroxide, Caro's acid, and persulphuric acid in a mixture of all three is described. The total active oxygen is determined by the addition of a known amount of a ferrous salt and back titration of the excess with potassium permanganate. The hydrogen peroxide is estimated by direct titration with permanganate. The difficulty arises in the attempt to differentiate between Caro's acid, $HO\cdot SO_2\cdot O\cdot OH$, and persulphuric acid, $HO\cdot SO_2\cdot O\cdot O\cdot SO_2\cdot OH$. The former liberates iodine instantaneously from potassium iodide, whilst the latter requires a considerable time. In practice, however, it is found that the hydrolytic change of persulphuric acid into Caro's acid during the titration of the latter is sufficient, unless precautions are taken, to impair the accuracy of the results. In order to arrest this hydrolysis, the solution must be kept cool and as acid as possible.

The above method estimates persulphuric acid only by difference. A direct method for the estimation of all three peroxide components is as follows. The hydrogen peroxide is first titrated with permanganate. Then sodium acetate is added to the solution until it contains free acetic acid, and the Caro's acid is estimated by titration with sodium sulphite, using iodine as indicator. Finally, the persulphuric acid is estimated by warming with a ferrous salt and titrating the excess of the latter with permanganate. The results may be checked by an estimation of the total active oxygen. H. H.

Analysis of Hydrogen for Traces of Nitrogen. R. L. Dodge (*J. Amer. Chem. Soc.*, 1923, **45**, 1688—1691).—A modification of the usual method for the estimation of hydrogen by combustion over copper oxide has been devised and applied to the analysis of hydrogen for traces of nitrogen. The method consists in drying the hydrogen and admitting it to a system evacuated to 0·01 mm. of mercury. As the gas enters the system it passes along a column of copper oxide 34 cm. long heated to a maximum temperature of 400°. The water formed is condensed in a graduated glass tube which is immersed in ice, and the unburnt gas circulated back through the copper oxide tube. After the whole of the hydrogen is burnt, the residual gas is pumped into a water-jacketed burette and measured. The method is accurate to 0·005%. J. F. S.

Behaviour of Nitro-derivatives of Aromatic Hydrocarbons in Kjeldahl's Process. B. M. Margosches and W. Kristen (*Z. ges. Schiess. Sprengstoffw.*, 1923, **18**, 73—76).—The results of the treatment of a number of nitro-derivatives of aromatic hydrocarbons by various modifications of Kjeldahl's process are given in a series of tables. In no case was the theoretical percentage of nitrogen obtained, owing to the volatilisation of the nitro-compound during the digestion. Tests were carried out with 20 c.c. of sulphuric acid alone, and with the addition of 10 g. of potassium sulphate, 0·5 g. of copper sulphate, 0·5 g. of mercuric oxide and also with the simultaneous addition of copper sulphate and mercuric oxide. The reduction of the period of digestion necessary by the addition of copper sulphate or mercuric oxide is very marked. H. C. R.

Influence of the Method of Precipitation of Proteins on the Results of the Estimation of Total Non-protein Nitrogen in Blood, Plasma, and Corpuscles. P. Cristol and S. Nikolitch (*Bull. Soc. Chim. biol.*, 1923, **5**, 469—486).—Detailed results are presented of a large number of estimations of the non-protein nitrogen in blood plasma and corpuscles, using metaphosphoric acid, tungstic acid, or trichloroacetic acid as protein precipitant. The acidity of the filtrate appears to exert considerable influence on the result. Highest values for non-protein nitrogen are obtained with filtrates of low acidity, whichever precipitant is used. With filtrates of high acidity, the results obtained with the different precipitants diverge considerably. E. S.

Micro-Kjeldahl Methods in the Tanning and Gelatin Industries. O. Gerngross and W. E. Schaefer (*Z. angew. Chem.*, 1923, **36**, 391—394).—An improved micro-Kjeldahl apparatus based on that of Bang is described and illustrated, together with a micro-burette capable of being read to 0·001 c.c. In leather or bone meal analyses, 0·5—1·0 g. of the sample is taken for the preliminary digestion, the contents of the flask diluted to 250 c.c., and 1 c.c. of this solution taken for distillation in the micro-apparatus. When dealing with dilute albuminous solutions such as are met with in the gelatin industry, 1 c.c. of the carefully homogenised solution may be taken directly for the digestion with 2 c.c. of concentrated

sulphuric acid and 3 drops of 10% copper sulphate. The digestion is in such cases complete in thirty to forty minutes. The precautions necessary in the distillation and titration are fully described. The titration may be carried out iodometrically after adding potassium iodide and potassium iodate, or by using a 1% alcoholic solution of *p*-nitrophenol as indicator, which is sensitive to 0·01 c.c. of *N*/80-sodium hydroxide, but cannot be used by artificial light.
H. C. R.

Method for the Estimation of Ammonia in Urine. MALTE LJUNGDAHL (*Compt. rend. Soc. Biol.*, 1922, **87**, 1414—1416; from *Chem. Zentr.*, 1923, ii, 556).—By rapid distillation with steam, the whole of the ammonia in (1 c.c. of) urine may be obtained in three to four minutes. Continuation of the distillation to ten minutes results in an increase of 0·05—0·09 mg. of ammonia obtained. The results obtained agree with those by the Folin method. The ammonia is collected in 2 c.c. of 0·1*N*-sulphuric acid and titrated with 0·1*N*-sodium hydroxide, using methyl-red as indicator. G. W. R.

Formation of Glucoheptonitrile in Urines containing Sugar and Cyanides as Cause of Error in the Estimation of Ammonia. Value of Schaffer's Sodium Carbonate Method. W. MESTREZAT and (MLLE) M. JANET (*Bull. Soc. Chim. biol.*, 1923, **5**, 464—468).—In the estimation of ammonia in urine by Schlœsing's bell method (cf. A., 1922, ii, 453), high results are obtained if large quantities of sugar are present in the urine. This is due to hydrolysis of the nitrile formed by interaction of the hexose and the mercuric cyanide used as antiseptic. Good results may, however, be obtained with such urines if sodium carbonate is used in place of milk of lime according to the technique of Schaffer. E. S.

The Estimation of Ammonia and Urea in Urine and other Fluids. SAMUEL LEVY-SIMPSON and DENIS CHARLES CARROLL (*Biochem. J.*, 1923, **17**, 391—402).—The method is based on the fact that when a mixture of urea and ammonia is distilled with steam and alcohol, only ammonia comes over during a certain stage of the distillation. Using 5 to 10 c.c. of the liquid and 90 c.c. of alcohol, it is found that all the ammonia distilled before frothing commenced. Details of the conditions under which accurate results can be obtained by this method are given. The method, which is claimed to be accurate, has the advantage of being rapid. An ammonia determination requires seven minutes, whilst a complete determination of ammonia and urea can be made with one apparatus in thirty minutes. S. S. Z.

Decomposition of Carbamide and other Nitrogenous Compounds during the Distillation of Urine with Steam. MALTE LJUNGDAHL (*Compt. rend. Soc. Biol.*, 1922, **87**, 1411—1413; from *Chem. Zentr.*, 1923, ii, 556).—In the estimation of ammonia in urine by distillation with steam, if a rapid current is employed the whole of the ammonia comes over within four minutes, whilst a longer time is required for the decomposition of carbamide and glycine.
G. W. R.

A Micro-method for Estimating the Total Phosphoric Acid in Blood and Fæces. WERNER GROTE (*Z. physiol. Chem.*, 1923, **128**, 254—256).—The phosphoric acid content of blood and of fæces may be estimated by destroying the organic matter with nitric acid and sulphuric acid, precipitating the phosphoric acid with ammonium molybdate, and estimating the ammonium in the filtrate as in Kjeldahl's method. It is found that each c.c. of *N*/70·2-hydrochloric acid used up by the ammonia distilled over corresponds with 0·00021 g. of P_2O_5 instead of with 0·000337 g., the value obtained by calculation from the formula

$(NH_4)_3PO_4,12MoO_3,12H_2O$. W. O. K.

Estimation of the Carbon Content of Solutions. JOSEPH NEEDHAM (*Biochem. J.*, 1923, **17**, 431—434).—The solution is burned in a silica boat placed in a quartz combustion tube. The carbon dioxide is caught in a receptacle containing baryta, from which solution it is liberated by the addition of tartaric acid and is estimated in a Haldane gas measuring apparatus. S. S. Z.

The Estimation of Carbon Monoxide in Vitiated Air. F. S. SINNATT and L. SLATER (*Lancs. Cheshire Coal Res. Assoc. Bull.*, 1923, No. 13).—A modification of the apparatus of Winmill (T., 1914, **105**, 1996) and Graham (A., 1919, ii, 117) is described, and its applications and those of the methods of Graham (*loc. cit.*) and Sinnatt and Cramer (A., 1914, ii, 383) are discussed in detail.

T. S. W.

Bicarbonate Equilibrium. J. W. SHIPLEY and IVAN R. MCHAFFIE (*J. Soc. Chem. Ind.*, 1923, **42**, 319—326T).—From data obtained in the electrometric titration of calcium hydroxide by carbon dioxide (see this vol., ii, 649), the condition of calcium hydrogen carbonate has been investigated. It is shown that the degree of hydrolysis of calcium carbonate in water at 20° is 10%. The solubility product of calcium hydroxide at 20° as calculated from the electrometric titration was found to be $0{\cdot}64\times10^{-5}$. Electrometric titrations of sodium carbonate and calcium carbonate in very dilute solutions were carried out in a closed electrode vessel, using hydrochloric acid as the titrating acid. A new constant, $H^{\cdot}\times CO_3''=5\times10^{-13}$, was found to hold for carbonate equilibria. The primary constant, $k_1=H^{\cdot}\times HCO_3'/H_2CO_3$, decreases with dilution, and the secondary constant, $k_2=H^{\cdot}\times CO_3''/HCO_3''$, increases on dilution, but the product, $H^{\cdot}\times CO_3''$, remains constant. The proportion, *n*, of the total carbon dioxide in solution existing as molecular carbonic acid, H_2CO_3, has been calculated and a curve constructed showing the variation of this proportion with dilution. This variation is directly proportional to the dilution. J. F. S.

Colorimetric Estimation of Small Quantities of Metals in Foodstuffs and the Preliminary Destruction of the Organic Matter. K. K. JÄRVINEN (*Z. Unters. Nahr. Genussm.*, 1923, **45**, 183—190).—Details of a method for the destruction of the organic matter in foodstuffs, preparatory to the colorimetric estimation of small quantities of metals are given. The organic matter is oxidised with strong nitric acid (*d* 1·40) in a Kjeldahl digestion flask. Sulphuric acid is added after a preliminary oxidation with nitric acid alone. Oxides of nitrogen are afterwards removed by dilution with water and boiling and sulphites by the addition of sodium thiosulphate and burning off the sulphur precipitated. Ten g. of organic dry matter can be completely destroyed in one to three hours and the method is suitable for use in estimating all metals except mercury, which is volatilised during the destruction of the organic matter. Details of colorimetric methods of estimating a few mg. of the following metals in 100 g. of foodstuffs are given: tin and lead in the presence of one another, copper and zinc in the presence of one another, aluminium, nickel, arsenic (in carpets, etc.), and antimony. The methods depend on the colour developed by passing hydrogen sulphide or adding sodium sulphide to the solution containing the metal after the removal of all organic matter and oxidising and reducing substances, and comparing it with the colour of a standard solution of the same metal treated under exactly similar conditions. The deposition of finely divided sulphur is prevented by the addition of 50% alcohol. Very accurate results were obtained in this way. H. C. R.

Microscopic Characterisation of the Picrates and Tartrates of Potassium and Sodium. ED. JUSTIN-MUELLER (*J. Pharm. Chim.*, 1923, [vii], **28**, 15—17).—The picrates of potassium and sodium, although similar macroscopically, are easily distinguishable microscopically, sodium picrate forming slender, yellow needles and potassium picrate long, yellow prisms. With tartaric acid, potassium salts give a precipitate visible to the naked eye only at a certain concentration, whilst with sodium salts the tartrate formed is never visible macroscopically. The salt formed may, however, be identified by microscopic examination of the sediment after standing or centrifuging. Potassium tartrate forms abundant lozenges, sodium tartrate octagonal plates and clinorhombic prisms. Sketches of the crystals are given. W. T. K. B.

The Kramer-Tisdall Method for the Estimation of Calcium in Small Amounts of Serum. FREDERICK F. TISDALL (*J. Biol. Chem.*, 1923, **56**, 439—441; cf. A., 1921, ii, 595).—Removal of the supernatant fluid from the calcium oxalate precipitate by decantation is simpler than using a siphon as originally described. E. S.

Analysis of Calcium Phosphate. ROKURO NAKASEKO (*Mem. Coll. Sci. Kyoto*, 1923, **6**, 157—164).—A method for the simultaneous estimation of calcium and phosphoric acid in calcium phosphate is described. The calcium is precipitated as oxalate from an acetic acid solution, and the phosphoric acid in the filtrate from the calcium oxalate is precipitated as ammonium manganese phosphate, after the excess of oxalic acid has been destroyed by the addition of the requisite quantity of potassium permanganate. Secondary and tertiary phosphates in a mixture may be estimated by titration with *N*/10-acid, using methyl-orange as indicator. The titration of primary calcium phosphate, after it has been rendered neutral towards methyl-orange with standard alkali solution, using phenolphthalein as indicator, yields untrustworthy results. W. P. S.

Estimation of Barium as Oxalate. BARBU N. ANGELESCU (*Bull. Soc. Chim. România*, 1923, **5**, 12—15).—A solution containing from 0·20 to 0·25 g. of the barium salt is mixed with three times its volume of alcohol, and ammonium oxalate solution is added. The mixture is heated on a water-bath for fifteen minutes and, after a further sixty minutes, the precipitated barium oxalate is collected on a filter, washed with 75% alcohol, dried at 70°, and weighed; 0·002 g. is added to the weight found as an allowance for the solubility of the barium oxalate. W. P. S.

Detection and Estimation of Mercury in Gauze Dressings. ET. BARRAL (*J. Pharm. Chim.*, 1923, [vii], **28**, 49—51).—In order to effect complete solution of the mercury the gauze is heated with eight to ten times its weight of dilute aqua regia containing 10% of strong hydrochloric acid and 2% of strong nitric acid. The warm liquid is filtered and evaporated nearly to dryness. Evaporation must be carried out at room temperature (or a maximum of 40—45°) to avoid loss of mercuric chloride by volatilisation. The slightly moist residue is tested with (*a*) stannous chloride, (*b*) diphenylcarbazide in benzene solution (after neutralising with a little sodium hydrogen carbonate), (*c*) potassium iodide, sodium carbonate, and ammonia, and (*d*) hydrogen sulphide. The above method of extraction may also be employed for the estimation of the merury present in the gauze, but an accuracy greater than 5% is not obtainable. W. T. K. B.

Colorimetric Methods with the Aid of Wilhelm Ostwald's Colour Standards. F. V. VON HAHN (*Z. angew. Chem.*, 1923, **36**, 366—369).—By the application of the Ostwald colour standards, colorimetric analysis is simplified and the necessity for preparing and keeping a number of standard colour solutions obviated. A known thickness of the coloured solution, contained in a cell, is illuminated from below by normal white light of the same intensity as that falling on the colour scale, and the two are viewed simultaneously through a tube into which a suitable colour filter can be inserted. By varying the filter and comparing with the standard colour scale, the colour of the solution is analysed into its components and so characterised. Details and tables for the colorimetric estimation of copper (as cuprammonium or potassium copper ferrocyanide), manganese (as permanganic acid), and lead (as colloidal lead sulphide) are given, and a "colorigram," with a triangular system of co-ordinates, drawn. The light used may with advantage be polarised, especially when artificial light is employed. W. T. K. B.

Detection and Separation of Indium. ISABURO WADA and SUNAO ATO (*J. Chem. Soc. Japan*, 1923, **44**, 1—36).—When the residue obtained by evaporation of an aqueous solution of indium nitrate is heated at 120° during one hour, the element does not form any dehydrated compound insoluble in nitric acid, thus differing from the metals of the tungsten and columbium group. Indium cannot be separated from other elements by distillation of the bromide from its hydrobromic acid solution, or by precipitation of its chloride. In neutral solution, indium is completely precipitated by hydrogen sulphide, even when it is present alone. When mixed with the elements of the hydrogen sulphide group, indium is largely precipitated by hydrogen sulphide if the concentration of the acid in the solution is less than 0·3*N*, but to a very slight extent only if the concentration is 0·6*N*. In 0·6*N*-acid solution the elements of the hydrogen sulphide group are nearly completely precipitated by sufficient excess of hydrogen sulphide, only a small quantity, with practically all the indium, remaining in the filtrate. From this filtrate on dilution with an equal volume of water all the elements of the hydrogen sulphide group are completely precipitated with a very small quantity of indium. The indium present in the precipitate is separated together with bismuth from the other metals. Platinum, iridium, rhodium, ruthenium, etc., are not completely precipitated under the same conditions, but are precipitated on heating the solution (acidity 1*N*), after saturation with hydrogen sulphide, in a pressure bottle in boiling water for one hour. The bismuth can be almost completely separated from indium by hydrolysis, the small quantity remaining in solution being precipitated as sulphide from 0·6*N*-acid solution. Indium behaves like titanium and zirconium with ammonia and ammonium sulphide, sodium hydroxide, peroxide, or carbonate or treatment with ether. It can be separated from the two elements by means of tartaric acid, ammonia, and ammonium sulphide. K. K.

Treatment of Permanganate Solutions for Volumetric Analysis. G. Bruhns (*Chem. Ztg.*, 1923, **47**, 613—615; cf. A., 1906, ii, 577).—A discussion of the preparation and use of standard solutions of potassium permanganate for volumetric analysis, with reference to their stability. A. A. E.

Titration of Solutions of Permanganate and Sodium Arsenite. William T. Hall and Carl E. Carlson (*J. Amer. Chem. Soc.*, 1923, **45**, 1615—1620).—The estimation of manganese in steel by the method of oxidation to permanganate and titration with sodium arsenite solution has been investigated. It is shown that under the conditions which usually prevail in the analysis of steel, the electrometric titration of permanganate with sodium arsenite solution causes the manganese to be reduced from a valency of seven to an average valency of 3·3 when the bismuthate method is used. This result is in agreement with the results of Rose (A., 1919, ii, 36) and Geloso (A., 1921, ii, 115). The reaction may be expressed $6MnO_4' + 11H_2AsO_3' + 15H^{\cdot} \rightarrow 2Mn^{\cdot\cdot\cdot\cdot} + 4Mn^{\cdot\cdot\cdot} + 11HAsO_4'' + 13H_2O$. The reduced condition corresponds with an oxide, Mn_3O_5, but it is improbable that such an oxide actually exists. The colour of the solution indicates the presence of tervalent manganese and the fact that manganese dioxide often separates on keeping shows that the quadrivalent manganese readily assumes the condition of colloidal dioxide and finally forms the gel. Probably this reaction takes place thus: $2Mn^{\cdot\cdot\cdot\cdot}+4Mn^{\cdot\cdot\cdot}+8H_2O \longrightarrow 2Mn^{\cdot\cdot}+4MnO_2+16H^{\cdot}$. The fact that halide causes a more complete reduction of the manganese is in accord with the usual behaviour of hydrogen halide in permanganate titrations. It prevents the formation of colloidal dioxide and keeps the manganese in a more reactive condition. The electrometric titrations show that when arsenite is titrated with permanganate in 2·5*N*-sulphuric acid solution the manganese is reduced to an average valency of 2·5, $4MnO_4'+9HAsO_3''+14H^{\cdot} \longrightarrow 2Mn^{\cdot\cdot}+2Mn^{\cdot\cdot\cdot}+9HAsO_4''+7H_2O$. Whenever the reaction between permanganate and arsenite is used in practice to determine either manganese or arsenic, it is important to direct attention to such details as temperature, acid concentration, and presence of halide or manganous salt, and to standardise the solutions under exactly the same conditions as prevail in the analysis. J. F. S.

Alleged Influence of Silicic Acid Hydrosol on the Volumetric Estimation of Iron in Hydrochloric Acid Solution. L. Brandt (*Z. anal. Chem.*, 1923, **62**, 417—450).—The alleged action of silicic acid hydrosol in inhibiting the oxidation of hydrochloric acid by permanganate in titrations of iron has been completely investigated anew (cf. Schwarz and Rolfes, A., 1919, ii, 170; Schwarz, A., 1919, ii, 480; 1920, ii, 389; Brandt, A., 1919, ii, 373, 428; 1920, ii, 269). It has now been found that commercial water-glass contains oxidisable impurities which tend to give erratic results, but the addition of a pure silicic acid sol made from silicon tetrachloride has no inhibiting action on the liberation of small amounts of free chlorine in side reactions. It is definitely proved that the addition of silicic acid sol has no influence on the results obtained in titrating ferrous chloride with permanganate either in the presence or absence of manganese sulphate. A. R. P.

Gravimetric and Volumetric Methods for the Estimation of Tin in Alloys. Antonín Jílek (*Chem. Listy*, 1923, **17**, 24—27; cf. this vol., ii, 186, 436).—The stannic oxide obtained in the analysis by Czerwek's method of tin alloys does not adsorb copper or lead salts, but can adsorb considerable quantities of antimony, particularly if potassium is present in solution. Thus the addition of potassium antimonyl tartrate to the solution from which the stanniphosphate is precipitated gives results which may be as much as 17·5% high. This error can be diminished by thorough washing of the stanniphosphate with a solution of the same composition as that recommended by Czerwek for the solution of bearing metal, instead of dilute nitric acid, which he used. With the modified method, results obtained are 1% high for alloys containing above 60% of tin, accurate for alloys containing about 14% of tin, and low for those containing less tin than this. R. T.

New Characteristic Microchemical Reaction for the Detection of Antimony and Tin. Andrei P. Ortodocsu and (Mlle) Marcelle Ressy (*Bull. Soc. chim.*, 1923, [iv], **33**, 991—994).—A drop of the solution under investigation is placed on a microscope slide side by side with a drop of a solution of sodium chloride containing 17 g. per litre. The drops are made to coalesce and are allowed to crystallise. The presence of tin is indicated by the appearance of six-pointed stars of the composition $2SnCl_2,3NaCl$. Antimony appears as four-pointed stars of the composition $SbCl_5,NaCl$. The forms are quite characteristic and distinctive, and are given by no other common metal. H. H.

The Electrolytic Estimation of Antimony. A. Lassieur (*Compt. rend.*, 1923, **177**, 263—265).—Hitherto all estimations of antimony by the electrolytic method have given incorrect values (cf. Henz, A., 1904, ii, 150). The error may be avoided by using a platinum electrode on which mercury has been electrolytically deposited. The difference of electrode potentials should be of the order of 1·3 volts, and the deposit then obtained is of good adherence and may be dried at 100° for weighing. The author suggests that the excessive values obtained when antimony is deposited directly on the platinum are due to the hydrogenating properties of the latter element. H. J. E.

Hexamethylenetetramine as a Reagent in Microscopic Qualitative Chemical Analysis. Howard Irving Cole (*Philippine J. Sci.*, 1923, **22**, 631—637).—Solutions in hydrochloric acid of salts of antimony, bismuth, cadmium, gold, iridium, mercury, palladium, platinum, tin, and silver (in nitric acid solution) give characteristic crystalline precipitates with hexamethylenetetramine, whilst solutions of salts of antimony, bismuth, cadmium, palladium, platinum, and tin also give characteristic precipitates, usually at greater dilutions, if potassium iodide is added as well as hexamethylenetetramine. Crystalline compounds not sufficiently characteristic for identifying the metals are also formed in the presence of calcium, iron, magnesium, manganese, and titanium. Hydrochloric acid, nitric acid, and sulphuric acid alone give crystalline precipitates with hexamethylenetetramine and potassium iodide, but the crystals are easily distinguished from those formed in the presence of any of the above metals. The procedure recommended for applying the test is to add a fragment of solid hexamethylenetetramine to a drop, 2—4 mm. in diameter, of the solution to be tested, and then to examine the solution under a low-power microscope, a fragment of potassium iodide being added subsequently if necessary. A description is given of the shape, colour, and effect on polarised light of the characteristic crystalline compounds, and photographs of most of them are reproduced. The test is most sensitive with antimony and bismuth, the addition of potassium iodide enabling these metals to be identified at dilutions of 1 : 15,000 and 1 : 100,000, respectively. L. A. C.

Titration of Very Small Amounts of Gold. W. B. Pollard (*Bull. Inst. Mining Met.*, 1923, **223**).—For the estimation of quantities of gold up to 5 mg., the metal is dissolved in 2 c.c. of aqua regia, the liquid being carefully boiled, the flask meanwhile being rotated, until only one or two drops remain. In order to avoid deposition of gold after dilution, nitrous acid must be removed by the addition of 2 c.c. of 1% paraldehyde solution, the fumes blown out of the flask, and the liquid allowed to remain for two minutes. Twenty-five c.c. of water are then added, together with 1 c.c. of a 0·1% solution of *o*-tolidine in 10% hydrochloric acid, and a small quantity of a dilute solution of silver nitrate as catalyst. The liquid is then titrated with 0·01*N*-*p*-methylaminophenol sulphate in 2% hydrochloric acid, the mixture finally being gently heated. Titration may be repeated on the same sample after evaporation to dryness, treatment with aqua regia, and repetition of the process. In the presence of iron, ammonium fluoride must be added; large quantities of copper cause somewhat high results. With the *o*-tolidine reagent, it is possible to detect gold by the development of a yellow or brown colour at a dilution of 1 in 2×10^7.

CHEMICAL ABSTRACTS.

Estimation of the Easily Dehydrated Alcohols in Essential Oils. L. S. GLICHITCH (*Compt. rend.*, 1923, **177**, 268—270).—The estimation of such alcohols as linalool and terpineol by acetylation with subsequent estimation of the ester formed is inaccurate owing to the incompleteness of the first stage by reason of the dehydration of a portion of the alcohol. Dilution of the reaction mixture with an inert solvent (Boulez, A., 1907, ii, 306; Schimmel & Co., A., 1907, ii, 782) diminishes but does not eliminate the error. By treatment of the alcohols with a mixture of acetic anhydride and formic acid at the ordinary temperature the alcohols are converted into formates (cf. Béhal, A., 1899, i, 734; 1900, i, 580) and these may be employed to obtain correct values by saponification in the usual way. Comparative results obtained by the normal method of acetylation, acetylation in presence of xylene, and by the above method are given. H. J. E.

Reaction of α- and β-Naphthol with Sodium. HERMANN KUNZ-KRAUSE (*Chem. Ztg.*, 1923, **47**, 646).—0·01—0·1 G. of the naphthol is dissolved in a few c.c. of absolute alcohol and thin pieces of sodium are dropped in as long as they will dissolve, the tube being cooled in water. In the case of α-naphthol, only a pale bluish-green colour is produced with a faint fluorescence, but with β-naphthol a deep royal blue colour appears, with a bluish-violet fluorescence. Further additions of sodium change the colour to olive-green, brown, and orange, in that order. The fluorescence remains throughout these colour changes. This test is recommended as superior to the ammonia test in aqueous solution for distinguishing between α- and β-naphthol. H. C. R.

Rapid Reduction Method for the Estimation of Sugar in Blood. G. DENIGÈS (*Compt. rend. Soc. Biol.*, 1922, **87**, 1283—1285; from *Chem. Zentr.*, 1923, ii, 607—608).—The use of trichloroacetic acid for the removal of proteins from blood prior to estimation of sugar with Fehling's solution is inapplicable. A solution containing 29 g. of sodium chloride in 71 g. of water containing 10% of trichloroacetic acid is recommended for this purpose.

After adding this solution to an equal volume of blood or serum the mixture is shaken and placed for three minutes on a boiling water-bath. After clarifying by centrifuging and making up to the original volume, one-tenth by volume of sodium hydroxide solution is added. The mixture is added to 1 c.c. of boiling Fehling's solution (Bonnans), containing ferrous cyanide and the boiling continued. For the completion, if necessary, of the reduction of the Fehling's solution, a solution of dextrose containing 0·36 g. in 10 c.c. of water is used. The reaction is not affected by the precipitate of calcium phosphate obtained on neutralisation.
G. W. R.

Inositol. I. A Method of Estimation. JOSEPH NEEDHAM (*Biochem. J.*, 1923, **17**, 422—429).—The tissues are extracted with dilute aqueous acetone, and from this the inositol is precipitated with a saturated basic lead acetate solution. The precipitate is then decomposed with hydrogen sulphide, filtered, and the inositol in the filtrate is further precipitated with alcohol and is estimated by determining the carbon in it, utilising the author's micro-method (cf. this vol., ii, 655). Inositol of ox muscle is identical with that produced by the hydrolysis of phytin. S. S. Z.

Comparative Experiments on the Different Methods of Estimating Maltose formed by the Fission of Starch. K. JOSEPHSON (*Ber.*, 1923, **56**, [*B*], 1758—1761).—The results obtained by Bertrand's method in following the course of the fission of starch by amylase are uniformly trustworthy; the process does not appear to be inferior to the hypoiodite method of Willstätter and Schudel (A., 1918, ii, 337). The main advantage of the latter procedure lies in the possibility of estimating aldehydic in the presence of ketonic sugars, if other substances which react with iodine are absent.

In the estimation of maltose in pure aqueous solution, the data obtained by Bertrand's process are uniformly somewhat higher than those obtained by the hypoiodite method. In general, slightly high results are obtained in estimating sugars by Bertrand's solutions which have been preserved during some months. In the estimation of maltose formed by the action of malt amylase on starch, the results obtained by the hypoiodite process are uniformly slightly lower than those by the Bertrand method; it appears possible that a slight, systematic error is inherent to the former procedure.
H. W.

Comparison of Methods of Estimating Starch. K. ALPERS and H. ZIEGENSPECK (*Z. Unters. Nahr. Genussm.*, 1923, **45**, 163—174).—Twelve different methods of estimating starch in flours and brans were tested and the results obtained are given in a table. All the methods suffered from certain disadvantages, some being troublesome and some giving inaccurate results. Mayrhofer's gravimetric method (A., 1897, ii, 525) gives accurate results only with pure starches and fails in the case of foodstuffs like flour containing bran or substances yielding pentosans. This method can, however, be employed in the case of sausage meats containing pure starch, but care must be taken that errors do not arise from the incomplete solution of the starch in the aqueous alkali. A method based on the estimation of the dextrose produced after treating the sample with alcoholic potassium hydroxide is also only applicable to pure starches. This method is preferable to that of Mayrhofer for estimations of starch in sausage meats. The results of estimations of starch in flours and brans by both these methods are much increased by the pieces of husk in the samples. The polarisation methods of Lintner and Belschner and of Evers are recommended on account of their simplicity. It is occasionally difficult to obtain a sufficiently clear solution for the polarimeter in Lehmann and Schowalter's polarisation method. The possible error of polarisation methods is assessed at more than 3%. When estimating starch in sausage meats, the possible decomposition of the starch by ferments and bacteria must not be overlooked.

H. C. R.

Estimation of Lactic Acid in Blood. J. J. R. MACLEOD [with M. E. ARMOUR] (*J. Lab. Clin. Med.*, 1923, 7, 635—642).—A modification of Fürth and Charnass's method (A., 1910, ii, 807). Proteins are precipitated from 25—50 c.c. of blood mixed with 100 c.c. of 2% hydrochloric acid by the addition of 5% mercuric chloride solution; dilution is followed by filtration and removal of the mercury as sulphide. An aliquot portion is nearly neutralised and evaporated below 40°, and then extracted with ether mixed with sodium hydroxide solution in a Dunbar apparatus, after addition of ammonium sulphate and phosphoric acid. After removal of the ether below 50°, the alkaline sodium lactate is distilled with 0·5% sulphuric acid in presence of potassium permanganate into a standard solution of potassium hydrogen sulphite, which is then titrated against iodine solution. Each 1 c.c. of 0·1*N*-iodine solution corresponds with 0·05 c.c. of 0·1*N*-lactic acid.

CHEMICAL ABSTRACTS.

Some Causes of Error in the Estimation of β-Hydroxybutyric Acid. CH. O. GUILLAUMIN (*Bull. Soc. Chim. biol.*, 1923, 5, 426—431).—The most practical method for the estimation of β-hydroxybutyric acid is that of Van Slyke (A., 1918, ii, 86). The blank estimation should not be carried out, since the value so obtained is usually due to the oxidation of some of the β-hydroxybutyric acid under the influence of the mercuric reagent. E. S.

A Modified Test for Phthalates, with Particular Reference to the Detection of Ethyl Phthalate. R. E. ANDREW (*Ind. Eng. Chem.*, 1923, 15, 838).—Ethyl phthalate is used as a denaturant for alcohol for certain purposes. The resorcinol test as generally given is not trustworthy, since a satisfactory blank cannot be obtained. In carrying out the test, it is necessary to avoid heating after adding acid to the resorcinol mixture. Ten c.c. of the solution to be tested are evaporated with 5 drops of a 10% solution of sodium hydroxide on a steam-bath, 0·5 c.c. of a 5%

solution of resorcinol is added, and the liquid again evaporated to dryness. It is removed from the bath and 6 drops of concentrated sulphuric acid are at once added and mixed thoroughly. When cool, 10 c.c. of water are added and it is transferred to a test-tube with 10 c.c. of wash water; 5 c.c. of 10% sodium hydroxide solution are added, when a green fluorescence will show the presence of phthalate. E. H. R.

Precipitation of Tannic Acid by Gelatin. ARTHUR W. THOMAS and ALEXANDER FRIEDEN (*Ind. Eng. Chem.*, 1923, **15**, 839—841).—Gelatin is completely precipitated by gallotannic acid when the ratio of tannin to gelatin is not less than 2 : 1 and the gelatin-tannin precipitate is not soluble in excess of tannic acid. The optimum hydrogen-ion concentration for gallotannic acid is p_H 4·4—4·6, but there is a definite hydrogen-ion concentration for each sort of vegetable tannin for optimal precipitation. If the solution is not adjusted to near this value, the precipitate may fail to form. The presence of a neutral electrolyte broadens the range of hydrogen-ion concentration for precipitation, but does not increase the sensitiveness of the reaction at the optimum hydrogen-ion concentration. Under the best conditions, tannin can be detected at dilutions as high as 1 : 100,000—200,000, depending on the source of the tannin. The ageing of gelatin solutions has no effect on the sensitiveness in testing for tannin, provided bacterial action is prevented. H. C. R.

Identification of Cacao Butters by Curves of Miscibility. MARANGE (*Compt. rend.*, 1923, **177**, 191—194).—Extending the work of Louise (A., 1911, ii, 548, etc.), the author studies the miscibility curves for mixtures, with aniline and alcohol, of various pure and adulterated cacao butters, and shows that these curves afford a ready indication as to the purity of the sample examined. E. E. T.

Schiff's Rosaniline–Sulphurous Acid Reaction for Aldehydes. KARL JOSEPHSON (*Ber.*, 1923, **56**, [*B*], 1771—1775).—Schiff's reaction can be applied to aldehydes only under definite conditions with regard to the acidity of the solution; the development of a not too weak violet coloration is regarded as a fairly definite proof of the presence of the aldehydic group.

A red coloration is caused by a number of organic substances, which in all probability do not contain the aldehydic groups. The tint is identical with that of rosaniline solutions. The effect is attributed to the withdrawal of a portion of the sulphurous acid from combination with rosaniline (to form salt-like compounds with the proteins), whereby rosaniline is liberated. A red coloration is also developed when Schiff's solution is treated with phosphate buffer solutions of P_H 4·5—7·8, the maximum intensity being observed at P_H 5·9—6·1. H. W.

The Titration of Sodium Formaldehydesulphoxylate. BERNARD SALKIN (*Ind. Eng. Chem.*, 1923, **15**, 848—849).—Contrary to what has been stated (cf. Heyl and Greer, A., 1922, ii, 288), sodium formaldehydesulphoxylate can be titrated with ammoniacal copper sulphate or with iodine with concordant results. The method of analysis now described involves three titrations, one with copper sulphate and two with iodine, from the results of which may be calculated the sodium formaldehydesulphoxylate, hyposulphite and hydrogen sulphite–formaldehyde present. In the first titration, the solution of the sample (15 g. in 100 c.c.) is run into a standard solution of copper sulphate (125 g. of crystals per litre) made strongly ammoniacal, at 55° (1 mol. of $CuSO_4 \equiv 0{\cdot}5$ mol. of hyposulphite or 0·5 mol. of sulphoxylate). For the second titration, 25 c.c. of a solution of the sample (6 g. per litre) are titrated with 0·1*N*-iodine solution, 2 c.c. excess of the iodine solution are added, and after five minutes titrated back with thiosulphate solution. In this case, 1 mol. of iodine$\equiv$1/6 mol. of hyposulphite or 1/4 mol. of sulphoxylate. These two titrations taken together give both hyposulphite and sulphoxylate. In the third titration 50 c.c. excess of 0·1*N*-iodine solution over that used in the second titration are added to 25 c.c. of the sample solution, followed by sodium hydroxide solution to give a yellow colour. After ten minutes, the solution is acidified and titrated back with thiosulphate. From the number of c.c. of iodine consumed, one and a half times the number of c.c. used in the second titration are subtracted. The difference is the equivalent of the sodium hydrogen sulphite–formaldehyde present. All the titrations must be made in absence of air. E. H. R.

Estimation of Aldehydes and Ketones in Essential Oils. C. T. BENNETT and F. C. L. BATEMAN (*Perf. and Essent. Oils Rec.*, 1923, **14**, 268).—A critical examination of the two methods generally adopted for the estimation of aldehydes and ketones in essential oils, namely the " bisulphite " method and the " neutral sulphite " method. E. M. V.

Some Observations on the Detection of Acetone in Urine. B. A. VAN KETEL (*Pharm. Weekblad*, 1923, **50**, 833—836).—The methods of Legal and le Nobel are not very sensitive, but the modification of Rotheva gives much better results. The ammonia used must be free from acetone; ammonia often contains traces of acetone, which may be due to its preparation from plant residues or from turf. Acetoacetic acid, which may be present in the urine of persons suffering from diabetes, readily forms acetone, and may thus invalidate the test, but β-hydroxybutyric acid does not give a positive result with the ordinary methods. S. I. L.

Estimation of Acetone and of Ethyl Alcohol in Mixtures of the Two. J. H. BUSHILL (*J. Soc. Chem. Ind.*, 1923, **42**, 216—218T).—The acetone is estimated iodometrically by the method described by Rakshit (A., 1916, ii, 544); the quantity of alcohol present is calculated from the specific gravity of the mixture after allowance has been made for the acetone. Tables are given, showing the specific gravity of solutions containing small quantities of acetone and alcohol. W. P. S.

Volumetric Estimation of Acetone. AL. IONESCU, (MLLE) ELISE SPIRESCU, and D. POPESCU (*Bul. Soc. Chim. România*, 1923, **5**, 15—21).—Ten c.c. of acetone solution (about 0·5%), 10 c.c. of 50% sulphuric acid, 10 c.c. of mercuric sulphate solution (50 g. of mercuric oxide dissolved in 200 g. of sulphuric acid and diluted to 1 litre), and 100 c.c. of water are boiled together in a reflux apparatus for twenty minutes. The precipitate is then collected on a filter, washed with 200 c.c. of water, transferred to a flask and dissolved by heating with 25 c.c. of a mixture of sulphuric acid and nitric acid (sulphuric acid, 2 parts, nitric acid, 1 part). The solution is treated with a few drops of permanganate solution to destroy nitrous compounds, diluted with 100 c.c. of water, 12 drops of 10% sodium nitroprusside solution are added, and the turbid mixture is titrated with $N/10$-sodium chloride solution, the disappearance of the turbidity denoting the end-point of the titration. Each c.c. of $N/10$-sodium chloride solution is equivalent to 0·0028 g. of acetone; this factor is found by actual experiment with pure acetone and is higher than the theoretical value (0·002348).

W. P. S.

Estimation of Tryptophan. GEORGE E. HOLM and GEO. R. GREENBANK (*J. Amer. Chem. Soc.*, 1923, **45**, 1788—1792).—Some of the difficulties and errors in the various methods previously used are indicated. The effect of temperature and time on the reaction of tryptophan with *p*-dimethylaminobenzaldehyde in 20% hydrochloric acid has been studied. In this concentration of acid, the reaction requires greater time than is generally supposed. Thus at 37° about eight days are necessary. At higher temperatures, the time required for the development of the colour is less, but the colour is then less stable. Pure tryptophan in solution can be accurately estimated by this method (cf. May and Rose, this vol., i, 160). Experiments on casein, fibrin, and Witte's peptone show that the tryptophan content of proteins can also be accurately estimated by this method without previous hydrolysis of the protein, but apparently an enzyme-digested protein is more suitable. There is excellent agreement between the tryptophan content of fibrin as estimated by the colorimetric method (5·00%), and as found by the "humin" formation method (5·05%) of Gortner and Holm (A., 1918, i, 84).

W. S. N.

Estimation of Urea by Urease. GEORGE MACFEAT WISHART (*Biochem. J.*, 1923, **17**, 403—405).—A method based on treating urea with soja bean meal in presence of sodium carbonate and blowing over the ammonia into standard acid. The method is accurate to less than 1%.

S. S. Z.

Estimation of Blood Urea. JEANETTE ALLEN BEHRE (*J. Biol. Chem.*, 1923, **56**, 395—404).—In the estimation of urea in whole blood, considerably higher (50%) results may be obtained when concentrated extracts of soja bean are used than when dilute extracts are employed. This is possibly due to the presence in the soja bean, in small concentration, of a second enzyme which produces ammonia from some constituent of blood other than urea. This constituent is present mainly in the corpuscles; it does not diffuse through collodion. Blood filtrates, obtained by heat coagulation or by precipitation with tungstic acid, do not give increased values for urea with increased concentrations of extract. E. S.

Application of the Diazotisation of the Benzoyl Group in the Toxicological Detection of Alkaloids. HENRI PECKER (*J. Pharm. Chim.*, 1923, [vii], **28**, 13—15).—Guerbet's method for the detection of alkaloids containing benzoyl groups (cf. A., 1920, ii, 517) is inapplicable in the presence of ptomaines, since the latter alone can give rise to the characteristic orange colour.
W. T. K. B.

Preparation and Comparison of Standards for the Estimation of Creatine and Creatinine. GRAHAM EDGAR (*J. Biol. Chem.*, 1923, **56**, 1—6).—Of the various substances which have been proposed as standards for the estimation of creatine and creatinine by Folin's colorimetric method (A., 1914, ii, 505), creatinine zinc chloride and creatinine picrate are considered to be the most suitable since they are readily obtained pure. Creatinine zinc chloride can be readily prepared by fusing commercial creatine with anhydrous zinc chloride. E. S.

Physiology and Pathology of the Bile Secretion. I. Estimation of the Bile Acids in Human Duodenal Bile. F. ROSENTHAL and M. FREIHERR VON FALKENHAUSEN (*Arch. expt. Path. Pharm.*, 1923, **98**, 321—338).—The various methods for the estimation of the bile acids are reviewed and a new method, suitable for clinical use, is described in which the gasometric method of Foster and Hooper (A., 1919, ii, 376) is combined with a sulphur estimation of the alcohol-soluble fraction of the bile. When applied to human bile, the gasometric estimation gives the total glycine and taurine derived from the bile acids, whilst the sulphur estimation gives the amount of taurocholic acid present. The value for glycocholic acid is then obtained by calculation. E. S.

Means for Differentiating between Chondrin and Glutin. M. A. RAKUZIN (*Chem. Ztg.*, 1923, **47**, 602).—Chondrin gives a very opalescent solution which gives the xanthoproteic reaction, whereas glutin gives a clear transparent solution in concentrations up to 0·75% which is not coloured by nitric acid. A hot 10% gelatin solution containing chondrin is immediately gelatinised by the addition of a saturated solution of chrome alum. A 0·2% chondrin solution shows no appreciable difference on addition of barium chloride owing to the already strong opalescence; if, however, the solution is stirred with 10% of aluminium hydroxide and filtered, the filtrate gives an immediate precipitate with barium chloride of the barium salt of chondroitinsulphonic acid ($[\alpha]_D = +46·5°$). A gelatin solution gives an immediate precipitate with barium chloride.
A. R. P.

Preservative Principles of Hops. III. THOMAS KENNEDY WALKER (*J. Inst. Brewing*, 1923, **29**, 379—399; cf. this vol., i, 78).—Light petroleum does not appear to be a suitable solvent for the extraction of hops, as it is slow in its extractive action and, indeed, fails to extract the resins thoroughly in the cold, and is, moreover, liable to hasten the resinification of the β-acid. The author finds that extraction with methyl alcohol gives better results and a method is described for estimating the soft resins in hops by means of this solvent; the method gives higher results than those in common use. T. H. P.

Colorimetric Estimation of Hydrogen-ion Concentration in Soils. C. T. GIMINGHAM (*J. Agric. Sci.*, 1923, **13**, 69—73).—A difficulty in the estimation of hydrogen-ion concentration in soil extracts has been due to their turbidity. The author has used the displacement method of Parker (A., 1922, i, 511), whereby it is possible to obtain comparatively clear liquid suitable for colorimetric hydrogen-ion estimations. Comparison of the results with those obtained electrometrically shows a fair agreement. In some cases, however, the hydrogen-ion concentration estimated colorimetrically on the first, clear, portion of the percolate showed a less satisfactory agreement with the electrometric figure than that determined on the later, more turbid, portions. G. W. R.

Estimation of Humus in Soils. V. AGAFONOFF (*Compt. rend.*, 1923, **117**, 404—406).—A comparison of three methods of estimating the humus content of soils: (1) The ignition method, taken as giving standard results, (2) Simon's method (this vol., ii, 506), and (3) the sulphuric–chromic acid oxidation method. It was found that the second method gives practically the same results as method (1), whilst being much less tedious. Method (3) gives low results, which falls in line with Simon's work, and indicates that whilst all the humus substances in some soils are oxidised under the given conditions, in other soils only a portion of the humus is oxidised. The chlorine index of a soil gives a rough indication of its humus content. E. E. T.

General and Physical Chemistry.

Open-spark Spectra and their Application in Chemical Analysis. C. Auer von Welsbach (*Ann. Physik*, 1923, [iv], **71**, 7—11).—The author advocates the more general application of spectrum analysis, and more especially the use of open-spark spectra in chemical analysis. Attention is directed to the change occurring in the spectrum of a substance due to the presence of other substances. J. S. G. T.

Grouping of the Lines in the Secondary Spectrum of Hydrogen. K. Basu (*Phil. Mag.*, 1923, [vi], **46**, 417—420).—Objections to the application of the quantum relation $h\nu = W$ to the process of molecular dissociation underlying the emission of the secondary spectrum of hydrogen are briefly reviewed. Assuming that the lines in this spectrum originate in two hydrogen nuclei separated by a definite distance, with an electron revolving about them, an expression involving amongst other factors azimuthal and radial quantum numbers, and the intra-nuclear distance is derived for the frequencies of the emitted lines. Assuming the intra-nuclear distance to be 10^{-8} cm. the author shows that the calculated frequencies fall into five classes, and that within each class there is very close agreement between the calculated and observed values of the frequencies. J. S. G. T.

The Band-spectrum of Iodine. R. Mecke (*Ann. Physik*, 1923, [iv], **71**, 104—134).—Particulars are given of measurements of 130 lines constituting the heads of bands in the absorption band-spectrum of iodine. These are classified into ten series and it is shown that the frequencies of respective lines in the various series can be represented by a formula of the Deslandres type expanded as far as n^3, namely, $\nu(n_1;\ n_2) = 18320{\cdot}97 - 213{\cdot}76n_1 + 0{\cdot}596n_1^2 + 0{\cdot}0021n_1^3 - 80{\cdot}66n_2 - 1{\cdot}012n_2^2 + 0{\cdot}0033n_2^3$, the values of n_1 ranging from 0 to 9, and of n_2 from -33 to $+24$. Particulars of wave-lengths and frequencies are given for the constituent lines in the bands λλ 6781·89, 6877·36, 6837·32, and 6934·16 Å. The components may be represented by a Deslandres type of formula, thus: $\nu = \nu(n_1;\ n_2) - bm^2$, where the value of $2b$ deduced from measurements of one group of 50 lines is 0·0161, and from another is 0·0176, the value increasing with increase of the value of the parameter m. No evidence was obtained of the existence of P and R series of lines in the various bands. The relation of the resonance spectrum of iodine to its absorption spectrum is discussed. J. S. G. T.

The Effect of Metallic Surfaces on the Spectra of Mercury, Cadmium, Helium, and Oxygen. L. Janicki and E. Lau (*Ann. Physik*, 1923, [iv], 7, 562—566).—Experiments carried out to ascertain the effect, if any, produced on the respective spectra of mercury, cadmium, helium, and oxygen excited in a discharge tube by coating the constricted portion of the discharge tube with a semi-transparent layer of silver are described. In the case of the discharge in mercury vapour contained in such a tube, a mercury band-spectrum was strongly developed. In the case of the discharge in cadmium vapour, the band spectrum was more strongly developed in the silvered than in the unsilvered tube. A similar phenomenon was exhibited by the discharge in oxygen, the band spectrum being developed at a higher pressure in the silvered than in the unsilvered tube. Changes in the relative intensities of components of the line spectrum of mercury accompanied the development of the band spectrum in the vapour. No effect whatsoever was observed in the case of the discharge in helium. J. S. G. T.

Distribution of Intensity in, and Origin of the Band Spectrum of Nitrogen. H. KIRSCHBAUM (*Ann. Physik*, 1923, [iv], **71**, 289—316).—Details are given of the variation with temperature of the intensities of lines in positive and negative groups of bands in the band spectrum of nitrogen, excited either in a canal-ray discharge or cathode ray discharge in the gas, the variation of temperature being effected either by external agency, or internally by electronic impacts at various gas pressures. The results indicate that the effects of high temperature in the positive column of the cathode discharge and of the impact of canal rays are the same, the respective intensities of the higher members of a band and the higher heads of bands in a group being in each case increased. It is concluded that either agency increases the amplitude of oscillation of the diatomic molecular systems originating the emission of the band spectrum. J. S. G. T.

The Band Spectrum of Carbon Monoxide. E. HULTHÉN (*Ann. Physik*, 1923, [iv], **71**, 41—49).—It is shown that the wave-lengths of the lines constituting the four bands λλ 5610, 5198, 4835, and 4393 Å. in the spectrum of carbon monoxide can be arranged in series, P, Q, and R, such that $R(m)-Q(m)=Q(m+1)-P(m+1)$, where the symbols have the customary significance. This relation is not quite so exactly satisfied by the band λ 4393 Å. as in the case of the other three bands. The relation $R(m)-Q(m)=3{\cdot}885\,m$ is found to hold for the bands λλ 5610, 5198, and 4835 Å., whilst for the remaining band, λ 4393 Å., the corresponding relation is $R(m)-Q(m)=3{\cdot}845\,m$. It is concluded that the three former bands originate in the same initial condition of the radiating molecule, whilst the bands λλ 4835 and 4393 Å. correspond with an identical final condition of the molecule. It is probable that the bands λλ 6622 and 6078 Å. belong to the system discussed.

J. S. G. T.

Relation between the Spectra of Ionised Potassium and of Argon. P. ZEEMAN and H. W. J. DIK (*Ann. Physik*, 1923, [iv], **71**, 199—203).—The electronic configurations of the ionised potassium atom and of argon resemble one another in that each comprises eighteen electrons, and differ only in that the nuclear charge in the case of the former is one unit greater than in the latter case. The displacement law of Kossel and Sommerfeld (A., 1919, ii, 378) indicates that the spark spectrum of any element is related to the arc spectrum of the preceding element in the periodic table. Literature dealing with the characteristic arc and spark spectra of potassium and of argon is briefly reviewed. It is remarked that the spark spectrum of singly ionised potassium is most readily excited by means of an electrodeless ring-discharge in potassium vapour. Paulson (A., 1915, ii, 194) showed that for lines in the argon spectrum included between λλ 9233 and 3319 Å. the respective frequencies can be expressed in terms of constants B, C, and D connected by the relations $B=A+846\cdot1$; $C=A+1649\cdot3$; $D=A+2256\cdot1$. The authors show that between the frequencies of lines included between λλ 6594 and 3063 Å. in the spark spectrum of potassium a similar and even simpler relation, expressed in the form $Q=P+847$; $R=P+1695$; $S=P+2542$, exists. The same numerical constant, approximately equal to 847, occurs in the expressions for A and Q, and the constant difference between succeeding members of the Q, R, S series is also equal to this constant. It is suggested that this constant has some simple physical significance. J. S. G. T.

Series of Multiple Lines with Fourfold Rydberg Constant in the Spectrum of Potassium. KNUD AAGE NISSEN (*Astrophys. J.*, 1923, 57, 185—190).—Sixty-four lines between λ 1873 and λ 4608 have been arranged in one diffuse subordinate series, $(2p)-(md)$, and in sharp subordinate series, $(2p_x)-(ms')$, $(2p_y)-(ms'')$, $(2p_u)-(ms''')$, $(2p_z)-(ms')$, and $(2p_z)-(ms'')$. An average agreement within one unit is obtained between the observed values reduced to international vacuum wave-numbers and those computed by Ritz's formulæ. The results support Sommerfeld's suggestion that there is a relationship between the spark spectrum of an alkali and the arc spectrum of the inert gas with atomic number one less. (See also McLennan, A., 1921, ii, 667; Schillinger, *Sitzungsber. K. Akad. Wiss. Wien*, 1909, **118**, II, A, 266; A., 1910, ii, 369; Nelthorpe, *Astrophys. J.*, 1919, **41**, 16). A. A. E.

The Spark Spectrum of Rubidium. H. REINHEIMMER (*Ann. Physik*, 1923, [iv], 71, 162—177).—Particulars are given of 142 lines included between λλ 3320 and 7320 Å. in the spark spectrum of rubidium excited in a discharge tube containing helium at about 3 mm. pressure, and of 12 lines in the arc spectrum of the metal. The displacement law of Sommerfeld and Kossel (A., 1919, ii, 378) indicates that if the spark spectrum of rubidium is attributable to the singly ionised atom of the metal, this spectrum should be analogous in structure to the arc spectrum of krypton. A direct comparison of these two spectra is at present impossible, but the comparison may be effected by way of the neon spectrum which is known to contain 10 p-terms. In this manner it has been found possible to classify 103 lines in the spark spectrum of rubidium into series containing a large number of p-terms. This result is held to confirm qualitatively the validity of the displacement law.
J. S. G. T.

The Arc Spectrum of Lead. WALTER GROTRIAN (*Naturwiss.*, 1923, **11**, 255—256; from *Chem. Zentr.*, 1923, i, 1413—1414).—The absorption spectrum of lead at 700—800° shows a first line at 2823 Å., which is held to be due to the term corresponding with the normal lead atom. At 1100° lines occur at 3639, 3683, 4057, 2614, 2613, and 2577 Å. The line 2833 Å. is the fundamental line of a subsidiary series which occurs in emission as a transition from $2s$ to $2p_4$. G. W. R.

Spectrum Analysis of the Rare Earths. J. M. EDER (*Ann. Physik*, 1923, [iv,] **71**, 12—18).—The main characteristics of the arc spectra of the rare elements yttrium, erbium, thulium, lutecium, neo-ytterbium, samarium, gadolinium, europium, "eurosamarium," terbium, "welsium," and holmium are discussed. The author considers the elemental character of thulium and terbium to be definitely established. That of samarium is not certain.
J. S. G. T.

The Spark Spectra of Aluminium. I and II. F. PASCHEN (*Ann. Physik*, 1923, [iv], **71**, 142—161; 537—561).—I. Particulars are given of the modes of excitation of the spectra of Al^{I}, Al^{II}, and Al^{III}. Various lines in the spark spectrum of doubly-ionised aluminium, Al^{III}, are classified into series and the spectrum is compared with those of Na^{I}, Mg^{II}, and H, the comparison confirming Bohr's conclusions relating to the electronic characteristics of these elements. In particular, it is pointed out that the ordinary spark spectrum of aluminium contains, in addition to a series of lines of the Fowler type, a series of lines analogous to those in the arc spectrum of Na^{I}, with the difference that Rydberg's constant, N, in the series-formula for the latter is replaced by $9N$ in the series-formula for the lines of Al^{III}, in accordance with Bohr's theory.

II. The author tabulates the intensities, wave-lengths, frequencies, and combination formulæ of about 300 lines in the spark spectrum of singly-ionised aluminium, Al^{II}. Various series of triplets in the spectrum are classified, and formulæ giving the frequencies of the series $4f_i—mf'$, $4p_i—ms$, $mp_i—md_j$ deduced. Similarly, values of the respective wave-lengths, frequencies, and differences of frequencies of the systems of triplets in the spectrum of chlorine excited between aluminium electrodes in an atmosphere of helium containing very little chlorine are tabulated and discussed. The spark spectrum of Al^{II} is compared with those of Mg^{I} and hydrogen.

Regularities of the Spectral Lines of Iron and the Atomic Magnetic Field. H. NAGAOKA and Y. SUGIURA (*Nature*, 1923, **112**, 359).—A preliminary account of regularities observed, particularly between λ 2400 and λ 3000 Å. The results appear to support the magneton theory. It is thought that the intricate nature of the spectral lines in ferromagnetic metals may ultimately be traced to the existence of an inner atomic field. A. A. E.

Symmetrical Series of Lines in the Spectrum of Iron. A. Hagenbach and H. Schumacher (*Ann. Physik*, 1923, [iv], **71**, 19—40).—In continuation of previous work (*Arch. de Genève*, 1919, **1**, 231) the authors have found two pairs of symmetrical double series of lines, the symmetry relating to the frequencies of the lines in the spectrum of iron. The one pair of double series occurs towards the red end of the spectrum, the other towards the violet end. The centre of symmetry is very approximately the same for the respective members of each pair, thus for lines in the respective groups 1, 2, 3, and 4, the centres of symmetry occur at λλ 5135·395±0·151, 5132·943±0·174, 3683·04±0·14, 3682·05±0·12 Å. Formulæ involving three constants and a single variable parameter are deduced for the frequencies of the lines in the various groups. There are as follows: Group I, $\nu=194727\pm11412m^4/(m^2-1{\cdot}3544m+13{\cdot}581)^2$, $m=3, 4, 5 \ldots$; Group II, $\nu=194820\pm11743m^4/(m^2-0{\cdot}5038m+5{\cdot}7173)^2$, $m=2, 3, 4 \ldots$; Group III, $\nu=271515\pm6735m^4/(m^2-0{\cdot}384m+6{\cdot}48)^2$, $m=2, 3, 4 \ldots$; Group IV, $\nu=271588\pm6136m^4/(m^2-1{\cdot}20279m+10{\cdot}4354)^2$, $m=2, 3, 4. \ldots$ The effects of pressure and of a magnetic field (Zeeman effect) on the various groups of lines are briefly discussed. The symmetrical character of the wave-lengths of certain groups of lines discovered by Gehrcke in the spectrum of iron (A., 1921, ii, 612; *Physikal. Z.*, 1922, **23**, 432) is critically examined, and the author concludes that the data available are insufficient to decide whether such symmetry is best expressed in terms of wave-lengths or frequencies.

J. S. G. T.

Regularities in the Arc Spectrum of Vanadium. W. F. Meggers (*J. Washington Acad. Sci.*, 1923, **13**, 317—325).—Of the 2000 lines already measured in the arc spectrum of vanadium about 15% have been now assigned to multiplets, tables of sixteen of which are given. Vanadium as a representative of Group V of the periodic classification is thus shown to conform to the alternation law of Kossel and Sommerfeld, which is now verified for arc spectra across the entire table. A. R. P.

Tesla-luminescence Spectra. III. Some Mono-substitution Products of Benzene. William Hamilton McVicker, Joseph Kenneth Marsh, and Alfred Walter Stewart (T., 1923, **123**, 2147—2163).

Absorption Spectra of Nitrosylsulphuric Acid and of the Complex Compounds of Copper Sulphate and Ferrous Sulphate with Nitric Oxide. H. I. Schlesinger and Albert Salathe (*J. Amer. Chem. Soc.*, 1923, **45**, 1863—1878).—The absorption spectrum of nitrosylsulphuric acid dissolved in sulphuric acid of various concentrations has been obtained and examined. The spectra show that appreciable quantities of the former remain undecomposed when the sulphuric acid is diluted to 50% with water, and that in sulphuric acid of greater concentrations relatively large amounts of nitrosylsulphuric acid are present. This result disproves one of the fundamental assumptions made by Raschig in his development of the theory of the chamber process. Absorption spectra of the complexes formed by ferrous sulphate with nitric oxide in solutions of sulphuric acid of various concentrations have been photographed. The spectroscopic data confirm the view that there are two such complexes, both of the composition $FeSO_4,NO$, and show that one of them is stable when the concentration of the sulphuric acid is greater than 65%, and the other when the concentration of acid is below 50%. Absorption spectra of $CuSO_4,NO$ have also been obtained and the spectra of these complex salts have been compared with those of the so-called ferrous and cupric nitrosisulphonates and have been found to be identical. A preliminary investigation of the absorption spectrum of "nitrosisulphonic acid" has shown it to be very similar to that of the ferrous sulphate–nitric oxide complex existing in concentrated sulphuric acid solution. This result supports the view that possibly nitrosisulphonic acid should be regarded as an unstable solution of a complex compound of sulphuric acid and nitric oxide. Examination of the spectra of solutions of nitric acid in concentrated sulphuric acid, both before and after the solutions have been heated, shows that nitric acid is not readily decomposed in such solutions into nitrosylsulphuric acid, at least if the solution is not very concentrated with respect to nitric acid. The character of the absorption spectrum of nitrosylsulphuric acid favours the view that this substance is present in solution largely as nitrososulphonic acid. J. F. S.

The Spectrophotometric Method for the Investigation of Dyes in Textile Fabrics by Transmitted Light. N. Uspenski and G. Worónkov (*Z. Physik*, 1923, **17**, 112—116).—The application of the König-Martens polarisation spectrophotometer to the determination of the absorption curves of various dyes contained in various dyed textile fabrics—cotton, wool, and silk—is briefly described. J. S. G. T.

Phosphorescent Zinc Sulphide. A. A. Guntz (*Compt. rend.*, 1923, **177**, 479—482).—A study of the phosphorescence of mixed crystals of zinc and cadmium sulphides. The phosphorescence of zinc sulphide changes in colour from greenish-blue to red with increasing quantities of cadmium sulphide. With a 12%, 20%, and 30% content of the latter substance, the phosphorescence is, respectively, lemon-yellow, orange, and red. The orange phosphorescence induced by the addition of traces of manganese to zinc sulphide is neither vigorous nor persistent, whereas cadmium sulphide produces no effect unless present in fairly large quantities, and does not diminish the vigour or the duration of phosphorescence, the colour change being a light-absorption effect and not due to phosphorogenic action on the part of cadmium sulphide (cf. A., 1922, ii, 502).

E. E. T.

Chemical Constitution and Rotatory Power. VI. Influence of the Chemical Function of the Substituent Groups. Mario Betti (*Gazzetta*, 1923, **53**, i, 417—431).—The results previously obtained (A., 1907, ii, 661, 726; 1916, ii, 279; 1921, i, 107) are summarised. T. H. P.

Partial and Consecutive Reactions in the Photosensitive System: Quinine Sulphate, Chromic and Sulphuric Acids. GEORGE S. FORBES, JOHN C. WOODHOUSE, and REGINALD S. DEAN (*J. Amer. Chem. Soc.*, 1923, **45**, 1891—1895).—The photochemical oxidation of quinine sulphate by chromic acid in the presence of sulphuric acid in the light emitted by a quartz mercury lamp has been investigated. With two photochemically activated reactants the total reaction velocity should be the sum of four partial reactions with four different velocity constants. One involves two activated molecular species, another only unactivated species, and two others involve one activated and one unactivated species. It is shown from the present work that species known to be activated in some reactions may give no evidence of activation in others. The concentration of a photochemically unactivated reactant is shown to be without effect on the velocity of a photochemical reaction, provided that its concentration is not so small that its reaction with activated reactants does not become the slow stage of the total process. J. F. S.

Long-range Particles from Radium-active Deposit. GERHARD KIRSCH and HANS PETTERSSON (*Nature*, 1923, **112**, 394—395).—By enclosing dry radium emanation mixed with oxygen in thin-walled capillaries of potassium glass or silica lined with aluminium foil (thickness 12 μ) pressing well against the glass, a strong and practically constant source of hydrogen nuclei is obtained. This method has been applied to scandium, vanadium, and cobalt (as oxides), arsenic, and indium (as chlorides); these elements do not give off long-range particles (>30 cm. of air) in greater number than $3\times$ or $4\times N.10^{-8}$, where N is the number of α-particles from radium-C discharged within the capillary.

By spreading substances over copper foil (which, after removal of occluded gases, showed a comparatively small number of hydrogen particles, probably "neutral" particles), fairly conclusive evidence was obtained that hydrogen nuclei are emitted from silicon, glucinum (oxide), magnesium (oxide), and lithium (carbonate), the approximate maximal ranges in air being, respectively, 12 cm., 18 cm., 13 cm., and 10 cm. A. A. E.

The β-Ray Spectrum of Uranium-X_1 and its Significance. LISE MEITNER (*Z. Physik*, 1923, **17**, 54—66).—The β-ray magnetic spectrum of uranium-X_1 has been found to consist of three sharp lines corresponding, respectively, with values of Hρ equal to 1057, 1028, and 927, and a faint band the centre of which corresponds with a value of Hρ equal to 1163, H denoting the strength of the magnetic field employed measured in Gauss units, and ρ the radius of curvature (in cm.) of the respective paths of the emitted β-rays in the field. The three sharp lines originate in the L, M, and N levels and the corresponding rays are ejected by the K_a characteristic radiation of the thorium isotope uranium-X_1 excited by the primary β-rays. Individual atoms are concerned throughout the whole process of disintegration. Apart from characteristic Röntgen radiation, no γ-rays are emitted by uranium-X_1. The results indicate that the primary β-rays are emitted from the atomic nucleus with a definite velocity, and are in agreement with the suggestion of Rosseland (*Z. Physik*, 1923, **14**, 173) that an excited atomic system can pass to the unexcited state by the emission of one of its constituent particles in the form of a corpuscular ray as an alternative to the emission of radiation. J. S. G. T.

The γ-Rays of Uranium-X and their Relation to Uranium-X_1 and Uranium-X_2. OTTO HAHN and LISE MEITNER (*Z. Physik*, 1923, **7**, 157—167).—In continuation of previous work (preceding abstract), the authors have determined the absorption, by various thicknesses of lead, of the γ-rays emitted by uranium-X, and the distribution of the respective groups of rays amongst the components uranium-X_1 and uranium-X_2. The experimental method employed eliminated the effect of β-rays from the observations. Three classes of rays were distinguished in the radiation emitted from uranium-X, and these were characterised by the following respective values of the thickness of lead required to reduce their initial activities by one-half: 9·6, 3·0, and 0·36 mm. Taken in conjunction with the results of Richardson (A., 1914, ii, 160) the results indicate that four types of γ-rays are emitted by a mixture of uranium-X_1 and uranium-X_2. Of these, the nuclear hard γ-rays (9·6 mm., 3·0 mm.) are associated with uranium-X_2 entirely, whilst the remaining group of γ-rays observed (0·36 mm.) and that observed by Richardson (half-absorption value 0·29 mm. aluminium) are associated entirely with uranium-X_1 and constitute, respectively, the characteristic K- and L-Röntgen radiation, a conclusion which is in agreement with a deduction drawn by Meitner from previous work concerned with the analysis of the β-radiation emitted by uranium-X (*loc cit.*). J. S. G. T.

Electrochemistry of Gases. S. C. LIND (*Amer. Electrochem. Soc.* [advance copy], 1923, 61—69).—A theoretical paper in which as a result of kinetic studies of gas reactions under ionising conditions (α-radiation), the following new principles, which are supported by recent electronic evidence may be put forward. Gaseous ions tend to form additive products with neutral molecules, which complexes are the intermediate products of gaseous electrochemical reactions. As a deduction from the above, ions do not interact, nor do molecules or atoms otherwise activated interact. Their momentary concentrations are too low; they react only with neutral or unactivated molecules. A low momentary concentration of an activated substance is capable of explaining the action of negative catalysts or inhibitors. Active ions may be destroyed by reverse action either in a uni- or multi-component system, without any effective chemical action resulting. This reversal may be prevented by a suitable acceptor. Free electrons will play a primary part in producing chemical reaction only in gaseous systems containing at least one gas with affinity for electrons. Absence of such a gas will result in a reaction with a lower M/N ratio than when one is present. A secondary rôle is always played by electrons in restoring final electrical neutrality. J. F. S.

Electricity in Flames. H. A. Wilson (*Amer. Electrochem. Soc.* [advance copy], 1923, 51—60).—A theoretical paper in which the present state of knowledge on the electrical properties of flames is reviewed. The electrical conductivity of salt vapours in flames, ionic mobilities in flames, the behaviour of flames in a magnetic field, the charge carried by the ions of salt vapours at high temperatures, the electrical conductivity of flames for rapidly alternating currents, and the thermodynamical theory of ionisation at high temperatures are considered. A bibliography of the subject is appended to the paper. J. F. S.

The Quinhydrone Electrode as a Comparison Electrode. Stig Veibel (T., 1923, **123**, 2203—2207).

Oxidation-Reduction. W. Mansfield Clark (*U.S. Pub. Health Rep.*, No. 823).—A theoretical treatment of oxidation, involving the measurement of oxidation potentials. J. F. S.

Heat Losses and Chemical Action in the High-voltage, High-frequency Discharge through Air. Farrington Daniels, Paul Keene, and P. D. V. Manning (*Amer. Electrochem. Soc.*, 1923, 141—151. [Advance copy]).—Experiments with a high frequency corona discharge at about 100,000 volts indicate that of the energy supplied to the discharge chamber, about 2% only was converted into chemical energy. This chemical efficiency is of the same order as that afforded by arc and other types of corona discharges in air. Short exposures to the discharge gave higher chemical efficiencies than long ones. The ratio of ozone to nitric acid produced by the discharge varied from 2·4 to 16, according to the character of the discharge, an increase of nitric acid accompanying an increase of intensity of the pink streamers, whilst uniformity of the blue corona increased the proportion of ozone. J. S. G. T.

Source of Trouble in Electrometric Measurements of Hydrogen-ion Concentration. W. T. Bovie and Walter S. Hughes (*J. Amer. Chem. Soc.*, 1923, **45**, 1904—1905).—It is pointed out that inaccuracies in the measurement of hydrogen-ion concentration may arise, which are due to the diffusion of mercuric chloride from the calomel electrode. This substance poisons the hydrogen electrode, slightly at first, but more as time goes on until eventually no trustworthy measurements can be made even with freshly platinised electrodes. A method of avoiding this error is described which can be used with a quadrant electrometer, which consists in closing the mouth of the calomel electrode with a very thin-walled glass bulb which is inserted in the liquid and is sufficiently conducting when an electrometer is used but not when a galvanometer is employed. J. F. S.

A Comparison of the Heating-curve and Quenching Methods of Melting-point Determinations. George W. Morey (*J. Washington Acad. Sci.*, 1923, **13**, 326—329).—Comparison of the results obtained with sodium metasilicate shows that the melting point determined by the heating-curve method is about 2° lower than that obtained by the quenching method, which is probably the more correct. The latter point lies on the sharply rising section of the heating curve just after the section that is flattened out. [Cf. *J.S.C.I.*, 1923, Oct.] A. R. P.

The Calorific Value of Carbon Compounds. Dimitri Konovalov (T., 1923, **123**, 2184—2202).

The Density of Liquids below 0°. Jean Timmermans (*Bull. Soc. chim. Belg.*, 1923, **32**, 299—306; cf. A., 1912, ii, 738).—The densities between 0° and the freezing points of ammonia, phosphorus trichloride, carbon disulphide, ethyl bromide, propionitrile, ethyl alcohol, and *n*-propyl alcohol are determined. It is shown that the scale of low temperatures adopted by the French is identical with that adopted in America, but is different from the German. The rule previously enunciated, $d_{\text{max}}/d_{\text{crit}} = d_{\text{crit.}}/d_{\text{theor.}}$, is confirmed. H. H.

Metallic Cementation. H. Weiss (*Ann. Chim.*, 1923, [ix], **19**, 201—275).—The author has studied the interfacial penetration of copper with nine other metals under various conditions, and, although the results show considerable variation both with temperature and with the nature of the second metal, he was able to draw certain general conclusions as to the nature and mechanism of the action. [Cf. *J.S.C.I.*, 1923, 982A.] H. J. E.

Equilibrium of the Ternary System Bismuth–Tin–Zinc. Sheikh D. Muzaffar (T., 1923, **123**, 2341—2352).

The Kinetics of the Reaction between Ferrous Phosphate and Sulphur Dioxide in Phosphoric Acid Solution. Sydney Raymond Carter and John Alfred Valentine Butler (T., 1923, **123**, 2370—2380).

Inversion of Sucrose by Saccharase. H. von Euler and K. Myrbäck (*Z. physiol. Chem.*, 1923, **129**, 100—105).—The inversion of sucrose by purified saccharase is approximately unimolecular (cf. Kuhn, this vol., i, 401), the reaction constant at optimum p_{H} showing only a very slight increase with time. Michaelis's constant, $k_M = [23\cdot75 \log (R+L)/(D+L) + 32\times0\cdot305 (R-D)/(R+D)]/t$, remains very constant both for purified saccharase and for crude yeast extract. W. O. K.

Influence of Neutral Salts on the Temperature Coefficient of Reaction Velocity. F. O. Rice and William Lemkin (*J. Amer. Chem. Soc.*, 1923, **45**, 1896—1900).—The velocity of the reaction between iodine and acetone in the presence of nitric, hydrochloric, hydriodic, perchloric, benzenesulphonic, trichloroacetic and naphthalene-2-sulphonic acids and also in the presence of normal salts of sodium, potassium, rubidium, lithium, and magnesium has been determined at 25° and 23°, and the temperature coefficient calculated for each case. It is shown that the temperature coefficient is the same for all strong acids, and it is unaffected by the presence of salts of the acid. The reaction has a lower temperature coefficient when catalysed by weak acids. If the acids are arranged in descending order of their strengths, this is also the order of diminishing temperature coefficients. When the reaction is catalysed by sulphuric acid, the presence of one of its salts diminishes the temperature coefficient considerably. This is probably true for all weak acids. Small quantities of about 0·01*M* of salts of the alkali metals increase the velocity slightly. There is no indication of any diminution such as might be expected on the basis of the law of mass action. J. F. S.

Line Spectra and Atomic Structure. NIELS BOHR (*Ann. Physik*, 1923, [iv], **71**, 228—288).—The quantum theory of the origin of spectral series, developed by the author, and the relation of spectra to atomic structure are reviewed. J. S. G. T.

An Explanation of the Theory of the Rotation of the Atomic Nucleus. III. HERBERT HENSTOCK (*Chem. News*, 1923, **127**, 18—21).—The author's theory (cf. this vol., ii, 477) is applied to the consideration of the structure of the oxides of the elements of groups I to IV of the periodic system. A double bond between a bivalent metal and oxygen may be formed by the juxtaposition of the faces of the respective cubic octets, the two nuclei being orientated perpendicularly to one another. In certain cases, for instance carbon monoxide, it is necessary to assume distortion of the octet. If the uncombined carbon atom has a tetrahedral form, in carbon monoxide it may have a semi-cubic, semi-tetrahedral form. The absence of free lines of force in the combined carbon atom will then account for the stability of the compound. A distorted octet must be characteristic of those atoms which have few electrons in their outer layers. E. H. R.

Structure of the Molecule. A. PEARSE JENKIN (*Nature*, 1923, **112**, 326).—The suggestion that both dynamic and static electrons take part in the formation of the molecule is applied to the cases of water and tartaric acid. A. A. E.

A Static Model of the Hydrogen Molecule. H. STANLEY ALLEN (*Proc. Roy. Soc. Edin.*, 1922—1923, **43**, 180—196).—A model of the hydrogen molecule, based on the assumption of the existence of the "quantum force," $n^2h^2/4\pi^2mr^3$, postulated by Langmuir (*Physical Rev.*, 1921, **18**, 104), varying inversely as the cube of the distance, and of which the sign depends on the signs of the electrical charges involved, is described. The model possesses many of the properties of the Bohr model of the hydrogen molecule, with the important difference that the electrons are at rest relatively to the hydrogen nuclei. Of the various possible electronic equilibrium configurations, the most stable is that in which the nuclei and electrons are situated at the corners of a square, the nuclei being at the extremities of one diagonal and the electrons at the ends of the other. The length of the diagonal is 0·871 Å. and the moment of inertia of the molecule $6{\cdot}261 \times 10^{-41}$ c.g.s. unit. The work necessary for the complete disintegration of the molecule corresponds with a potential difference of 30·06 volts. In the case of the charged hydrogen molecule with only one electron, the distance between the nuclei is 1·239 Å., and the ionisation potential 17·34 volts. Calculated and experimental values of the ionisation potentials are in moderately good agreement. A possible configuration for the molecule of triatomic hydrogen (Thomson, "Rays of Positive Electricity," 1921, 196), in which nuclei and electrons are disposed at alternate corners of a regular hexagon, is suggested. It is pointed out that a static model of the hydrogen molecule accords with the diamagnetic character of the element and with evidence derived from band spectra. J. S. G. T.

The Curves of the Periodic Law. W. M. THORNTON (*Phil. Mag.*, 1923, [vi], **46**, 442—448).—The minor fluctuations exhibited by the graph associated with the presentation of the periodic law, in which the densities of the elements are plotted as ordinates against the respective values of the atomic weights as abscissæ, are discussed. It is shown that the main features of the curve can be represented by a fundamental wave-form in which the amplitude and period vary; it represents the periodic change in the configuration of the outer electrons in an atom under their own forces. Superposed on this fundamental, in order to reproduce the minor fluctuations, is, after the manner employed in harmonic analysis, a smaller wave-form of double the frequency of the fundamental, the amplitude and phase of this second wave-form being chosen by inspection. It is shown that the physical and chemical properties of the elements appear to depend as much on the minor periodicity as on the fundamental. This is exhibited by a series of curves in which ordinates represent the densities of the respective elements and abscissæ represent the projections of the major harmonic curve, referred to, on the vertical axis. Properties of the elements —density, radioactivity, stability, contraction, and expansion, ductility—are discussed in connexion with these curves. J. S. G. T.

Nature of Chemical Valency. W. NERNST (*Z. angew. Chem.*, 1923, **36**, 453—455).—The hydrogen atom is the only chemical substance of the structure of which we have up to the present obtained a satisfactory and definite picture, because only in this case, that of two electrically charged units of mass, are the quantum energy relationships understood. Pauli's conception of the hydrogen molecule (A., 1922, ii, 703) as two hydrogen nuclei which may be considered as relatively at rest, around which a free electron vibrates round the surface of an ellipsoid of rotation, is considered to be a conception of the nature of valency capable of extension to all chemical compounds, although, of course, our knowledge does not enable us to supply the details in other cases. The conception is extended to the case of the theoretically simplest crystalline structure—that of hydrogen atoms—and the resultant forces exerted by the vibrating electrons are shown to be equivalent to six subsidiary valencies arranged in space at right angles to one another. These valencies would not, however, exercise a continuous but a pulsating force, causing the positive nuclei to undergo vibrations of very small amplitude with relation to one another, even at the absolute zero of temperature. The same conception can be applied to the molecules in potassium chloride vapour, the molecule being held together by a free electron belonging to the potassium atom, travelling in an ellipsoidal path round the potassium and chlorine atoms. The distinction between polar and non-polar valency is considered to be determined by the behaviour of the free electron when the compound is decomposed. In the case of polar or dualistic compounds, the electron passes on decomposition to the other atom of the former compound and ionisation is the result. Ordinary crystals are cases of non-polar valency, the binding electrons remaining with their original partners on dissolution of partnership. Whether ionisation occurs or not will depend on the structure of the constellation of electrons associated with the atoms in question. These considerations apply only to matter in the neighbourhood of absolute zero of temperature. At higher temperatures, the matter is complicated by the superposition of heat vibrations on the simple vibrations here considered. The conception is also applicable to the conductivity of electricity through metals. H. C. R.

Studies of Electrovalency. II. Co-ordinated Hydrogen. THOMAS MARTIN LOWRY and HENRY BURGESS (T., 1923, **123**, 2111—2124).

The Relationship of the Tautomeric Hydrogen Theory to the Theory of Induced Alternate Polarities. FRED ALLSOP and JAMES KENNER (T., 1923, **123**, 2296—2315).

Chelate Co-ordination. J. D. MAIN SMITH (*Chemistry and Industry*, 1923, **42**, 847—850).—A criticism of Lowry's views (this vol., ii, 555) that two types of co-ordination exist, centric and cyclic; these two terms are not mutually exclusive, for all cyclic groups have centric atoms at their reacting ends. There is no need to modify the term " chelate group " until it has been proved that fundamentally different types of co-ordination exist. Lowry's criticism merely directs attention afresh to the fact, insisted on by Werner, that differences in stability in co-ordination compounds are due to differences in intensity, but not in type, of co-ordination. Against Lowry's view that ethylenediamine should not be regarded as a chelate group, evidence is quoted to show that it is, on the contrary, a chelate group of maximum activity. Morgan's idea of a chelate group is defined precisely as " a linked system of atoms which, in combination with another atom, completes a cyclic system." The resolution of the ferrous αα-dipyridyl complex is quoted as evidence against Lowry's statement that ring formation does not directly promote co-ordination, and the fact that αα-diquinolyl does not form co-ordinated ferrous compounds contradicts Lowry's general conclusion that the maximum of stability should be reached in a six-atom ring containing three pairs of conjugated atoms. The fact that no compounds, stable or unstable, are found in the case of αα-diquinolyl is proof that conjugation external to the chelate group is not even a minor factor in co-ordination. All co-ordination compounds are held to be of the same ("centric") type. F. A. M.

Electron Theory of Chemistry. Changes in Chemical Properties produced by the Substitution of One Element by Another, with Applications to Benzene Substitutions. (SIR) J. J. THOMSON (*Phil. Mag.*, 1923, [vi], 46, 497—514).—The author investigates the nature of the change in and around the molecule, and the effect produced on the chemical properties of the molecule, by the substitution of a univalent atom or radicle for an atom of hydrogen whereby the number of electrons in the molecule is increased. It is shown that the electrical effect of such substitution may be represented by the introduction of an electric doublet at the hydrogen atom. The sign of the doublet depends on the nature of the radicle. In the case of radicles of type I, including Cl, Br, I, OH, NH_2, CH_3, each containing 7 electrons forming an uncompleted octet, the positive end of the doublet will be directed towards the molecule with which the hydrogen is combined and its negative end away from it. In the case of the substitution of hydrogen by radicles of type II, including O:N:O, OH·C:O, H·C:O, and CN, each containing one electron in excess of the number required to form complete octets, the doublet will be directed in the opposite direction to that characterising type I. The magnitude of the electrostatic moment introduced by the respective substitutions indicates that, in agreement with experimental results, the specific inductive capacities of water, and methyl, ethyl, and propyl alcohols, referred to the same number of molecules in the liquid state, should be approximately equal. Immediate deductions from the natures of the electric field produced by the two types of substitutions referred to include the following. Where one carbon atom in a carbon compound has been halogenated, it is more likely to be still further halogenated than a carbon atom associated with hydrogen atoms none of which have been replaced by halogen atoms. The same rule applies to the process of oxidation of an organic compound. The substitution of hydrogen by atoms and radicles of type I, *e.g.*, the substitution of two hydrogen atoms in methyl alcohol to form formic acid, should increase the acidity of the compound. This is further illustrated by the relative acidities of mono-, di-, and tri-chloroacetic acids, where, however, a further factor involving the period of existence of the acid in one or other of two phases is probably concerned. In the case of carbon atoms connected, as in ethylene, by a double bond, the substitution of a hydrogen atom by an atom of chlorine, etc., results in polarisation of the double bond. It follows that additive compounds would be more freely formed with a compound such as CH_2:CHCl than with one like CH_2:CH_2.

In the case of a series of carbon atoms occupying positions designated in succession, starting from one end of the chain, by the numbers 1, 2, 3, 4, 5 . . ., when the substituent atom or radicle is of type I, the active carbons are those which are 1, 3, 5 . . . places from the atom where substitution took place, whilst when the substituent is of type II, the active carbon atoms are 2, 4, 6 . . . places away from the substituent. This is illustrated by the case of substitution of hydrogen in benzene. Substituents which direct a second substituent into the ortho- and para-positions include Cl, Br, I, OH, NH_2, and CH_3 (type I), whilst NO_2, CO, OH, CN, HSO_3 (type II), as substituents, direct a second substituent into the meta-positions. The high values of the respective specific inductive capacities of benzonitrile, nitrobenzene, and phenylacetonitrile are in accord with deductions from the theory. In the case of di-substituted benzenes, if both substituents belong to the same type, the specific inductive capacity will be least for the para- and greatest for the ortho-substitution, the value for the meta-substitution being unchanged. If the two substituents belong to different types, the specific inductive capacity will be greatest for the para- and least for the ortho-substitution. The author suggests that determinations of specific inductive capacities of di-substituted bodies might thus be employed in determining whether the second substituent enters into the ortho-, meta-, or para-position. J. S. G. T.

The Geber Question. J. Ruska (*Chem. Ztg.*, 1923, **47**, 717—718).—Observations by an orientalist contributing to the study of works ascribed to Geber (cf. Darmstaedter, this vol., ii, 628). A. A. E.

The Works of Geber. J. R. Partington (*Chemistry and Industry*, 1923, **42**, 790—791).—Polemical against Lippmann (this vol., ii, 314; see also Partington, this vol., ii, 148, and Darmstaedter, this vol., ii, 628). A. A. E.

Concerning Geber. Ch. M. van Deventer (*Chem. Weekblad*, 1923, **20**, 514—515).—In view of the work of Holmyard and of Partington (this vol., ii, 148) the author withdraws his view that Geber wished to pass as an older and more famous Dschâbir, but suggests the former name may have been a pseudonym of a writer of the early fourteenth century. S. I. L.

Extraction Apparatus for Large Amounts of Liquids. Hartwig Franzen (*Z. physiol. Chem.*, 1923, **129**, 307—308).—An electrically driven and electrically heated apparatus, which can be run continuously for months, and may have a capacity of more than 25 litres, is described with the aid of a diagram. W. O. K.

Inorganic Chemistry.

Chemical Action and the Disappearance of Gas in the Electrical Discharge Tube. F. H. NEWMAN (*Amer. Electrochem. Soc.* [advance copy], 1923, 43—49).—Hydrogen and nitrogen are absorbed in the presence of different elements, deposited on the walls of the cathode of a discharge tube, when the discharge is passing. The elements which exhibit this effect most strongly are phosphorus, sulphur, iodine, sodium, potassium, and the alloys of sodium and potassium. The rate of disappearance of the gas is greatest with phosphorus, sulphur, and iodine, and the final pressure attained is a minimum with phosphorus and sulphur. There is a similar absorption of these two gases when they are ionised by α-rays from polonium. The disappearance of the gas is due to the production of chemical compounds (nitrides and hydrides). The formation in this manner of nitrides of sodium, potassium, magnesium, and tin, and the hydrides of sodium, potassium, and sulphur have been proved by chemical analysis of the products. The gas under the ionising effect becomes modified, assuming an active condition which consists probably of triatomic molecules.

J. F. S.

The Photochemical Decomposition of Chlorine Monoxide. EDMUND JOHN BOWEN (T., 1923, **123**, 2328—2330).

Reaction between Bromine and Ammonium Salts and its Effect on the Precipitation of Manganese Dioxide. STEPHEN G. SIMPSON (*J. Amer. Chem. Soc.*, 1923, **45**, 1883—1890).—The effect of the presence of ammonium salts on the precipitation of manganese dioxide by bromine water following a basic acetate separation has been investigated, by determining the amounts of bromine used up in reactions with solutions of (*a*) ammonium sulphate, (*b*) manganous sulphate, (*c*) mixtures of the two, under varying degrees of initial acidity and in the presence of varying amounts of alkali acetate. The results show that each of the reactions is progressively retarded by an increase in the initial concentration of acid, and progressively accelerated by an increase in the concentration of acetate present, and the effect is greater in the case of the manganese salt than in the corresponding case of the ammonium salt. In the absence of acid, ammonium-ion and manganous-ion are quantitatively oxidised by bromine water, but the amount of free bromine used up is slightly in excess of the amount theoretically necessary. The results can be explained by considering the mass-action effect of the hydrogen-ion and of the acetate-ion on the equilibrium reaction between bromine and water, and assuming that the hypobromous acid formed oxidises the ammonium-ion and the manganous-ion more readily than does bromine and under existing conditions also decomposes slightly into oxygen and bromine. When ammonium and manganous salts are present together in neutral solution in the presence of acetate, the ammonium-ion is more readily oxidised by bromine water, and by its formation of hydrogen-ions retards the precipitation of manganese dioxide. J. F. S.

Thunderstorms and Ozone. WILLIAM C. REYNOLDS (*Nature*, 1923, **112**, 397).—Analyses of atmospheric air showed that there was no appreciable increase of the nitrogen peroxide content of the air during or after a thunderstorm, whilst the quantity of ozone was increased by two to seven times. A. A. E.

The Ternary System, Sulphur–Selenium–Tellurium. L. LOSANA (*Gazzetta*, 1923, **53**, i, 396—410).—The author summarises and supplements previous results obtained with the three binary systems included in the ternary system sulphur–selenium–tellurium, and gives the results of his own thermal, dilatometric, and micrographic investigations of the ternary system.

In the case of sulphur–selenium, Ringer (A., 1902, ii, 651) has shown that there is complete miscibility in the liquid, and partial solution in the solid, state, and that the compound Se_2S possibly exists within certain limits of temperature. For selenium–tellurium Pellini and Vio (A., 1906, ii, 663) found formation of mixed crystals, with no miscibility gap, throughout the whole extent of the system, so that the two component elements are isomorphous.

For sulphur–tellurium some disparity exists between the results of different investigators. The author's thermal measurements confirm the value, 1·9%, of tellurium given by Pellini (A., 1909, ii, 726, 805) to the limit of complete miscibility, and show that the minimum on the liquid curve is about 6% of tellurium, with which the maximum eutectic arrest corresponds. With more than 97·6% of tellurium there is no trace of arrest and the end of the solidification is perceptible with moderate clearness; Chikashigé's statement that mixed crystals are formed with 98—100% of tellurium (A., 1911, ii, 978) is thus confirmed. In its middle portion the curve agrees generally with the results of Chikashigé and, especially, of Pellini.

The ternary system exhibits formation of neither compounds nor ternary eutectics, but contains two zones of complete miscibility in which there exist mixed crystals of selenium and tellurium in sulphur and mixed crystals of sulphur and tellurium in selenium. The formation of mixed sulphur–tellurium crystals is favoured by the presence of selenium, which causes solid solutions with high proportions of tellurium to be formed; many of such solid solutions exhibit, however, the phenomenon of more or less rapid de-mixing. The first transformation point of sulphur is depressed considerably by selenium and tellurium separately and to a still greater extent by the two elements together. T. H. P.

Production of Nitrogen Oxides and Ozone by High Voltage Electric Discharges. KARL B. MCEACHRON (*Amer. Electrochem. Soc.* [advance copy], 1923, 71—86).—The production of nitric oxide and ozone in tubes of various designs under various pressures and electrical conditions has been investigated. It is shown that the previous electrical history of the gas has a marked effect on the character of the discharge and the products formed. Traces of the products of previous experiments, made in small tubes of the Siemens type, modify the character of the discharge and decrease the absorbable products. Increase of current flowing in the discharge increases the yield of both ozone and nitric acid up to a certain maximum, beyond which further increase in current decreases the yields. With increase of pressure, the yields of ozone increase until a pressure near to that of the atmosphere is reached. At higher pressures, the yields in general decrease. With decreasing pressures, within the limits investigated, the yield of nitric acid increases with tubes in which sparking occurs, and decreases in tubes, like the rod tubes, in which sparking does not occur. Increase in the rate of air flow will in general increase the yields of nitric acid up to a certain maximum, the critical air flow rate being dependent on the tube used. Increased air rates give increased yields of ozone which tend to become constant at higher rates. Sparks passing through air cause a pressure increase much too rapid to be a heat effect. With an enclosed volume of air, a pressure decrease occurs at the instant the power is disconnected, which is the pressure change due to ionisation noted by Farwell. A tube of the rod type, if properly cooled, gives yields of ozone of sufficient magnitude, so that the tube becomes of importance as a commercial ozoniser. In air, the corona discharge favours the production of ozone, whilst sparks tend to produce oxides of nitrogen. Some exceptions may be found to this, as in Siemens tubes, where the yield of nitrogen pentoxide was at times quite large, and yet the discharge consisted of a fine glow only. A combination of sparks and corona produces the higher oxides which are desirable from the absorption point of view. J. F. S.

The Slow Oxidation of Phosphorus. ELIZABETH GILCHRIST (*Proc. Roy. Soc. Edin.*, 1922—1923, **43**, 197—215).—Visible glow is emitted from phosphorus during oxidation only when the action occurs at a certain minimum rate, and is probably attributable to the oxidation of phosphorus trioxide, which must occur at a considerably slower rate than the oxidation of phosphorus to phosphorus trioxide preceding this action. The glow occurs chiefly in the gas phase, and may be steady, fluctuating, or intermittent. The rate of the reaction increases with rise of temperature, and at partial pressures of oxygen of about one atmosphere the rate is diminished with increase of oxygen pressure and may be slowed below the glowing point. The presence of ozone in oxygen greatly increases the glow, but the glow is not under ordinary conditions attributable to ozone produced in the reaction. A trace of moisture seems necessary to start the reaction, but as the pressure of water vapour increases, the rate attains a maximum value and thereafter falls. Gases and vapours capable of developing negatively-charged carbon molecules, *e.g.*, ethylene, acetylene, or ethane, are negative catalysts towards the reaction, whilst others, including ammonia and methyl alcohol, are promoters of the reaction. J. S. G. T.

The Reaction between Phosphorous Acid and Iodine. ALEC DUNCAN MITCHELL (T., 1923, **123**, 2241—2254).

Action of Potassium Carbonate on Lead Glass. H. DROOP RICHMOND (*Analyst*, 1923, **48**, 260—262).—When stored in lead glass bottles, potassium carbonate may become contaminated with considerable quantities of lead and arsenic derived from the glass. This action of the salt on the glass is relatively rapid if moisture is admitted to the bottle owing to a defective stopper. W. P. S.

Correction to the Freezing-point Diagram of Lead–Sodium Alloys. G. CALINGAERT and W. J. BOESCH (*J. Amer. Chem. Soc.*, 1923, **45**, 1901—1904).—The thermal data obtained by the authors for lead–sodium alloys (66·6 atomic % of sodium) differed appreciably from Mathewson's results (A., 1906, ii, 666); consequently they have determined the freezing-point data for alloys between 50 and 75 atomic % of sodium. It is shown that the pure compound separating from alloys of lead and sodium, the composition of which is between 58·8 and 76·6 atomic % of sodium, is Na_5Pb_2, this compound forming solid solutions with both NaPb and Na_4Pb. Alloys containing 58·8 to 71·4 atomic % of sodium rearrange at 182° on cooling, the compound Na_5Pb_2 disappears and a new compound, Na_2Pb, is formed. The complete diagram of lead–sodium alloys is given corrected for the above results. J. F. S.

The Crystal Structure of Sodium Chlorate. WILHELM KIBY (*Z. Physik*, 1923, **7**, 213—250).—The work of Kolkmeijer, Bijvoet, and Karssen (A., 1921, ii, 200) and of Dickinson and Goodhue (A., 1922, ii, 145) on the determination of the crystal structure of sodium chlorate by Bragg's method of X-ray crystal analysis is briefly reviewed. Wulff (*Z. Kryst.*, 1922, **57**, 190) employing Laue's method of analysis, calculated values of the parameters differing considerably from those found by the previous observers. The present paper contains the mathematical analysis of a method whereby the crystallographic parameters of a crystal of sodium chlorate are determined from a consideration of the distribution of intensities in the X-radiation diffracted in various directions by the crystal, as evidenced by the intensities of the photographic point images contained in the appropriate Laue X-ray diagram. In the case of a crystal of sodium chlorate, such a diagram contains 51 points in each quadrant. Employing the method of combination suggested by Schiebold, sixteen only of these points are required in the analysis. The following assumptions amongst others are made in the analysis: that the structure is close-packed; the oxygen atoms in the crystal structure lie each in contact with the appropriate chlorine atom and the two nearest sodium atoms and each lies in the plane defined by these three atoms; each chlorine atom is at an equal distance from each of the corresponding two sodium atoms referred to. With these assumptions, it is shown that the values of the parameters a, b, p, q, and r referring, respectively, to the co-ordinates of a sodium atom, a chlorine atom, and the three oxygen atoms in a molecule of sodium chlorate, which enable the positions of all atoms within the structure to be calculated are *a*, 0·071; *b*, 0·429; *p*, 0·301; *q*, 0·473; *r*, 0·590. The values are in close agreement with those deduced from the work of Dickinson and Goodhue referred to. J. S. G. T.

The Properties of Ammonium Nitrate. VI. The Reciprocal Salt Pair Ammonium Nitrate and Potassium Sulphate. EDGAR PHILIP PERMAN and WILLIAM JOHN HOWELLS (T., 1923, **123**, 2128—2134).

The Diffusion of Oxygen through Silver. LEO SPENCER (T., 1923, **123**, 2124—2128).

The Crystalline Structures of Silver Iodide. R. B. WILSEY (*Phil. Mag.*, 1923, [vi], **46**, 487—496).—Employing the powder-method of *X*-ray crystal analysis, the author has determined as follows the lattice structure, length of side of the elementary structure, and distance apart of the nearest atomic centres in the cases of the respective silver halides and metallic silver:—silver chloride: simple cubic of the sodium chloride type, 5·540, 2·770 Å.; silver bromide: simple cubic of the sodium chloride type, 5·768, 2·884 Å.; silver iodide: diamond cubic of the zinc sulphide type, 6·493, 2·812 Å.; and hexagonal of the zinc oxide type, 4·593, 2·813 Å.; metallic silver: face-centred cubic, 4·078, 2·884 Å. Most of the samples of silver iodide examined showed predominance of the hexagonal structure. In some cases the cubic structure alone was evident, whilst all samples exhibited this to some extent. The axial ratio of the hexagonal structure in the case of silver was found to be 1·633±0·008. J. S. G. T.

The Preparation of Barium Alloys. V. M. GOLDSCHMIDT (*Norg. Geol. Undersökelse, Statens Raastofkomite Publication*, 1922, No. 7).—Alloys of barium with lead have been prepared by the electrolysis of fused barium chloride (8 parts), potassium chloride (5 parts), and sodium chloride (3 parts) in a cell with a carbon anode and molten lead as the cathode. The preparation of an alloy containing 10% of barium requires a temperature of 600—650°, using 4—6 volts, with electrodes 1—1·5 cm. apart, and a current density not exceeding 3 amperes/cm.^{2} at the anode and 1 ampere/cm.^{2} at the cathode. Alloys have been prepared containing 18% of barium and less than 1% of sodium; alloys with zinc and tin, of low barium content, have also been obtained.

CHEMICAL ABSTRACTS.

Reduction of some Rarer Metal Chlorides by Sodium. M. A. HUNTER and A. JONES (*Amer. Electrochem. Soc.* [advance copy], 1923, 35—41).—The anhydrous chlorides of glucinum, chromium, uranium, vanadium, and zirconium when heated with sodium in a closed steel bomb are reduced to the metal, which is generally comparatively pure and in the form of small pellets. In the case of glucinum the beads contained 99·6% of metal, *d* 1·793, m. p.

in hydrogen 1370°. The metal could not be completely burnt in air; it is readily soluble in hydrochloric acid, but is not attacked by cold concentrated nitric acid. With chromium, the product was 99·86% pure, *d* 6·29—6·40; it is unattacked by cold hydrochloric or sulphuric acid, but is readily attacked by either acid when heated. It is unattacked by nitric acid. In the case of uranium, powdered metal of 99% purity was obtained which oxidised slowly in the air. Similarly, vanadium was obtained as a powder of *d* 5·97. Zirconium gave a yield of 76% of powdered metal of 93·2% purity, *d* 5·29. J. F. S.

A Double Salt of Magnesium Chloride and Carbonate. TSUNEKICHI NISHIMURA (*Rikwagaku Kenkyujo Ihô*, 1923, 2, 63—65).—The double salt, $MgCl_2,MgCO_3,6H_2O$, was prepared by passing carbon dioxide into a mixture obtained by adding calculated amounts of magnesium chloride and carbonate to 27·5% or more concentrated solution of magnesium chloride. The double salt is decomposed at once by water, but is stable towards absolute alcohol. The salt purified with absolute alcohol and dried at 40° has d^{16} 1·679. Part of the water of crystallisation is lost at 50—60°; at 100° the salt has the composition $MgCl_2,3MgCO_3,7H_2O$. A similar double salt is not formed with calcium chloride and carbonate. K. K.

Separation of Common Lead into Fractions of Different Density. R. H. ATKINSON (*Nature*, 1923, **112**, 282).—Fractional crystallisation of lead, followed by purification, yielded samples having *d* 11·345±0·005 and 11·313±0·005, respectively. It was observed that lead which has solidified slowly is not homogeneous as regards density, the portions which solidify first being the denser. A. A. E.

Comparison between Dilatation and Thermal Curves. L. LOSANA (*Gazzetta*, 1923, **53**, i, 393—395).—The author has applied the dilatometer described by Montemartini and Losana (this vol., ii, 373) to the study of the changes occurring during the cooling of pure tin and of tin–lead, tin–lead–cadmium–bismuth, and lead-bismuth alloys and finds that, for temperatures up to 400°, the singular points are indicated as clearly as by the ordinary cooling or heating curves. For higher temperatures, a suitable liquid with the necessary continuity in thermal dilatation is lacking. T. H. P.

Complex Formation in Lead Nitrate Solutions. I. The Ternary Systems Lead Nitrate–Sodium Nitrate–Water, and Lead Nitrate–Potassium Nitrate–Water. SAMUEL GLASSTONE and HAROLD NICHOLAS SAUNDERS (T., 1923, **123**, 2134—2140).

Rare Earth Elements in Triple Nitrites. V. CUTTICA and and F. GALLO (*Gazzetta*, 1923, **53**, i, 374—379; cf. this vol., ii, 497).—Cobalt, nickel, and copper form triple nitrites in which the other metals are an alkali metal and a metal of the cerium or yttrium group. In the cerium compounds now described, the cerous nitrite exhibits the normal composition, $Ce(NO_2)_3$, which is not that of the isolated salt itself. Since, also, the normal nitrites of cobalt, nickel, and copper are not known, the following triple nitrites must be considered as true complex compounds.

$2Co(NO_2)_2,Ce(NO_2)_3,5KNO_2$ forms a green powder and is decomposed by water, yielding cerous nitrite and potassium cobaltosonitrite. $2Co(NO_2)_2,Ce(NO_2)_3,5RbNO_2$, which is also green and $2Co(NO_2)_2,Ce(NO_2)_3,5TlNO_2$, which is deep brown, behave similarly towards water. These compounds, which are slowly attacked by cold, dilute acids, yielding $R_3Co(NO_2)_6$, may be represented by the general formula, $\left[\mathrm{Co(NO_2)}\right]_2\begin{matrix}\mathrm{Ce(La,Pr,Nd,Y)}\\ \mathrm{K(Rb,Tl)_5}\end{matrix}$

As has been found in other cases, the following compounds, containing nickel or copper in place of cobalt, exhibit no general formula. $3Ce(NO_2)_3,5Ni(NO_2)_2,13KNO_2$ forms a flesh-red powder; $2Ce(NO_2)_3,6Ni(NO_2)_2,7TlNO_2$ (cf. this vol., ii, 77) has a pale chestnut colour; $3Ce(NO_2)_3,4Cu(NO_2)_2,15NH_4NO_2$ forms a black, crystalline precipitate, readily soluble in water to a green solution, remains unaltered for some time in a desiccator, but decomposes in the air with evolution of nitrous fumes; $Ce(NO_2)_3,4Cu(NO_2)_2,12KNO_2$ is similar in appearance to, but more stable in the air than, the preceding compound; $Ce(NO_2)_3,3Cu(NO_2)_2,5TlNO_2$ is the most stable of these copper complexes. T. H. P.

Some Properties of Electrolytic Manganese. ALAN NEWTON CAMPBELL (T., 1923, **123**, 2323—2327).

The Reaction between Ferrous Phosphate and Sulphur Dioxide in Phosphoric Acid Solution; the Nature of the Decomposition Products. SYDNEY RAYMOND CARTER and JOHN ALFRED VALENTINE BUTLER (T., 1923, **123**, 2380—2384).

The System Ferric Oxide–Phosphoric Acid–Water. A New Phosphate. SYDNEY RAYMOND CARTER and NORMAN HOLT HARTSHORNE (T., 1923, **123**, 2223—2233).

Electrolytic Reduction of Molybdic Acid Solutions. F. FOERSTER and E. FRICKE (*Z. angew. Chem.*, 1923, **36**, 458—460).—The electrolytic reduction of molybdic acid solutions to the quinquevalent stage and the preparations of compounds of the type $(MoOCl_5)M_2$, where M is an alkali metal or ammonia, is described. Amalgamated lead anodes were replaced by platinised platinum wire netting, as the lead was found to go into solution. The solution can also be reduced to the tervalent stage by suitable choice of acid concentration and current density. The properties of complex salts of the type $[MoCl_5,H_2O]M_2$ and $[MoCl_6]M_3$ are described. The salt $[MoBr_5,H_2O](NH_4)_2$ was also prepared. Attempts to prepare the alums and complex oxalates of molybdenum, rubidium, and cæsium were unsuccessful. Only the tervalent elements of lower atomic weight (Ti, V, Cr, Mn, Fe, Co) in this horizontal row of the periodic system appear to form easily crystallisable complex salts with bivalent anions, whereas the elements of higher atomic weight also give well crystallised complex salts with univalent anions. The existence of the red salts, $(MoCl_6)M_3$ and $[MoCl_5,H_2O]M_2$ indicates that in the reddish-brown solutions of tervalent molybdenum an equilibrium exists between the tervalent kations and the complex ions, $(MoCl_5,H_2O)''$ and $[Mo(H_2O)_6]^{\cdots}$, respectively. Considerations of static potential lead to similar conclusions. No confirmation was obtained of Chilesotti's hypothesis of an incipient reduction of tervalent to bivalent molybdenum taking place (A., 1906, ii, 263, 365). The presence of the ions $MoCl_6'''$, $(MoCl_5,H_2O)''$, and $[Mo,(H_2O)_6]^{\cdots}$ is held to account for the increased reducing power of the green tervalent molybdenum solution. The fact that solutions of molybdic acid in dilute hydrochloric acid can only be reduced to the quinquevalent stage, whilst solutions in more concentrated hydrochloric acid can be reduced electrolytically to the tervalent stage, is explained by assuming that the next stage to quinquevalent molybdenum is $Mo^{\cdots}$-ions, which in the presence of a high concentration of Cl′-ions immediately form complex ions and the static potential of the solution is reduced below that necessary for the generation of hydrogen from platinised platinum electrodes. If the concentration of chloride-ions is low, however, comparatively few complex ions are formed, and the static potential of the solution remains higher than that necessary for the evolution of hydrogen. If polished platinum electrodes are used, however, owing to the much higher potential necessary for the evolution of hydrogen, the tervalent stage can be reached even in dilute hydrochloric acid solution. The electrolytic reduction of molybdenum shows changes of potential parallel with those occurring in vanadium and titanium solutions under similar conditions. H. C. R.

Normal Thorium Molybdate, $Th(MoO_4)_2$. FERRUCCIO ZAMBONINI (*Atti R. Accad. Lincei*, 1923, [v], **32**, i, 518—524; cf. A., 1916, ii, 249).—*Thorium molybdate*, $Th(MoO_4)_2$, obtained by fusing partly dehydrated thorium chloride with excess of anhydrous sodium molybdate, forms tetragonal crystals, $a : c = 1 : 0{\cdot}73565$, $d^{7\,5}$ 4·92, which exhibit mutual miscibility in the solid state with cerous molybdate. The properties of the thorium salt are compared with those of other molybdates. The fact that thorium and cerium may replace one another isomorphically in such simple compounds as their normal molybdates supports the view that the element observed by Dauvillier in the mixture of rare earths containing Urbain's original celtium is identical with that encountered some months subsequently by Coster and Hevesy in certain zirconiferous minerals. T. H. P.

Bismuth Tetroxide Prepared from Sodium Bismuthate. C. E. CORFIELD and ELSIE WOODWARD (*Pharm. J.*, 1923, **111**, 80—82).—Attempts to prepare bismuthic acid and bismuth pentoxide by decomposing sodium bismuthate with nitric acid, under the most favourable conditions, were unsuccessful. If formed at all, these compounds appeared to be unstable and decomposed immediately into the tetroxide with loss of oxygen. The authors have obtained a hydrated tetroxide containing between $1H_2O$ and

$2H_2O$, but this could not be reduced to $1H_2O$ without simultaneous loss of oxygen. W. P. S.

Celtium or Hafnium? (*Chemistry and Industry*, 1923, **42**, 784—788).—A review of the facts concerned in the controversy regarding priority of nomenclature of the element of atomic number 72. On the evidence so far published, it is held that Urbain's claim to priority of discovery and to the name "celtium" should be admitted. A. A. E.

Hafnium or Celtium? BOHUSLAV BRAUNER (*Chemistry and Industry*, 1923, **42**, 884—885).—Polemical in support of Urbain's celtium. Attention is directed to the significance of the spectrographic observations of Exner and Hatschek in 1911. A. A. E.

Mineralogical Chemistry.

Chemical Relations between Humic Substances and Coal. MAURICE PIETTRE (*Compt. rend.*, 1923, **177**, 486—488; cf. *ibid.*, 139).—Extraction of Brazilian, American, or Elsecar coals with boiling pyridine, and subsequent evaporation of the solvent, gives a residue which on extraction with alcohol–ether mixtures affords an insoluble, humus-like substance (nitrogen content 2·25—2·50%), and a soluble, brown resin. The latter may be separated, by extraction with alkalis, into acidic and tarry substances.

Cardiff coal gives no appreciable pyridine extract, and is therefore to be regared as a completely mature coal. On treatment with nitric acid (*d* 1·40), it affords a highly combustible nitrated product, which, after reduction in presence of alkali, gives a black substance (nitrogen content about 4·45%) possessing most of the properties of humus. This suggests a common origin for humus, peat, and coal. E. E. T.

Japanese Minerals containing Rarer Elements. V. Analysis of Beryl from Ishikawa, Ishikawa Province. TAKU UYEMURA (*J. Chem. Soc. Japan*, 1923, **44**, 296—302).—The analysis of beryl produced in Ishikawa, Ishikawa Province, opaque, slightly green crystals, *d* 2·8, gave the following results:

SiO_2.	GlO.	Fe_2O_3.	Al_2O_3.	CaO.	MgO.	Alkali (as Na_2O).	Loss by heating.	Total.
49·60	19·31	0·11	24·09	0·79	0·14	3·65	2·81	100·50

By spectrum analysis silicon, glucinum, iron, aluminium, calcium, magnesium, scandium, and sodium, but not chromium were detected. The formula $4GlO,Al_2O_3,4SiO_2$ and a constitutional formula are proposed; in the latter, one molecule of silicic acid is expressed as ortho-acid. In the present case, Copaux's method (A., 1919, ii, 192) was useless for the estimation of glucinum. K. K.

Clays. I. The Acidic Reaction of Japanese Acid Clays. TSURUJI OKAZAWA (*Rikwagaku Kenkyujo Ihô*, 1923, **2**, 189—221).—When treated with a neutral salt solution, Japanese acid clay gives an acidic reaction to the solution, a phenomenon which K. Kobayashi (" Japanese Acid Clay," Tokyo, 1922; *J. Chem. Ind. Japan*, 1923, **26**, 289) has attributed to its large adsorptive action, but the author has put forward a different explanation. Clays may be classified into three kinds according to their reactivity with salt solutions and acids. The first group gives no dissolved part by treatment with salt solutions and only a slight amount with strong acids; the second yields none by the salt solution, but a large quantity by the acid; and the third, which includes Japanese acid clay, gives a large amount by both the solutions. When treated with salt solutions, clay particles absorb positive radicles, aluminium being dissolved as the corresponding salt, *e.g.*, $R{:}Al{\cdot}OH + MgCl_2 = RMg + AlCl_2{\cdot}OH$, and $AlCl_2{\cdot}OH + 2H_2O = Al(OH)_3 + 2HCl$. This reaction is therefore attributed partly to adsorption, but mainly to double decomposition, and the acidity is governed by the salt used, adsorptive and reactive affinities of the clay, stability of the reaction product, reaction velocity, etc.

The acidity is therefore not definitely determined by titrating with alkali solution, and reaction will be as follows (when a chloride is used as a salt): $AlCl_2{\cdot}OH + 2H_2O = Al(OH)_3 + 2HCl$; or $AlCl_3 + 3H_2O \rightleftharpoons 3HCl + Al(OH)_3$; $AlCl_2{\cdot}OH + 2NaOH = Al(OH)_3 + 2NaCl$; or $AlCl_3 + 3NaOH \rightarrow Al(OH)_3 + 3NaCl$. Aluminium hydroxide thus produced will further react with alkali.

When the clay is burned, the so-called acidity is decreased and almost completely removed in one hour at 700—800°. By the action of heat the state of molecular aggregation will be changed and the aluminium oxide in the clay will not be dissolved by salt solutions. But a reverse relation exists between the temperature of burning and the quantity of aluminium oxide dissolved by acids; the quantity dissolved attains a maximum value at about 700—800°, and decreases rapidly above 900°. K. K.

Oxydase Reaction of Japanese Acid Clay, Fuller's Earth, and Florida Earth. KYUHEI KOBAYASHI and KEN-ICHI YAMAMOTO (*J. Chem. Ind. Japan*, 1923, **26**, 289—296).—Japanese acid clays, fuller's earth, and Florida earth, but not kaolin, kieselguhr, or volcanic ash, give the oxydase reaction with an alcoholic solution of guaiacum, and with other substances. It is supposed that the so-called Helmholtz double layer is formed around the surface of the clay when suspended in water and that it absorbs hydroxyl-ions, hydrogen-ions being liberated near the surface. The hydroxyl-ions thus absorbed combine directly, liberating one atom of oxygen and forming water. This active atom of oxygen may act on oxidisable reagents and give the oxydase reaction. K. K.

Analytical Chemistry.

A New Colorimeter having Perfectly Symmetrical Light Distribution. K. Bürker (*Z. angew. Chem.*, 1923, **36**, 427—429).—Two parallel beams of light pass upwards through equal and variable thicknesses of, respectively, pure solvent and the coloured solution under examination, and then through 10 mm. of standard colour solution and pure solvent, respectively. They are brought together by means of an Albrecht-Hüfner hexagonal lens and appear in the eyepiece of the instrument as two semicircular fields separated by a narrow boundary line. [Cf. *J.S.C.I.*, 1923, Oct.]
W. T. K. B.

[Use of] the Gooch Crucible. Archibald Craig (*Chem. Age* [*N.Y.*], 1923, **31**, 31—32).—The importance of rapidly filtering asbestos is emphasised. A modified form of bell-jar for filtering directly into a beaker is described. To enable a pencil to be used for marking crucibles, the surface of the porcelain is roughened by application of a paste of barium sulphate and hydrofluoric acid. For calculating results of gravimetric analyses, an empirical factor, dependent on the conditions of the estimation, should be used instead of the theoretical factor. Chemical Abstracts.

A New Explosion Pipette. K. Tiddy (*Gas World*, 1923, **79**, 187).—A modification of the Hempel explosion pipette employed in gas analysis, which eliminates leakage of gas under the pressure developed by the explosion, and is more robust than the customary form, is described. In this, the U-shaped exit tube connected by a rubber joint with the capillary of the measuring vessel is replaced by a straight capillary tube and stop-cock. The device can be readily incorporated in a gas analysis apparatus of the Orsat type.
J. S. G. T.

Carbinols as Indicators. L. Karczag and R. Bodó (*Biochem. Z.*, 1923, **139**, 342—344).—The colourless carbinols of certain triphenylmethane dyes (*e.g.*, red-violet, fuchsin-S, water-blue) may be utilised as indicators, since on the addition of acid they are immediately converted into the coloured ammonium bases. The carbinols were obtained by decolorising solutions of the dyestuffs with stick charcoal, and by using these with buffer solutions according to Sörensen's method it was found that water-blue has a range from p_H 5·0 to 6·2, the colour development being instantaneous at the higher hydrogen-ion concentration and requiring from ten to fifteen minutes at the lower value. Fuchsin-S showed a similar but more rapid change over a range from p_H 5·2 to 6·6. J. P.

The Colorimetric Estimation of Hydrogen-ion Concentration by the Method of Michaelis, with One Colour Indicators, using Inorganic Comparison Solutions. I. M. Kolthoff (*Pharm. Weekblad*, 1923, **60**, 949—966).—In view of the application of the method of Michaelis and his co-workers (A., 1921, ii, 56; *Biochem. Z.*, 1921, **109**, 307) to the examination of urine, drinking-water, and other biologically important liquids, a critical examination has been made of his results. The low buffer capacity of his solutions renders the accuracy of his figures questionable, and the necessity of preparing for each series of determinations a great number of comparison solutions of the indicators makes his method cumbrous. The constants of the indicators have now been redetermined, using the buffer mixture solutions of Clark, which have also been checked potentiometrically.

The indicators 2 : 4-, 2 : 5-, and 2 : 6-dinitrophenol, *m*- and *p*-nitrophenol, and salicyl-yellow have thus been examined, and the constants with their temperature coefficients now determined show good agreement with those given by Michaelis, except in the case of *p*-nitrophenol, for which $p_{\mathrm{H}} = 7{\cdot}04$, a value considerably below the figures given in the literature.

In place of the alkaline solutions of the indicators themselves, solutions of potassium chromate (for 2 : 4-dinitrophenol and *p*-nitrophenol) and dichromate (2 : 5-dinitrophenol, *m*-nitrophenol, and salicyl yellow) and mixtures of the two (2 : 6-dinitrophenol) may be more conveniently employed as comparison solutions, and details are given of the concentrations and quantities corresponding with the colour of definite indicator solutions. S. I. L.

Estimation of Total Sulphur in Biological Material. MABEL STOCKHOLM and FRED C. KOCH (*J. Amer. Chem. Soc.*, 1923, **45**, 1953—1959).—The dry fusion method for the estimation of sulphur in organic material tends to give low and irregular results when properly corrected for blanks; this is due to loss of reduced sulphur by volatilisation during the heating of the dry mixture, the loss being greater the more rapidly the temperature is increased (cf. Barlow, A., 1904, ii, 82). It is found that the following procedure gives the calculated value for cystine, and uniform results, usually higher than by the fusion method, with different biological materials containing organically combined sulphur. 0·5—2 G. of material and 10 c.c. of 25% sodium hydroxide solution are slowly evaporated on the steam-bath until almost dry; 5 c.c. of 30% hydrogen peroxide solution are then very gradually added, the heating being meanwhile continued. The partly oxidised material is now acidified by means of nitric acid, and concentrated more rapidly until crystallisation commences. The boiling solution is oxidised by the gradual addition of 10 c.c. of fuming nitric acid and 40—50 drops of bromine. In the analysis of lipin materials, *e.g.*, nerve-tissue or egg-yolk, the treatment with nitric acid and bromine is prolonged during twenty-four hours. The solution is evaporated almost to dryness, water is added, and the evaporation repeated, to remove most of the nitric acid. The aqueous solution, filtered if necessary, is neutralised by means of sodium hydroxide, diluted to about 600 c.c., and acidified by means of 10 c.c. of concentrated hydrochloric acid. The sulphate is estimated in the usual way, after the addition of 10 c.c. of 0·1*N*-sulphuric acid. This addition of a standard quantity of sulphuric acid in estimations of sulphate, including blanks, is recommended, because in this way the complete precipitation of small traces of sulphate is promoted. W. S. N.

Detection of Nitrites by Rodillon's Test. HANS HELLER (*Chem. Ztg.*, 1923, **47**, 701).—Leffmann's failure to obtain consistent results in Rodillon's test for nitrites in water (this vol., ii, 37) was due to his use of hot sulphuric acid for dissolving the resorcinol (*Amer. J. Pharm.*, 1923, **95**, 110). If the cold acid is used and the reagent freshly prepared for each test trustworthy results are always obtained; on keeping, the solution slowly deposits crystals and is then useless. The following modification of the original method is recommended: 0·4 g. of resorcinol is shaken with 5 c.c. of cold, concentrated sulphuric acid and 1 c.c. of this solution is carefully poured below the surface of 5 c.c. of the water to be tested. At the interface between the liquids a green, violet, or blue colour appears, according to the concentration of the nitrite. The reagent crystallises after eight hours; for further use, a few drops of water are added and the whole is warmed until the crystals dissolve, and then cooled. A. R. P.

Estimation of Phosphorus in Light Aluminium Alloys. L. LOSANA and C. E. ROSSI (*Annali Chim. Appl.*, 1923, **13**, 200—204). —The estimation of sulphur or phosphorus in aluminium alloys containing 1% of either copper or tin should be effected by the oxidation method and not by treating the metal with hydrochloric acid and estimating the hydrogen sulphide or phosphide liberated; zinc, however, does not interfere with the latter method. T. H. P.

The Micro-estimation of Phosphoric Acid. RICHARD KUHN (*Z. physiol. Chem.*, 1923, **129**, 64—79).—The micro-estimation of phosphoric acid is best carried out gravimetrically by weighing the precipitate obtained on precipitation with ammonium molybdate. The alkalimetric titration is not satisfactory except with very small quantities of material. Separation of arsenic from phosphorus is best carried out by distillation of the arsenic in a stream of hydrogen chloride. The phosphorus is then estimated either gravimetrically or, if there is less than 0·04 mg., nephelometrically (cf. Kleinmann, *Biochem. Z.*, 1919, **99**, 115, 150). W. O. K.

Chemistry of the Reinsch Test for Arsenic and Antimony and its Extension to Bismuth. B. S. EVANS (*Analyst*, 1923, **48**, 357—367).—The tests were carried out by comparing the colour of the film deposited on a cleaned and polished surface of electrolytic copper suspended in the solution to be tested by means of a glass stirrup, with a standard copper-arsenic or copper–antimony alloy similarly suspended in the same beaker, but enclosed in a smaller interior beaker containing distilled water. The time taken for the electrolytic copper surface to assume the same appearance as the standard alloy under different conditions as regards concentrations of sodium chloride, sulphuric acid, arsenic, antimony, or bismuth, and cupric-ions was noted. For arsenic tests, a 70 : 50 copper–arsenic alloy polished and etched with nitric acid (d 1·2) was used, and a 50 : 50 copper–antimony alloy, similarly treated, was used for the antimony tests. For the bismuth tests, a 90 : 10 copper–arsenic alloy, polished but not etched, was employed. The results of varying the factors mentioned above one at a time are given in a series of tables. Increase of sodium chloride concentration increases the rate of formation of the standard film markedly in the case of arsenic and antimony, less so in the case of bismuth. Increase of sulphuric acid concentration also increases the rate of formation of the film, but in all three tests there is a certain concentration of acid above which further additions are without influence on the rate of reaction. These concentrations are for arsenic, antimony, and bismuth, respectively, 5·47%, 2·74%, and 2·28%. The presence of cupric-ions in the solution retards the formation of the film to such an extent that any considerable concentration may be said to inhibit it, but cuprous-ions which are formed during the reaction itself have no such action. The film formed in the test for arsenic was analysed, and consisted chiefly of the compound Cu_5As_2, with the addition of a little elementary arsenic deposited electrolytically. In the case of the bismuth reaction, only a trace of copper was found in the film. The separation of the antimony film presented great difficulty. The initial purple film probably consists of the compound Cu_2Sb, but the composition of the subsequently formed white film could not be determined. H. C. R.

Estimation of Boric Acid by the Hönig-Spitz Method. HANS RATH (*Naturprodukte*, 1923, 134—139).—A detailed account of the method of titrating boric acid with sodium hydroxide in presence of glycerol. E. H. R.

Estimation of the Content of Active Carbon Dioxide in Drinking Waters. P. LEHMANN and A. REUSS (*Z. Unters. Nahr. Genussm.*, 1923, **45**, 227—236).—A consideration of the work of Schlœsing (*Compt. rend.*, 1872, **74**, 1552; **75**, 70) and the application of the law of mass action leads to the deduction of the following formula for calculating the combined carbon dioxide (c) in a sample of drinking water from the total carbon dioxide (t) determined in mg. per litre: $c=27[\sqrt[3]{t+\sqrt{t^2+5823}}+\sqrt[3]{t-\sqrt{t^2+5823}}]$. If, however, t exceeds 200, a correction is necessary on account of the carbonate not being completely dissociated at higher concentrations. This correction factor is deduced to be $2772{\cdot}9/(2886-c)$. A table is given of the sums of combined and active carbon dioxide concentrations corresponding with experimentally determined total carbon dioxide concentrations, calculated by means of the above formula, the correction factor being applied where necessary. Details are given of methods of estimating the combined and free carbon dioxide by titrations with hydrochloric acid, using methyl-orange as indicator, and with sodium carbonate, using phenolphthalein as indicator, respectively. The active carbon dioxide in water containing calcium sulphate must be estimated directly by experiments on powdered marble according to von Heyer's method (*Gesundheitsingenieur*, 1912, **35**, 675; see also Kolthoff, A., 1921, ii, 59). H. C. R.

The Estimation of Alkalis in Rocks by the Indirect Method. FREDERICK WALKER (T., 1923, **123**, 2336—2341).

Estimation of Potassium by the Perchlorate and Cobaltinitrite Methods, and the Removal of Sulphates. R. LEITCH MORRIS (*Analyst*, 1923, **48**, 250—260; cf. A., 1920, ii, 707).—The perchlorate method is trustworthy for the estimation of potassium in the presence of phosphates, but sulphates and ammonium salts must be removed previously. It is recommended that the sulphate should be precipitated as barium sulphate from a strongly hydrochloric acid solution and that the barium sulphate precipitate should be ignited and extracted with hot hydrochloric acid, the acid extract being added to the main solution. The potassium perchlorate precipitate should be washed first with alcohol containing 0·2% of perchloric acid and then with this alcohol–perchloric acid mixture saturated previously with potassium perchlorate. Drushel's modification of the cobaltinitrite method (A., 1908, ii, 66) also yields trustworthy results provided that, in the oxidation of the precipitate, a considerable excess of permanganate solution is used and the mixture heated for ten minutes before the sulphuric acid is added; the heating should be continued for a further ten minutes before the oxalic acid is added. W. P. S.

New Method of Analysing Sodium Hyposulphite. S. H. WILKES (*J. Soc. Chem. Ind.*, 1923, **42**, 356—357T).—Sodium hyposulphite is estimated by determination of the amount of iodine liberated from excess of an iodate–iodide mixture according to the equation $3Na_2S_2O_4+4KIO_3+2KI=3I_2+3Na_2SO_4+3K_2SO_4$. The iodine liberated is not titrated directly with thiosulphate, but excess of the latter is used and the quantity unused is determined by back titration with standard iodine. The method is not applicable to samples of hyposulphite containing soda-ash or decomposition products. H. H.

Estimation of Calcium in Plasma. A. HIRTH (*Compt. rend. Soc. Biol.*, 1923, **88**, 458—460; from *Chem. Zentr.*, 1923, ii, 1099).—The ash from 5 c.c. of plasma is dissolved in 2 c.c. of 7% hydrochloric acid. Four drops of 4% ferric chloride solution and one drop of bromine water are added, and the liquid is heated to boiling. After cooling and diluting to 15 c.c., ammonia is added until the liquid is alkaline to phenolphthalein. A slight excess of acetic acid is added and the ferric phosphate and basic ferric acetate are removed by filtration; the precipitate is washed with water containing ammonium acetate and acetic acid. The neutralised filtrate is concentrated to about 4 c.c. and the calcium precipitated as calcium oxalate. G. W. R.

Estimation of Magnesium in Plasma. A. HIRTH (*Compt. rend. Soc. Biol.*, 1923, **88**, 460—461; from *Chem. Zentr.*, 1923, ii, 1099).—The filtrate from the estimation of calcium (see preceding abstract) is evaporated to dryness and heated to remove ammonium compounds. The residue is dissolved in hydrochloric acid. After addition of ammonia solution, the magnesium is precipitated by addition of ammonium phosphate solution. The precipitate after washing is dissolved in nitric acid containing sulphuric acid. Ammonium molybdate is added to precipitate the phosphate (Lorenz-Pregl). The precipitate of ammonium phosphomolybdate is then dissolved in ammonia solution and precipitated with 2 c.c. of 10% barium chloride solution (Posternak). This precipitate after collection is incinerated and weighed. The factor used for conversion to magnesium is 0·00579. G. W. R.

A New Reaction for Zinc. G. Spacu (*Bul. Şoc. Ştiinţe Cluj*, 1922, **1**, 348—351; from *Chem. Zentr.*, 1923, ii, 1052).—The reaction proposed depends on the insolubility of the compound $[Zn(C_5H_5N)_2](CNS)_2$. It takes place preferably in neutral solution or with a slight excess of pyridine. With great excess of pyridine the precipitate redissolves. One part of zinc in 200,000 parts of water may be detected. G. W. R.

Estimation of Cobalt in Special Steels. Giulio Ferreri (*Giorn. Chim. Ind. Appl.*, 1923, **5**, 339—340).—The tungsten and silicon are removed from the solution as oxides and the cobalt separated as potassium cobaltinitrite and estimated electrolytically. [Cf. *J.S.C.I.*, 1923, Oct.] T. H. P.

Estimation of Chromium in Presence of Organic Matter. G. Grasser (*Z. Leder-u. Gerb.-Chem.*, 1922—1923, **2**, 185—188).—The treatment of chromium residues with sulphuric acid and potassium permanganate to destroy organic matter prior to the iodometric estimation of the chromium gives concordant results, but not with iron alum solution. The Fresenius-Babo method of oxidising with sulphuric acid and potassium chlorate gives good results with iron alum and iodometrically. Potassium chlorate and hydrochloric acid, also chloric acid, have been used to oxidise the organic matter, in some cases completing the oxidation with ammonium persulphate. The quickest and best method of oxidation consists in heating a mixture of 10 parts of the chromium residue, 3 parts of potassium nitrate, and 1 part of calcined sodium carbonate to dryness and then fusing to oxidise the chromium to chromate. The fused mass is extracted with hot water, acidified, and the chromium estimated iodometrically or with iron alum. D. W.

Uses of Amalgams in Volumetric Analysis. VIII. Estimation of Chromium and of Iron in the Presence of Chromium. Naotsuna Kano (*J. Chem. Soc. Japan*, 1923, **44**, 37—46).—Chromium was estimated volumetrically after reduction with ferrous or titanous sulphate, which was prepared by reducing with zinc amalgam. A definite quantity of titanic sulphate was reduced to the titanous salt with zinc amalgam, potassium chromate was added until the colour of chromium-ion appeared, and the remaining tervalent titanium was titrated with about 0·1*N*-iron alum solution, using ammonium thiocyanate as indicator. Towards the end, the solution should be warmed at 50°. 0·1*N*-Potassium permanganate may be used instead of iron alum solution. A definite quantity of iron alum may be used instead of titanic sulphate and the remaining bivalent iron titrated with 0·1*N*-potassium permanganate solution. When the quantity of chromium is large, *e.g.*, 0·03 g. of the oxide in 100 c.c., the first method is the most accurate. When less chromium is present, a definite quantity of titanic sulphate can be reduced to titanous salt, a mixture of potassium chromate and iron alum in different proportions added, and the chromium titrated with potassium permanganate. Chromium may also be estimated by the same method, using iron alum instead of titanic sulphate. Iron in presence of chromium is estimated as follows. A mixture of iron and chromium salts is reduced with zinc amalgam in the presence of carbon dioxide. When reduction is complete, the carbon dioxide is replaced by air and the liquid shaken for a few minutes; chromium is completely changed into the tervalent form, and the bivalent iron is titrated with 0·1*N*-potassium permanganate solution; the quantity of chromium should be limited to 0·03 g. of the oxide in 100 c.c. of solution. K. K.

Uses of Amalgams in Volumetric Analyses. IX. Estimation of Titanium and of Iron in the Presence of Titanium. NAOTSUNA KANO (*J. Chem. Soc. Japan*, 1923, **44**, 47—53; cf. *ibid.*, 1922, **43**, 544, 547, 554, 555).—Titanium and iron are estimated volumetrically without separation. A mixture of iron alum and titanium sulphate is reduced with zinc amalgam and titrated with 0·1*N*-potassium permanganate, by which the sum (*s*) of the titanium and iron is determined. Next a definite volume (*a* c.c.) of the mixture of iron alum and titanium sulphate is reduced with zinc amalgam and titrated with the unreduced mixture (*b* c.c.) using ammonium thiocyanate as indicator; tervalent iron in the latter mixture oxidises tervalent titanium in the reduced mixture. Then the ratio of the concentrations $c_{Fe}/c_{Ti}=a/b$, and $c_{Ti}(1+a/b)=s$. K. K.

Estimation of Antimony and its Separation from Tin. P. WENGER and G. PARAUD (*Ann. Chim. Analyt.*, 1923, [ii], **5**, 230—232).—The methods of Henz (A., 1904, ii, 150), Wortmann and Metzel (A., 1905, ii, 655), Bunsen and Baubigny (A., 1897, ii, 351), and Classen for the estimation of antimony gave results varying between 99·34% and 99·79% of the theoretical. Rose's method, however, gave very low results and is not considered to be of any value for exact estimations. Wortmann and Metzel's and Classen's methods are the most convenient and rapid. In separating antimony from tin, Clarke's method (*Chem. News*, **21**, 124) and Tomula's method (A., 1922, ii, 74) were found satisfactory, but Rose's method is again useless. H. C. R.

Detection of Methyl Alcohol in Ethyl Alcohol. R. MEURICE (*Ann. Chim. Analyt.*, 1923, [ii], **5**, 204—205).—Ten c.c. of the

95% alcohol are mixed at 18° with 10 c.c. of 22% ammonium sulphate solution; in the case of pure ethyl alcohol, the mixture separates into two clear layers within about two minutes, but if the alcohol under examination contains 3% of methyl alcohol the lower layer is turbid and contains crystals of ammonium sulphate. In the presence of 10% of methyl alcohol, a voluminous precipitate of ammonium sulphate is formed. W. P. S.

The Detection of Methyl Alcohol in Alcoholic Liquids. VAN RIJN (*Pharm. Weekblad*, 1923, **60**, 978—984).—Samples of spirits suspected to contain methyl alcohol were examined by (1) Mannich and Fendler's method, (2) method of Pfijl, Reif, and Hanner, and (3) Riche-Bardy's method, the results being checked by determination of the refractive indices of the absolute alcohol obtained by distillation over calcium oxide. All these methods gave parallel results, but owing to the time required for (3), the first two are more suitable.

From 500 c.c. of the original sample half was distilled, from the distillate half again, and so on until 15 c.c. only of distillate was left, each fraction and the original sample being tested by the three methods. In all cases positive results were obtained from the original sample, and sometimes from the first distillate, but never from the fourth and fifth distillates. Since methyl alcohol concentrates in the final fractions, as was confirmed by adding 0·5% to one sample, it is evident that positive results are given by substances other than this alcohol (higher alcohols or ethers ?), in testing for which, accordingly, it is necessary to fractionate repeatedly. The refractive index of the anhydrous alcohol affords a valuable check. S. I. L.

Critical Examination of Methods for the Estimation of Lævulose in the Presence of Dextrose. H. COLIN (*Bull. Assoc. Chim. Sucr.*, 1923, **40**, 397—405).—The methods investigated were (1) the polarimetric method; (2) oxidation of the dextrose by bromine, (3) oxidation of the dextrose by iodine; (4) conversion of the dextrose into methyl glucoside; (5) destruction of the lævulose by heating at 100° for three hours with 7% hydrochloric acid; and (6) detection of lævulose by precipitating it as its calcium compound. All these methods yielded trustworthy results when applied to the pure sugars alone, but not in the case of complex mixtures such as plant extracts. The latter contain substances which interfere particularly with the polarimetric, bromine, and iodine methods. W. P. S.

Estimation of Starch. FRANZ TEMPUS (*Naturprodukte*, 1923, 52—58).—The difficulties attending the accurate estimation of starch in vegetable materials can be overcome by means of a preliminary heating with strong ammonia solution. This treatment brings about disruption of the cell-walls, frees the starch granules, and facilitates the removal of sugars, dextrin, hemicelluloses, and fats. A dried sample, not more than 2 g., is finely powdered and warmed for three hours in a stoppered glass vessel at 40—45° with 50 c.c. of concentrated ammonia. It is then filtered through a linen filter on a Gooch crucible and washed well. The residue is then finely ground and the starch estimated by the diastase method. E. H. R.

Estimation of Starch. II. Estimation of Starch in Potatoes. Arthur R. Ling and W. J. Price (*J. Inst. Brewing*, 1923, **29**, 732—734; cf. A., 1922, ii, 879).—A curve, similar to that given for barley and wheat starches, has now been obtained showing the dependence of the proportion of apparent maltose yielded by potato starch on the diastatic power of the malt used to effect the starch conversion. The two curves are almost parallel, the percentages of maltose being higher for potato starch than for barley and wheat starches.

To estimate the starch in potatoes, about 8 g. of the finely sliced tubers are weighed exactly and pounded in a glass mortar, the pulp being washed into a beaker with about 100 c.c. of water and left for thirty minutes with occasional stirring. The supernatant liquid is then decanted on to a No. 41 Whatman filter and another 100 c.c. of water are added to the pulp and decanted at the end of thirty minutes, the pulp and filter being well washed with water. The filter and its contents are boiled in the beaker containing the pulp with 100 c.c. of water for ten minutes, and the gelatinised starch is afterwards hydrolysed at 57° by treatment for an hour with 10 c.c. of the extract of a malt of known diastatic power. The liquid is then boiled, cooled, and made up to 200 c.c., an aliquot portion being then titrated with Fehling's solution. T. H. P.

Estimation of the Eugenol Content of Volatile Oils by Titration. P. N. van Eck (*Pharm. Weekblad*, 1923, **60**, 937—940).—A weighed quantity of clove or other eugenol-containing oil is heated with excess of standard ammoniacal silver nitrate solution, the excess of silver nitrate being estimated after filtration by titration with standard thiocyanate solution. One part of eugenol is found by experiment to cause the separation of 1·75 parts of silver. S. I. L.

Estimation of Simple, Soluble Cyanogen Compounds, Making Use of the Principle of Aëration. Joseph H. Roe (*J. Amer. Chem. Soc.*, 1923, **45**, 1878—1883).—An aëration process for estimating cyanides has been devised, in which the liberated hydrocyanic acid is swept by a current of air into a dilute solution of an alkali hydroxide and the mixture then titrated with standard silver nitrate solution, using a little potassium iodide solution as indicator. In the case of a soluble cyanide, the procedure is as follows: a quantity of the cyanide (0·05 g.) is dissolved in 100 c.c. of water and placed in a cylinder of 200 c.c. capacity fitted with a doubly bored stopper. Through one hole, a glass tube, which reaches to the bottom of the cylinder, is placed and a glass exit tube passes through the other hole. The exit tube is connected with a double bubbler apparatus containing about 100—150 c.c.

of 5% sodium hydroxide. A few drops of amyl alcohol are added to the cyanide solution to prevent foaming. The apparatus is connected to a water pump and a slow current of air drawn through, and at the same time 25 c.c. of saturated tartaric acid solution are added to the cyanide. Air is drawn through at the rate of 3 litres per minute for two to three hours. The alkaline solution is then treated with 10 drops of 10% potassium iodide and titrated with 0·01*N*-silver nitrate solution until a faint turbidity is produced. The method has been applied to the case of mercuric cyanide. In this case, a few crystals of sodium chloride are added to the solution of mercuric cyanide and then, in addition to the tartaric acid which is added as before, 10 c.c. of 5% stannous chloride are added and the process is carried out as described. The present method has many advantages over the older distillation methods, among which may be noted the absence of loss due to hydrolysis of the hydrocyanic acid and its power of estimating cyanides in the presence of ferrocyanides and ferricyanides. The results are highly accurate. J. F. S.

Potassium Ferrocyanide as a Reagent in the Microscopic Qualitative Chemical Analysis of the Common Alkaloids. HOWARD IRVING COLE (*Philippine J. Sci.*, 1923, **23**, 97—101).—Potassium ferrocyanide forms definite crystalline compounds with certain alkaloids (cf. Cumming, T., 1922, **121**, 1287) and may be used for their microchemical detection. A small drop (2 to 3 mm. diameter) of the solution of the alkaloid in hydrochloric acid is placed on the microscope slide near a smaller drop of a 5% solution of potassium ferrocyanide and a narrow channel between the drops is made by means of a platinum wire; after a short time the preparation is vigorously scratched with the wire to induce crystallisation. β-Eucaine yields, under these conditions, thin elongated hexagonal or rhombic plates which exhibit parallel and symmetrical extinction under crossed nicols; brucine gives highly refractive prisms arranged in rosettes and exhibiting strong polarisation; cinchonidine gives rosettes of yellow, curving, hair-like needles, cinchonine, yellow, irregular, trapesium-shaped crystals which polarise strongly, and cocaine, irregular, six-sided plates and prisms which grow much thicker, polarise more strongly, and are more irregular in shape than those of the β-eucaine compound. The coniine compound crystallises in rosettes of colourless needles, which polarise weakly, exhibiting oblique extinction, that of heroin in spheroidal crusts only from concentrated solutions and that of hydrastine in spheroidal crusts which are polarised under crossed nicols. The crystals obtained from quinoline are lemon-yellow rhombohedra exhibiting parallel and oblique extinction, those from sparteine are colourless rhombs giving symmetrical extinction, and those of stovaine are rosettes of needles showing parallel extinction. Potassium ferrocyanide in hydrochloric acid solution affords a very sensitive test for strychnine, with which it gives long, slender needles or spear-shaped crystals with serrated edges and exhibiting oblique extinction. Veratrine yields an amorphous precipitate under these conditions and, although this crystallises slowly, the test is unsatisfactory in this case. A. R. P.

Evaluation of the Catalytic Power of Diastases. L. MATHIEU (*Bull. Assoc. Chim. Sucr.*, 1923, **40**, 423—426).—The method proposed consists in mixing 10 c.c. of the diastase solution (vegetable or other extract) with 5 c.c. of hydrogen peroxide in a suitable apparatus and measuring the volume of oxygen liberated within one minute. It is suggested that the catalytic value be expressed as the ratio between the volume of oxygen thus found and that obtained when 1 g. of manganese dioxide is treated under the same conditions. The manganese dioxide used should pass a 100-mesh sieve; the hydrogen peroxide (12 vol.) should be treated previously with sodium hydroxide so that 90% of its acidity is neutralised. W. P. S.

Pancreatic Enzymes. IV. The Stalagmometric Estimation of Hydrolysis of Tributyrin by Lipase. RICHARD WILLSTÄTTER and FRIEDRICH MEMMEN (*Z. physiol. Chem.*, 1923, **129**, 1—25).—The estimation of lipase may be carried out conveniently by measuring with a stalagmometer the change in a given time in the "drop-number" of a saturated aqueous solution of tributyrin. It is found that albumin inhibits the hydrolysis of tributyrin by lipase in acid and in alkaline media, whilst albumin inhibits the hydrolysis of olein in an acid and accelerates it in an alkaline medium. This is because the sodium oleate produced increases the rate of hydrolysis by lipase. The rate of hydrolysis of tributyrin is increased by the presence of sodium oleate or sodium glycocholate, but more particularly by calcium oleate. It is suggested that the inhibition due to albumin is caused by the adsorption of one component only (the lipase), whilst in the presence of soaps, both components are adsorbed. The measurements of the amount of lipase present, obtained by the tributyrin method, are not always identical with those obtained from the hydrolysis of olein, although they are approximately so for lipase from pig's or sheep's pancreas. A tributyrin unit is therefore suggested—the amount which will cause a decrease of 20 drops, *i.e.*, about half the difference between the drop number of pure tributyrin solution and of pure water, in fifty minutes under specified conditions. For such estimations, the lipase is activated by sodium oleate, calcium chloride, and albumin, and brought to p_H 8·6, and a temperature of 20°.

The polypeptide, leucylglycylglycine, very markedly increases the rate of hydrolysis of tributyrin by lipase. If albumin, calcium chloride, and sodium oleate, however, are there previously, the tripeptide has little effect. The hydrolysis of olein or methyl butyrate in presence of calcium oleate is markedly increased by albumin, but that of tributyrin under similar conditions is not.

W. O. K.

General and Physical Chemistry.

Some Refractive Indices of Benzene and *cyclo*Hexane. J. W. Gifford and T. M. Lowry (*Proc. Roy. Soc.*, 1923, [*A*], **104**, 430—437).—Values of the refractive indices of benzene and *cyclo*hexane at 15°, for about twenty wave-lengths between 7701·92 and 2980·75 Å., have been determined to the seventh significant figure, by the method of the hollow prism. In the case of *cyclo*hexane, the refractive index, n, corresponding with the wave-length λ, is, in the case of wave-lengths other than 3261·17 and 3252·65 Å., given with an average error equal to 0·00006, by the equation

$$n^2=2\cdot011046+0\cdot0102467/(\lambda^2-0\cdot013977).$$

In the case of the two wave-lengths referred to, the respective differences between experimental and calculated values of n are +0·00121 and +0·00130. No corresponding relation holds in the case of benzene, a result which is in accord with the more complex chemical structure of this substance. J. S. G. T.

Spectrochemistry of Tropane Derivatives. K. von Auwers (*J. pr. Chem.*, 1922, [ii], **105**, 102—119).—The following data are recorded. Tropane has $d_4^{10\cdot5}$ 0·9386, $n_\alpha^{10\cdot5}$ 1·47950, $n_{\mathrm{D}}^{10\cdot5}$ 1·48187, $n_\beta^{10\cdot5}$ 1·48845, $n_\gamma^{10\cdot5}$ 1·49394, $d_4^{21\cdot6}$ 0·9307, $n_\alpha^{21\cdot6}$ 1·47427, $n_{\mathrm{D}}^{21\cdot6}$ 1·47659, $n_\beta^{21\cdot6}$ 1·48318, $n_\gamma^{21\cdot6}$ 1·48854. Tropidine has $d_4^{18\cdot4}$ 0·9535, $n_\alpha^{18\cdot4}$ 1·48752, $n_{\mathrm{D}}^{18\cdot4}$ 1·49037, $n_\beta^{18\cdot4}$ 1·49793, $n_\gamma^{18\cdot4}$ 1·50417, $d_4^{10\cdot5}$ 0·9609, $n_\alpha^{10\cdot5}$ 1·49199, $n_{\mathrm{D}}^{10\cdot5}$ 1·49486, $n_\beta^{10\cdot5}$ 1·50257, $n_\gamma^{10\cdot5}$ 1·50898. Tropine has $d_4^{99\cdot8}$ 1·0161, $n_\alpha^{99\cdot8}$ 1·47917, $n_{\mathrm{D}}^{99\cdot8}$ 1·48113, $n_\beta^{99\cdot8}$ 1·48766, $n_\gamma^{99\cdot8}$ 1·49269. Acetyltropein has $d_4^{15\cdot4}$ 1·0627, $n_\alpha^{15\cdot4}$ 1·47456, $n_{\mathrm{D}}^{15\cdot4}$ 1·47687, $n_\beta^{15\cdot4}$ 148321. Propionyltropein has $d_4^{19\cdot6}$ 1·0399, $n_\alpha^{19\cdot6}$ 1·47208, $n_{\mathrm{D}}^{19\cdot6}$ 1·47434, $n_\beta^{19\cdot6}$ 1·48069, $n_\gamma^{19\cdot6}$ 1·48591. Tropinone has $d_4^{99\cdot6}$ 0·9872, $n_\alpha^{99\cdot6}$ 1·45975, $n_{\mathrm{D}}^{99\cdot6}$ 1·46205, $n_\beta^{99\cdot6}$ 1·46910. Ethyl tropane-2-carboxylate has $d_4^{20\cdot5}$ 1·0408, $n_\alpha^{20\cdot5}$ 1·47272, $n_{\mathrm{D}}^{20\cdot5}$ 1·47562, $n_\beta^{20\cdot5}$ 1·48197, $n_\gamma^{20\cdot5}$ 1·48719, d_4^{15} 1·0468, n_α^{15} 1·47583, n_{D}^{15} 1·47805, n_β^{15} 1·48448, n_γ^{15} 1·48968. The methyl ester of *l*-ecgonine has $d_4^{20\cdot5}$ 1·1468, $n_\alpha^{20\cdot5}$ 1·48474, $n_{\mathrm{D}}^{20\cdot5}$ 1·48765. Ethyl tropidine-2-carboxylate has $d_4^{21\cdot3}$ 1·0625, $n_\alpha^{21\cdot3}$ 1·49173, $n_{\mathrm{D}}^{21\cdot3}$ 1·49480, $n_\beta^{21\cdot3}$ 1·50300, $d_4^{11\cdot7}$ 1·0721, $n_\alpha^{11\cdot7}$ 1·49615, $n_{\mathrm{D}}^{11\cdot7}$ 1·49930, $n_\beta^{11\cdot7}$ 1·50768, $n_\gamma^{11\cdot7}$ 1·51462. Ethyl tropinone-2-carboxylate has $d_4^{20\cdot8}$ 1·1207, $n_\alpha^{20\cdot8}$ 1·49225, $n_{\mathrm{D}}^{20\cdot8}$ 1·49537, $n_\beta^{20\cdot8}$ 1·50432, $d_4^{18\cdot7}$ 1·1228, $n_\alpha^{18\cdot7}$ 1·49312, $n_{\mathrm{D}}^{18\cdot7}$ 1·49626, $n_\beta^{18\cdot7}$ 1·50353. Tropacocaine has $d_4^{100\cdot1}$ 1·0426, $n_\alpha^{100\cdot1}$ 1·50440, $n_{\mathrm{D}}^{100\cdot1}$ 1·50801, $n_\beta^{100\cdot1}$ 1·51840, $n_\gamma^{100\cdot1}$ 1·52707. *d*-ψ-Cocaine has $d_4^{99\cdot6}$ 1·1020, $n_\alpha^{99\cdot6}$ 1·49862, $n_{\mathrm{D}}^{99\cdot6}$ 1·50218, $n_\beta^{99\cdot6}$ 1·51199, $n_\gamma^{99\cdot6}$ 1·51959. $(d+l)$-ψ-Cocaine has $d_4^{99\cdot5}$ 1·1026, $n_\alpha^{99\cdot5}$ 1·49867, $n_{\mathrm{D}}^{99\cdot5}$ 1·50209, $n_\beta^{99\cdot5}$ 1·51193, $n_\gamma^{99\cdot5}$ 1·51996. ψ-Pelletierine has $d_4^{99\cdot5}$ 1·0014, $n_\alpha^{99\cdot5}$ 1·47351, $n_{\mathrm{D}}^{99\cdot5}$ 1·47596, $n_\beta^{99\cdot5}$ 1·48289, $n_\gamma^{99\cdot5}$ 1·48861. Ethyl *N*-methylpyrrolidine-2 : 5-diacetate has $d_4^{15\cdot4}$ 1·0490, $n_\alpha^{15\cdot4}$ 1·45872, $n_{\mathrm{D}}^{15\cdot4}$ 1·46113, $n_\beta^{15\cdot4}$ 1·46765, $n_\gamma^{15\cdot4}$ 1·47035.

s-Copellidine has $d_4^{19\cdot0}$ 0·8315, $n_\alpha^{19\cdot0}$ 1·44113, $n_{\mathrm{D}}^{19\cdot0}$ 1·44354, $n_\beta^{19\cdot0}$ 1·44982, $n_\gamma^{19\cdot0}$ 1·45524, and is converted by the action of methyl iodide into N-*methyl*-2 : 4 : 6-*trimethylpiperidine*, a colourless oil, which has b. p. 153—155°, $d_4^{19\cdot7}$ 0·8231, $n_\alpha^{19\cdot7}$ 1·44063, $n_{\mathrm{D}}^{19\cdot7}$ 1·44299, $n_\beta^{19\cdot7}$ 1·44952, $n_\gamma^{19\cdot7}$ 1·45471. *N*-Methyltetrahydroquinoline has $d_4^{17\cdot3}$ 1·0236, $n_\alpha^{17\cdot3}$ 1·57620, $n_{\mathrm{D}}^{17\cdot3}$ 1·58268, $n_\beta^{17\cdot3}$ 1·60057. Bornyl acetate has $d_4^{22\cdot6}$ 0·9833, $n_\alpha^{22\cdot6}$ 1·45998, $n_{\mathrm{D}}^{22\cdot6}$ 1·46225, $n_\beta^{22\cdot6}$ 1·46827, $n_\gamma^{22\cdot6}$ 1·47319. *iso*Bornyl acetate has $d_4^{23\cdot4}$ 0·9807, $n_\alpha^{23\cdot4}$ 1·45978, $n_{\mathrm{D}}^{23\cdot4}$ 1·46191, $n_\beta^{23\cdot4}$ 1·46798, $n_\gamma^{23\cdot4}$ 1·47275. Bornyl *iso*valerate has $d_4^{22\cdot2}$ 0·9487, $n_\alpha^{22\cdot2}$ 1·45779, $n_{\mathrm{D}}^{22\cdot2}$ 1·46001, $n_\beta^{22\cdot2}$ 1·46590, $n_\gamma^{22\cdot2}$ 1·47068. Camphidine reacts readily with methyl iodide, giving N-*methylcamphidine*, a colourless oil, which gives a *picrate*, short, slender needles, m. p. 234°; it has b. p. 195—197°, $d_4^{19\cdot0}$ 0·9011, $n_\alpha^{19\cdot0}$ 1·47378, $n_{\mathrm{D}}^{19\cdot0}$ 1·47625, $n_\beta^{19\cdot0}$ 1·48308, $n_\gamma^{19\cdot0}$ 1·48869, $d_4^{20\cdot8}$ 0·8998, $n_\alpha^{20\cdot8}$ 1·47311, $n_{\mathrm{D}}^{20\cdot8}$ 1·47552, $n_\beta^{20\cdot8}$ 1·48230, $n_\gamma^{20\cdot8}$ 1·48767.

It is concluded that, in general, a molecule containing a seven- or eight-membered ring having a –NMe– group as a bridge, shows a depression in the values of the molecular refraction and molecular dispersion. W. S. N.

Spectrochemistry of Compounds with Augmented Conjugations. K. von Auwers (*J. prakt. Chem.*, 1923, [ii], **105**, 361—384).—The following data are recorded and discussed [With H. Westermann]—Allylpropenylcarbinol,

$CH_2{:}CH{\cdot}CH_2{\cdot}CH(OH){\cdot}CH{:}CHMe$,

has b. p. 61—62°/15 mm., d_4^{20} 0·8612, n_α^{20} 1·45089, n_{He}^{20} 1·45414, n_β^{20} 1·46191, n_γ^{20} 1·46840, and gives, when distilled with potassium hydrogen sulphate in a current of hydrogen, $\Delta^{\alpha,\gamma,\epsilon}$-heptatriene, which has b. p. 113—114°, $d_4^{19\cdot8}$ 0·7636 (hence d_4^{20} 0·764), $n_\alpha^{19\cdot8}$ 1·50786, $n_{\mathrm{He}}^{19\cdot8}$ 1·51604, $n_\beta^{19\cdot8}$ 1·53754, $n_\gamma^{19\cdot8}$ 1·55742, n_{He}^{20} 1·5160 (cf. Enklaar, A., 1913, i, 243).

[With J. Heyna.]—*Ethyl* β-*vinylacrylate* is prepared by the action of ethyl iodide on an ethereal solution of silver β-vinylacrylate; it polymerises very readily, and has b. p. 70—71°/31 mm., 59·9°/18 mm., or 57·2—57·5°/13 mm., $d_4^{22\cdot9}$ 0·9348, $n_\alpha^{22\cdot9}$ 1·46948, $n_{\mathrm{He}}^{22\cdot9}$ 1·47504, $n_\beta^{22\cdot9}$ 1·48928, $n_\gamma^{22\cdot9}$ 1·50252, n_{He}^{20} 1·4764. Closely corresponding figures for *d* and *n* are quoted for other temperatures. Ethyl sorbate has b. p. 81°/15 mm., or 76·5°/12 mm., $d_4^{15\cdot25}$ 0·9405, d_0^{18} 0·9408, $n_\alpha^{15\cdot25}$ 1·49149, $n_{\mathrm{He}}^{15\cdot25}$ 1·49775, $n_\beta^{15\cdot25}$ 1·51395, n_{He}^{20} 1·4956. Ethyl α-methylsorbate has $d_4^{16\cdot5}$ 0·9501 (d_4^{20} 0·947), $n_\alpha^{16\cdot5}$ 1·49306, $n_{\mathrm{He}}^{16\cdot5}$ 1·49907, $n_\beta^{16\cdot5}$ 1·51492, $n_\gamma^{16\cdot5}$ 1·52998, n_{He}^{20} 1·4976. Ethyl α-ethylsorbate has $d_4^{15\cdot3}$ 0·9345 (d_4^{20} 0·931), $n_\alpha^{15\cdot3}$ 1·49076, $n_{\mathrm{He}}^{15\cdot3}$ 1·49653, $n_\beta^{15\cdot3}$ 1·51162, $n_\gamma^{15\cdot3}$ 1·52605, n_{He}^{20} 1·4944. Ethyl γ-methylsorbate has $d_4^{15\cdot6}$ 0·9499 (d_4^{20} 0·946), $n_\alpha^{15\cdot6}$ 1·49484, $n_{\mathrm{He}}^{15\cdot6}$ 1·50087, $n_\beta^{15\cdot6}$ 1·51642, $n_\gamma^{15\cdot6}$ 1·53138, n_{He}^{20} 1·4989. Ethyl βδ-dimethylsorbate has $d_4^{18\cdot5}$ 0·9343 (d_4^{20} 0 933), $n_\alpha^{18\cdot5}$ 1·48301, $n_{\mathrm{He}}^{18\cdot5}$ 1·48823, $n_\beta^{18\cdot5}$ 1·50175, $n_\gamma^{18\cdot5}$ 1·51447, n_{He}^{20} 1·4876. Diethyl crotonylidenemalonate has b. p. 149°/15 mm., $d_4^{14\cdot}$ 1·0508 (d_4^{20} 1·045), $n_\alpha^{14\cdot3}$ 1·47867, $n_{\mathrm{He}}^{14\cdot3}$ 1·48353, $n_\beta^{14\cdot8}$ 1·49629, n_{He}^{20} 1·4809.

Sorbyl chloride has $d_4^{18\cdot75}$ 1·0666 (d_4^{20} 1·065), $n_\alpha^{18\cdot75}$ 1·54707, $n_{\mathrm{He}}^{18\cdot75}$ 1·55710, $n_\beta^{18\cdot75}$ 1·58453, n_{He}^{20} 1·5566.

[With W. Müller.]—The ethyl ester of the stable cinnamylideneacetic acid (Vorländer, A., 1906, i, 362), has m. p. 25—26°, $d_4^{41\cdot6}$ 1·0299 ($d_4^{42\cdot2}$ 1·0294, d_4^{20} 1·049), $n_\alpha^{42\cdot2}$ 1·60039, $n_{\mathrm{He}}^{42\cdot2}$ 1·61348, $n_\beta^{42\cdot2}$ 1·65080, $n_\gamma^{42\cdot2}$ 1·69311, n_{He}^{20} 1·6233. *Ethyl* allo*cinnamylideneacetate* is a colourless, mobile oil, which decomposes when heated under 10 mm. pressure. It has $d_4^{16\cdot8}$ 1·0473 (d_4^{20} 1·044), $n_\alpha^{16\cdot8}$ 1·60645, $n_{\mathrm{He}}^{16\cdot8}$ 1·61950, $n_\beta^{16\cdot8}$ 1·65722, $n_\gamma^{16\cdot8}$ 1·70002, n_{He}^{20} 1·6181. *Ethyl α-methylcinnamylidene acetate* is an oil which cannot be distilled. It has d_4^{22} 1·0391 (d_4^{20} 1·041), n_α^{22} 1·60324, n_{He}^{22} 1·61641, n_β^{22} 1·65401, n_{He}^{20} 1·6155. β-Methylcinnamylideneacetic acid has m. p. 156—157° (Kohler, A., 1910, i, 484, gives m. p. 153°); its *ethyl* ester is an oil, which cannot be distilled, and has $d_4^{25\cdot1}$ 1·0384 (d_4^{20} 1·043), $n_\alpha^{25\cdot1}$ 1·58849, $n_{\mathrm{He}}^{25\cdot1}$ 1·59936, $n_\beta^{25\cdot1}$ 1·63013, $n_\gamma^{25\cdot1}$ 1·66379, n_{He}^{20} 1·6017. γ-*Methylcinnamylideneacetic acid*, short, thick prisms, m. p. 108—110°, is prepared by the condensation of malonic acid with α-methylcinnamic acid in the presence of hot pyridine, which is accompanied by elimination of carbon dioxide, or by dehydrating the hydroxy-ester formed by condensing α-methylcinnamic acid, ethyl bromoacetate, and zinc in benzene solution. *Ethyl γ-methylcinnamylideneacetate*, a colourless oil, which cannot be distilled, has $d_4^{20\cdot3}$ 1·0387 (d_4^{20} 1·039), $n_\alpha^{20\cdot3}$ 1·59010, $n_{\mathrm{He}}^{20\cdot3}$ 1·60100, $n_\beta^{20\cdot3}$ 1·63176, $n_\gamma^{20\cdot3}$ 1·66551, n_{He}^{20} 1·6012. Ethyl β-acetylacrylate has $d_4^{18\cdot1}$ 1·0387 (d_4^{20} 1·037), $n_\alpha^{18\cdot1}$ 1·44987, $n_{\mathrm{He}}^{18\cdot1}$ 1·45346, $n_\beta^{18\cdot1}$ 1·46250, $n_\gamma^{18\cdot1}$ 1·47081, n_{He}^{20} 1·4526. Ethyl muconate has $d_4^{88\cdot8}$ 0·9832 ($d_4^{90\cdot1}$ 0·9829), $n_\alpha^{90\cdot1}$ 1·46178, $n_{\mathrm{He}}^{90\cdot1}$ 1·46755, $n_\beta^{90\cdot1}$ 1·48259, $n_\gamma^{90\cdot1}$ 1·49695. Dimethyl β-methyl-$\Delta^{\alpha\gamma}$-butene-αδ-dicarboxylate has $d_4^{34\cdot8}$ 1·1006 ($d_4^{34\cdot9}$ 1·1005, d_4^{20} 1·115), $n_\alpha^{34\cdot9}$ 1·50142, $n_{\mathrm{He}}^{34\cdot9}$ 1·50762, $n_\beta^{34\cdot9}$ 1·52413, $n_\gamma^{34\cdot9}$ 1·53993, n_{He}^{20} 1·5143. The corresponding diethyl ester has b. p. 163—164°/19 mm. (Stephen and Weizmann, T., 1913, **103**, 276, give b. p. 170°/10 mm.), and does not solidify when strongly cooled. It has d_4^{17} 1·0586 (d_4^{20} 1·056), n_α^{17} 1·49515, n_{He}^{17} 1·50081, n_β^{17} 1·51560, n_γ^{17} 1·52985, n_{He}^{20} 1·4995.

W. S. N.

Dispersion Accompanying Magnetic Double-refraction. G. Szivessy (*Z. Physik*, 1923, **18**, 97—104).—Values of the phase difference, ψ, between the ordinary and extraordinary rays propagated in a magnetic field of strength $H=10{,}100$ gauss, and of the respective refractive indices n, at about 20° are tabulated for λλ 486, 520, 550, 589, 620, and 656 μμ in the cases of toluene, *p*-xylene, *m*-xylene, chlorobenzene, bromobenzene, quinoline, anethole, benzoyl chloride, benzyl alcohol, and benzonitrile. From the results the respective values of the Cotton-Mouton constant, C, and the Havelock constant, h, are calculated by means of the equations $\psi=ClH^2$ and $C=h(n^2-1)^2/n\lambda$, where l denotes the length of path traversed in the respective substances. In the case of any of the substances investigated, the respective values of h are found to be independent of the wave-length employed, in accordance with Havelock's theory.

J. S. G. T.

The Influence of Foreign Gases on the Secondary Spectrum of Hydrogen. S. BARRATT (*Phil. Mag.*, 1923, [vi], **46**, 627—629).—In continuation of previous work on the enhancement of lines in the secondary spectrum of hydrogen due to the presence of helium (A., 1922, ii, 461), the author finds that similar changes, evidently related although on a far smaller scale, are produced by argon, whilst oxygen exerts no influence of the kind. The secondary hydrogen lines λλ, 6392·99 and 6111·08 Å., previously observed only in the presence of helium, were developed when argon was present.
J. S. G. T.

The Zeeman Effect associated with the Red and Blue Hydrogen Lines. K. FÖRSTERLING and G. HANSEN (*Z. Physik*, 1923, **18**, 26—33).—In a magnetic field of strength up to 20,000 gauss, each component of the doublets H_α and H_β in the hydrogen spectrum becomes a normal Zeeman triplet. Contrary to the conclusion of Erochin (*Ann. Physik*, 1913, [iv], **42**, 1054), the authors find that the central components of each pair of triplets arising respectively from H_α and H_β are displaced towards one another in the magnetic field, a result which is not in accord with any current theory of the Zeeman effect. J. S. G. T.

Ultra-violet Resonance Spectra of Iodine Vapour. OTTO OLDENBERG (*Z. Physik*, 1923, **18**, 1—11).—Iodine vapour, excited by ultra-violet radiation of short wave-length emits a resonance spectrum comprising a series of lines characterised by the same regularity and nuclear vibration quanta as in the case of the resonance spectrum excited by the green mercury line. In the neighbourhood of the band λ 3250 Å., additional bands λλ 3169, 3191, 3212, 3237, 3261, 3285, 3311, 3338, 3364, 3394, 3417, 3442, 3466, 3495, 3495, 3525, 3559, 3596, 3640, 3680, 3720, 3765, 3813, 3866, 3925, and 4007 Å. are observed when extraneous light is carefully excluded. The frequencies, ν, of about thirty-five lines conforming with Stokes's law, and of three lines of shorter wave than that of the exciting radiation, are, in the case of excitation with the zinc line λ 1900, represented by the equation $\nu=52630(1-0{\cdot}00416n+0{\cdot}000017n^2)$, $n=0, 1, 2, 3. \ldots$ Toward the region of long wave-lengths, the resonance spectrum passes gradually into the ultra-violet fluorescence band spectrum of iodine vapour observed by McLennan (A., 1913, ii, 455; 1914, ii, 829), which corresponds fairly well with the ultra-violet bands in the spectrum emitted by iodine vapour under electrical excitation. It is concluded that the band spectrum is the long wave-length extension of the short wave-length resonance spectrum. The author discusses a possible origin of emission of the fluorescence spectrum, which is excited only by radiation of wave-length shorter than 1950 Å. It is shown conclusively, in agreement with McLennan's result, that the visible and ultra-violet fluorescence spectra are emitted by the iodine molecule and are not attributable to the presence of an impurity. J. S. G. T.

Series Spectra in Oxygen and Sulphur. J. J. HOPFIELD (*Nature*, 1923, **112**, 437—438).—The series for oxygen previously reported (*Physical Rev.*, 1923, **21**, 710) have been extended from two to seven and from one to six members, respectively. No second member of the third series was found. Gaseous sulphur dioxide has a strong absorption band extending from λ 2500 to λ 1700, and another from λ 1650 indefinitely into the ultra-violet. The spark spectrum of sulphur extends to λ 350; the arc spectrum contains a number of triplets of wide separation and constant frequency difference which have been classified in series by analogy with oxygen. In the cases of both oxygen and sulphur, the intensities and separations observed are inverted as compared with the known spectra of these elements in the visible and ultra-red. One stable and two metastable forms of each of the elements atomic oxygen and atomic sulphur appear to exist. The resonance and ionising potentials, respectively, for the stable forms are calculated to be: oxygen, 9·11 and 13·56 volts; sulphur, 6·50 and 10·31 volts.

A. A. E.

The Carbon Arc Spectrum in the Extreme Ultra-violet. II. F. SIMEON (*Proc. Roy. Soc.*, 1923, [*A*], **104**, 368—375).—In continuation of previous work (this vol., ii, 45), the author has shown that the spectrum of the carbon arc in vacuum extends as far in the extreme ultra-violet as that of the spark, with the exception of a very faint line at λ 360·5 Å. The wave-lengths and relative intensities of twenty-five new lines in the region between λ 976·7 and λ 371·5 Å. are tabulated. In agreement with a deduction from the quantum theory, it is found that a potential of between 30 and 40 volts is sufficient to excite the *L*-series of carbon lines. Reasons are advanced for attributing the lines λλ 1751·8, 1760·6, 2297·1, 2509·5, and 2512·4 Å., excited at 30 volts to the carbon spark spectrum, and the remainder to the arc spectrum. J. S. G. T.

Structure of the Spectrum of Neon. A. LANDÉ (*Z. Physik*, 1923, **17**, 292—294).—It is shown that certain lines in the neon spectrum analysed by Paschen (A., 1920, ii, 69, 718), which, according to Grotrian (A., 1922, ii, 179) may be regarded as L_1 and L_2 terms derived by extrapolation of the *L*-series of doublets in the Röntgen spectrum of neon, can be classified as the first components of a system of quintuplets, two systems of triplets, and a system of singlets. In the latter classification, both L_1 and L_2 terms originate by the displacement of electrons from 2_2 orbits. J. S. G. T.

Excitation of the Spark Spectra of Lithium. E. VON ANGERER (*Z. Physik*, 1923, **18**, 113—119).—The literature of the excitation of spark spectra is briefly reviewed, and experimental details of attempts made by the author to excite the spectra of Li^{II} and Li^{III} are given. The following lines, hitherto unrecorded, and possibly attributable to Li^{II}, were observed in the vacuum spectrum: 3143·7, 3028·5, 3024·6, 2988·5, 2959·5, 2899·66, 2869·90, 2866·45, 2704·60, 2635·20. J. S. G. T.

Spectra and the Periodic Classification. M. A. CATALÁN (*Anal. Fis. Quim.*, 1923, **21**, 321—329; cf. this vol., ii, 104, 105, 356).—Further data are given for the spectrum of manganese. The relation of ionisation potentials to the periodic classification is discussed. Well defined maxima are shown for zinc and cadmium and a less marked maximum for calcium. [illegible] W. R.

The α-Lines in the *K*-Series Tungsten Spectrum. Charles Crofutt (*Proc. Iowa Acad. Sci.*, 1921, **28**, 117—118; cf. Duane and Shimizu, *Physical Rev.*, 1919, **13**, 306; Duane and Patterson, A., 1921, ii, 363; *Proc. Nat. Acad. Sci.*, 1920, **6**, 509; Duane and Stenström, *ibid.*, 1920, **6**, 477).—Experiments with a crystal of thickness 0·015 cm., a front slit 0·005 cm. wide, and a prolonged exposure did not reveal the α_3-line, which is therefore assumed to have an intensity less than one-tenth of that of the α_2-line, or to differ from it in wave-length by less than 0·05%.

Chemical Abstracts.

The Absorption Spectra of some Metallic Vapours. Walter Grotrian (*Z. Physik*, 1923, **18**, 169—182).—In continuation of previous work (this vol., ii, 106), the author has investigated the absorption of visible radiation and radiation extending into the ultra-violet as far as about λ 2350 Å. by the vapours of copper, silver, gallium, lead, tin, bismuth, antimony, and manganese. In the case of copper vapour, in a tube 30 cm. long, absorption of the first members of the doublet principal series, λλ 3247 and 3274 Å., was observed at about 1050°. Under similar conditions, absorption of the corresponding lines λλ 3280 and 3383 Å. in the case of silver vapour was observed at about 900°. In the case of gallium, absorption of the first members of the subordinate series was observed at 850° in the case of the $2p_2$-lines λλ 2874 and 4033 Å., whilst in the case of the $2p_1$ lines λλ 2943·7, 2944·2, and 4172 Å. absorption was first observed at about 900°. Absorption of the line λ 2833 Å. by 30 cm. of lead vapour was observed at 550°. At temperatures above 950°, the line broadened unsymmetrically, the centre being displaced towards the red end of the spectrum. At 1200°, a continuous absorption band, about 10 Å. wide, relatively sharply defined towards the blue and indefinite towards the red end of the spectrum, was observed. The broadening is attributable to the formation of lead molecules, probably Pb_2. From the position of the line 2833 in the series proposed for the lead spectrum by Thorsen (*Naturwiss.*, 1923, **11**, 78), the ionisation potential of the lead atom is found to be 7·38 volts. As the normal condition of the lead atom corresponds with a *p*-term, it is concluded that the 82 electrons associated with the atom are arranged in a 6_2 orbit. Absorption of other lines was observed at higher temperatures, in accordance with theoretical considerations. The partial pressure of the atoms exhibiting absorption was of the order 10^{-5} mm. In a tube 15 cm. long, absorption of the lines λλ 3009·2, 2863·4, and 2706·6 Å. by tin vapour was observed at 1,050°. Bismuth exhibited typical absorption of the line 3067 Å. at 650°. At higher temperatures, bands were strongly developed. It is suggested that the molecule of bismuth vapour is partly polyatomic. Absorption of the manganese triplet 2794·82, 2798·27, and 2801·07 by manganese vapour was observed at about 850°, whilst absorption of the triplet 4030·76, 4033·07, and 4034·49 occurred at about 880°. The results are considered to justify the assumption by Catalán (A., 1922, ii, 726) of the [illegible] as the normal condition of the manganese atom.

J. S. G. T.

Röntgen Spectroscopy. Absorption Spectra in the *L*-Series Relating to the Elements from Lanthanum (57) to Hafnium (72). D. Coster, Y. Nishina, and S. Werner (*Z. Physik*, 1923, **18**, 207—211).—The authors have determined the respective wave-lengths of the heads of absorption bands L_{I}, L_{II}, and L_{III} in the L-series relating to the elements of atomic numbers 57, 58, 64, and 68 to 72. The results confirm the existence, suggested by Bohr and Coster (this vol., ii, 110) of an anomaly in the level curves in the region of the rare earths.

J. S. G. T.

Influence of the Aperture of the Spectrometric Slit on the Form of the Absorption Curves of the Infra-red. G. B. Bonino (*Gazzetta*, 1923, **53**, 591—597).—A mathematical paper which does not lend itself to abstraction.

T. H. P.

Spectrochemistry in the Ultra-red. G. B. Bonino (*Gazzetta*, 1923, **53**, 555—575).—The author gives a summary of previous publications on this subject and describes the apparatus and methods of observation employed in his own investigations (see succeeding abstracts).

T. H. P.

Spectrochemistry in the Ultra-red. II. Absorption of the Alcohols. G. B. Bonino (*Gazzetta*, 1923, **53**, 575—582; cf. preceding abstract).—From the results of investigations on the absorption of alcohols in the ultra-red region between 2·5 and 3·8 μ, Henri and Wurmser (Henri, "Études de Photochimie," 1919, 45) deduced a linear relation between the molecular coefficient of maximum absorption and the chemical composition. The author finds, however, that, if the slit of the spectrometer used is gradually made narrower, the absorption curves of the alcohols are not so simple as is represented by Henri and Wurmser's results, the value of which is questionable.

Compounds containing hydrogen united to a single other element exhibit in the ultra-red a simple absorption band of constant spectral position under ordinary dispersive conditions, whereas compounds containing hydrogen atoms united to two different elements present, in the same region of the spectrum, two distinct bands. In the case of the alcohols, the maximum of one of these bands coincides with that shown by the hydrocarbons, and that of the other with the maximum of the band exhibited by water. It appears, then, that the position of the maximum for these bands is to be attributed to the hydrogen and varies, in one and the same spectral region, according to the nature of the linking (cf. Puccianti, A., 1900, ii, 585).

On the assumption that the bands in question are to be attributed to the partial field of the valency electron of the hydrogen (cf. Stark, "Prinzipien der Atomdynamik," 1915), Planck's elementary law, $h\nu=E$, where ν is an infra-red frequency, h Planck's constant, and E the energy of the field or a measure of the work necessary to rupture the bond between the valency electron of the hydrogen and the other atom, indicates that the frequency ν should be proportional to the energy value of the bond. With hydrofluoric, hydrochloric, and hydrobromic acids the author finds that this is very nearly the case. Moreover, Haber's relation, $\nu_{uv}/\nu_{ir}=\sqrt{M/m}$, where ν_{uv} and ν_{ir} are, respectively, the ultra-violet and infra-red characteristic frequencies, m the mass of the electron, and M that of the vibrating atom, is found to hold satisfactorily for the hydrocarbons if the mass of the hydrogen atom is put in place of M and the total mass of the electrons forming the bond of Stark's hypothesis in place of m.

With different compounds, the molecular absorption coefficient for the band in the infra-red varies in the same sense as the number of hydrogen atoms in the molecule, and in a homologous series the coefficient of maximum absorption varies, approximately and with certain limitations, proportionally with the number of hydrogen atoms in the molecule. It may thus be assumed that $d\epsilon=Kd\rho/\rho$, where ρ is the ratio between the numbers of hydrogen atoms and molecules present, K a constant, and ϵ the coefficient of absorption divided by the number of g.-mols. present. Integration of this expression between two limits corresponding with the ratios of two definite homologous compounds having, respectively, n_1 and n_2 molecules of hydrogen per molecule yields, $\epsilon_2=\epsilon_1+C\log_{10}.n_2/n_1$. Thus from the value of ϵ for one compound that of a homologous compound can be calculated. Excellent agreement is obtained in this way with the lower monohydric aliphatic alcohols and with certain higher members of the ethylene series. T. H. P.

Spectrochemistry in the Ultra-red. III. Absorption of certain Solutions. G. B. Bonino (*Gazzetta*, 1923, **53**, 583—590; cf. preceding abstracts).—The author has investigated the molecular coefficient of infra-red absorption ϵ of solutions of methyl alcohol in carbon tetrachloride under dispersion conditions analogous to those of Henri's experiments ("Études de Photochimie," 1919), the values of ϵ being calculated by means of the expression $I=I_0\,10^{-\epsilon cd}$, in which c is the number of g.-mols. of the substance per litre of the liquid examined, d the thickness of the liquid layer in cms., and I_0 and I the respective intensities of the radiation emerging from the cell charged with the solvent and the solution. The results obtained show that the value of ϵ increases with the dilution of the alcohol.

The case of the alcohols being complicated by the appearance in the infra-red spectrum of a double band with maxima presumably attributable to the hydroxyl group and the hydrogen united with carbon, similar measurements have been made on benzene and its solutions in carbon tetrachloride. Here, too, the molecular coefficient for the position of maximum absorption increases with the dilution of the benzene. Both in this instance, and also with the carbon tetrachloride solutions of methyl alcohol, the curve connecting the logarithm of the molecular absorption coefficient with the logarithm of the volume in litres of solution containing 1 g. mol. of the solute is sensibly linear at relatively high concentrations, but at lower concentrations a constant value of the former logarithm is approached. For the benzene solutions, especially the more dilute ones, the experimental values are in moderately good agreement with those calculated from the expression given by Baly and Tryhorn (A., 1916, ii, 278). T. H. P.

The Absorption Spectra of the Vapours and Solutions of Various Ketones and Aldehydes. JOHN EDWARD PURVIS (T., 1923, **123**, 2515—2521).

Absorption Spectra and Molecular Phases. I. RICHARD ALAN MORTON and HARRY BARNES (T., 1923, **123**, 2570—2572).

A Theory of Colour Production. I and II. JULIUS STIEGLITZ (*Proc. Nat. Acad. Sci.*, 1923, **9**, 303—308, 308—312).—I. All organic dyes have the property of being reducible to a so-called leuco-compound which can in turn be oxidised again to the dye. Fundamentally, oxidation consists in the removal of electrons from an atom, through which process it acquires the power of attracting electrons. The author traces colour production in dyes to electronic vibrations brought about by the oxidising power of an oxidised atom exerting its influence on a neighbouring atom in the molecule having strong reducing properties. In the case of indophenol, 
, which exemplifies the theory, the carbon atom of the quinonoid nucleus attached to the nitrogen atom is fully oxidised and consequently has a strong attraction for the electrons attached to the corresponding carbon atom in the strongly reducing phenolic nucleus. These electrons, being "largely freed from intra-atomic restraints," have their vibrational orbits so modified that absorption of white light results. The known fact that the reducing power of organic compounds such as quinol or *p*-aminophenol is greatly increased by strong bases can be correlated with the deepening effect of such bases on the colour of indophenol. Similarly, the fact that basic dyes such as pararosaniline have their maximum colour depth and intensity when combined with acid may be due to the known effect of acids in intensifying the oxidising power of oxidising agents. The electronic vibrations postulated must be intra-atomic, and must not involve any actual transference of electrons from one atom to another, as this would involve the migration of the hydrogen atom of the hydroxyl group in indophenol from one nucleus to the other. There is positive evidence that such migration does not take place in the dimethylmurexides, of which two can be prepared. The one is prepared from dimethyluramil and alloxan, the other from uramil and dimethylalloxan, and in both cases the original components can be recovered by decomposition of the dye. The source of colour cannot therefore be migration of the electrons, as this would, in the case under consideration, involve migration of the methyl groups.

II. The ideas developed in the preceding section are applied to inorganic compounds, and it is concluded that colour in these compounds must be ascribed to intra-atomic or inter-atomic oxidation-reduction potentials of sufficient force to make possible vibrations of electrons in the reducing component long enough to absorb visible light waves. Combination of a strong oxidising kation with a strong reducing anion leads to strong colour, as in PtI_4. In permanganates and chromates the source of colour lies in the tendency of the valence electrons of the oxide oxygen atoms to pass to the strongly oxidising atoms Mn^{++++}_{+++} and Cr^{+++}_{+++}. Intense colour is produced by the association of atoms of a given element in two conditions of oxidation, as in ferrosoferric oxide, ferrous ferricyanide, and red lead. The colour of chromic salts must be due to intra-atomic forces caused by the presence in the atom Cr^{+++} of three valence electrons. Aluminium and gallium salts contain no such valence electrons and are colourless. A number of other examples are discussed. E. H. R

Röntgenographic Investigations of Systems Capable of Luminescence. ARTHUR SCHLEEDE and HANS GANTZCKOW *Z. physikal. Chem.*, 1923, **106**, 37—48).—Substances capable of phosphorescence are considered, and it is shown that the power of luminescence is never connected with glass-like substances, but only with crystalline substances, provided that a few of the metallic atoms of the fundamental substance are replaced by atoms which are foreign to the lattice of the fundamental substance. The various types of luminescence phenomena, cathodic luminescence, fluorescence, phosphorescence, in one and the same fundamental substance prepared in various ways, depend in all probability on various conditions of deformation of the lattice. J. F. S.

Radiochemistry and Fluorescence. JEAN PERRIN (*Compt. rend.*, 1923, **177**, 612—618).—The author re-discusses previous ideas on the radiation theory of chemical change (cf. A., 1922, ii, 628), more particularly in connexion with the recent work of Levaillant (this vol., ii, 597). The rate of decolorisation of new methylene-blue and fluorescent-blue in glycerol solution is appreciably increased by rise in temperature. Thus, for the former blue, at temperatures from 19—55°, the velocity of disappearance of colour under the influence of orange rays is multiplied by 1·3 for an increase, by one-thirtieth, of the absolute temperature. From this, the author concludes that the infra-red rays producing the critical molecules of glycerol (the cause of the reduction of the colouring matter) have a frequency of 5×10^{13} and a wave-length of 6μ. Fluorescent-blue gave similar results, but neither solution underwent change in absence of light. At 150°, however, New methylene-blue solutions are slightly decolorised in the dark.

E. E. T.

Luminescence of Organo-magnesium Halides. R. T. DUFFORD, S. CALVERT, and DOROTHY NIGHTINGALE (*J. Amer. Chem. Soc.*, 1923, **45**, 2058—2072).—An investigation of the luminescence of organo-magnesium halides. It is shown that Grignard reagents in ethereal solution exhibit chemi-luminescence on oxidation by oxygen only when the magnesium is attached to an unsaturated carbon atom. This holds for both aromatic and aliphatic compounds in all the cases (60) investigated. The nature of the solvent affects the intensity of the luminescence but not the wave-length. Zinc and mercury organic halides give no luminescence. Both the intensity and the wave-lengths of the luminescence are affected by the nature of the reacting halogen. The wave-length and the intensity are affected by the nature of the organic radicle involved, and especially by the nature of the substituting groups in cyclic compounds. The effect depends on the position of the substituting group and its chemical character. But it is definitely shown that the mass of the substituting group is not the controlling factor. Certain cases of very bright chemi-luminescence are described and that of magnesium *p*-chlorophenyl bromide is believed to be the brightest yet recorded. A new method of preparing chlorine-containing Grignard compounds is described; this consists in carrying out the Grignard reaction in *iso*amyl ether and using either iodine or ethyl bromide as catalyst. Many Grignard compounds emit light when treated with chloropicrin or with bromopicrin. This light is not the same as that emitted on oxidation with oxygen. Many Grignard compounds, and especially their oxidation products, are found to be fluorescent in ultra-violet light. Tables are given of the luminescent properties of sixty Grignard compounds. J. F. S.

Rotatory Polarisation in an Orthorhombic Crystal [Triphenylbismuthine Dichloride] Exhibiting Crossed Axial Dispersion. GILBERT GREENWOOD (*Min. Mag.*, 1923, **20**, 123—130).—Circular polarisation, if any, in optically biaxial crystals is masked by the double refraction, but when they exhibit crossed axial dispersion they are optically uniaxial for a certain colour, and the effects of the circular polarisation can then be observed in light of that colour. In crystals of triphenylbismuthine dichloride (orthorhombic-holoaxial class, $a:b:c=0{\cdot}774:1:0{\cdot}409$), the acute positive bisectrix is perpendicular to (010), and for red to green light the axial plane is (100), whilst for green to violet it is (001). For green light of wave-length 510 $\mu\mu$, the crystal is uniaxial at 17°. A section perpendicular to the acute bisectrix does not extinguish between crossed nicols in parallel white light, but transmits light of a bright green colour: this was examined spectroscopically. The optic axial angles for different wave-lengths were determined at two temperatures (17° and 35°). Similar phenomena are shown by potassium sodium tartrate. A salt of one part of sodium potassium tartrate and two parts of sodium ammonium tartrate is uniaxial in the green, whilst a salt of equal proportions is uniaxial in the blue. L. J. S.

Absorption and Anomalous Rotation Dispersion of Camphorquinone. NINA WEDENEEWA (*Ann. Physik*, 1923, **72**, 122 140).—Measurements of the rotation, the ellipticity, and the absorption of a solution of camphorquinone in toluene (0·6913 g. in 200 c.c.) have been made in the regions of the absorption bands. The results are discussed from the point of view of Drude's theory, and the activity coefficients have been calculated. A method of measuring the phase difference and the dichroism is described.

J. F. S.

Models for the Illustration of some Propositions of the Rules of Symmetry in the Exposition of Stereochemistry. Ernst Mohr (*J. pr. Chem.*, 1922, [ii], **105**, 93—101).—The author describes paper or cardboard models by means of which various types of molecular symmetry may be demonstrated. The original does not lend itself to abstraction, and must be consulted for details.

W. S. N.

Specific Action of Luminous Rays of Various Colours in Photosynthesis. V. Lubimenko (*Compt. rend.*, 1923, **177**, 606—608).—For most plants, the amount of photosynthesis in red light (λ 760—600 $\mu\mu$), as measured by the carbon dioxide exchange, is greater than that in bluish-violet light (λ 480—400 $\mu\mu$), although with a few plants, accustomed to diffused daylight, photosynthesis is nearly as great in bluish-violet as in red light.

E. E. T.

Influence of Drying on Photochemical Reactions. Heinrich Tramm (*Z. physikal. Chem.*, 1923, **105**, 356—401).—An apparatus is described by means of which the purification and drying of gases may be carried out at the temperature of liquid air. No drying agents are used, and a degree of dryness greater than that represented by a pressure of water vapour less than 0·004 mm. is achieved. The photochemical formation of ozone, hydrogen chloride, sulphuryl chloride, and carbonyl chloride and the photochemical decomposition of hydrogen chloride, hydrogen bromide, and hydrogen iodide in the presence of various quantities of moisture have been investigated. It is shown that a highly desiccated mixture of hydrogen and chlorine free from oxygen does not combine to a measurable extent under the influence of light. A mixture of carbon monoxide and oxygen which has been dried to the point where it ceases to be explosive and at high temperatures reacts very sluggishly in the dark, when exposed to ultra-violet light exhibits the same velocity of reaction as a similar moist mixture. This shows that the reversal of the photo-decomposition of carbon dioxide by ultra-violet light in the presence of traces of moisture as demonstrated by Coehn and Sieper (A., 1916, ii, 281) is not due to an acceleration of the formation of carbon dioxide, but to a retardation of the decomposition. Traces of sulphur dioxide retarded the decomposition of carbon dioxide by ultra-violet light in exactly the same way as water. Against the assumption that the accelerating action of water vapour on the reaction between carbon monoxide and oxygen under the influence of heat is due to the formation of formic acid as an intermediate product, it is shown that mixtures of oxygen and formic acid do not explode, whilst an equivalent mixture of hydrogen, oxygen, and carbon monoxide does so. A mixture of hydrogen and oxygen so dry that it does not explode in a vessel heated to a red heat but only combines slowly when exposed to ultra-violet light reacts at exactly the same rate as the undried mixture. The author has been unable to dry hydrogen chloride and ammonia to such an extent that they do not combine. J. F. S.

The Influence of Ultra-violet Radiation on the Reactivity of Halogen attached to the Nucleus in the Presence and Absence of Catalysts. K. W. ROSENMUND, K. LUXAT, and W. TIEDEMANN (*Ber.*, 1923, **56**, [*B*], 1950—1957).—The reactivity of halogen atoms attached to aromatic nuclei is greatly enhanced by ultra-violet radiation; this is more particularly the case when copper is present as catalyst. Thus, for example, the chlorine atom of *p*-chlorobenzoic acid is removed quantitatively when its solution in aqueous potassium hydroxide (35%) is boiled for six hours in the presence of copper and ultra-violet light. The enhanced reactivity appears to be due to the effect of the radiation on the organic molecule, and not on the catalyst. The reaction between halogen compounds and alkali hydroxides under these conditions does not lead smoothly to the expected hydroxy-compounds, but the process is well adapted to the production of ethers from halogen compounds and alkyloxides, and to that of acids from halogen compounds and cyanides: $C_6H_4Cl{\cdot}CO_2H+KCN+2H_2O \longrightarrow KCl+NH_3+C_6H_4(CO_2H)_2$. Copper precipitated in the solution appears to be more effective than Ullmann's copper powder or Piccard's copper (A., 1922, ii, 216).

The reactions are carried out in small flasks of clear silica exposed to the light of a Heraeus mercury lamp. The following examples are cited: phenyl *iso*amyl ether, b. p. 210—215°, from bromobenzene and sodium *iso*amyloxide; phenyl *n*-propyl ether, from bromobenzene and sodium *n*-propoxide; *p*-tolyl *iso*amyl ether, b. p. 232—235°, from *p*-bromotoluene and sodium *iso*amyloxide; *o*-tolyl *iso*amyl ether, b. p. 213°, from *o*-bromotoluene and sodium *iso*amyloxide; *p*-anisyl *iso*amyl ether, b. p. 234—237°, from *p*-bromoanisole and sodium *iso*amyloxide. α-Bromonaphthalene and sodium *iso*amyloxide unexpectedly yield naphthalene in almost quantitative yield.

Potassium *p*-chloro- or *p*-bromo-benzoate and potassium cyanide in aqueous solution, in the presence of cuprous cyanide, give terephthalic acid in 70% yield. *p*-Bromobenzenesulphonic acid yields *p*-sulphobenzoic acid (yield 75%), whilst *p*-bromotoluene-*o*-sulphonic acid is similarly transformed into the corresponding carboxylic acid.

The formation of nitriles from alkyl halides and potassium cyanide is appreciably facilitated by the presence of cuprous cyanide and ultra-violet light. H. W.

The Protective Action of Antioxidising Substances [Polyphenols] against Fading of Dyed Fibres in the Light. P. SISLEY (*Bull. Soc. chim.*, 1923, [iv], **33**, 1079—1081).—It is found that certain polyphenols exercise a protective action on some dyes on the fibre, in that the latter are rendered more stable to the action of light and, sometimes, of oxygen. It is not possible, however, to draw any general theoretical conclusions from the results observed, because it is found that a polyphenol which protects one dye may even accelerate the fading of a closely related dye. Tannin, for instance, has a well-marked protective action on methylene-blue dyed on silk, but has practically no effect on auramine. Hydroxylamine sulphate, again, protects methylene-blue, but accelerates the fading of phloxine, whilst thiocarbamide protects the latter, but accelerates the fading of the rhodamines. H. H.

Some Biochemical Effects of Polarised Light. ELISABETH SIDNEY SEMMENS (*Chemistry and Industry*, 1923, **42**, 954).—The hydrolysis of starch in the mustard seed, and also of starch grains when acted on by diastase in vitro, is accelerated by exposure to plane polarised light. It is suggested that the influence of polarised light brings about some change in the starch granules prior to the rupture of the membrane. C. H. R.

Influence of the Wave-length on the Energy Change in Carbon Dioxide Assimilation. OTTO WARBURG and ERWIN NEGELEIN (*Z. physikal. Chem.*, 1923, **106**, 191—218).—Making use of the method previously described (A., 1922, i, 1097) for measuring the energy changes accompanying the assimilation of carbon dioxide, the authors have investigated the change in the following spectrum ranges: infra-red, 800—900 $\mu\mu$, red, 780—700 $\mu\mu$; 690—610 $\mu\mu$; yellow, 578 $\mu\mu$; green, 546 $\mu\mu$; blue, 436 $\mu\mu$, and ultra-violet, 366 $\mu\mu$. There is no decomposition of carbon dioxide in the infra-red region and the decomposition in the ultra-violet and the long wave red 780—700 $\mu\mu$ has proved to be unsuitable for quantitative experiments. The absorption coefficient of a methyl alcohol extract of the colouring matter of the alga *Chlorella* has been determined for the four spectral regions and it is found that the value is smallest for the green line ($\alpha=0{\cdot}09$), 1·8 times as large for the yellow, 9 times as large in the red, and 20 times as large in the blue. The assimilation experiments were carried out with *Chlorella* stems, and show that the yield in the carbon dioxide assimilation decreases with decreasing wave-length. No relationship between the yield and the wave-lengths of the absorption bands can be found; the yield in the red, a region of strong absorption, is greater than that in the green, a region of very weak absorption, whilst the yield of this is greater than that in the blue, the region of strongest absorption. J. F. S.

The Photoelectric Conductivity of Cinnabar. B. GUDDEN and R. POHL (*Z. Physik*, 1923, **18**, 199—206).—Whilst the results obtained by the authors (A., 1921, ii, 145; this vol., ii, 528) and by Rose (*Z. Physik*, 1920, **3**, 174) are in substantial agreement in regard to the spectral distribution of the photo-sensitivity of cinnabar, they exhibit differences greater than the possible experimental error. These differences are now attributed to differences in the experimental conditions—direction and intensity of illumination, voltage applied to the crystal—whereby the increased conductivity of the crystal when illumined originates in a primary or secondary effect, or a combination of both effects, produced by the incident radiation. The current produced by the secondary effect arises in somewhat the same manner as ionisation in a gas is produced by collisions. In an electric field transverse to the direction of illumination, the secondary current constitutes a greater proportion of the total current than is the case in a longitudinal field. The same considerations are applied to the discussion of selective maxima of sensitivity exhibited more especially by powders in strong electric fields. The energy relations observed in connexion with the photo-sensitivity of cinnabar are held to support, in a general manner, the truth of the photo-chemical equivalence law.

J. S. G. T.

The Passage of Corpuscular Radiation through Matter, and Atomic Constitution. II. W. BOTHE (*Jahrb. Radioaktiv. Elektronik*, 1923, **20**, 46—84).—The literature of the scattering and absorption of α- and β-rays, and of the production of secondary radiation and of ionisation by the passage of these rays through matter is critically reviewed. J. S. G. T.

The Period of Protactinium. JOHN H. MENNIE (*Phil. Mag.*, 1923, [vi], **46**, 675—685).—From a comparison of the α-activities of ionium and protactinium, separated from several kilograms of uranyl nitrate, the author has found the average life period of protactinium to be 18,000 years, in substantial agreement with the period of half-change, 12,500 years, found by Hahn and Meitner (A., 1921, ii, 150). J. S. G. T.

Radioactive Disintegration Series and the Relation of Actinium to Uranium. A. S. RUSSELL (*Phil. Mag.*, 1923, [vi], **46**, 642—656).—Regarding a disintegration series as made up of three types of successive changes, the author deduces that there are probably only four such series which are independent, these corresponding, respectively, with the values 222, 221, 220, and 219 for the respective atomic weights of components of the series having an atomic number 86. Of these, the series 221 is new. The series 222, 220 refer, respectively, to the uranium and thorium series, and it is shown that series 219 is the actinium series. Simple empirical relations between the periods of substances related by the expulsion of at least four α-particles without the expulsion of separate β-particles, and of substances related by the expulsion of an α-particle followed by two β-particles in succession and then an α-particle are given. It is deduced that the actinium series originates from an isotope of uranium having an atomic weight 239 (actinuranium-I), present to the extent of about 5% in ordinary uranium. Estimates of the periods of the substances preceding protoactinium in this series are given. Radioactive isotopes are compared with those of inactive elements, and it is suggested that thallium and bismuth, in addition to isotopes of lead, may form end-products of radioactive series. J. S. G. T.

The Short-lived Radioactive Products of Uranium. WILLIAM GEORGE GUY and ALEXANDER SMITH RUSSELL (T., 1923, **123**, 2618—2631).

Long-range Particles from Radium Active Deposit. L. F. BATES and J. STANLEY ROGERS (*Nature*, 1923, **112**, 435—436; cf. Kirsch and Pettersson, this vol., ii, 675).—Radium active deposit, *B*+*C*, on a brass disk was found to emit particles with ranges in air (15°/760 mm.) of 9·3, 11·1, and 13·2 cm., respectively, as well as particles (presumably hydrogen particles) of range >18 cm., in quantities of 380, 126, 65, and 160, respectively, compared with 10^7 of α-rays of range 6·97 cm. It was ensured that the long-range particles were not produced by collisions of the 6·97 cm. α-particles with air molecules, or by excitation in the mica sheets; they appeared to be independent of the metal on which the deposit was formed. It is considered possible that Kirsch and Pettersson's (*loc. cit.*) 12, 13, and 10 cm. hydrogen particles are actually long-range α-particles emitted by the active deposit. A. A. E.

Method for Photographing the Disintegration of an Atom, and a New Type of Rays. WILLIAM D. HARKINS and R. W. RYAN (*J. Amer. Chem. Soc.*, 1923, **45**, 2095—2107).—The rarity of a collision between a fast helium nucleus (α-particle) and the nucleus of an atom in a gas through which it is passing increases greatly as the directness of the collision increases. In three cases the authors have obtained photographs which show the rebound of the α-particle, and taking account of the number of photographs obtained and the fact that the α-particle has passed through about 12 billion atoms in air, this alone indicates that the nucleus of an atom of nitrogen or oxygen is of the order of slightly more than 10^{-13} cm. in radius. A more accurate value can be obtained by a mathematical analysis of all of the deflections of the α-particle through smaller angles. In an ordinary collision, three tracks meet in a point, one for the particle before collision, and a second for the same particle after collision. Should the oxygen or nitrogen nucleus disintegrate, then at least four tracks should meet, the additional track being due to a fragment, such as an electron, a hydrogen, or a helium nucleus disrupted from the bombarded nucleus. The chance of such a disintegration increases rapidly with the directness of the collision and with the speed of the α-particle. The authors have obtained a photograph in which the fourth track appears, and this should characterise an atomic disintegration. That this track starts from the proper point in space is shown by two projections obtained simultaneously. These give two views at an angle of 90°. Rays of a new type, designated by the authors ζ-rays, have been photographed. In this case, the α-particle evidently drives particles from two widely separated atoms in its path. It is remarkable that the two tracks thus obtained lie in almost parallel planes, both are highly curved and almost parallel lines, and both have a sharp retrograde motion. It seems probable that the ζ-rays are due to electron emission. The particles must be very light, since the direction of the α-particle is not materially affected by the emission, and the tracks of the particles are moderately long, very much longer than those of the previously recorded δ-rays. The apparatus used by the authors in this work records 3,000 photographs per hour, and 40,000 such photographs have been secured. It is shown that in no case does an oblique impact effect a disintegration. The argon nucleus remains intact even under the sharp impact of a helium nucleus from thorium-*C*′. J. F. S.

The Values of the Electrical Moments of the Atoms and their Connexion with other Quantities. R. D. KLEEMAN (*J. Franklin Inst.*, 1923, **196**, 479—493).—Assuming that atoms and molecules in their interactions are characterised by possessing definite electrical moments, which at 0° (absolute) are approximately independent of the density of the substance, the author shows from a consideration of the values of the internal heat of vaporisation of various substances that the electrical moments of atoms and molecules are, respectively, equal to $10^{-19}N^{2/3}$ and $10^{-19}\Sigma N^{2/3}$, in which N denotes the atomic number of the atoms concerned. The distance of separation of the electrical charges in the representative atomic doublet is shown to be equal to $2{\cdot}09\times10^{-10}N^{-1/3}$ cm., which is much smaller than the diameter of the atom. It is suggested that, in the case of the hydrogen atom, the nucleus is situated at a point distant $2{\cdot}09\times10^{-10}$ cm. from the centre of the circular path of the rotating electron and in a plane at right angles to the plane of motion. The doublet effect in the case of the more complicated atomic structures is probably attributable to the nuclei not occupying the foci of the electronic paths. It is shown that in the case of a number of substances, the respective values of the internal specific heat, c_i, at 0°, are related to the atomic weights a_w of the atoms constituting the molecules, by the equations $\log c_i = h_1\Sigma N^{2/3} = h_2\Sigma a_w{}^{1/2}$, where h_1 and h_2 are constants. More generally, at corresponding temperatures T_1 the relation takes the form $\log c_i = \phi(T/T_c)\Sigma N^{2/3}$, where T_c denotes the absolute critical temperature and $\phi(T/T_c)$ denotes a function of T/T_c. The application of the doublet effect to the subject of specific inductive capacity is briefly discussed.
J. S. G. T.

Formation of Gaseous Ions in the Oxidation of Nitric Oxide. A. K. BREWER and FARRINGTON DANIELS (*Trans. Amer. Electrochem. Soc.* [advance copy], 1923, 171—182).—Experiments with a special form of chamber show that when nitric oxide is oxidised between oppositely charged electrodes a current of electricity passes through the gases. The current is of the order of 10^{-14} amperes for the oxidation of 50 c.c. of nitric oxide per minute reacting in a field of 450 volts per cm. This corresponds with about one ion for every million molecules reacting. The current is directly proportional to the voltage and to the number of molecules reacting. No evidence of a saturation current could be detected. Various hypotheses to explain the results are advanced.
J. F. S.

Motion of Electrons in Helium. J. S. TOWNSEND and V. A. BAILEY (*Phil. Mag.*, 1923, [vi], **46**, 657—664).—In continuation

of previous work (A., 1922, ii, 43, 277, 494, 836), the authors have determined the velocities of translation and of agitation of electrons in helium submitted to the action of a uniform electric force, at various pressures ranging from 5 to 240 mm. of mercury. Values are deduced for the mean free path of the electron at 1 mm. pressure, and the proportion of energy lost by an electron on collision. The results indicate that, so calculated, the free path of an electron in helium is about twice that in hydrogen. The mean free path is approximately constant and equal to about 0·05 cm. for velocities between 10^8 and 5×10^7 cm. per sec. Moreover, the increase in the free path as the velocity diminishes occurs for smaller velocities in helium than in argon. The proportion of energy lost by an electron due to collision is approximately constant and equal to $2{\cdot}5\times10^{-4}$ for velocities ranging between 2×10^7 and 10^8 cm. per sec. For velocities greater than 10^8 cm. per sec., the proportion increases considerably owing to ionisation produced by the collision.
J. S. G. T.

The Motion of Electrons in Carbon Monoxide, Nitrous Oxide, and Nitric Oxide. M. F. Skinker and J. V. White (*Phil. Mag.*, 1923, [vi], **46**, 630—637).—In continuation of previous work, the authors have investigated the velocities of translation and of agitation of the electrons under various electrical forces and at various pressures, in the cases of the gases carbon monoxide, nitrous oxide, and nitric oxide. The results indicate that in the case of carbon monoxide the electrons in the stream do not tend to form ions by adhering to molecules of the gas, whilst such ions are produced in nitrous oxide and nitric oxide. Values of the mean free path of the electrons, the effective radius of the molecules, and the proportion of energy lost in collision between an electron and a molecule are tabulated. J. S. G. T.

Problems of Hydrone and Water: the Origin of Electricity in Thunderstorms. Henry E. Armstrong (*Nature*, 1923, **112**, 537—538).—If it is assumed that changes in the size of particles of water can, in the absence of conducting electrodes, give rise to free electricity, it is held that the coalescence of small drops is more likely to induce electrical phenomena than is the reverse process, in that energy is thereby liberated (cf. this vol., ii, 542). Chemical interchanges are believed to account for observations recorded by Simpson (*Phil. Trans.*, 1909, [*A*], **209**, 379) and Lenard (*Ann. Phys. Chem.*, 1892, [ii], **46**, 584). A. A. E.

Electrical Conductivity of Dilute Aqueous Solutions of Hydrogen Chloride. Henry C. Parker (*J. Amer. Chem. Soc.*, 1923, **45**, 2017—2033).—The electrical conductivity of aqueous solutions of hydrochloric acid has been determined at 25° for concentrations between 0·04 and 3·0 millimols. per litre. The solutions were made up by weight and were accurate to a few hundredths %, and the water had a specific conductivity of $0{\cdot}1\times10^{-6}$. The values for the equivalent conductivity show a slight maximum in the region of 0·1 millimol. per litre, due to the influence of the impurities in the water, which apparently cause a somewhat greater effect than in the case of iodic acid (this vol., ii, 7). Comparison with the results of other investigators confirms the conclusions of Kraus and Parker (*loc. cit.*) regarding the considerable influence of the impurities in the water and of the alkali in glass cells on the electrical conductivity of dilute solutions of acids. Values have been interpolated for rounded concentrations from the results for hydrochloric and iodic acid. The data for iodic acid cover the range $0{\cdot}05\times10^{-3}N$ to $0{\cdot}5N$. The cell constant was determined by an intercomparison with three standard cells, over a considerable range of concentrations, with potassium chloride as electrolyte. The unusual results of this intercomparison may be explained by assuming the presence of an adsorbed layer in contact with the electrodes, the resistance of which is greater or less than that of the bulk of the solution, according to whether the electrolyte is negatively or positively adsorbed. One of the intercompared cells apparently has a greater correction for this adsorbed layer than the cell used in the measurements with hydrochloric acid, whilst the other two have a smaller correction. On the supposition that hydrochloric acid will be positively adsorbed and will consequently have but slight correction for this effect, a value for the constant was selected at the minimum point of the cell constant curve, which value is assumed to remain fixed in the measurements of the acid solutions. Extrapolation of the results on the assumption that the law of mass action is approached as a limiting form at infinite dilution gives a value of Λ_0 for hydrochloric acid of 425·69. Assuming that the value of Λ_0 for the chloride-ion at 25° is 75·8, a value of 349·89 is obtained for the hydrogen-ion at that temperature. Comparison of this with the value 349·93 obtained by Kraus and Parker (*loc. cit.*) for iodic acid leads to the value $349{\cdot}89\pm0{\cdot}05$ as the most probable value for the hydrogen-ion at 25°, since the basis for the cell constant is more firmly established for the measurements with hydrochloric acid. The mass-action constant corresponding with this extrapolation has a value 0·105.

J. F. S.

Electrical Conductivity Measurements on Dilute Aqueous Salt Solutions at 0°, 18°, and 100°. P. WALDEN and HERM. ULICH (*Z. physikal. Chem.*, 1923, **106**, 49—92).—Very exact electrical conductivity determinations have been made at 0°, 18°, and 100° with solutions of potassium chloride, nitrate, and perchlorate, sodium chloride and nitrate, cæsium nitrate, lithium perchlorate and picrate, tetraethylammonium picrate, potassium picrate, chlorate, bromate, and iodate in concentrations down to the most dilute. The limiting conductivity has been deduced by means of P. Hertz's hypothesis, and values have been found which confirm the hypothesis. Electro-conductivity–concentration curves have been drawn, and in the case of the less soluble salts it is found that regular deviations from the Hertz curve occur. Lithium picrate and tetraethylammonium picrate follow Stokes's law with sufficient exactitude in the temperature range examined. This result makes it possible to determine the ionic mobility at 100° with satisfactory accuracy. In the case of the perchlorate-ion, ClO_4', the mobility at 18° equals 58·4, a value which is lower than the older measurements indicated. J. F. S.

Simple Determination of the Limiting Value of the Molecular Conductivity of Strong Electrolytes. C. DRUCKER (*Z. physikal. Chem.*, 1923, **105**, 472—475).—A criticism of Lorenz and Landé's papers (this vol., ii, 9, 284), in which it is shown that the statement that α is a constant characteristic of the substance is at variance with facts; the author shows that α expresses in its variability the accepted variability of the transport number. Consequently the suggested new extrapolation process is not applicable. J. F. S.

The Theory of Electrolytes. II. P. DEBYE and E. HÜCKEL (*Physikal. Z.*, 1923, **24**, 305—325).—In continuation of previous work (this vol., ii, 459), the authors present a mathematical analysis of the effect on the electrical conductivity of a completely ionised solution due to the presence of, and the mutual electric forces between, the ions. Ionic and electrophoretic forces are investigated, attention being directed to the following, among other matters: potential distribution around the moving ions, the motion of the solvent, and velocity and pressure distribution in the neighbourhood of the ions. An expression for the conductivity coefficient, f_λ, is derived in the form $1-f_\lambda=(4\pi\epsilon^2\nu n/DkT)^{1/2}[\epsilon^2 w_1/6DkT+bw_2]$, in which ϵ is the electronic charge, ν the total number of ions, n the number of molecules dissolved per c.c., D the dielectric constant of the solvent, k, Boltzmann's constant, T the temperature, w_1 and w_2 are complex valency factors, expressions for which are given, and b the mean diameter of the ions. This expression agrees with the conclusion of Kohlrausch (A., 1907, ii, 600), that in the case of dilute solutions, $1-f_\lambda \propto c^{1/2}$, c denoting the concentration. Results deduced from the expression are compared with experimental results in the cases of aqueous solutions of univalent and multivalent salts, and of non-aqueous solutions. Generally, the agreement between calculated and experimental results is satisfactory. J. S. G. T.

Relative Measurement of the Electrical Resistance of Thallium in the Region of the Temperature of Liquid Helium. H. KAMERLINGH ONNES and W. TUYN (*Arch. Néerland*, 1923, [iii], **6**, 284—292).—The electrical resistance of thallium has been determined at the temperature of liquid air, liquid hydrogen, and liquid helium with the object of ascertaining whether thallium is a super-conductor like mercury and lead. It is found that at 2·32°*K* all resistance has disappeared. J. F. S.

Relative Measurements of the Electrical Resistance of Ordinary Lead and Lead from Uranium at Temperatures below 14° *K*. H. KAMERLINGH ONNES and W. TUYN (*Arch. Néerland*, 1923, [iii], **6**, 293—300).—The electrical resistance of ordinary lead and lead from uranium (radium-*G*) has been determined and the point at which the resistance disappears ascertained. It has been found that pure lead (at. wt. 207·20) and uranium lead (at. wt. 206·06) have the same point of disappearance of resistance within 0·025°. J. F. S.

Electrical Resistance of Phenol–Water Systems, and the Application of [the Properties of] such Systems to Biological [Processes]. MARTIN H. FISCHER (*Kolloid Z.*, 1923, **23**, 131—147).—After a discussion of the theory of the colloidal condition, in which the lyophilic colloidal condition is defined as the product of two mutually soluble substances and is compared with the system phenol–water, the author describes a number of measurements of the electrical resistance of the system phenol–water to which various additions of acids, bases, salts, and non-electrolytes have been made. In these systems, the phenol phase is regarded as comparable with protoplasm, and the physico-chemical properties of this phase are regarded as of importance in the elucidation of the characteristic properties of living substance. Pure hydrated phenol has a very high electrical resistance, which is reduced by the addition of acids and alkalis. The addition of neutral salts also reduces the resistance, but not to so marked an extent. In all these cases, the amount of reduction is dependent, not only on the concentration of the added substance, but also on its chemical nature. The reduction caused by the addition of salts of constant concentration is not the same in all cases, and it is deduced that an " antagonism " exists in certain cases. Some non-electrolytes, such as the lower alcohols, also lower the resistance, but not so strongly as the electrolytes. The behaviour of hydrated phenol is parallel with that of cells and animal fluids under the same conditions. The presence of various electrolytes and non-electrolytes in mixtures of phenol and water changes the volume of the hydrated phenol phase. Acids slightly reduce the volume, whilst alkalis increase it considerably, that is, they bring about a swelling of the phenol. Salts reduce the volume in proportion to their concentration. This behaviour is parallel with the absorption and loss of water in living cells, which is usually attributed to changes in osmotic pressure. Protoplasm is not, as is so generally held, a solution of protoplasmic materials in water, like phenol in water, but a system of the opposite type, namely, water dissolved in protoplasmic material, like water in phenol. The physico-chemical laws which apply to the latter type of system alone hold for living material. J. F. S.

Single Potential of Arsenic and its Power to Replace other Metals in Solutions. LOUIS KAHLENBERG and JOHN VERNON STEINLE (*Trans. Amer. Electrochem. Soc.* [advance copy], 1923, 203—226).—The single potential of arsenic has been determined in a number of different electrolytes, including arsenic trichloride, tri-iodide, arsenious oxide, *p*-aminophenylarsinic acid, *p*-hydroxyphenylarsinic acid, *p*-glycinoaminophenylarsinic acid, *p*-acetamidophenylarsinic acid, and di-*p*-aminophenylarsinic acid, and in general the results of previous investigators have been confirmed. In making the single potential measurements, the arsenic electrodes were prepared in a number of different ways. It was found that a solid arsenic electrode, sawn from a large piece of arsenic, gives trustworthy results, and offers on the whole the best form of electrode for making the determinations. Electrodes prepared by electroplating arsenic on other metals were found to yield untrustworthy results, in that they do not develop the true potential of pure arsenic. Metallic arsenic was used to displace the metals silver, copper, and mercury from their compounds. The reaction which occurs in these cases may be represented by $6MX+2As+3H_2O=6M+6HX+As_2O_3$. Arsenic has been displaced from its compounds by other metals, including sodium, magnesium, aluminium, zinc, cadmium, iron, cobalt, nickel, lead, tin, bismuth, and antimony. In many of these cases the replacement could not have been predicted from a knowledge of the single potentials of the metals concerned. The authors are of the opinion that in the case of arsenic the power of a metal to replace this metal is a highly specific property which depends on the individual nature of the metals in question and also on the liquids used in the experiments.

J. F. S.

Electric Potential of Antimony–Lead Alloys. S. D. Muzaffar (*Trans. Faraday Soc.*, 1923, **19**, 56—58).—Measurements of the electric potential of antimony–lead alloys against a calomel electrode in *N*-potassium hydroxide, *N*-lead nitrate, and acid potassium antimony tartrate solutions showed that up to 98% of antimony the potentials were identical with that of lead, thus demonstrating that, in the antimony-lead series, there are no solid solutions and no compounds formed. A. R. P.

Oxidation–Reduction. III. Electrode Potentials of Mixtures of Indophenol-1-Naphthol-2-Sulphonic Acid and the Reduction Product. W. Mansfield Clark and Barnett Cohen (*U.S. Pub. Health Rep.*, 1923, No. 834, 3—28; cf. this vol., ii, 677).—A new indophenol, 4-*indophenol*-1-*naphthol*-2-*sulphonic acid*, $HO{\cdot}C_6H_4{\cdot}N{:}C_{10}H_5(SO_3H){:}O$ or $O{:}C_6H_4{:}N{\cdot}C_{10}H_5(OH){\cdot}SO_3H$, has been synthesised by grinding 14·2 g. of quinone chloroimide with 25 g. of water and a quantity of ice, then with continual grinding adding 24·6 g. of sodium 1-naphthol-2-sulphonate in 75 c.c. of 4*N*-sodium hydroxide. The solution is kept for an hour. A cold saturated salt solution is then added, when a thick precipitate is formed. This is filtered and washed with cold saturated salt solution. The material is extracted with water and filtered. The filtrate is cooled and precipitated with carbon dioxide. The precipitate, after drying on porous plates, is recrystallised from alcohol, when a red sodium salt of the above-named compound separates. The reduction potentials of this compound in equilibrium with its reduction product at different P_H values have been determined at 30°. It is found that the measurements conform fairly with the equation $E_h=0{\cdot}5440-0{\cdot}03006\log[S_r]/[S_0]+0{\cdot}03006\log(K_rK_2[H^{\cdot}]+K_r[H^{\cdot}]^2\ldots+[H^{\cdot}]^3)\ 0{\cdot}03006\log(K_0+[H^{\cdot}])$, where S_r is the concentration of the total reductant, $[S_0]$ that of the total oxidant, K_r the dissociation constant of that phenolic group in the reductant which is possessed by the oxidant, K_0 is the dissociation constant of the same group in the oxidant, and K_2 is the dissociation constant of the phenolic group created by the reduction. The following values are obtained: $K_0=2\cdot09\times10^{-9}$, K_r $8\cdot01\times10^{-10}$, and $K_2=2\cdot00\times10^{-11}$. The hypothetical normal potential is $+0\cdot5440$ volt. It is shown that an 80—90% reduction of 4-indophenol-1-naphthol-2-sulphonic acid within the ordinary physiological range of P_H indicates a reduction potential about 0·52 volt more positive than the hypothetical hydrogen electrode potential of the solution, and it is suggested that the reduction of this dye should indicate minute degrees of physiological reduction. J. F. S.

Reduction Potentials of Quinones. I. The Effect of the Solvent on the Potentials of certain Benzoquinones. JAMES B. CONANT and LOUIS F. FIESER (*J. Amer. Chem. Soc.*, 1923, **45**, 2194—2218; cf. A., 1922, ii, 547; this vol., ii, 9, 285).—The reduction potentials of various alkyl and chloro-derivatives of benzoquinone have been measured in alcoholic and in aqueous solution. A method has been devised whereby the free energy of reduction of a quinone, and the reduction potential, referred to the solid state, can be found. A cell is constructed consisting of a hydrogen electrode, immersed in a given solvent, connected with a half-cell containing an inert electrode immersed in the same solvent saturated with both the quinol and the quinone, and containing both solid substances. From the potential of this combination it is possible to calculate directly the free energy of reduction, referred to the solid states. This method cannot be used, however, if a quinhydrone is formed; the following procedure is then adopted. Two separate combinations are investigated. In one the half-cell contains a solution saturated with the quinone and the quinhydrone; in the other, the solution is saturated with the quinol and the quinhydrone. The algebraic mean of the potentials of the two combinations is the required reduction potential referred to the solid states, whilst the difference between the potentials is a measure of the free energy of the formation of the solid quinhydrone from its solid components. The results obtained show that, either in solution or referred to the solid states, the introduction of methyl groups into the quinone nucleus decreases the reduction potential, whilst the introduction of chlorine atoms at first raises the potential and then lowers it. Essentially the same relationships are found between the reduction potentials of different substances in aqueous and alcoholic solution, but the potentials referred to the solid states are not entirely parallel to those measured in solution. The temperature coefficient of the reduction potential (solid states) has been measured for all the quinones investigated, and the total energy of reduction calculated. Comparison with previous thermochemical measurements reveals, probably owing to errors inherent in the latter, great discrepancies in the figures for the polychloroquinones. W. S. N.

Membrane Potentials Considered as Diffusion Potentials. E. B. R. Prideaux and W. E. Crooks (*Chemistry and Industry*, 1923, **42**, 955).—Measurements of conductivities, viscosities, diffusion, and membrane potentials in solutions of potassium benzoate and potassium salicylate with parchment membranes, show a definitely diminished mobility of the organic anions in the parchment; this retardation accounts for the increase of the diffusion potential with such salts. C. R. H.

Behaviour of Cuprous Oxide Photo-voltaic Cells. Allen D. Garrison (*J. Physical Chem.*, 1923, **27**, 601—622).—The formation of cuprous oxide electrodes and the conditions under which they have both a positive and a negative light effect are described and the general characteristics of each effect discussed. The positive photo-potential is found to be approximately proportional to the logarithm of the light intensity and to increase with increasing hydrogen-ion concentration. The maximum negative photo-potential is proportional to the intensity of the light for low intensities and constant at high intensities, whilst the positive recoil following the negative maximum increases with the intensity. The maximum negative photo-potential decreases with increasing hydrogen-ion concentration. For large effects, the negative photo-potential decreases and for small effects increases with increasing cupric-ion concentration. The characteristics of the cuprous oxide electrodes which are now known are all explained by the established laws of electro-chemistry by the assumption that the light displaces the equilibrium constant of the reaction, Cu_2O (solid) $\leftrightarrow$ Cu_2O (dissolved) $\leftrightarrow 2Cu^{\cdot}+O''$, causing the cuprous oxide to behave as though its solubility was increased in the light. The results are what would be expected if Einstein's photo-chemical law applied to this reaction in a qualitative manner. The active frequencies have not yet been determined. The theory is also applicable to the silver halide electrodes as well as to the copper electrodes, since they behave in the same way, and is opposed to the theory that the primary effect of radiation is either photoelectric in its nature or causes a direct separation of the uncharged elements. The hypothesis that the effect of the light is a separation of the charged elements as ions or thereby an increase in the solubility of the salt and that the decomposition is made complete only by electrochemical equilibrium is supported by the experimental fact that perfectly dry salts are stable in light. J. F. S.

The Electromotive Behaviour of Magnesium. II. A. Smits (*Proc. K. Akad. Wetensch. Amsterdam*, 1923, **26**, 395—407; cf. A., 1921, ii, 402).—The effect of amalgamation on the *E.M.F.* of the magnesium electrode was studied. From theoretical considerations it was found that the magnesium electrode cannot possibly behave as an oxygen or hydrogen electrode, but that the explanation of its low *E.M.F.* is to be found in the fact that the formation of a layer of hydroxide on the surface of the metal hinders the establishment of the metal–hydrogen inner equilibrium. Activation by means of mercury causes the true inner equilibrium to be approached more closely. By actual measurement it was found that the potential of a magnesium half-element containing *M*/10-magnesium sulphate was −1·902 volt with respect to a normal calomel electrode, but that on the addition of 3% of a saturated solution of mercuric chloride it fell to −1·740 volt. On removing the magnesium, washing with distilled water, and immersing in *M*/10-pure magnesium sulphate, it showed immediately an *E.M.F.* of −1·898 volt, and, after five minutes, one of −1·956 volt. H. H.

Electrolysis with an Aluminium Anode the Anolyte being: I. Solutions of Sodium Nitrite. II. Solutions of Potassium Oxalate. F. H. JEFFREY (*Trans. Faraday Soc.*, 1923, **19**, 52—55).—Electrolysis of solutions of sodium nitrite in concentrations varying from normal to saturated resulted in the formation of much aluminium hydroxide and in the evolution of nitric oxide, whilst nitric acid was found in the anolyte. Probably the primary product at the anode is aluminium nitrite, which is immediately hydrolysed to aluminium hydroxide and nitrous acid. The latter compound then decomposes into nitric oxide and nitric acid.

Electrolysis with potassium oxalate solution as the anolyte resulted in the aluminium anode dissolving; on evaporation of the liquid, well-developed, colourless crystals of potassium alumini-oxalate, $K_3Al(C_2O_4)_3,3H_2O$, were obtained analogous to potassium chromi-oxalate. A. R. P.

The Electron in the Chemistry of Solutions and in Electrochemistry. I. The Paths of Electrons in Solutions during Electrolysis with a Spark Cathode. L. V. PISARSHEVSKI and (MLLE) M. ROSENBERG (*J. Russ. Phys. Chem. Soc.*, 1923, **54**, 533—547).—A solution of *N*/4-potassium iodide was electrolysed, keeping the cathode 3—4 cm. above the surface of the liquid so that a spark was produced. The addition of phenolphthalein causes the appearance of a red stream in the liquid along the path of the spark through the liquid; a blue stream is observed under the same conditions if starch be added instead of the phenolphthalein, whilst the colour of the stream is violet if both indicators are added together. Under the standard conditions adopted, the stream was usually visible to a depth of about 9 cm., and widened at the end, and it was observed that the red streams were somewhat more tortuous and irregular than the blue ones. The streams are deflected by the introduction of a magnetic field, and are due to a pencil of electrons, unaccompanied by matter, being projected into the liquid from the cathode. These electrons encounter ions of iodine and cause them to lose their electrons or become oxidised, the atomic iodine then reacting with the starch in the usual way. A secondary process is the reduction of potassium-ions, which acquire an additional electron and become atomic potassium; this then reacts with water, producing potassium hydroxide, which ionises and is detected by the red coloration of the phenolphthalein. It appears likely that the reduction of the potassium-ions is due both to the electrons lost by the iodine-ions and those of the cathode stream. These experiments are thus a demonstration of the fact that the process of oxidation is the loss of an electron, whilst reduction involves the acquisition of an electron by an ion. G. A. R. K.

The Electron in the Chemistry of Solutions and in Electrochemistry. II. The Electrons of Radium as a Reducing Agent and α-Particles as an Oxidising Agent. L. V. PISARSHEVSKI (*J. Russ. Phys. Chem. Soc.*, 1923, **54**, 548—570).—Aqueous solutions of hydrogen iodide (0·5*N*) and ferrous chloride were kept in contact with a radium preparation for about a year; the radium preparation was introduced directly into the solution in some cases and in others was contained in a separate glass vessel sufficiently thick to absorb all α-particles; control solutions were also kept. It was found that oxidation took place to an appreciable extent in solutions containing the radium preparation, iodine being liberated and ferrous-ions being converted into ferric-ions. No decomposition of the solvent was observed, doubtless because the oxygen and hydrogen produced were immediately acted on by the dissolved substances. It is shown by calculation that the results obtained can only be explained on the assumption that the ions of ferrous iron and iodine are oxidised, that is, they lose a valency electron, when they collide with α-particles derived from the radium salt. It was found that hydrogen iodide exposed to bombardment by β-particles (or electrons) alone showed slight but definite signs of decomposition; the action is explained by the absorption of the electrons by the ions of iodine. In solutions containing radium, this reducing process goes on concurrently with the oxidation due to α-particles, but the latter process predominates owing to the fact that α-particles are given out in far greater number than β-particles. In connexion with these experiments, the nature of chemical and electrochemical processes is discussed. G. A. R. K.

The Electron in the Chemistry of Solutions and in Electrochemistry. III. The Electronic Nature of Ionic Reactions and their Capacity to Produce a Current. L. V. PISARSHEVSKI and (MLLE) M. ROSENBERG (*J. Russ. Phys. Chem. Soc.*, 1923, **54**, 570—600).—When two unequal platinum plates are dipped in a solution in which a chemical reaction is proceeding and the plates are connected together through a sensitive galvanometer, the passage of a current is observed. The current is due to the following causes. Every ionic reaction, such, for instance, as oxidation or reduction (cf. preceding abstract), involves the passage of electrons to and fro in the reacting medium. Some of these encounter the platinum plates dipping in the liquid and communicate an electric charge to them by virtue of a two-fold process; some electrons will encounter atoms of platinum with force sufficient to remove valency electrons from them, that is, causing the ionisation of the metal, whilst other electrons will merely enter the plates, increasing the concentration of electrons within it (the two processes are evidently mutually opposed). If it now be assumed that the electronic concentration in the two plates is not the same, it is clear that a current must be produced when they are joined by a wire; it is proved that if the plates are of unequal dimensions, such is actually the case, and if the potential is due to the electrons acquired from the solution the larger plate is negatively charged whilst the smaller one is positive. The converse is, however, the case, if the chief process depends on the loss of electrons by the plates, favoured by the presence in the solution of some reagent ready to unite with the electrons set free. The larger plate then becomes positive and the current flows from the smaller plate to the larger; this is particularly noticeable in reactions involving oxidation and reduction, in accordance with the authors' view of these processes (preceding abstracts). Processes of ionic dissociation also produce an appreciable current under these conditions, and it is significant that the current is increased if pure water be added to the solution so as to cause increased ionisation of the electrolyte. The direction of this current is, however, dependent on the existence and relative magnitude of two processes, the ionisation of the electrode when brought into contact with the solution and the dissociation of the solute with a consequent movement of electrons; these two processes cause changes in opposite directions, and therefore the current between two unequal platinum plates dipped in a salt solution may pass in either direction, according to circumstances.

The influence of a radioactive substance on the phenomenon is described, and the observations of Schtschukarev (A., 1916, ii, 172) bearing on some aspects of the subject are discussed. G. A. R. K.

Electro-endosmosis and Electrolytic Water Transport. HEINRICH REMY (*Z. Elektrochem.*, 1923, **29**, 365—370).—The author has determined the electrolytic transport of water as well as the water transported by electro-endosmosis for a number of normal and decinormal solutions. The water carried electrolytically is that which forms a layer round the ions, and in consequence is carried along with them. The amount of water carried in this way furnishes a measure of the number of molecules of water associated with each ion. The results show that the amount of water associated with the alkali-ions including ammonium follows the same order as has been previously calculated by the author from a comparison of the mobilities of these ions (A., 1915, ii, 310). The positive electrolytic water transport of the acids examined shows that the hydrogen-ions are sheathed in a small amount of water. The amount of water connected in this way lies between one and two molecules for each hydrogen-ion on the assumption that the water sheath of the chlorine-ion contains between three and nine molecules. J. F. S.

Velocity of Migration of Isomeric Ions. I. H. LEY and H. DIEKMANN (*Z. physikal. Chem.*, 1923, **106**, 161—177).—The authors have redetermined the electrical conductivity of the sodium or potassium salts of *o*-hydroxybenzoic acid, *p*-hydroxybenzoic acid, *p*-cresotic acid, 6-hydroxy-*m*-toluic acid, *o*-hydroxybenzenesulphonic acid, *p*-hydroxybenzene sulphonic acid, anisic acid, and *o*-methoxybenzoic acid at 25° for a number of dilutions, and the molecular conductivity at infinite dilution has been obtained in each case. From these values, on the basis of $\lambda_{Na^{\cdot}}=50{\cdot}2$, the ionic mobility of the anions has been deduced and the following values obtained: $OH\cdot C_6H_4\cdot CO_2'$ [o] $\lambda_a=36\cdot 8$; [p] $\lambda_a=31\cdot 5$. $OH\cdot C_6H_4Me\cdot CO_2'$, [Me : OH : CO_2'=1 : 3 : 4] $\lambda_a=34\cdot 4$; [Me : OH : CO_2'=1 : 2 : 3] $\lambda_a=34\cdot 4$; [Me : OH : CO_2'=1 : 3 : 6] $\lambda_a=30\cdot 5$. $OMe\cdot C_6H_4\cdot CO_2'$ [o] $\lambda_a=33\cdot 5$; [p] $\lambda_a=33\cdot 3$; $OH\cdot C_6H_4\cdot SO_3'$ [o] $\lambda_a=35\cdot 5$; [p] $\lambda_a=33\cdot 9$. The results are discussed in connexion with the orientation of the compounds. J. F. S.

The Constitution of Soap Solutions : Migration Data for Potassium Oleate and Potassium Laurate. James William McBain and Richard Charles Bowden (T., 1923, **123**, 2417—2430).

Crystalline Form of Electro-deposited Metals. William Blum and H. S. Rawdon (*Trans. Amer. Electrochem. Soc.* [advance copy], 1923, 245—267).—A simple hypothesis of the mechanism of crystal formation in electro-deposition is put forward, according to which the cathode discharge of metal-ions and the formation of crystals constitute one and the same process, and any given ion is discharged at the point at which the lowest discharge potential is required. The discharge potential is a function of the solution pressure of the metal and the " effective " metal-ion concentration adjacent to it. The single potential and solution pressure of a metal are the resultant of the " primary single potential," which is defined in terms of the solution pressure of a single unorientated atom, and the "orientation potential," which is a measure of the diminution in solution pressure and corresponding algebraic increase in single potential caused by the arrangement or orientation of the adjacent metal atoms. A higher potential is required to discharge an ion in a position unrelated to those of previously discharged atoms than on an existing crystal, and similarly a higher potential is required to discharge an ion on a small crystal than on a large one. Typical structures of electrode deposits are classified into three major groups : those in which all, or practically all, of the initial nuclei continue to grow, those in which only a part of the initial nuclei continue to grow, and those in which none of the initial nuclei grow. The factors which determine the character of the crystals are discussed and the direction of the change produced by any change in operating conditions is predicted and illustrated. J. F. S.

Passivity. Gerhard C. Schmidt (*Z. physikal. Chem.*, 1923, **106**, 105—154).—Attempts to measure the solubility of hydrogen and oxygen in iron, platinum, chromium, nickel, gold, and copper have been made by liberating these gases electrolytically on one side of a metal electrode and measuring the potential of the other side against a normal calomel electrode. The effect of leading hydrogen and oxygen over surfaces of copper, iron, nickel, chromium, platinum, and gold on the potential of these metals in various solutions has also been determined. The effect of roughening and polishing the surface of chromium, iron, molybdenum, nickel, tantalum, vanadium, and platinum on the potential of these metals has been determined. The results of the above determinations are discussed in connexion with the passivity phenomena of the metals. It is shown that Warburg's hypothesis (*Ann. Phys. Chim.*, 1889, [iii], **38**, 321) that the change of potential brought about by the passage of hydrogen or oxygen over a metal is due to changes of concentration in the surrounding solution is not confirmed by the present experiments. On the other hand, the hypothesis which states that gases dissolved in metals change the potential on account of their solution pressure is found to be in agreement with the experiments. No sure conclusions with respect to activity or passivity can be drawn from potential measurements alone, since the potential depends for the most part on whether the gas is dissolved or not in the metal. Chromium, nickel–chromium-steel, molybdenum, and tantalum after polishing give a very low potential which reaches the normal value again in fifty minutes with chromium, thirty minutes with molybdenum, and twenty minutes with tantalum. In the case of nickel, cobalt, and vanadium the change of potential is nothing like so great as in the above cases and it regains its normal value much more rapidly. Platinum, copper, antimony, aluminium, and iron exhibit a still smaller change of potential on polishing and in the case of zinc, tellurium, magnesium, cadmium, tin, and lead the change of potential is so small as to be scarcely detectable. The presence of gases or polarisation take no part in these changes. A complete parallelism exists between the amount of the change of potential, the time required for the metal to regain its normal potential, and the hardness of the metal. Thus the hardest metal, chromium, exhibits the largest change in potential and requires the longest time to regain its normal potential. This phenomenon is attributed to the diminution of the surface tension. Passive nickel becomes active when its surface is chemically attacked; this can occur by means of electrolytes such as sulphuric acid or by chlorine, bromine, or iodine. On account of the passivity of nickel, iodine separates at first in the electrolysis of potassium iodide solutions, but when the surface of the nickel has been attacked, nickel iodide is formed and the metal is then active. Nickel can also be activated by the removal of gases from its surface and by mechanically roughening the surface. Passive chromium becomes active by disturbing the surface, by scratching, knocking, and so on, but in nitric acid it remains permanently passive. Activated chromium placed in dilute hydrochloric or sulphuric acid remains permanently active. On removal from the acid, however, it becomes passive again after a short time, even although oxygen is rigorously kept away. Chromium heated in a vacuum or in nitrogen is active. In hydrochloric acid at 100° it is also active, and at this temperature chlorine, bromine, and iodine attack chromium and activate it, solely because the surface is disturbed. When hydrogen is evolved from one side of a sheet of iron the other side becomes active; diffusing oxygen acts in the same way. Even in a solvent in which iron does not dissolve, for example, a solution of potassium nitrate, it may be activated as above. This fact is in direct opposition to the oxidation and oxygen-alloy hypotheses. In addition to its activating action, oxygen also shows a passivating action. Iron becomes passive in a solution of chromic acid which contains a trace of sulphuric or hydrochloric acid; it may be activated by diffusing hydrogen or by disturbing the surface. The passivity of metals is therefore to be attributed to a large surface tension, for when the surface tension is reduced the metal becomes active. Reduction of the surface tension can be brought about by attacking the surface chemically, by disturbing the surface mechanically, or by causing gases to escape from the surface. Oxygen passivates and hydrogen activates. J. F. S.

Relation between Current, Voltage, and the Lengths of Carbon Arcs. II. A. E. R. WESTMAN and W. J. CLAPSON (*Trans. Amer. Electrochem. Soc.* [advance copy], 1923, 87—100).—Conditions have been found under which steady arcs can be maintained with currents from 120 to 700 amperes and voltages from 15 to 60. The appearance of steady arcs and of the various unsteady arcs that were encountered are described. A technique for accurately determining the relationship between current, voltage, and the length of carbon arcs has been developed, and has led to results which are tabulated in the paper. These results lead to the conclusion that $e=0{\cdot}99L$, where e is the voltage over the arc and L the length in millimetres from the tip of the cathode to the bottom of the anode crater. J. F. S.

Spectroscopic Magneton Numbers. A. SOMMERFELD (*Physikal. Z.*, 1923, **24**, 360—364).—The author considers the physical reality of the magneton, in accordance with the ideas of Gerlach (*Physikal. Z.*, 1923, **24**, 275) and of Epstein (*Science*, 1923, **57**), to be definitely established from a consideration of the series of multiplets in the spectra of chromium and manganese. It is shown that whereas in the transition from group to group in the periodic classification of the elements the value of the atomic magnetic moment associated with the atomic condition responsible for the emission of the lines of greatest multiplicity increases by one unit, the mechanical moment or the internal quantum number corresponding thereto increases by half a unit only. This result the author considers to be the basis of the explanation of certain apparent magneto-optic and magneto-mechanical anomalies, including the Richardson effect. J. S. G. T.

Determination of the Isothermals of Hydrogen and Helium at Low Temperatures, made with the Object of examining whether the Compressibility of these Gases is Influenced by the Quanta. J. PALACIOS MARTINEZ and H. KAMERLINGH ONNES (*Arch. Néerland*, 1923, [iii], 6, 253—276).—With the object of ascertaining whether or no the compressibility of hydrogen and helium is influenced by the quanta, the authors have determined the isothermals of these two gases at 20·50°. The values of δ_A and pv_A have been calculated, and it is shown that the product pv_A is practically a linear function of the density δ_A. It is concluded from this fact that the quanta exert no influence on the form of the isothermals, a result which is contrary to the demands of the hypothesis advanced by Sackur and by Keesom. J. F. S.

Isothermals of Oxygen at 0° and 20°. H. A. Kuypers and H. Kamerlingh Onnes (*Arch. Néerland*, 1923, [iii], **6**, 277—283).—The isothermals of oxygen have been determined at 0° and 20°, and the values of pv_A, d_A, and p tabulated and compared with the calculated value of pv_A. The experimental values when plotted lead to a parabolic curve represented by the equation $pv_A = A_A + B_A d_A + C_A d_A^2$, for which the constants have been ascertained in the usual manner. These have the values for 0°, $A_A = 1{\cdot}000956$, $B_A = -0{\cdot}95803 \times 10^{-3}$, $C_A = 2{\cdot}0608 \times 10^{-6}$ and for 20°, $A_A = 1{\cdot}07426$, $B_A = -0{\cdot}80379 \times 10^{-3}$ and $C_A = 2{\cdot}0591 \times 10^{-6}$. By means of these coefficients the coefficient of dilation under constant pressure has been calculated and the following values have been obtained: $p = 20$, $[\alpha_{t,p}]_0^{20} = 0{\cdot}00393$, $p = 40$, $\alpha = 0{\cdot}00425$, and $p = 60$, $\alpha = 0{\cdot}00449$.

J. F. S.

Influence of Small Variations of Temperature on the Conductivity of Solid Salts and the Rôle of Humidity in the Phenomenon. P. Vaillant (*Compt. rend.*, 1923, **177**, 637—639).—The temperature–conductivity curves for heating and cooling are identical when the material examined has been previously powdered and dried. With compressed, ground material (sodium chloride), not previously dried, or with a crystalline layer of material (Iceland spar), the conductivity at first rises rapidly with increase of temperature, reaches a maximum and then decreases steadily, the decrease continuing on cooling. At the original temperature, the material shows a smaller conductivity than at the outset. A second heating gives similar results, but the conductivity variations are smaller, whilst a third heating is accompanied by no variations. The loss of conductivity is, however, temporary, for on leaving the material exposed for some hours, it not only regains its conductivity, but then possesses a greater conductivity, and the above temperature effects are more pronounced than before. The conductivity in these cases is apparently a surface effect; it is decreased or increased by exposure of the material to a dry or wet atmosphere respectively.

E. E. T.

Melting Point of Ice on the Absolute Scale. Leighton B. Smith and Robert S. Taylor (*J. Amer. Chem. Soc.*, 1923, **45**, 2124—2128).—The value, T_0, the absolute temperature of melting ice, from the nitrogen volume and pressure expansion coefficients gives a mean value of 273·12° (see this vol., ii, 755). The mean value obtained by using the data of other gases including the Joule-Thomson coefficient is $273{\cdot}13 \pm 0{\cdot}01°$. J. F. S.

The Use of Rast's Camphor Method for Micro-determinations of the Molecular Weight of Liquids. J. Houben (*J. pr. Chem.*, 1922, [ii], **105**, 27—30).—Rast (A., 1922, ii, 421) has determined the molecular weight of four solid substances, by measuring the depression in the freezing point of camphor, using small quantities of material, and determining the freezing point by the capillary tube method. It is now shown that this procedure may be adopted to determine the molecular weight of any liquid of fairly high boiling point. Excellent agreement with the theoretical figures is obtained for *n*-heptyl alcohol, geraniol, terpineol, methyl salicylate, methyl anthranilate, aniline, *n*-decyl alcohol, benzyl benzoate, ethyl benzoate, methyl nonyl ketone, benzonitrile, and tetrachloroethane. W. S. N.

Azeotropic Mixtures. SYDNEY YOUNG (*Proc. Roy. Irish Acad.*, 1922, [*B*], **36**, 22—30).—The question whether two or three given liquids are likely to form a binary or ternary azeotropic mixture, of minimum or maximum boiling point, is discussed. No ternary azeotropic mixture of maximum boiling point has yet been discovered. Values of the boiling points of members of the methyl alcohol series from methyl to *n*-octyl alcohol inclusive are tabulated. The following are the values of the boiling points of binary and ternary azeotropic mixtures of the respective alcohols with water (represented by the symbol *w*), hexane (symbol *h*) benzene (symbol *b*), and toluene (symbol *t*), so far as these have been determined: methyl: *h*, 50·0°; *b*, 58·35°; ethyl: *w*, 78·15°; *h*, 58·7°; *b*, 68·25°; *t*, 76·7°; *h*, *w*, 56·6°; *b*, *w*, 64·85°; *t*, *w*, 74·55°; *iso*propyl: *w*, 80·37°; *h*, 61·0°; *b*, 71·9°; *t*, 80·6°; *h*, *w*, 58·2°; *b*, *w*, 66·5°; *t*, *w*, 76·2°; *tert*.-butyl: *w*, 79·9°; *h*, 63·7°; *b*, 73·95°; *h*, *w*, 58·9°; *b*, *w*, 67·3°; *n*-propyl: *w*, 87·7°; *h*, 65·65°; *b*, 77·1°; *t*, 92·6°; *h*, *w*, 59·95°; *b*, *w*, 68·5°; *t*, *w*, 80·05°; *sec*.-butyl: *w*, 88·5°; *h*, 67·5°; *b*, 79°; *h*, *w*, 61·1°; *tert*.-amyl, $CMe_2Et\cdot OH$: *w*, 87° (?); *h*, 68·5°; *t*, 99·2°; *t*, *w*, 82°; *iso*butyl: *w*, 89·9°; *h*, 68·1°; *b*, 79·85°; *t*, 101·15°; *t*, *w*, 83°; *n*-butyl: *w*, 92·25°; *t*, 105·5°; *iso*amyl, $CHMe_2\cdot CH_2\cdot CH_2\cdot OH$: *w*, 95·15°; *t*, 110·5°; *n*-octyl: *w*, 98°. Methyl alcohol forms no azeotropic binary mixtures with water, benzene, or toluene, and no azeotropic ternary mixtures with the respective systems hexane–water, benzene–water, or toluene–water. *iso*Butyl alcohol forms no azeotropic ternary mixture with the system hexane–water. It is possible that the amyl alcohol, $CMe_3\cdot CH_2\cdot OH$, may form an azeotropic mixture with hexane, but much less probable that the amyl alcohol, $CHMe_2\cdot CHMe\cdot OH$, forms such a mixture. It may be regarded as certain that none of the alcohols with higher boiling points do so. No alcohol with a higher boiling point than 108° should form a ternary azeotropic mixture with hexane and water, nor form a binary mixture with benzene. It is uncertain whether *sec*.-butyl alcohol forms a ternary mixture with benzene and water; it is almost certain that *tert*.-amyl alcohol does not. Alcohols of higher boiling point cannot form ternary azeotropic mixtures with benzene and water. The existence of a binary methyl alcohol–toluene azeotropic mixture is doubtful. The b. p. of the amyl alcohol, $CMe_3\cdot CH_2\cdot OH$, is probably 112°. J. S. G. T.

Vapour Pressure Thermometer. ALFRED STOCK (*Z. Elektrochem.*, 1923, **29**, 354—358).—A full description of the method of making and filling of a vapour pressure thermometer previously described by Henning and Stock (A., 1921, ii, 432). The original must be consulted for details and dimensions. The thermometer filled with carbon disulphide has a range from the ordinary temperature to —10°, with sulphur dioxide —10° to —40°, with ammonia —30° to —77°, with carbon dioxide —75° to —100°, hydrogen chloride —85° to —111°, ethylene —100° to —150°, methane —150° to —185°, and with oxygen —180° to —200°. A very complete table of vapour pressures from about 1,000 mm. downward with the corresponding temperatures is given for all the gases named above. The thermometer is capable of an accuracy sufficient for most purposes. J. F. S.

The Vapour Pressures of Concentrated Sucrose Solutions. EDGAR PHILIP PERMAN and HORACE LEONARD SAUNDERS (*Trans. Faraday Soc.*, 1923, **19**, 112—116).—The curves showing the relation between the vapour pressure of sucrose solutions and the concentration of the sugar at 70° and 90° have been determined and found to be smooth curves and not straight lines as previously found by Perman and Price (A., 1913, ii, 20). From these curves the value of the hydration factor a in Callendar's formula, $p'/p=(N-an)/(N-an+n)$, is found to be 5 between concentrations of 20 and 65 g. of sugar per 100 c.c. Babo's law holds for sugar solutions up to a concentration of 80% of sugar. A. R. P.

Improved Methods of Evaporation in the Laboratory. H. G. BECKER (*Sci. Proc. Roy. Dubl. Soc.*, 1923, **17**, 241—248).—Experiments were made to determine the rate of evaporation of distilled water at different temperatures in still air and in air currents of different speeds. Using an open dish in an oil-bath, a bath temperature of 100° gives a water temperature of 70° in still air and of 54° in a strong draught. To maintain the water at 100°, bath temperatures of 170° and 215° are needed in still air and a strong draught respectively. The rate of evaporation increases very rapidly at higher temperatures, and between 90° and 100° each degree rise is about six times as effective as between 30° and 40°. The air current is relatively more effective at lower temperatures, on account of its greater cooling effect at high temperatures. The normal rate of evaporation on a water-bath in still air is 0·01 c.c. per minute per sq. cm. This can be increased without difficulty to 0·07 c.c. per sq. cm. by raising the dish temperature to 95° and using an air draught of 500 feet per minute. An effective apparatus for evaporating solutions is described, consisting of a glass bulb blown in a wide-bore tube, mounted horizontally and rotated whilst heated with a gas burner. A current of air may be passed through the bulb, or it may be evacuated. In this apparatus superheating is entirely avoided, and such substances as ferric chloride may be readily crystallised. E. H. R.

Calorimetric Micro-bomb. M. PADOA and B. FORESTI (*Gazzetta*, 1923, **53**, 493—498).—Heats of combustion may be determined with a high degree of accuracy by means of a small bomb calorimeter inserted in an ice calorimeter of the Bunsen form. Only 0·03—0·06 g. of the substance is required, this being weighed on a microbalance. [Cf. *J.S.C.I.*, 1923, 1045A.] T. H. P.

The Heat of Combination of the Metals of the Alkaline Earths with Oxygen, Hydrogen, and Nitrogen. A. GUNTZ and F. BENOIT (*Ann. Chim.*, 1923, [ix], **20**, 5—33; cf. this vol., ii, 126).—The following heats of formation were determined: Strontium hydride, 42·2 cal.; barium hydride, 40·9; strontium nitride, 31·8; barium nitride, 31·3; calcium amide, 93·0; lithium amide, 86·7 (for $2LiNH_2$); strontium amide, 84·3; barium amide, 80·24; lithium imide, 52·6; barium imide, 54·4. In each case the measurement depended on the heat developed when the substance is dissolved in dilute hydrochloric acid. The purity of the material used was verified in some cases by analysis of the reaction products. The above results together with others quoted (without references) lead to the conclusions that heats of formation of the oxides, hydrides, nitrides, and amides decrease with rise of atomic weight and that lithium occupies from the thermochemical point of view a position between calcium and strontium. The authors point out that lithium and barium easily yield amides and stable imides by direct action of the metal on ammonia, whilst the calcium and strontium compounds are only obtainable indirectly by decomposition of the corresponding nitride, which is a matter of some difficulty. A comparative table embodying both original and quoted results is given. H. J. E.

Heats of Vaporisation of Mercury and Cadmium. MAYOR F. FOGLER and WORTH H. RODEBUSH (*J. Amer. Chem. Soc.*, 1923, **45**, 2080—2090).—The importance of directly measured heat data as a supplement to vapour pressure data is discussed. The heat of vaporisation of mercury has been determined at 142°, and as a mean of 25 determinations the value 14490±50 cal. is obtained. The value calculated for 298·1° *K* is 14670±50 cal. A number of vapour pressure measurements have been made for cadmium at temperatures from 754·0° *K* to 867·6° *K* and from these data the value 25350±100 cal. is obtained as the latent heat of vaporisation at 594·1° *K*. The generalisations regarding the entropies of monatomic gases, and relating vapour pressures to heats of vaporisation are confirmed for zinc, cadmium, and mercury. J. F. S.

Study of Solutions at Different Temperatures. I. The Capacity for Heat of Aqueous Solutions of Hydrogen Chloride and Ammonia. M. S. VREVSKI and A. I. KAÏGORODOV (*J. Russ. Phys. Chem. Soc.*, 1923, **54**, 335—347).—The capacities for heat of aqueous solutions containing from 0·6 to 37·7% of hydrogen chloride, and from 1·47 to 32·3% of ammonia were determined at about 3°, 20°, 40°, and 60°. The determinations were carried out in a closed vessel to eliminate the effect of vaporisation at higher temperatures; the method of heating was electrical. The values obtained for the heat capacities at room temperature agree substantially with those of Thomsen, Marignac, and others.

The results of the investigation are expressed in the form of curves and it is shown that the heat capacity of hydrogen chloride solutions diminishes with increasing concentration, this being observed at all temperatures. The heat capacity of ammonia solutions at low temperatures (2·4°) at first diminishes with increasing concentration and reaches a minimum at about 25% NH_3; it then begins to rise again. The curve for the same solutions at 20·7 shows a horizontal portion between 0 and 8% NH_3, the heat capacity being equal to that of pure water; it then increases for higher concentrations. At higher temperatures the heat capacity rises in proportion to the concentration.

Weak solutions of hydrogen chloride (below 3%) and ammonia (below 5%) exhibit a minimum of heat capacity similar to that observed for pure water by Callendar and Barnes (Kaye and Laby, "Chemical and Physical Constants," London, 1919, p. 56).

The heat capacity of hydrogen chloride solutions is lower than the calculated value, whilst the converse is observed for ammonia solutions. G. A. R. K.

Study of Solutions at Different Temperatures. II. The Heat of Solution of Hydrogen Chloride and Ammonia at Different Temperatures. M. S. VREVSKI and N. N. ZAVARICKI (*J. Russ. Phys. Chem. Soc.*, 1923, **54**, 348—360).—The molecular heats of solution of hydrogen chloride and ammonia in water were determined at various temperatures. The method used consisted in the direct absorption of the gas in water, carried out in several stages; this is shown to be more accurate than the method of dilution.

It is found that the heat of solution rises rapidly in strong solutions, less so in weak solutions. With rise of temperature the heat of solution of hydrogen chloride rises, whilst that of ammonia diminishes. The heat of solution of hydrogen chloride at all temperatures increases with dilution; that of ammonia is remarkably constant for all concentrations below 12 or 15%.

Study of Solutions at Different Temperatures. III. The Determination of the Density and Composition of the Vapour of Aqueous Solutions of Hydrogen Chloride and Hydrogen Bromide at Various Temperatures. M. S. VREVSKI, N. N. ZAVARICKI, and L. E. SCHARLOV (*J. Russ. Phys. Chem. Soc.*, 1923, **54**, 360—375).—Using a specially constructed apparatus, the pressure and composition of the vapour in equilibrium with aqueous solutions at various temperatures were determined. Dry nitrogen was bubbled through the solution under investigation and the amount of water and acid carried away estimated. It is shown that the total vapour pressure of the solution diminishes with increasing concentrations of acid and reaches a minimum, then rises again; this minimum is more marked in solutions of hydrogen bromide and is greatest at low temperatures.

The partial pressure of the acids greatly depends on the concentration of the solution and is practically zero for solutions containing less than 10 % HCl and 20 % HBr at 19·9°. With rising concentration, the partial pressure rises rapidly and for solutions containing more acid than the constant-boiling mixture the vapour consists of pure acid, the curve expressing the composition of the vapour rising very steeply.

A rise of temperature causes an increase in the partial pressure of the acid in solutions weaker than the constant-boiling mixture, whilst the converse is observed in stronger solutions; the effect of the temperature appears to be greatest for strong solutions. The experimental data referring to the composition of constant-boiling mixtures agree with the older data in the literature.

The results are shown to support the authors' view that for solutions the vapour pressure curve of which shows a minimum, the composition of the vapour and that of the constant-boiling mixture changes in opposite directions with change of temperature.

Study of Solutions at Different Temperatures. IV. The Vapour Density and Heats of Formation of Solutions of Gases. M. S. Vrevski (*J. Russ. Phys. Chem. Soc.*, 1923, **54**, 376—401).—A theoretical paper in which the results obtained in the three preceding papers are discussed from a mathematical point of view.

G. A. R. K.

Titrimetric Method for the Estimation of Density by Means of Floating Bodies. Doemens (*Svensk. Bryggmästare-Tidning*, 1923, 1; *Z. Ges. Brauwesen*, 1923, **46**, 23—29; from *Chem. Zentr.*, 1923, ii, 1201).—A method for the estimation of the density of a liquid consists in the addition of water to a known volume of the liquid until a glass float of known density sinks to the bottom of the vessel containing the liquid. G. W. R.

Piezochemical Studies. XXI. Calculation of the Coefficient of Compressibility. A. L. Th. Moesveld (*Z. physikal. Chem.*, 1923, **105**, 442—449; cf. this vol., ii, 537).—A theoretical paper in which a method is described whereby equations may be deduced which enable the pressure relationship of the mean and actual compressibility to be calculated. For amyl alcohol, the two equations are: $\beta_m=101\cdot5-36\cdot3\times10^{-9}p+7\cdot47\times10^{-12}p^2$, and $\beta_w=101\cdot5-72\cdot6\times10^{-9}p+22\cdot41\times10^{-12}p^2$, where β_m and β_w are the mean and true compressibilities, respectively, and p is the pressure. The calculated and observed values are in good agreement. J. F. S.

Piezochemical Studies. XXII. Compressibility of Mixtures of Alcohol and Water. A. L. Th. Moesveld (*Z. physikal. Chem.*, 1923, **105**, 450—454; cf. preceding abstract).—The mean compressibility of various mixtures of water and ethyl alcohol at 25° has been determined over the pressure range 0—1,500 atm. An equation has been evolved, which represents the mean compressibility of these mixtures as a function of the pressure, and also equations which represent the mean compressibility as a function of the concentration over the same pressure range. Tables of the experimental and calculated compressibilities are given which show a good agreement between the two sets of values. The

mean compressibility in terms of concentration is given by the following equations for the pressure ranges indicated: $10^6\beta_c^0 = 44 \cdot 5 - 0 \cdot 5443c + 0 \cdot 01754c^2 - 0 \cdot 06585 \cdot 10^{-3}c^3$; $10^6\beta_c^{0-500} = 42 \cdot 2 - 0 \cdot 4514c + 0 \cdot 01395c^2 - 0 \cdot 05234 \cdot 10^{-3}c^3$; $10^6\beta_c^{0\ 1000} = 39 \cdot 4 - 0 \cdot 3457c + 0 \cdot 01049c^2 - 0 \cdot 03773 \cdot 10^{-3}c^3$; $10^6\beta_c^{0-1500} = 37 \cdot 1 - 0 \cdot 3253c + 0 \cdot 00962c^2 - 0 \cdot 03762 \cdot 10^{-3}c^3$.
J. F. S.

Relation between Young's Modulus and Atomic Volume. ALBERT PORTEVIN (*Compt. rend.*, 1923, **177**, 634—636).—An equation recently given by Peczalski (*ibid.*, **176**, 500), connecting Young's modulus (E) and atomic volume, is identical with that given by Fessenden (*Chem. News*, 1892, **66**, 206). The latter equation held for the common metals, but is useless where the value of E is high (rhodium tantalum and tungsten). In these cases, more satisfactory results are obtained with the equation $E = kT^a/V^b$, where T = absolute temperature, and a and b are, respectively, about 1 and 2. The various equations connecting coefficients of elasticity (modulus of compressibility, etc.) with surface tension, cubic expansibility, and specific heat are obviously simply modifications of the above type of formula. Some calculations are made (of E) for various minerals, using existing compressibility data. E. E. T.

Velocity of Sound in Nitrogen Tetroxide. A Lower Limit of its Velocity of Dissociation. E. GRÜNEISEN and E. GOENS (*Ann. Physik*, 1923, [iv], **72**, 193—220).—The velocity of sound in nitrogen tetroxide has been measured at various pressures and temperatures by Thiessen's method of closed cylindrical resonators. It is shown that up to frequencies of the order 15,000 sec.$^{-1}$ there is no indication that the velocity of sound depends on the frequency, as should be the case if the time required for setting up the dissociation equilibrium were comparable with the vibration period of sound. The absolute value of the velocity of sound agrees much better with the assumption that the time required for the setting up of a dissociation equilibrium is small in comparison with the vibration period. It can be stated from the most exact measurements at 25° and 760 mm. that the velocity constant of the decomposition, k, under the experimental conditions is certainly larger than 10,000. That is, every molecule of nitrogen tetroxide dissociates on the average at least once in every 10^{-4} sec. J. F. S.

Capillary Phenomena manifested at Surface of Separation of Water and Liquid Vaselin in Presence of Fatty Acids and Alkalis. RENÉ DUBRISAY and PIERRE PICARD (*Compt. rend.*, 1923, **177**, 589—591; cf. A., 1918, ii, 368).—Alkali carbonates, like alkali hydroxides, diminish the interfacial tension between liquid vaselin and water, although to a much less extent. Alkali hydrogen carbonates have a slighter effect still. Neutral salts decrease the interfacial tension between mixtures of liquid vaselin and oleic acid and dilute soap solution, probably owing to their decreasing the solubility of soap and thus favouring its separation at the surface of separation. E. E. T.

Separation of Gas Mixtures by Diffusion into Steam under Pressure. Franz Fischer, Hans Schrader, and Albert Jaeger (*Brennstoff-Chem.*, 1923, **4**, 289—296).—The gas mixture and steam are passed in opposite directions on either side of a porous earthenware division, and thence, through water condensers, to gas receivers. The best separation of light and heavy constituents is obtained with a medium gas and steam velocity and a relatively low steam pressure. Similar results are obtained by replacing the earthenware division by a layer of Raschig rings. For example, an illuminating gas containing 44—45% of hydrogen gave a diffusate containing 70—74% of hydrogen, and this was increased by a second diffusion to 95%. Using a diffusion zone of sand or a large number of narrow tubes, rather less satisfactory results are obtained. [Cf. *J.S.C.I.*, 1923, Nov.] W. T. K. B.

Calculation of Molecular Weights of Associated and Non-associated Liquid from the Critical Data. W. Herz (*Z. Elektrochem.*, 1923, **29**, 394—395).—A theoretical paper in which it is shown that Berthelot's formula, $M=11\cdot4dT_k/p_k(2-T/T_k)$, yields at low temperatures fairly accurate values for the molecular weights of non-associated liquids and absolutely correct values at high temperatures. In the case of associated liquids, the molecular weights calculated by this formula are considerably too large at ordinary temperatures and only at very high temperatures are accurate figures obtained. Associated and non-associated liquids pass gradually into one another. J. F. S.

Mechanical Theory of Solutions. C. Dieterici (*Ann. Physik*, 1923, [iv], **72**, 241—264).—A theoretical paper in which, by means of an empirical approximation, the author demonstrates the applicability of van der Waals's internal pressure equation to liquids, without making any assumptions with regard to van der Waals's quantities π and b. The author considers that the statement, that in the liquid phase of pure liquids over a wide range of temperature and pressure a constant value of the volume correction is always obtained, and that this same value of the volume correction is again found for all solutions in which no association or compound formation takes place, is fully confirmed on the mechanical basis considered. Further, the dimensions of cohesion pressure and its dependence on volume and temperature are also confirmed on the same basis. J. F. S.

Selective Solvent Action by the Constituents of Aqueous Alcohol. II. The Effect of some Alcohol-soluble Semi-solutes. Robert Wright (T., 1923, **123**, 2493—2499).

The Increased Solubility of Phenolic Substances in Water on Addition of a Third Substance. Charles Reynolds Bailey (T., 1923, **123**, 2579—2590).

Furthering of the Separation of Crystals and Gases from Supersaturated Solutions by Means of Fresh Surfaces and other Causes. R. Fricke and C. Rohmann (*Z. Elektrochem.*, 1923, **29**, 400—402).—From a large number of experiments with supersaturated solutions of potassium hydrogen tartrate it has been shown that the formation of a fresh surface or a surface partly separated from its surface film favours the separation of crystals. The effect of rubbing the vessel walls with a glass rod appears therefore to act in this way by forming a fresh surface. From a large number of experiments on solutions saturated with carbon dioxide, it is shown that the formation of a fresh surface also causes the separation of the gas, but here the nature of the substances in the surface is of importance, for some organic substances are active even with old surfaces, whilst others are not active. The presence of bubbles of another gas also favours the separation of the gas. J. F. S.

The Alleged Anomalous Reflection of *X*-Rays in Crystals. RALPH W. G. WYCKOFF (*Amer. J. Sci.*, 1923, [v], **6**, 277—287).—The "X-peak reflections," recorded by G. L. Clark and W. Duane (this vol., ii, 468) from spectrometric observations on potassium iodide, are not confirmed by Laue photographs taken through the cube faces of crystals of this salt, there being no spots developed in the required positions. The photographs conform completely with the sodium chloride arrangement of the atoms; and the only anomalous effect to be observed is a slight hazy diffraction quite close to the central spot, due, perhaps, to distortion in the crystal or to "asterism." L. J. S.

The Law of Distribution of Particles in Colloidal Suspensions with Special Reference to Perrin's Investigations. II. ALFRED W. PORTER and J. J. HEDGES (*Trans. Faraday Soc.*, 1923, **19**, 1—3).—In an emulsion of paraffin in distilled water, made by shaking the two liquids together for some hours and filtering, the change in concentration occurs at the bottom of the vessel and an increase of concentration takes place towards the surface of the liquid. The concentration n varies with the depth y according to the equation $\log_e n/(1-bn)+1/(1-bn)=Ky+A$, the values of the constants A, b, and K being, respectively, 83·23, $9{\cdot}7\times10^{-7}$, and -235. A. R. P.

The Penetration of Electrolytes into Gels. V. Diffusion of Mixtures of Chlorides in Gels. WALTER STILES (*Biochem. J.*, 1923, **17**, 530—534).—There is no antagonism between the chlorides employed in regard to their diffusion through agar and gelatin. The rate of diffusion of mixed chlorides is a little higher than would be expected from the values of the coefficients of diffusion of the respective salts in pure solution. S. S. Z.

Water-line Corrosion. KENNETH M. WATSON (*Trans. Amer. Electrochem. Soc.* [advance copy], 1923, 195—202).—Experiments have been carried out to ascertain the cause of water-line corrosion. Strips of zinc, copper, and brass were partly submerged in various corrosive liquids such as hydrochloric acid and solutions of sodium chloride, potassium nitrate, ammonium nitrate, calcium chloride, chromic, formic, acetic, phosphoric, hydrofluoroboric, and hydrofluorosilicic acids, and the conditions under which water-line corrosion occurs investigated. The results indicate that although the depolarising effect of oxygen is necessary for the corrosion of many metals in certain solutions, the contact of air with the upper surface of a liquid is never directly responsible for the occurrence of water-line corrosion. This phenomenon is caused by the slow downward flow of the heavier film of corrosion products along the surface of the metal, which draws in at the upper surface of the liquid a fresh supply of solution. Since all the metal except that at the surface of the liquid is in contact with partly exhausted solution, corrosion is most rapid at the water line. Although there is an even greater circulation of solution down the face of anodes used in the plating and refining of metals, water-line corrosion does not occur. In this work, the rate of corrosion is determined by the distribution of current over the anode surface, which depends on Ohm's law, and is only slightly affected by the amount of corrosion products contained in the film of solution that touches the anode. J. F. S.

The Distribution of Normal Fatty Acids between Water and Benzene. FREDERICK STANLEY BROWN and CHARLES E. BURY (T., 1923, **123**, 2430—2434).

The Liesegang Phenomenon—an Historical Note. J. R. I. HEPBURN (*Nature*, 1923, **112**, 439).—A claim for priority on behalf of Ord ("The Influence of Colloids upon Crystalline Form and Cohesion," London, 1879) over Liesegang in respect of the discovery of the phenomenon of stratified precipitation in gels. A. A. E.

A Method of Measuring the Velocity of Very Rapid Chemical Reactions. H. HARTRIDGE and F. J. W. ROUGHTON (*Proc. Roy. Soc.*, 1923, [*A*], **104**, 376—394).—A form of apparatus is described suitable for measuring the velocities of very rapid chemical reactions, such as the velocities of unimolecular reactions of which the half reaction is completed in as short a time as 1/300 sec. The fluids to be mixed are brought together at a high velocity within a restricted space by forcing them under considerable pressure through jets entering the space tangentially. The mixture thereafter flows with uniform velocity within a glass tube in such manner that estimations of the composition of the fluid at any cross section of the tube can be made by measuring the colour opacity, spectral absorption, optical activity, etc., of the fluid thereat. By using as fluids to be mixed *N*/10-solutions of sodium hydroxide and hydrochloric acid, the former being coloured with phenolphthalein, it is shown that with rates of flow through the observation tube equal to 400 cm. per sec., not more than 1% of the fluid remains unmixed. Various factors (nature of the flow in the observation tube, specific gravities of the liquids, surface tension) which might possibly influence the results obtained are discussed, and their effects shown to be negligible. J. S. G. T.

Mechanism of the Reduction of Permanganate and its Physico-chemical Basis. V. Mechanism of the Reduction of Manganate and its Dependence on the Alkalinity. JOSEF HOLLUTA (*Z. physikal. Chem.*, 1923, **106**, 276—294; cf. A., 1922, ii, 448, 628, 700, 771).—The reduction of manganate by formate has been investigated in respect of its relation to the hydroxyl-ion concentration. It is shown that the velocity coefficients at low hydroxyl-ion concentrations change in inverse proportion to the square root of the hydroxyl-ion concentration. The effect of the hydroxyl-ion concentration on the velocity constant and on the pressure of oxygen liberated from the manganate is strictly in accord with the theory. It is shown to be probable that hydrated derivatives of manganese peroxide are the end-product of the reduction of manganate at high hydroxyl-ion concentrations. These compounds have a salt-like character. The importance of the adsorptive properties of the precipitated products on the further course of the reaction is discussed, and it is shown that in many cases a further reduction of the quadrivalent manganese takes place, which disturbs the normal course of the reaction when its velocity is very small. The retarding effect of low concentrations of hydroxyl-ion is overcome by an accelerating action at high alkali concentration which is found to be directly proportional to the hydroxyl-ion concentration. J. F. S.

Velocity of Formation of Chloride from Chloroform and Alkali. E. Abel (*Z. Elektrochem.*, 1923, **29**, 391—394).—The velocity of formation of potassium chloride from potassium hydroxide and chloroform in ethyl alcohol solution at 25° has been investigated. The results show that the velocity is proportional to the chloroform concentration, but it is not proportional to the alkali concentration. The velocity increases much more rapidly than the concentration of alkali in the sense that starting with very dilute alkali solutions the apparent order of the reaction with respect to alkali is unity, but this increases with increasing alkali concentration. J. F. S.

The Velocity of Reaction in Mixed Solvents. VI. The Velocity of Saponification of certain Methyl Esters by Potassium Hydroxide in Methyl Alcohol–Water Mixtures. Walter Idris Jones, Hamilton McCombie, and Harold Archibald Scarborough (T., 1923, **123**, 2688—2698).

Rate of Hydrogenation of Cinnamic and Phenylpropiolic Acids. Eric Keightley Rideal (*Trans. Faraday Soc.*, 1923, **19**, 90—97).—The mechanism of the hydrogenation of sodium cinnamate and sodium phenylpropiolate in aqueous solution in the presence of a palladium sol stabilised with gum arabic has been examined. In the presence of sufficient catalyst, the rates at which $M/10$-solutions of the salts are hydrogenated are practically the same and proportional to the square of the shaking speed within very wide variations, the reaction velocity being of the zero order. For small quantities of catalyst, the reaction velocity is proportional to the palladium concentration, independent of the concentration of the salt within limits, and, above certain critical limits, of the shaking speed, but the rate of hydrogen absorption by the phenylpropiolate is twice that by the cinnamate. The reaction velocity in all cases depends on the age of the sol; with freshly prepared sols, the curve is of the zero order practically throughout the reaction. As the age of the sols increases the proportion of the curve of zero order becomes gradually less, the reaction finishing as one of the first order, until with very old and inactive sols the reaction throughout is of the first order. It is shown that the salt is adsorbed on the surface of the catalyst together with the hydrogen, and that it remains adsorbed until completely hydrogenated; this explains the fact that both salts are hydrogenated at the same rate, the phenylpropiolate taking up 2 mols. of hydrogen whilst the cinnamate is taking up 1 mol. A. R. P.

Piezochemical Studies. XXIII. Influence of Pressure on the Velocity of Reaction in Homogeneous Liquid Systems. V. Liquid Mixtures. A. L. TH. MOESVELD (*Z. physikal. Chem.*, 1923, **105**, 455—471; cf. this vol., ii, 740).—The velocity reaction between 0·01*N*-sodium hydroxide and 0·01*N*-ethyl *o*-methoxycinnamate in 31 and 42·5 weight % ethyl alcohol at 25° has been determined at 1, 500, 1,000, and 1,500 atm. pressure. It is shown that in both solvents the velocity increases considerably as the pressure is increased. At 1,500 atm., the velocity constant is 2·34 and 2·15 times as large, respectively, as under 1 atm. pressure. The pressure coefficient of the velocity increases very much with increase in pressure. J. F. S.

The Kinetics of Hæmoglobin. II. The Velocity with which Oxygen Dissociates from its Combination with Hæmoglobin. H. HARTRIDGE and F. J. W. ROUGHTON (*Proc. Roy. Soc.*, 1923, [*A*], **104**, 395—430).—In continuation of previous work (this vol., ii, 229), the authors have determined the rate of reduction of oxyhæmoglobin by sodium hyposulphite, employing for this purpose the form of apparatus described in a previous paper (this vol., ii, 744). The chemical composition of the solution at any section of the observation tube through which it flowed from the mixing chamber was determined by means of the reversion spectroscope (this vol., ii, 105), using an auxiliary trough containing a solution of hæmoglobin saturated with carbon monoxide. It was shown that the velocity of reduction due to sodium hyposulphite was practically identical with that found when the reduction was effected by suitable physical means. For this and other reasons, it was concluded that the dissociation was not appreciably retarded by any back reaction between oxygen and reduced hæmoglobin. The results obtained indicate that the reduction of oxyhæmoglobin is a unimolecular reaction obeying the law of mass action. Hydrogen-ion concentration has a marked effect on the velocity of the reaction. On the alkaline side of p_H 7·7, the velocity is constant, and on the acid side of p_H 6·3, the velocity is probably also constant, having a value about seven times that corresponding with p_H 7·7; between p_H 6·3 and p_H 7·7 there is a gradual change from the one rate to the other. The interpretation of the p_H effect and the legitimacy of adopting a single velocity equation are discussed in detail. The effect of temperature on the velocity constant is in accord with Arrhenius's equation (A., 1889, 1103). At p_H 6·3 and p_H 7·7, the value of the temperature coefficient of the velocity of reaction is 3·8. At the low concentrations of hæmoglobin used, variations in the salt content of the solution are without effect on the velocity of reduction. J. S. G. T.

Catalysis by the Action of Subdivided Metals. I. Heat of Adsorption of Hydrogen on Finely-divided Nickel. B. FORESTI (*Gazzetta*, 1923, **53**, 487—493).—The author obtains values lying between 10957·6 and 11977·2 cal. for the molecular heat of adsorption at 0° of hydrogen at constant volume by nickel reduced from its oxide at 300°. The mean value, 11430·8 cal., is in satisfactory agreement with that calculated by Rideal (T., 1922, **121**, 309). The amount of the gas adsorbable by the metal varies with different samples of nickel, and is considerably affected by the extent of the vacuum attained during the evacuation of the metal prior to the experiment and by the period of contact of the metal with the gas at reduced pressure. The values found by Gauger and Taylor for the heat of adsorption of hydrogen (this vol., ii, 398) are lower than the true values. T. H. P.

Behaviour of certain Metals as Catalysts. II. C. SANDONNINI (*Gazzetta*, 1923, **53**, 453—461).—Investigation of the changes occurring in hydrogen–oxygen mixtures at various temperatures and in presence of either reduced nickel, or purified sugar carbon containing 0·65% of ash, or mixtures of these two catalysts (cf. A., 1922, ii, 557) shows that carbon does not act on detonating gas as an energetic catalyst and that at 300—350° it absorbs oxygen, which at higher temperatures it gives up as carbon monoxide and dioxide. Nickel, however, exerts marked catalysing influence on the union of hydrogen and oxygen and also on the reactions resulting in the oxidation of the carbon. Formation of hydrocarbons was observed in none of the experiments.

T. H. P.

Catalytic Decomposition of Hydrogen Peroxide in a Bromine–Bromide Solution. II. Rate Measurements in Dilute Solutions and in the Absence of Sulphate, and their Interpretation as a Function of the Activity Product of Hydrobromic Acid. ROBERT S. LIVINGSTON and WILLIAM C. BRAY (*J. Amer. Chem. Soc.*, 1923, **45**, 2048—2058; cf. this vol., ii, 473).—A continuation of previous work in which the catalytic decomposition of hydrogen peroxide in solutions of sulphuric acid and potassium bromide, more dilute than previously examined, has been investigated at 25° with the object of determining the reason why the value of *k* increased as the acid concentration was decreased below 0·2*N*. It is shown that the steady state rate of the bromine–bromide catalysis approaches a definite finite value as the concentration of the sulphuric acid is indefinitely decreased. The steady state rate has also been measured in solutions of hydrobromic acid, hydrobromic acid–perchloric acid, hydrobromic acid–potassium bromate, hydrobromic acid–barium bromide, and perchloric acid–potassium bromide. The rate constants obtained from measurements in these various solutions are all slightly larger than those obtained in sulphuric acid solutions more concentrated than 0·2*N*. At the steady state in hydrobromic acid and hydrobromic acid–perchloric acid solutions of ionic strength less than 0·25 and in many of the experiments in the absence of sulphate, the rate of decomposition of the peroxide is represented by the following expression within the limits of experimental error, 1%—2%: $-d(H_2O_2)/dt=0{\cdot}0437(H_2O_2)(H^{\cdot})(Br')\gamma^2_{HBr}$. The activity coefficient, γ_{HBr}, in solutions containing sulphuric acid and potassium bromide has been estimated from the rate measurements in these solutions on the assumption that the above equation is true. The application of the "activity rate" hypothesis and of Brönsted's hypothesis to the present experiments is discussed. J. F. S.

Catalytic Dehydroxidation of Formic Acid. II. ERICH MÜLLER and JOHANNES KEIL (*Z. Elektrochem.*, 1923, **29**, 395—399; cf. A., 1922, ii, 558).—The catalytic decomposition of formic acid into carbon dioxide and hydrogen by means of metallic osmium is connected very largely with the degree of dispersion of the metal. The necessary degree of dispersion is obtained when a compound of osmium (osmium tetroxide, potassium osmate, or potassium chloro-osmate) is acted on by formic acid itself. The osmium thus produced enters in the highly dispersed condition with the acid practically in statu nascendi, and exhibits a hitherto unobserved catalytic action. The catalyst loses its activity rapidly, because the degree of dispersion is reduced. The retardation of the catalysis can be largely prevented by the addition of a protective colloid, such as gelatin. The catalysis of the decomposition of formic acid by osmium shows a large induction period which is removed very largely by the presence of a little metallic osmium. The catalytic decomposition of formic acid in the presence of an osmium compound and gelatin takes place more easily, more certainly, and more completely than in the presence of metallic osmium which has been prepared by the reduction of the tetroxide by means of hydrogen. J. F. S.

Isotopes. F. W. ASTON (*Chemistry and Industry*, 1923, **42**, 935).—Measurements of the masses of the atoms or isotopes of elements not hitherto examined have now been made by a new method. The following elements are found to be simple: scandium, 45; titanium, 48; vanadium, 51; chromium, 52; manganese, 55; cobalt, 59; strontium, 88; yttrium, 89. Gallium has two isotopes, 69 and 71, germanium has three, 74, 72, and 70, and silver has two, 107 and 109. The atomic masses and isotopes of the first forty elements and a few others are now known. With the exception of nitrogen, every odd element has an odd atomic weight, and no atomic weight, excepting that of hydrogen, is less than twice the atomic number. E. H. R.

A Calculation of the Atomic Weights of Isotopes. A. S. RUSSELL (*Nature*, 1923, **112**, 588—589; cf. this vol., ii, 719).—Rules have been formulated from radioactive data whereby the atomic weights of the principal isotopes of common and radioactive elements may be calculated. It is deduced solely from radioactive evidence that isotopes probably do not differ by more than 8 units of atomic weight; that only end-products of radioactive series or radio-elements emitting α-particles should be considered when a comparison is made between common and radioactive isotopes; that all elements are limited to two isotopes of odd atomic weight, differing by 2 units only; that elements of odd atomic number have odd isotopes only, the lighter being likely to be the more stable and abundant; that even elements may have both even and odd isotopes, the former usually being at least twice as numerous as the latter, and the lightest or heaviest not being odd; that isobares of common elements may be of even atomic weight only; that an element of atomic number [?] $4n+3$ has an isotope of atomic weight $4n+1$ and vice versa; and that an even element has always one isotope a unit of atomic weight higher than one of the isotopes of the element next below it. The rules, some of which have already been formulated by Aston, do not apply in their entirety to elements below nickel and cobalt. Branching according to an unknown plan, and indecisive radioactive evidence concerning which mass-numbers are unstable and which are possible isobares, prevent the determination by calculation of all the isotopes of every element. The atomic weights of isotopes calculated in this way are quoted, and shown to agree closely, although not absolutely, with Aston's results. The complexity of an element appears to be a simple function of the atomic number $16n$. It is considered probable that elements of atomic numbers $16n+7$, $16n+10$, and $16n+11$ are simple; that $16n+3$, $16n+5$, $16n+13$, and $16n+15$ have two isotopes; that $16n+8$, and $16n+14$ have no odd isotopes; and that $16n$, $16n+2$, and $16n+12$ have odd isotopes A. A. E.

The Periodic Law. P. I. PETRENKO-KRITSCHENKO (*J. Russ. Phys. Chem. Soc.*, 1923, **54**, 447—454).—A theoretical paper in which certain seemingly anomalous chemical facts such as the effect of accumulation of hydroxyl groups in organic acids, the heats of combination of elements with oxygen, etc., are discussed, and an attempt is made to demonstrate an element of periodicity in connexion with these facts. The arguments do not lend themselves to condensation. G. A. R. K.

Active Cross-section of Gas Molecules for Slow Electrons. II. CARL RAMSAUER (*Ann. Physik*, 1923, [ii], **72**, 345—352; cf. A., 1921, ii. 324).—In the earlier paper (*loc. cit.*), methods were described for the determination of the total active cross-section of gaseous molecules for slow electrons as a function of the velocity of the electrons. Using the same method, the work has been continued with krypton and xenon. It is shown that whilst for hydrogen, nitrogen, helium, and argon the active cross-section and the absorbing cross-section are practically the same for the smallest electron velocities, there are indications that these two quantities for argon, krypton, and xenon commence to differ for velocities between 30 and 70 volts; the divergence between the two commences sooner the larger the atomic number. All inactive gases show the same peculiarity in comparison with the other gases (nitrogen, hydrogen, and carbon dioxide) investigated namely that the active cross-section reaches a maximum and then falls with decreasing electron velocity. The gases argon, krypton, and xenon exhibit the above peculiarity very markedly in two respects; the active cross-section increases to a maximum which is four to five times as large as the kinetic gas cross-section and then falls to one-seventh of the kinetic cross-section for velocities of 0·75 volt. Below this velocity no definite statements can be made. The gases neon, argon, krypton, and xenon show a definite progression in respect of the position and height of their maxima; with increasing atomic number (10, 18, 36, 54) the maxima increase strongly (active cross-section in cm.^{2}/cm.^{3} for 0° and 1 mm. mercury, 13, 82, 98, 141), and in addition are displaced to smaller electron velocities ($\text{volt}_{\text{max.}}$ - 25, 13·2, 11·3, 6·4). J. F. S.

Structure and Deformation of Electron Sheaths and their Significance for the Optical and Chemical Properties of Inorganic Compounds. K FAJANS (*Naturwiss.*, 1923, **11**, 165 172; from *Chem. Zentr.*, 1923, iii, 2—3).—The author discusses the hypothesis that in the activation of ions, and consequently of atoms and molecules, the deformation of electron sheaths is an important factor.

[With G. Joos.]—Optical properties are a measure of deformability. The deformation of inert gas electron sheaths increases with increase of atomic size, anions being more deformable than kations, particularly when associated with a hydrogen nucleus.

[With H. BEUTLER.]—It appears from colour phenomena that the electron path of the anion is deflected to the kation. This is illustrated by compounds of copper. With kations of the inert gas type, the colour effect is the greater the more highly charged is the kation and the smaller its radius.

[With A. SCOTT.]—A deformed anion will approach more closely to a kation than will a rigid anion of equal magnitude. This is illustrated by data for heats of formation and lattice energies of salts. In general, the lattice energy of a salt with a heavy metal (without inert gas sheath) exceeds that of a salt of an equally charged kation of the inert gas type the more deformable the associated anion is.

[With A. HOLSTAMM.]—The behaviour of alkali metal halides shows that the ions compete for water in solutions. When acids dissociate in aqueous solution it is supposed that the hydrogen-ion associates with water to form H_3O^+.

It is concluded from a study of the colour of the halides of titanium and silicon and of other compounds that extreme deformation results in a compacting rather than a loosening of electron paths. G. W. R.

Co-ordination and the Electrons. T. MARTIN LOWRY (*Chemistry and Industry*, 1923, **42**, 1004—1007).—The factors which have led to delay in the universal acceptance of Werner's theory of co-ordination are discussed. The view that the development of conjugated rings is an important factor in promoting co-ordination is maintained, in view of the strong experimental evidence on which it is based.

Kinetic Foundation for Chemical Affinity. J. K. SYRKIN (*Z. physikal. Chem.*, 1923, **106**, 243—254).—A theoretical paper in which it is shown that a kinetic representation of chemical affinity can be developed from considerations of molecular collisions on the assumption that not all the molecules are active, but only a portion of them, which is determined by a definite energetic condition furnished from considerations of statistical mechanics. An equation for chemical equilibrium is deduced on this basis and has the form $\log k = \log_e n_1!n_2!/n_1'!n'_2! - Q/RT - \Sigma n$, where k is the equilibrium constant, Q is the heat change of the reaction, n_1 and n_2 are the number of molecules of each kind reacting, n'_1 and n'_2 are the number of molecules of each product, and n is the total number of reacting molecules, $n = n_1 + n_2$. A kinetic equation is developed for reactions of any given order (2 or higher); this has the form $K = (\sqrt{0(8)}\pi R\sigma^{n-1}/n_1!n_2!r)N_0^{n-1}\sqrt{(n_1/M_1 + n_2/M_2 + \ldots)/(n_1 + n_2)}\sqrt{1}\,e^{-q/RT}$, where K is the velocity constant, σ is the sphere in which collision can occur, r is the radius of the reaction sphere, M_1 and M_2 are the molecular weights, and the other symbols have their usual meanings or those given in the first equation. J. F. S.

Measure of Chemical Affinity. RUDOLF WEGSCHEIDER (*Z. physikal. Chem.*, 1923, **106**, 18—36).—A theoretical paper in which it is shown from a measure of affinity that it must be demanded that it shall depend on the momentary state of the system alone and not on the conditions under which the following change takes place. This condition is satisfied only by the measurement of the affinity from the maximum obtainable work reduced by that required for overcoming the external pressure. Consequently, the volume energy is not to be regarded as a constituent of the chemical energy, nor is the opposing pressure which stops a reaction a measure of the affinity. On the other hand, the work of mixing is only to be deducted when the mixing takes place independently of the reaction itself, but it must not be deducted for the chemical processes which occur in galvanic elements in which actually no mixing takes place. The affinity is dependent on the condition of the system and consequently can, in general, not be defined by any work done by a finite change, but only by the differential quotient. These views are expressed by equations and elaborated by means of definite examples. Here, among other things, a new method is used for proceeding from the unmixed reactants to the unmixed products in a chemical reaction. Previous definitions of affinity refer to processes leading to equilibria (reaction and opposing reaction). The author discusses whether or no the forces of a single reaction can be defined. J. F. S.

Early Greek Chemistry. J. R. PARTINGTON (*Nature*, 1923, **112**, 590).—Comments on Berthelot and Ruelle's "Collection des anciens alchimistes grecs" and Stéphanidès's emendations thereof (*Rev. études grecques*, 1922, **35**, No. 162). A. A. E.

Glass to Metal Joint. CYRIL H. MEYERS (*J. Amer. Chem. Soc.*, 1923, **45**, 2135—2136).—Glass to metal joints may be made by coating the metal part with tin or solder and cleaning the surface thoroughly with zinc chloride. The glass part is cleaned with chromic acid and water and then dried. The metal part is then heated until the solder or tin just melts and the glass, which has been previously warmed, slowly inserted. It is essential that the surfaces of both glass and metal should be clean and that the temperature reached in the soldering does not exceed that required to melt the solder. J. F. S.

A Simple Attachment for Gas Generators. L. SPIEGEL (*Ber.*, 1923, **56**, [*B*], 2068).—A device for attachment to the lower end of the tap funnel used in ordinary gas generators, to prevent a back-rush of gas through the tap. It consists of a U-tube with the longer leg closed except for a small hole at the top. The short limb is attached to the lower end of the dropping funnel by means of a well-greased ground joint. The result is that the U-tube becomes full of liquid, which effectually prevents a back-rush of gas. H. H.

Cellulose Acetate as a Material for the Preparation of Ultra-filters. R. FRICKE and P. KLEMPT (*Kolloid Z.*, 1923, **23**, 164—168).—Ultra-filters may be made from cellulose acetate as follows : A solution of cellulose acetate (3—10 g.) in a mixture of one volume of 96% ethyl alcohol and nine volumes of chloroform is poured uniformly on a glass plate and allowed to dry in the air. The plate and filter are then placed in 96% alcohol for a short time to dissolve out the last traces of chloroform. The filter is loosened at one side and stripped from the plate and preserved in cold water. Such filters are durable and of suitable density, they may be bent without breaking and are best used inside a filter-paper. A number of examples of the use of cellulose acetate filters is given in the paper. J. F. S.

Inorganic Chemistry.

Electrolytic Generator for Pure Hydrogen. VISCOUNT ELVEDEN and ERIC SINKINSON (T., 1923, **123**, 2715—2716).

The Low Temperature Activation of Hydrogen. ALLAN ERNEST MITCHELL and ABRAHAM LINCOLN MARSHALL (T., 1923, **123**, 2448—2457).

The Catalytic Decomposition of Hydrogen Peroxide Solution by Carbons prepared from Carbohydrates. J. B. FIRTH and F. S. WATSON (*J. Soc. Chem. Ind.*, 1923, **42**, 371—372T; cf. T., 1923, **123**, 1750).—The volume of oxygen liberated from hydrogen peroxide by carbon from various carbohydrate sources was studied. When the samples of carbon were merely dried at 100°, it was found that those from cellulose and rice starch were moderately active; those from dextrin, inulin, and wheat starch were slightly active; whilst those from dextrose, lactose, lævulose, maltose, and potato-starch were practically inactive. Heating the carbons in a vacuum for two hours at 600° increased their catalytic activity in all cases. The increase was most marked in the case of inulin carbon, and least for potato-starch and lævulose carbons. Previous sorption and removal of iodine caused a marked increase in the activity in all cases except that of wheat-starch carbon. The increase in the activity of cellulose-carbon was especially striking. The relative bulk of a carbon is not a decisive factor in determining its activity. H. H.

Vapour Pressures and Crystal Lattices of the Hydrogen Halides. F. A. Henglein [with R. Roth and P. Andres] (*Z. Physik*, 1923, **18**, 64—69).—The following values, expressed in mm. of mercury, have been found for the vapour pressures of solid hydrochloric acid, liquid and solid hydrobromic acid, and solid hydriodic acid, at the respective temperatures (measured on the absolute scale) stated: HCl (solid): 161°, 122·2; 158·9°, 100·2; 156·7°, 82·6; 156·0°, 76·0; 149·7°, 40·2; 142·2°, 17·9; 121·0°, 0·891; 115·1°, 0·363; HBr (liquid): 208·7°, 869·9; 194·5°, 400·9; 187·3°, 255·9; (solid) 177·6°, 124·5; 161·2°, 28·2; 157·0°, 17·66; 156·0°, 16·0; 148·7°, 7·30; 144·1°, 4·03; HI (solid): 208·3°, 162·0; 194·7°, 68·0; 177·7°, 18·8. The author's results in the case of hydrobromic acid are not in agreement with those of McIntosh and Steele (A., 1904, ii, 533). The respective vapour pressures in mm. of mercury can be represented as a function of the absolute temperature by equations of the form $\log p=7{\cdot}5030-K/T^n$, the following being the respective values of K and n: HCl (liquid), 945·7, 1·0160; (solid), 1966·3, 1·1600; HBr (liquid), 1037·2, 1·0160; (solid), 2202·0, 1·1602; HI (liquid), 1197·3, 1·0160; (solid), 1435·9, 1·0496. The results indicate that as in the case of the halogens, the hydrogen halides form molecular lattices. Moreover, the crystal form of solid hydrogen iodide is different from that of hydrogen chloride and hydrogen bromide, and it is possible that at lower temperatures a second crystalline modification occurs. The following values of vapour pressure (in mm.) at the melting point characterise the respective molecular and ionic lattices:—molecular lattices: Cl, 8·9; Br, 44·1; I, 87·0; HCl, 125·2; HBr, 224·2; HI, 369; ionic lattices: KCl, KBr, KI, about 0·4. J. S. G. T.

Irregularities in the Rate of Solution of Oxygen by Water. H. G. Becker and E. F. Pearson (*Sci. Proc. Roy. Dubl. Soc.*, 1923, **17**, 197—200).—Measurements of the rate of absorption of oxygen at a still water surface show that, up to 60 or 70% of saturation, the absorption follows the same logarithmic law as if the water were kept continually mixed, but beyond this point wide irregularities occur. The causes determining the uniform mixing in the early stages and its failure in the later stages of absorption have not been elucidated. E. H. R.

Recent Progress in the Production of Ozone with High Tension Discharges. FRANK E. HARTMAN (*Trans. Amer. Electrochem. Soc.* [advance copy], 1923, 295—306).—The paper deals with the production of ozone by the silent discharge methods. Data are given which show that the energy density of an ozoniser is a straight-line function of the cycles; and that the yield of ozone is a straight-line function of the energy density at atmospheric pressure. It is further shown that ozonising at high gas pressures is conducive to better cooling of the electrodes, thus making it possible to produce high concentrations of ozone with high energy densities. A relationship is also established between high gas pressures and the efficiency of an ozoniser. J. F. S.

Preparation of Ozone with a High Frequency Alternating Current. ALFRED STARKE (*Z. Electrochem.*, 1923, **29**, 358—364).—The author has made experiments to ascertain whether by increasing the frequency of the alternating current up to the value 10,000 it is possible to reach the increased theoretical intake of energy in an ozone tube without decreasing the energy yield, the ozone concentration, and the safety of the tube. Experiment shows that by using a frequency of 10,000 at constant voltage, about 200 times as much ozone can be produced in the same tube as with a frequency of 50. An unfavourable effect of the high frequency could not be found in connexion with the energy yield, the concentration of the ozone, or the safety of the tube; on the other hand, a slight influence of the frequency on the work factor was found. The work factor increases up to a frequency of 3,200, and then falls slightly. A calculation shows that the very high costs of a large ozone plant are considerably reduced by employing a high frequency alternating current. J. F. S.

Amorphous Sulphur in Flowers of Sulphur and its Transformation in the Preparation of Precipitated Sulphur. R. HUERRE (*J. Pharm. Chim.*, 1923, [vii], **28**, 223—232).—Amorphous sulphur insoluble in carbon disulphide, is converted into the soluble modification when heated at about 100° with an animal or vegetable oil, with a 10% solution of sodium sulphite, or with water alone. The insoluble sulphur does not dissolve in a cold 10% solution of sodium sulphite, and only a trace dissolves in the boiling solution. Amorphous sulphur is completely soluble in a cold aqueous solution of sodium sulphide, and from the solution the soluble modification is obtained by precipitation with an acid or even by extraction with carbon disulphide. W. T. K. B.

Action of Selenium Oxychloride on Various Metals and Metallic Oxides. WARD L. RAY (*J. Amer. Chem. Soc.*, 1923, **45**, 2090—2094).—Selenium oxychloride reacts with metallic copper at the ordinary temperature, forming a black substance which is a mixture of cuprous and cupric selenides. On continued action, the selenides are converted into anhydrous cupric chloride:—

$3Cu+4SeOCl_2=3CuCl_2+2SeO_2+Se_2Cl_2$. Anhydrous cupric chloride reacts with selenium oxychloride to form a green, crystalline acid selenite, $CuCl_2+3SeO_2=CuSeO_3,SeO_2+SeOCl_2$. The selenium oxychloride acts merely as a solvent for cupric chloride and selenium dioxide formed by hydrolysis of some of the oxychloride by moist air. Silver is changed successively into the selenide and chloride by the same reagent. The oxides of copper, silver, lead, nickel, cobalt, iron, antimony, bismuth, and tin are converted into chlorides by the action of selenium oxychloride and selenium dioxide is formed. J. F. S.

Equation of State for Pure Nitrogen, Gas Phase. LEIGHTON B. SMITH and ROBERT S. TAYLOR (*J. Amer. Chem. Soc.*, 1923, **45**, 2107—2124).—The *p.v.T.* relationship of pure gaseous nitrogen has been studied by the isometric method over the temperature range 0° to 200° and the pressure range 30—300 atms. The Keyes equation expresses the data obtained within the limits of experimental error. The equation obtained is $p_{\text{atm.}}=2{\cdot}92855T/(v\text{-}\delta)-1623{\cdot}63/(v+0{\cdot}2954)^2$, where $\delta=0{\cdot}18683-0{\cdot}3113/v$. The weight of a litre of nitrogen at *N.T.P.* is calculated from the equation of state to be 1·2509 g., as compared with the generally accepted value, 1·2507 g. The compressibility coefficient at 0° is calculated and found to be 0·00061, as compared with 0·00056 from Otto and Holborn's equation and Rayleigh's work, and 0·00043 and 0·00044 from Chappius Maverick, respectively. J. F. S.

Nitrogen Fixation by Means of the Cyanide Process and Atomic Structure. L. HAMBURGER (*Proc. K. Akad. Wetensch. Amsterdam*, 1923, **26**, 480—485).—From consideration of atomic structure, it is deduced that for reactions which occur in the gas phase, the relation, critical energy supply/reaction temperature= constant, should hold good. For reactions of the type $MO=M+O$, there then exists the relation, ionisation potential of the metal (V)/ absolute temperature of reaction (T)$=k$. This is found to be substantially true for the alkali and alkaline-earth metals. For reactions between compounds, however, *e.g.*, $MCO_3=MO+CO_2$, the term ionisation potential cannot strictly be employed, because the electron which is to be ionised is probably already moving in a distorted orbit, so that an amount of energy less by V' than the ionisation potential of the free metal will be required to detach the electron completely. V' is termed the dislocation potential of the compound, and is probably nearly equal to its excitation potential (V''). It is found that, in accordance with this theory, $(V-V'')/T$ is practically constant for cyanising reactions. H. H.

The Glow of Phosphorus, and its Extinction by Moist Oxygen. LORD RAYLEIGH (*Proc. Roy. Soc.*, 1923, [*A*], **104**, 322—332).—The author has investigated the conditions determining the possibility of detaching the luminosity from a stick of glowing phosphorus by a blast of air, a phenomenon previously described by L. and E. Bloch (A., 1908, ii, 1032). It was found that the velocity of the blast necessary to effect such detachment increased greatly with rise of temperature and decreased greatly with increase in the oxygen content of the air blast. Thus at 4°, the necessary velocity was increased 1,000 times by an increase of 1% in the oxygen content of the air blast employed. When the velocity of the blast was 100 cm. per sec. or more, the glow exhibited a tendency to cling to certain points at which depressions occurred on the phosphorus surface and from which the luminosity spread out fanwise. Extinction of the glow by an atmosphere of moist oxygen is regarded as the limiting case of slow propagation, and arises probably owing to failure of the catalytic action of the products of combustion of the phosphorus to effect propagation of the glow. Oxygen, present in excess, inhibits such catalytic action, possibly by a process of condensation analogous to that whereby the motion of ions produced in gaseous combustion is reduced. J. S. G. T.

Change of Realgar into Orpiment and the Analogous Behaviour of Arsenic Sulphide Sols. S. S. Bhatnagar and B. Lakshman Rao (*Kolloid Z.*, 1923, **23**, 159—164).—It is shown that the hydrosulphide-ion, SH′, and not the sulphide-ion, S″, is the active agent in the precipitation of metallic sulphides by hydrogen sulphide. The colloidal solutions of sulphides obtained in this way can be regarded as solutions of hydrosulphides. When a colloidal solution of arsenic sulphide is heated or when hydrogen is passed through it so that all the free and combined hydrogen sulphide is removed, the formula of the colloidal sulphide is not As_2S_3, but much more nearly As_2S_2 or AsS. It is shown that the action of heat on a red colloidal solution converts it into a yellow sol with the precipitation of sulphur, according to the equation $As_2S_2,xH_2S+xO=As_2S_3+xH_2O+(x-1)S$. When the content of combined hydrogen sulphide is small, no sulphur is precipitated. The action of light and heat consists mainly in the transformation of one variety into the other, and may be represented by the equation $As_2S_2+H_2S+O=As_2S_2,S+H_2O$. By analysis, measurement of density, and the absorption spectrum, it is shown to be likely that the red variety is identical with realgar and the yellow precipitate with orpiment, both in colour and in other properties. J. F. S.

Perborates. Heinrich Menzel (*Z. physikal. Chem.* 1923, **105**, 402—441).—By means of freezing point and electrical conductivity measurements at 0°, it is shown that a combination between hydrogen peroxide and boric acid in aqueous solution cannot be substantiated, and in consequence the decomposition constant of perboric acid, $K=[H_2O_2][H_3BO_3]/[H_3BO_3,H_2O_2]$, must be exceedingly large. The effect of varying quantities of hydrogen peroxide on the equivalent conductivity of metaborate and borax solutions of various concentrations has been investigated. It is shown that with increasing concentration of hydrochloric acid and increasing additions of hydrogen peroxide the electrical conductivity is continuously decreased, which is to be regarded as due to the formation of many additive products with small degree of hydrolysis and small mobility. Cryoscopic measurements with solutions of metaborates and borax in the presence of hydrogen peroxide show that the metaborate-ion and the more complicated ions from concentrated solutions of borax combine with hydrogen peroxide, and in the higher concentrations of metaborates a polymerisation of the simpler ions also takes place, since the osmotic concentration is smaller than that of the original metaborate solution. By means of partition experiments with amyl alcohol, the combination of hydrogen peroxide with the metaborate-ion is also demonstrated. These results taken together with the freezing-point measurements show that in 0·02—0·07*M* metaborate solutions containing hydrogen peroxide the simple ion $(BO_2,H_2O_2)'$ is in equilibrium with free metaborate and free hydrogen peroxide, whilst in concentrated solutions, polymerisation takes place and more than 1 mol. of hydrogen peroxide is combined with a single boron atom. In the case of the simple acid, H_3BO_3,H_2O_2, and its ion, BO_2,H_2O_2', it is found that the decomposition constant of perboric acid bears the same relation to the decomposition constant of its ion as the dissociation constant of perboric acid bears to the dissociation constant of boric acid. Since free perboric acid is not present to a measurable extent and its decomposition constant is very large, an apparent dissociation constant for perboric acid can be deduced from the equilibrium $H^{\cdot}+(BO_2H_2O_2)' \rightleftharpoons HBO_2+H_2O_2$, which has the form

$$[H^{\cdot}][BO_2,H_2O_2']/[HBO_2][H_2O_2]=K'_p,$$

and is equal to the quotient of the true dissociation constant of perboric acid and its decomposition constant, and therefore equal to the ratio between the dissociation constant of boric acid to the decomposition constant of the perborate-ion. From partition experiments, it is found that the decomposition constant, Kzi, of the perborate-ion at 0° is $2{\cdot}4\times10^{-2}$, and at 18°, $3{\cdot}3\times10^{-2}$ from which the apparent dissociation constant of perboric acid, K'_p is calculated to be $>1{\cdot}10^{-8}$ for 0° and $1{\cdot}7\times10^{-8}$ for 18°. Independently from the above, colorimetric measurements with dilute solutions give as the apparent dissociation constant of perboric acid $K'_p \simeq 2\times10^{-8}$ against the boric acid constant $K_B=5{\cdot}7\times10^{-10}$. Further, colorimetric measurements show that in the more concentrated solutions a greater reduction of alkalinity and affinity takes place, due to the formation of complicated acids, a fact which explains the evolution of carbon dioxide from mixtures of borax and hydrogen carbonates on the addition of hydrogen peroxide. J. F. S.

Vitreous Carbon. A Special Form of Crystalline Carbon. K. A. HOFMANN and CURT RÖCHLING (*Ber.*, 1923, **56**, [*B*], 2071—2076).—By exposing a heated, chemically inert surface to the luminous flame of some aliphatic hydrocarbons or halogenated compounds, a deposit of a hard, lustrous, crystalline form of carbon is obtained. The minimum temperature of the surface is 650°, and both the nature of the surface and the kind of compound used to carburet the gas are important. A steel surface, probably owing to the intermediate formation of metallic carbides, gives only a deposit of graphitic carbon, whilst flames of burning benzene and naphthalene gave only amorphous, sooty carbon, or, at higher temperatures, graphitic carbon.

The vitreous form of carbon now described has a high density (d_4=2·07), is very pure (C=99·06%, H=0·48%), and has a low electrical conductivity ($\frac{1}{8}$—$\frac{1}{15}$ of that of Ceylon graphite, and $\frac{1}{3}$—$\frac{1}{8}$ of that of Acheson graphite). It is also very hard, that prepared at 900° having a hardness equal to that of quartz, at 1100° having a hardness equal to that of topaz, whilst that prepared at 1300° is harder than carborundum. It is considered to be a form intermediate between graphite and diamond, and its *X*-ray spectrum shows characteristic lines of both these forms. H. H.

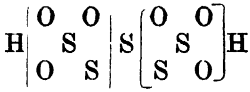
Silica. I. Loss of Water of Kaolin and its Behaviour in the Solid State towards the Carbonates and the Oxides of the Alkaline Earths. G. Tammann and W. Pape (*Z. anorg. Chem.*, 1923, **127**, 43—67).—Experiments were carried out with carefully washed Oschatz earth dried at 150°, and its dehydration and the behaviour of the carbonates and the oxides of the alkaline earths towards the anhydrous compound Al_2O_3,SiO_2 formed and towards kaolin were studied. At 550°, kaolin loses water and decomposes into alumina and silica, and at 930° the alumina undergoes a change. These conclusions are based on the following results. After heating at 550°, the alumina of kaolin is soluble in acids, further heating at 900° renders pure alumina and that of kaolin difficultly soluble in acids. Pure alumina evolves heat at 850—1060°; kaolin evolves heat at 930°, the amount being proportional to its alumina content. Both alumina and kaolin show an increase in density at still higher temperatures, and they both lower the dissociation temperature of the alkaline-earth carbonates (1 atmosphere by about 220°). W. T.

Crystal Structure of Potassium Hydrogen Fluoride. Richard M. Bozorth (*J. Amer. Chem. Soc.*, 1923, **45**, 2128—2132).—The positions of the potassium and fluorine atoms in tetragonal potassium hydrogen fluoride have been determined by *X*-ray photographs. The dimensions of the unit cell are 5·67 × 5·67 × 6·81 Å. The structure may be described as an ammonium chloride arrangement of potassium atoms and fluorine "dumb-bells," the two atoms of each "dumb-bell" lying in a plane perpendicular to the tetragonal axis. For the hydrogen atoms, there are two possible positions, one of which is in the middle of the "dumb-bell," forming an HF_2'-ion. The distance between potassium and fluorine atoms is 2·77 Å., between two potassium atoms 3·41 and 4·01 Å., and between two fluorine atoms 2·25 Å. In the case of potassium fluoride, the distance between potassium and fluorine is 2·68 Å. and between two potassium atoms 3·79 Å. The complete unit cell contains 4 mols. of potassium hydrogen fluoride. J. F. S.

Saturated Solutions of Potassium and Magnesium Sulphate. S. M. Levi (*Z. physikal. Chem.*, 1923, **106**, 93—104). —Solubility determinations of the system magnesium sulphate–

potassium magnesium sulphate have been made at a series of temperatures from 0° to 37·8°, and a further series for the system potassium sulphate–potassium magnesium sulphate for temperatures between 0° and 63·4°. The values interpolated for 25° from the present measurements agree with those determined by van Klooster (A., 1917, ii, 471). The solubility curve of magnesium sulphate for the system potassium sulphate–double salt shows a sharp break at about 52°, which is not in agreement with the dilatometric and tensimetric determinations of the transition point of the system potassium sulphate–schönite–leonite determined by van't Hoff as 47·5°. A simple process is described whereby thermometrically the transition points of the systems double salt–ice–less soluble component, and double salt–both components, may be distinguished from one another. J. F. S.

The Energy Content and Constitution of the Potassium Polythionates. F. Martin and L. Metz (*Z. anorg. Chem.*, 1923, **127**, 83—100).—The heats of formation of potassium di-, tri-, tetra-, and penta-thionate, potassium sulphite, and potassium thiosulphate were determined in a Berthelot-Mahler bomb; to ensure complete combustion it was necessary to mix the salt with potassium chlorate and magnesium. The heats of formation were found to be $K_2S_2O_6$, 415 Cal.; $K_2S_3O_6$, 401 Cal.; $K_2S_4O_6$, 393 Cal.; $K_2S_5O_6$, 386 Cal.; K_2SO_3, 273 Cal., and $K_2S_2O_3$, 283 Cal. Thus the addition of solid sulphur to the polythionates is endothermic. The constitution of these salts is discussed from the point of view of Werner's co-ordination theory. They are given a binuclear structure—the central atom sulphur being assigned a co-ordination number equal to 4 and a valency of +6, whilst the co-ordinated sulphur atoms have a valency of −2. Pentathionic acid is formulated thus:



$$\mathrm{H}\left|\begin{matrix}\mathrm{O} & & \mathrm{O}\\ & \mathrm{S} & \\ \mathrm{O} & & \mathrm{S}\end{matrix}\right|\mathrm{S}\left[\begin{matrix}\mathrm{O} & & \mathrm{O}\\ & \mathrm{S} & \\ \mathrm{S} & & \mathrm{O}\end{matrix}\right]\mathrm{H}$$

The method of preparation of the salts is given in detail. W. T.

Mechanism of certain Catalysed Reactions. Carlo Sandonnini (*Atti R. Accad. Lincei*, 1923, [v], **32**, ii, 84—88).—Investigation of the changes occurring in solutions of potassium and ammonium hydrogen sulphites in presence of selenium indicates that, under certain conditions, the total reaction may be expressed by the equation: $4MHSO_3 \longrightarrow 2M_2SO_4+SO_2+S+2H_2O$. This probably takes place in the three stages, (1) $M_2SO_3+Se \longrightarrow M_2SSeO_3$, (2) $M_2SSeO_3+M_2SO_3+2H_2SO_3 \longrightarrow M_2SO_4+M_2S_3O_6+Se+H_2O$, and (3) $M_2S_3O_6 \longrightarrow M_2SO_4+SO_2+S$. Thus, the true catalytic action of the selenium would cease when only one-half of the total sulphuric acid is formed. It is found that, when reprecipitation of the selenium occurs in accordance with equation (2), the quantity of sulphuric acid present does not correspond exactly with one-half of the final amount, and that the latter exceeds what should be formed according to equations (1) and (2). These divergences may be attributable to the facts that the end of the initial phase cannot be gauged exactly, that the reactions become superposed, and that the excess of sulphur dioxide undergoes partial oxidation. The quantity of sulphur which separates and that of sulphur dioxide not participating in the reaction do not, indeed, correspond exactly with those calculable from the above reactions. It is possible also that secondary reactions lead to the formation first of selenothionate and thiosulphate and afterwards of other polythionates, and that the formation and subsequent decomposition of these compounds give rise to the divergences mentioned above.

T. H. P.

Solubility of Sodium Chlorate. Hugh Chester Bell (T., 1923, **123**, 2713—2714).

Stability of Solutions of Alkali Chlorites. G. R. Levi and G. Natta (*Gazzetta*, 1923, **53**, 532—538; cf. this vol., ii, 767).—Solutions of chlorites are not altered at 100°, even when hydrogen or oxygen is passed through them. Various finely divided metals are, however, capable at even moderately high temperatures of exerting a marked catalytic effect on the decomposition of chlorites which, in presence of palladium or gold, is expressed by the equation $9NaClO_2=4NaCl+5NaClO_3+O$ (1); this reaction is modified by a current of hydrogen to $2NaClO_2=NaCl+NaClO_3+O$ (2). Similar decompositions are produced by platinum and nickel, but in these cases the loss of oxygen is greater, although the decomposition is less rapid; the effect of copper is negligible. Decomposition of solutions of chlorites in quartz vessels exposed to sunlight is accompanied by formation of ozone, which probably results also from reaction (1).

The decomposition of chlorite into chloride and chlorate by the agency of catalysts corresponds only partly with that effected when the solid salt is heated at 180—200°, the loss of oxygen in the latter case being very small (A., 1922, ii, 567). T. H. P.

Stability of Sodium Thiosulphate Solutions. Martin Kilpatrick, jun., and Mary L. Kilpatrick (*J. Amer. Chem. Soc.*, 1923, **45**, 2132—2135).—The stability of several 0·01*N*-solutions of sodium thiosulphate has been investigated over a period of eight months. It is found that freshly boiled redistilled water yields a solution of thiosulphate that is more stable than a solution made with ordinary laboratory distilled water, ordinary distilled water, or redistilled water through which carbon dioxide-free air has been bubbled. Carbon dioxide, oxygen, and dilute sodium hydroxide have very little effect on the stability of solutions of sodium thiosulphate. The decomposition in these solutions is caused by bacteria.

J. F. S.

The Ammines of the Alkali Halides. Wilhelm Biltz and Werner Hansen (*Z. anorg. Chem.*, 1923, **127**, 1—33).—The following compounds were prepared and investigated; the heats of formation in calories and the temperature at which the dissociation pressure equals 100 mm. of mercury are given. $LiCl,NH_3$, 12·4,

+70°; $LiCl,2NH_3$, 11·5, +44°; $LiCl,3NH_3$, 10·7, +23·5°; $LiCl,4NH_3$, 8·8, −20·5°; $LiCl,5NH_3$, 8·0, −44°; $LiBr,NH_3$, 13·6, +102°; $LiBr,2NH_3$, 11·7, +48°; $LiBr,3NH_3$, 11·1, +33°; $LiBr,4NH_3$, 10·2, +20°; $LiBr,5NH_3$, 8·05, −44°; $LiBr,6{\cdot}5NH_3$, 6·9, −67°; LiI,NH_3, 16·0, +169°; $LiI,2NH_3$, 13·8, +108°; $LiI,3NH_3$, 12·2, +64°; $LiI,4NH_3$, 11·6, +60·5°; $LiI,5NH_8$, 8·1, −43°; $LiI,5{\cdot}5NH_3$, 7·2, −62°; $LiI,7NH_3$, 7·1, −65°; $NaCl,5NH_3$, 7·8, −49°; $NaBr,5{\cdot}25NH_3$, 8·45, −31·5; $NaBr,5{\cdot}75NH_3$, 6·95, −66°; $NaI,4{\cdot}5NH_3$, 9·4, −3°; $NaI,6NH_3$, 7·5, −52°; $KBr,4NH_8$, 7·15, −64°; $KI,4NH_3$, 7·65, −46°; $KI,6NH_3$, 7·35, −55°; $RbBr,3NH_3$, 7·1, −62°; $RbI,6NH_3$, 7·5, −55°. The compound $NaCl,2{\cdot}5NH_3$ described by Friedrich (A., 1921, ii, 503), could not be isolated. The capacity of the alkali halides to co-ordinate ammonia increases from cæsium to lithium and from chlorides to iodides. Methods of investigation were as previously described (A., 1922, ii, 59). W. T.

The System Ammonium Nitrate–Ammonia. F. Halla and K. Hirschko (*Z. anorg. Chem.*, 1923, **127**, 137—152).—Diver's liquid, which is formed by passing ammonia over ammonium nitrate, is only stable up to a temperature of 23·7° with a pressure of 1 atmosphere of ammonia. Above this temperature it exists in a metastable condition (supersaturated solution). The system ammonia–ammonium nitrate forms a simple binary system. The rate of absorption of allotropic forms of the nitrate were found to be the same. W. T.

Double Decomposition in the Absence of Solvents. IV. The Systems Formed by Metallic Nitrates, Chlorates, and Halides. A. G. Bergmann (*J. Russ. Phys. Chem. Soc.*, 1923, 474—492).—A number of binary mixtures of salts have been investigated by the thermal method.

A.—Systems with silver nitrate. The system $AgNO_3$–$HgBr_2$ is complex in nature, the liquidus curve showing a maximum in the region of 50%, but this is probably not due to compound formation, as the molten mass solidifies over a large range of temperature. The mixtures after melting are hygroscopic; they are very sensitive to overheating. The system $AgNO_3$–$HgCl_2$ is similar in nature; the liquidus curve also shows a break in the region of 50%, but the mass solidifies even more slowly; the mixtures are also hygroscopic. The system $AgNO_3$–CdI_2 was only partly studied, because mixtures containing more than 20% of the latter constituent readily underwent decomposition. The eutectic is observed in the neighbourhood of 93° and 11% CdI_2, the liquidus curve is very steep, doubtless owing to the formation of complex compounds, but no double decomposition occurs; the crystals separating when the melt solidifies are not like the hexagonal plates of cadmium iodide. A very similar result is obtained with cadmium chloride; the liquidus curves are also very steep. Silver chloride and iodide appear to be quite insoluble in cadmium nitrate, either in the molten state or in solution.

On melting silver nitrate with thallium chloride or iodide double decomposition is complete, the two immiscible layers obtained consisting of silver halide and thallium nitrate; thallium thus behaves in the same way as the alkali metals. The calculated thermal effect is —11·2 and —13·57 cal., respectively, and therefore favourable to the reaction.

B.—Nitrates of alkalis and alkaline earths. The nitrates of the alkalis and the alkaline-earth group are all partly miscible with mercuric halides in the molten state; here, again, the greater the miscibility the less is the negative thermal effect of the double decomposition.

C.—Chlorates. The chlorates of sodium, potassium, and silver form two layers when melted with mercuric chloride or iodide, but they were not studied in detail; the thermal effect of double decomposition is actually positive.

The various liquidus curves for systems containing silver nitrate are tabulated; the flattest curves represent systems where double decomposition takes place, whilst the steepest denote the formation of complexes; the curves of systems containing chlorides are the flattest, those with iodides the steepest. G. A. R. K.

Changes between Metals or Metallic Oxides and Carbon. KURT NISCHK (*Z. Elektrochem.*, 1923, **29**, 373—390).—A graphical method of representation is described by means of which equilibria in ternary and quaternary systems may be plotted. A number of metals have been investigated with regard to their affinity for carbon in comparison with their affinity for oxygen by melting a mixture of the oxide and carbon together. It is shown that when copper is added to the mixture a definite percentage of the metal from the oxide is found alloyed with the copper; the percentage depends on the affinity of the metal for carbon. Barium and strontium on reduction of the oxide passed completely into carbide even in the presence of metallic copper. In the case of calcium and magnesium, a small amount of these metals was found in the copper. Glucinum and aluminium can exist to the extent of several per cent., alloyed with copper, in the presence of carbon. Boron, silicon, and titanium show a still greater affinity for carbon. Chromium, molybdenum, and manganese exhibit a great affinity for carbon, but they can exist alloyed with copper in the presence of carbon. The tendency to carbide formation decreases with the change in the position of the element in the periodic system, from group I to group VIII and in the case of cobalt and nickel it is a minimum. Microscopic investigation in the case of chromium and molybdenum shows that the carbides richest in metal are Cr_2C and Mo_2C, respectively. Some experiments were made with calcium carbide as reducing agent; this substance is very useful, since with a suitable addition of fluorspar a completely molten mixture is obtained. A method is described whereby glucinum, boron, silicon, and titanium can be cheaply alloyed with copper. Photomicrographs of sections of the reaction mixtures and copper alloys are included in the paper. J. F. S.

Calcium Carbonate Hexahydrate. JOHN EDWIN MACKENZIE (T., 1923, **123**, 2409—2417).

The Solubility and Hydrolysis of Calcium Carbonate. H. O. ASKEW (*Trans. New Zealand Inst.*, 1923, **54**, 791—796).—The solubility of calcite in gas-free water at 25° in a closed vessel is $13{\cdot}4\times10^{-5}$ g.-mols. per litre. The presence of traces of carbon dioxide exerts a considerable influence on the solubility, the mean value found when using ordinary distilled water being $19{\cdot}6\times10^{-5}$ g.-mols. per litre. The solubility is affected, apparently in an irregular manner, by the presence of other salts. In the measurement of hydrolysis, the velocity-constant method was not successful and some unknown factor seemed to affect electromotive force measurements, so that trustworthy values were not obtained.

H. J. E.

The Dissociation of Dolomite. CECIL S. GARNETT (*Min. Mag.*, 1923, **20**, 54—59).—The statement that dolomite [$CaMg(CO_3)_2$] when heated first breaks down with magnesium oxide and calcium carbonate ($MgO+CaCO_3$) is not confirmed. White, crystalline dolomite-rock from Steetley near Worksop (which gave on analysis CaO 30·4, MgO 21·4, CO_2 47·6, SiO_2 0·16, Al_2O_3 0·09, FeO 0·41%) was heated in a flask through which passed a current of air, and the carbon dioxide evolved was absorbed in potassium hydroxide solution. A selection of the observed values is:

Temp.	350°	550°	650°	760°	805°	830°	898°
CO_2%	0·01	0·42	2·21	19·6	33·1	44·8	47·6

The presence of free calcium oxide was established after dissociation had only commenced. The rock fragments suffered no contraction in volume by the heating. Grecian magnesite ($MgCO_3$) heated under the same conditions lost 0·84% CO_2 at 500°; dissociation was vigorous from 540° and complete below 650°. Artificially prepared magnesium carbonate ("magnesia alba") lost 0·72% CO_2 at 250°; dissociation was appreciable at 300° and complete at about 430°. L. J. S.

The Conversion of Calcium Phosphates into Chloro-derivatives of Phosphorus by Means of Sulphur Chloride. P. P. BUDNIKOV and E. A. SHILOV (*J. Soc. Chem. Ind.*, 1923, **42**, 378T).—Calcium phosphates may be converted almost quantitatively into phosphorus trichloride by heating them at 1,000° with sulphur chloride and a catalyst. Suitable catalysts are silica or coal, separately or together. It is advisable to convert calcium orthophosphate into the metaphosphate before heating with sulphur chloride.

H. H.

Allotropy of Zinc. L. LOSANA (*Gazzetta*, 1923, **53**, 539—545).—Measurements of the variation with temperature of the cubical expansion of zinc indicate the existence at 176° and 320° of singular points which indicate with certainty the occurrence of allotropic transformations. When the temperature variations are measured, in comparison with those of a substance exhibiting no allotropic changes, by means of highly sensitive thermo-electric couples, small but distinct divergences are observed at 173° and 323°. The mean values found for these transformation points are 174° and

322° for the α- to β- and β- to γ-changes, respectively. If the zinc contains traces of iron or tin, the former of these points is not observed, whereas when cadmium is present the distance between the two points is considerably diminished. Between −150° and the ordinary temperature, no anomaly occurs except a change in the direction of the thermal curve at about −80° which is too slight to justify the assumption of an allotropic transformation. T. H. P.

Use of Mercury in the Purification of Zinc Sulphate Solutions. SAMUEL FIELD and WILLIAM E. HARRIS (*Trans. Amer. Electrochem. Soc.* [advance copy], 1923, 269—293).—The need for zinc sulphate solutions of a high degree of purity in the electrolytic zinc industry is explained and the advantages of a pure salt are pointed out. The use of mercury as a purification agent is based on the overvoltage of mercury against hydrogen; this is discussed in detail. By amalgamating finely divided negative metals, such as zinc and aluminium, complete purification can be readily and economically effected even in strongly acid solutions. The mercury is added to the zinc liquors as mercuric sulphate, followed by zinc powder or zinc blue. The impurities are eliminated in preference to the hydrogen of the acid added. Economy of zinc is thus effected, and the method becomes applicable also for cases in which high acid content would prohibit purification owing to high consumption of zinc. J. F. S.

Attempted Separation of the Isotopes of Lead. The Atomic Weight of Lead. O. HÖNIGSCHMID and M. STEINHEIL (*Ber.*, 1923, **56**, [*B*], 1831—1837).—Lead chloride was fractionally distilled in a high vacuum by Brönstedt and von Hevesy, and the end fractions were submitted to the authors for atomic-weight determinations. The samples were fused and distilled in quartz apparatus in a current of hydrogen chloride before analysis, which was carried out nephelometrically against pure silver dissolved in nitric acid in order to determine the ratios $PbCl_2 : 2Ag$ and $PbCl_2 : 2AgCl$. The result for the more volatile fraction (mean of ten) was $Pb=207{\cdot}229\pm0{\cdot}003$, and for the less volatile fraction (mean of ten) $Pb=207{\cdot}236\pm0{\cdot}003$. This difference is too small, in the authors' opinion, to warrant any claim for separation, and they suggest the value $Pb=207{\cdot}23$ for ordinary lead. H. H.

Atomic Weight of Uranium-lead. O. HÖNIGSCHMID and L. BIRCKENBACH (*Ber.*, 1923, **56**, [*B*], 1837—1839; cf. preceding abstract).—The atomic weight of lead from Upper Katanga in the Belgian Congo was determined by the method described in the preceding abstract. The mean of three determinations gave $Pb=206{\cdot}048$, whence the authors conclude this to be pure uranium-lead. H. H.

Double Decomposition in the Absence of Solvents. III. The Systems Thallium Nitrate : Mercuric Chloride and Bromide. A. G. BERGMANN, T. A. HENKE, and F. M. ISAÏKIN (*J. Russ. Phys. Chem. Soc.*, 1923, **54**, 466—473; cf. this vol., ii, 568).—In continuation of previous work, the above systems have now been examined and the results were found to confirm the theoretical conclusions already expressed; no double decomposition is observed. Thallium nitrate forms an equimolecular compound with mercuric bromide, melting at 152°; there is, in addition, an eutectic at 146° and 30% of mercuric bromide; the cooling curves are, otherwise, of simple type. With mercuric chloride (m. p. 282°, rhombic), thallium nitrate forms two compounds,

$$TlNO_3,HgCl_2,$$

and $2TlNO_3,HgCl_2$. The transition points observed in this system are the eutectic of the latter compound and thallium nitrate, corresponding with 12·8% of mercuric chloride and 176°; the melting point of the compound $2TlNO_3,HgCl_2$ at 195°; another eutectic at 192° and 37% of mercuric chloride; the melting point of the equimolecular compound at 202·5° and the eutectic formed by this compound and mercuric chloride at 197°. No solid solutions appear to be formed. The equimolecular compound crystallises not unlike thallium nitrate, but the crystals are better defined, whilst the compound $2TlNO_3,HgCl_2$ forms distinctive long needles.

G. A. R. K.

Reduction of Copper Oxide by Carbon Monoxide and the Catalytic Oxidation of Carbon Monoxide in the Presence of Copper and Copper Oxide. HOWARD ALGERNON JONES and HUGH STOTT TAYLOR (*J. Physical Chem.*, 1923, **27**, 623—651).—The reduction of copper oxide by carbon monoxide has been investigated under varying conditions. It is shown that the process is autocatalytic, copper being the auto-catalyst, the reduction occurring at the copper–copper oxide interface. The retarding effects of carbon dioxide and oxygen on the primary reaction of the reduction process, that is, the formation of copper nuclei, are pointed out. The mechanism for the combination of carbon monoxide–oxygen mixtures over copper oxide is shown to be alternate reduction and oxidation of the copper oxide. The mechanism for the combination of carbon monoxide–oxygen mixtures over copper is shown to be the oxidation of an adsorbed layer of carbon monoxide. It is shown that oxygen is a "permanent poison" in the combination of carbon monoxide with oxygen over copper.

J. F. S.

Cupric Oxide Jellies. HARRY B. WEISER (*J. Physical Chem.*, 1923, **27**, 685—691).—Hydrated cupric oxide jellies are formed when a suitable concentration of colloidal oxide is precipitated at a suitable rate. The desired conditions may be realised by adding ammonia to cupric acetate in the presence of a small amount of sulphate and allowing the colloidal solution to precipitate spontaneously. Jellies are not formed by adding ammonia to cupric acetate alone, since a colloid of suitable concentration cannot be prepared in this way.

J. F. S.

Baskerville and Catlett's Lanthanates. FERRUCCIO ZAMBONINI and GUIDO CAROBBI (*Atti R. Accad. Lincei*, 1923, [v], **32**, ii, 53—59).—In criticising the work of Baskerville and Catlett

(A., 1904, ii, 260), the authors point out that the resemblance between lanthanum and aluminium is slight and quite insufficient to suggest the existence of lanthanum compounds corresponding with the aluminates; unlike aluminium, which is markedly amphoteric, lanthanum shows very distinct basic properties. The supposed compound, $Na_2La_4O_7$, is shown to be a mixture of lanthanum oxide, various indefinite substances, and the double carbonate, $La_2(CO_3)_3,Na_2CO_3,12H_2O$, the last being formed by the action of water on the product obtained when lanthanum oxide is fused with sodium carbonate. The other compounds obtained by Baskerville and Catlett by heating lanthanum oxide with metallic hydroxides on a water-bath, namely, $NaH_9La_5O_{15},4H_2O$, $LiH_9La_5O_{15},2H_2O$, $KH_9La_{10}O_{15},15H_2O$, and $Ba(H_9La_5O_{15})_2$, are composed of lanthanum oxide and hydroxide, together with the hydroxide and carbonate of the alkali or alkaline-earth metal; the first two of these compounds may contain also lanthanum carbonate, and double carbonates likewise may be present, although the protracted digestion on the water-bath would probably completely destroy them. T. H. P.

Ternary Alloys of Aluminium, Zinc, and Tin. L. LOSANA and E. CAROZZI (*Gazzetta*, 1923, **53**, 546—554).—This work was completed before the publication of that of Crepaz (this vol., ii, 641).

The metals employed contained, respectively, 99·83% of aluminium, 99·92% of zinc, and 99·92% of tin. For the system aluminium–tin, a few melting-point estimations were made in the region between 0 and 10% of aluminium, the results obtained differing only slightly from those of Heycock and Neville (T., 1890, **57**, 376) and of Gwyer (A., 1906, ii, 544). Similarly for the system aluminium–zinc, the few values found agree well with Rosenhain and Archbutt's complete investigation (A., 1911, ii, 895).

In the ternary system, the eutectic contains 1·46% of aluminium, 10·37% of zinc, and 88·17% of tin, melts at 194°, and is characterised clearly by the maximum time of crystallisation with respect to the other alloys. Aluminium and zinc form solid solutions over a moderately wide region of the diagram, the mixed crystals exhibiting distinct transformations at temperatures varying with the proportion of aluminium present; the same happens when a little tin is present. Alloys containing high percentages of zinc show a transformation point corresponding with the passage from the third to the second form of this metal, but the thermal change is very slight and difficult to detect. Of greater magnitude, although not very distinct, is the variation due to the change from the third to the second modification of the tin. In no case is the point of transformation of β- to α-zinc detectable. T. H. P.

An Example of Polymorphism in an Intermetallic Compound. DAVID STOCKDALE (*Trans. Faraday Soc.*, 1923, **19**, 135—139).—Evidence is given, from an examination of the equilibrium curves and of the microstructure of aluminium–copper alloys, for the existence of the compound Cu_2Al containing 17·5% Al and melting at 1016°, but unstable above 1015°. On cooling alloys containing 14 to 21% of aluminium an arrest point occurs between 875° and 770° and is at the maximum in the alloy containing 17·8% of aluminium, corresponding with Cu_3Al. Addition of copper lowers this point considerably, and addition of aluminium slightly. No micrographical change takes place on cooling through the arrest point; it is therefore probable that the heat evolution or absorption is due to a change in the arrangement of the atoms or molecules in the compound Cu_3Al itself, *i.e.*, to a polymorphic transformation [cf. *J.S.C.I.*, 1923, 556A]. A. R. P.

Iron Carbide. FRANZ WEVER (*Mitt. Kaiser Wilh.-Inst. Eisenforsch.*, 1922, **4**, 67—80; from *Chem. Zentr.*, 1923, iii, 187).—By *X*-ray analysis it is shown that the forms of cementite shown in the iron–carbon thermal diagram are not distinguishable by their lattice structure. Iron carbide, Fe_3C, crystallises in a rhombic lattice denoted by the quadratic form $\sin^2\theta/2=0{\cdot}0464x^2+0{\cdot}0367y^2+0{\cdot}0208z^2$. The edge lengths are $a=4{\cdot}481$ Å., $b=5{\cdot}034$ Å.; $c=6{\cdot}708$ Å. The density is calculated therefrom as 7·82. Data by the Debye-Scherrer method above 210° show that the magnetic transformation is not associated with a change in the type of lattice. The quadratic form is expressed by $\sin^2\theta/2=0{\cdot}0456x^2+0{\cdot}0362y^2+0{\cdot}0203z^2$. The edge lengths are $a=4{\cdot}52$ Å.; $b=5{\cdot}08$ Å.; $c=6{\cdot}77$ Å. G. W. R.

The Acid Decomposition of Metallographically Defined Iron and Manganese Carbide Alloys. R. SCHENCK, J. GIESEN, and FR. WALTER (*Z. anorg. Chem.*, 1923, **127**, 101—122).—The alloys (iron–carbon and iron–manganese–carbon) were dissolved in hydrochloric acid, and the hydrocarbons evolved identified by (1) bromination, (2) condensation by liquid air, and (3) absorption by charcoal. In the case of the iron–carbon alloys and those of low manganese content, the chief gaseous products are propylene, Δ^β-butylene, ethylene, the higher olefines, methane, and ethane. In the case of the iron-manganese carbon alloys rich in manganese, the chief product is octene; some still higher olefines were also found, but ethane and ethylene could not be detected. Quantitative results are given. W. T.

Chlorites of certain Cobaltammines. G. R. LEVI (*Atti R. Accad. Lincei*, 1923, [v], **32**, i, 623—626).—*Hexamminecobalt chlorite*, $[Co(NH_3)_6](ClO_3)_2,H_2O$, prepared from the luteo-chlorite and silver chlorite, forms slender, orange-yellow needles, explodes on percussion and, when treated in solution with cupric chloride, yields the double salt, $[Co(NH_3)_6]Cl_3,CuCl_2$.

Chloropentamminecobalt chlorite, $[Co(NH_3)_5Cl](ClO_2)_2$, obtained similarly, gradually emits chlorous vapours, and is exploded when struck, but gives no double compound with cupric chloride. Aquopentamminecobalt chlorite, obtainable in solution, cannot be isolated in the solid form.

A table is given showing all the chlorites, numbering 34, now known. According to the results as yet obtained, there exists but little analogy between chlorites and nitrites.

The solubilities of barium, lead, and silver chlorites have been measured. At 0°, 100 g. of solution contain 30·5, 0·035, and 0·17 g. respectively, and at 100°, 44·7, 0·41, and 2·11 g., respectively, of these salts. T. H. P.

Nickel Sulphide. Fritz Ephraim (*Ber.*, 1923, **56**, [*B*], 1885—1886; cf. this vol., ii, 423).—Nickel sulphide is readily soluble in yellow ammonium polysulphide solution, but much less soluble in colourless ammonium sulphide. By analogy with copper sulphide, of which the same is true, which forms the red ammonium copper tetrasulphide, it was thought that a similar compound might exist in the case of nickel. Nickel sulphate was added to a solution of ammonium polysulphides in an air-tight flask, and after some days a considerable quantity of a black, crystalline substance of composition intermediate between $(NH_4)NiS_4$ and $(NH_4)NiS_5$ was deposited. Salts of cobalt, iron, zinc, manganese, and cadmium did not give similar compounds. H. H.

Density Measurements of some Simple and Complex Salts of Nickel and Cobalt. Wilhelm Biltz and Erwin Birk (*Z. anorg. Chem.*, 1923, **127**, 34—42).—The lattice structure of hexamminenickelous chloride has been measured by Scherrer (A., 1922, ii, 514); the lattice constants of the hexammines of the nickel group can be calculated from their densities, assuming that their structures are the same. The following values for the densities were obtained, high boiling fractions of petroleum (d=0·7975—0·7998) being used as the pyknometer liquid. $NiCl_2$ sublimed 3·521, $NiCl_2$ (prepared from the hexammine) 3·508. $NiBr_2$ sublimed 5·098, $BiBr_2$ (prepared from the hexammine) 5·042. NiI_2 (prepared from the hexammine) 5·834. $CoCl_2$ 3·367. $CoBr_2$ 4·849. CoI_2 5·584. $[Ni(NH_3)_6]Cl_2$ 1·468. $[Ni(NH_3)_6]Br_2$ 1·889. $[Ni(NH_3)_6]I_2$ 2·113. $[Co(NH_3)_6]Cl_2$ 1·479. $[Co(NH_3)_6]Br_2$ (prepared by the wet method) 1·871, (prepared by the dry method) 1·879. $[Co(NH_3)_6]I_2$ 2·096. $[Co(NH_2)_6]Cl_3$ 1·710. $[Co(NH_3)_6]Br_3$ 2·340. $[Co(NH_3)_6]I_3$ 2·746. Agreements with previous determinations are not good. The method of preparation of the salts is given in detail. W. T.

The Lattice Structure, Directions of Slip, and Slip Planes of White Tin. H. Mark and M. Polanyi (*Z. Physik*, 1923, **18**, 75—96).—The authors find that the phenomena associated with the extension of a single crystal of tin are analogous to those exhibited under similar conditions, by a single crystal of zinc (*ibid.*, 1922, **12**, 58). White tin crystallises in the ditetragonal-bipyramidal system, space group D_{4h}^{19}. The lengths of the axes of the crystal structure are respectively a 5·84 Å., c 3·15 Å., and the elementary cell contains four atoms. Slipping occurred in the directions [100], [101], and [111]. Of these directions, [100] occurred most frequently, and [111] only at a high temperature. The slip planes were represented by (110) and (100), the former occurring more frequently (8 : 3) than the latter. J. S. G. T.

Preparation of Coarsely Crystalline, Anhydrous Titanium Trichloride, and the Mechanism of the Reduction of Titanium Tetrachloride by Means of Hydrogen. FRIEDRICH MEYER, ALFRED BAUER, and RICHARD SCHMIDT (*Ber.*, 1923, **56**, [*B*], 1908—1914; cf. A., 1912, ii, 1051).—The two requirements for the successful preparation of coarsely crystalline titanium trichloride by reduction of the tetrachloride are, first, a steep temperature gradient to ensure rapid cooling, and secondly, the depression of the hydrogen chloride concentration. The first condition is best secured by using a non-conducting (quartz) tube of narrow bore, with air cooling at the receiver end. The second is attained most easily by the addition of metallic titanium to the reaction mixture. It is shown that the reduction is not direct, but that three reactions, $TiCl_4+H_2=TiCl_2+2HCl$; $TiCl_2+TiCl_4=2TiCl_3$; $2TiCl_3+2HCl=2TiCl_4+H_2$, may proceed simultaneously. H. H.

The Chemistry of Hafnium. G. VON HEVESY (*Chemistry and Industry*, 1923, **42**, 929—930).—The natural oxides of zirconium, such as baddeleyite, contain only 1% or 2% of the new element No. 72, hafnium, whilst the common zirconium minerals, such as zircon, contain up to 7%. The minerals richest in hafnium are the secondary zirconium minerals alvite, cyrtolith, naegeite, and malakon, which may yield zirconium containing up to 30% of hafnium. The hafnium content of a specimen or preparation is determined by comparing the intensity of *X*-ray lines due to hafnium with the intensity of the line due to a known quantity of the neighbouring element No. 73 (tantalum) added to the specimen. Separation of hafnium from zirconium is accomplished through the different solubilities of their corresponding salts and the different basicity of their oxides. Zirconium potassium fluoride has a solubility of 2·6% at 20°, hafnium potassium fluoride nearly 3·0%. Hafnium ammonium fluoride forms prismatic, pseudo-hexagonal crystals. Hafnium ammonium oxalate and hafnium ammonium sulphate are more soluble than the corresponding zirconium salts, whilst, of the oxychlorides, that of hafnium is the less soluble. Hafnium is more basic than zirconium, and consequently when the latter is precipitated as a basic salt hafnium accumulates in solution. Concentrated preparations of hafnium are purified from zirconium by dissolving the oxychloride in alcohol and adding ether, when the basic salt, $Zr_2O_3Cl_2,5H_2O$, is precipitated; this is less soluble than the corresponding hafnium compound. The properties of hafnium are in every way much closer to those of zirconium than to those of thorium. In several cases, the solubility of a hafnium compound is greater than that of the corresponding zirconium or thorium compound. E. H. R.

Germanium. VI. Metallic Germanium. Reduction of Germanium Oxide. Preparation of Fused Germanium. Physical and Chemical Properties. P. M. DENNIS, KATHARINA M. TRESSLER, and F. E. HANCE (*J. Amer. Chem. Soc.*, 1923, **45**, 2033—2047; cf. this vol., ii, 570).—Germanium dioxide may be dehydrated by heating at 950° for three hours; the product is not volatile at 1,250° and is not hygroscopic. Germanium dioxide may be reduced to the metal by the alumino-thermic method, but the metal obtained constitutes a yield of only 61%, and there is a big loss of germanium dioxide by volatilisation. Small quantities of germanium dioxide (2 g.) may be reduced completely to the metal, in the form of a grey powder, by heating for two hours at 540° in a current of hydrogen, and there is no loss of material as hydride. But if larger quantities (10—14 g.) are employed, the yield is always below the theoretical quantity, and a black deposit shading off to brown and yellow appears in the colder parts of the tube. Coherent germanium is best prepared from the powder by fusion with sodium chloride at 980—1,000° for thirty minutes. In this way, about 96% of the powder is recovered as a single, lustrous button; the residue remains with the flux as sodium germanate. Fusion with sodium sulphate gave only a 73·8% yield, the residue of the germanium being present as sulphide, due to reduction of the sodium sulphate. Borax also proved to be an unsuitable flux. Metallic germanium which is quite free from oxide does not lose weight when heated in highly purified hydrogen to temperatures not exceeding 800°, but volatilisation of germanium does take place when hydrogen is passed over the molten metal. Pure germanium melts at 958·5°. Germanium expands on solidification and gives rise to protuberances on the buttons as it cools. It has d_{20}^{20} 5·35, which compares favourably with the value 5·36 calculated from *X*-ray analysis. Germanium is extremely brittle, and has a hardness between that of adularia and that of epidote, about 6·25. Germanium crystallises in elongated crystals bounded in some cases by octahedral faces and often covered with dendritic branches. Some of the crystals obtained were 3 cm. long. The thermo-electric power of germanium is a linear function of the temperature, and the electrical resistance is an exponential function of the form $\log R=\log A+\alpha T+Q/kT$, except over the range 100° to 600°, where an inversion takes place. More exact examination shows that germanium passes through a gradual molecular inversion with two or more modifications between 117° and 560°. When heated at 730° in oxygen, germanium is incompletely oxidised to a mixture of germanous oxide and germanium dioxide; at higher temperatures the lower oxide volatilises, so that it is impossible to oxidise germanium completely in oxygen. Germanium is not attacked by hydrogen sulphide at temperatures below 200°, and the action of the gas is comparatively slight until the hydrogen sulphide commences to dissociate. The reaction then becomes one between germanium and sulphur, with the formation of germanous sulphide. Sulphur dioxide acts on crystallised germanium at temperatures a little below 500°; the reaction becomes rapid between 510° and 530°, with the formation of the dioxide and disulphide of germanium. At the ordinary temperature and at 90°, germanium is not attacked by water, 50% sodium hydroxide solution, 1 : 1-hydrochloric acid, concentrated hydrochloric acid, or 1 : 1-sulphuric acid. It is slightly tarnished by 10% sodium hydroxide, both cold and warm. Dilute nitric acid oxidises it superficially to the dioxide, but the concentrated acid, beyond darkening the surface slightly, had no other action. Concentrated sulphuric acid has no action at the ordinary temperature, and only a very slight action at 90°. Hydrofluoric acid, 19*N*, has only slight action, but 3% hydrogen peroxide slowly converts the metal into the dioxide and dissolves it. Metallic germanium dissolves rapidly in molten potassium hydroxide, sodium hydroxide, sodium carbonate, potassium nitrate, and sodium peroxide; it dissolves slowly in molten potassium hydrogen sulphate and potassium chlorate, and is not attacked by molten potassium cyanide. Attempts to prepare germanium carbide were without success.

J. F. S.

Hydrosol of Vanadium Pentoxide. A. Dumanski (*Kolloid Z.*, 1923, **23**, 147—159).—The methods of preparation and the properties of vanadium pentoxide hydrosol have been investigated. It is shown that the hydrosol as well as solutions of vanadium pentoxide yield the ions of hexavanadic acid. Electrical conductivity measurements indicate a gradual hydrolysis of the pentoxide hydrosols on dilution with water. This hydrolysis is confirmed by measurements on the absorption of light. The colloidal particles of vanadium pentoxide are negatively charged and are very small, so small as to be indistinguishable in the ultramicroscope. The sol is coagulated by electrolytes and the positive ion of the electrolyte is adsorbed. The adsorption compounds thus obtained pass, on keeping, into ordinary chemical compounds. Determinations of the depression of the freezing point indicate that the colloidal particles are not very large, and from these measurements the equivalent of the colloidal particle is deduced as approximately 1,000. The colloidal particles are given a formula of the type $[H_3V_6O_{17},(V_2O_5)_n]'$ or $[H_2V_6O_{17},(V_2O_5)_n]''$. Starting from the value of the equivalent as 1,000, the second of these formulæ in which $n=5$ is obtained, namely, $[H_2V_6O_{17},(V_2O_5)_5]''$. The double refraction of the sol increases with its age and with the formation of a turbidity in the sol. The gels of this colloid consist of orientated particles, which exhibit double refraction when they are still. Vanadium pentoxide sol on reduction furnishes the sols of lower oxides of vanadium. These sols are all charged negatively. J. F. S.

Atomic Weight of Antimony from Different Sources. I. Sheikh D. Muzaffar (*J. Amer. Chem. Soc.*, 1923, **45**, 2009—2013).—An account of preliminary determinations of the atomic weight of antimony obtained from stibnite from various sources. The experiments cover material obtained from Peru, Bolivia, Borneo, and Hungary. The antimony from all samples was purified by the same method and converted into the trichloride and the ratio between antimony trichloride and potassium bromate determined by titration. The reaction between the two substances is given by the equation $3SbCl_3+KBrO_3+6HCl=3SbCl_5+KBr+3H_2O$. The following results were obtained: Hungarian material, Sb=121·144 (7 expts.), Borneo material Sb=121·563 (7 expts.), Peruvian material, Sb=121·720 (7 expts.), and Bolivian material, Sb=122·374 (11 expts.). Each set of results is remarkably concordant. The author is of the opinion that the present results point to the occurrence of a different distribution of the isotopes of antimony in the different stibnites. J. F. S.

The Hydrates of Antimony Pentoxide. GERHARDT JANDER and ARTHUR SIMON (*Z. anorg. Chem.*, 1923, **127**, 68—82).—Hydrates of antimony pentoxide were prepared by three methods, (1) the hydrolysis of the pentachloride at 0—1°, (2) hydrolysis at 100°, (3) oxidation of the trichloride by concentrated nitric acid and hydrolysis of the product at 60°. The products were dried on porous plates in the air, and were found to contain (1) 30·57, (2) 9·97, (3) 7·91 mols. of water to 1 mol. of the pentoxide. After drying over sulphuric acid, the water contents were (1) 3·68, (2) 2·17, (3) 0·60 mols. per mol. Sb_2O_5. Drying at 105° reduced the molecules of water per mol. of the pentoxide to (1) 2·43, (2) 1·02, (3) 0·45. The behaviour of the three hydrates towards alkali and phosphoric acid was investigated, and their vapour tension isotherms were measured. Results indicate that no definite hydrates were formed, but that gels were present, the behaviour of which depend on grain size, which varies with the method of preparation (cf. stannic acid, Mecklenburgh, A., 1914, ii, 529). Alcogels of the pentoxide were also prepared, and these were de-alcoholated by placing them over glycerol; the curves of de-alcoholation were similar to those of dehydration. The pentoxide was also able to take up benzene when kept in an atmosphere of the latter. W. T.

Bismuth Reduced by Dextrose. H. COUSIN (*J. Pharm. Chim.*, 1923, [vii], **28**, 179—181).—The black precipitate produced by the action of dextrose on a bismuth salt in presence of alkali was found on analysis to contain different amounts of bismuth, the percentage of the metal present increasing with the proportion of dextrose and sodium hydroxide used in the reaction. By adding a large excess of dextrose, the reaction may be utilised as a means of estimating bismuth, but the author does not recommend the method. H. J. E.

Electrical Conductivity and the Chemical Constitution of Alloys. II. The System Bismuth–Thallium. W. GUERTLER and A. SCHULZE (*Z. physikal. Chem.*, 1923, **106**, 1—17; cf. this vol., ii, 418).—The electrical conductivity of alloys of thallium and bismuth has been determined at 80° and 180°. The results confirm the condition diagram of this system obtained by other methods and make additions to the diagram. J. F. S.

Heterogeneous Equilibrium Produced by the Hydrolysis of Bismuth Chloride. KARL JELLINEK and WALTHER KÜHN (*Z. physikal. Chem.*, 1923, **105**, 337—355).—The equilibrium set up when various quantities of water are added to solutions of bismuth sesquioxide in hydrochloric acid has been examined by estimating the quantity of bismuth and hydrochloric acid left in solution after the addition of definite amounts of water. The solubility curve of the ternary system bismuth sesquioxide–hydrochloric acid–water has been determined, and it is shown that in certain concentrations the oxychloride, BiOCl, constitutes the solid phase, whilst in others the hydroxide, $Bi(OH)_3$, is the solid phase. In alkaline solution, the oxychloride passes quantitatively into the hydroxide. The bismuth normal potential has been measured and the value +0·266 volt found in terms of the normal hydrogen electrode. The hydrogen-, chlorine-, and bismuth-ion concentrations have been determined for solutions of hydrochloric acid saturated with the oxychloride and by means of these results the law of mass action has been shown to be true for the reaction $Bi^{\cdot\cdot\cdot}+H_2O+Cl' \rightleftarrows BiOCl+2H^{\cdot}$. The results make it probable that complex chlorobismuthic acids exist. Modified analytical methods have been deduced for the estimation of bismuth and chlorine in solutions of bismuth chloride. In the case of the estimation of bismuth the modification consists in precipitating as sulphide, filtering on a Gooch crucible, washing with acidified water, and drying at 110°. The free sulphur is then removed by placing the crucible in a furnace at 260—300° and heating for thirty minutes in a current of carbon dioxide. The results are accurate to 0·2%. J. F. S.

The Supposed Volatility of Tantalic Acid with Hydrofluoric Acid. Some Tantalum Compounds. OTTO HAHN and KARL F. PUETTER (*Z. anorg. Chem.*, 1923, **127**, 153—168).—Pure tantalic acid was prepared by the oxidation of the element in a stream of oxygen, and it was found to be non-volatile. Hydrofluoric acid solutions of pure tantalic acid on evaporation undergo hydrolysis; the residue shows no volatility on heating. Commercial tantalic acid loses weight on heating; this is due to the alkali which it contains. The higher the alkali content the greater is the volatility. The following new crystalline compounds were prepared: *tantalum hydrogen fluoride*, $HF,TaF_5,6H_2O$; *barium tantalum fluoride*, $3BaF_2,2TaF_5$; *monammonium tantalum fluoride*, NH_4F_2,TaF_5. Heating barium tantalum fluoride is a convenient method for the preparation of pure tantalum pentafluoride. W. T.

Platinum Oxide as a Catalyst in the Reduction of Organic Compounds. III. Preparation and Properties of the Oxide of Platinum obtained by the Fusion of Chloroplatinic Acid with Sodium Nitrate. ROGER ADAMS and R. L. SHRINER (*J. Amer. Chem. Soc.*, 1923, **45**, 2171—2179; cf. Voorhees and Adams, A., 1922, ii, 558; Carothers and Adams, this vol., ii, 310).—The fusion of sodium nitrate and chloroplatinic acid has been carried out at temperatures between 310° and 700°. The various samples of platinum oxide are tested as catalysts as follows. Maleic acid (20 g.) or benzaldehyde (20 g.) is dissolved in 150 c.c. of 95% alcohol. To the benzaldehyde solution, 1 c.c. of 0·0001*M*-ferrous chloride solution is added (Carothers and Adams, *loc. cit.*). The solutions are then reduced as previously described, using 0·25 g. of catalyst, and the time elapsing before reduction commences and the time taken for complete reduction are noted. The period of reduction is least when the catalyst has been prepared at about 500°, according to the benzaldehyde test, 400—500°, as shown by the reduction of maleic acid. The best temperature is certainly about 500°.

Analyses of the oxide agree with the formula PtO_2,H_2O. The compound is amorphous; if produced at comparatively low temperatures, it is a very light brown, but this colour deepens as the fusion temperature is increased. The oxide dissolves only slightly in hot aqua regia, or in boiling, concentrated hydrochloric acid. It is insoluble in boiling, concentrated nitric acid. Nevertheless, boiling hydrobromic acid (10%), or cold hydrobromic acid of constant b. p., readily dissolves the oxide, with evolution of bromine, and formation of bromoplatinic acid. The oxide is rapidly dissolved when warmed with a mixture of hydrochloric and sulphurous acids. It causes the immediate decomposition of hydrogen peroxide, being itself apparently unchanged. It is gradually reduced when boiled with ethyl alcohol in the absence of air, acetaldehyde being produced.

It is shown that, for the production of the catalyst, the nitrates of lithium, potassium, calcium, barium, and strontium, are much less efficient than sodium nitrate. The oxide produced by this method is far more active as a catalyst than the other oxides of platinum described in the literature. Moreover, it is much more readily prepared. W. S. N.

A New Series of Complex Iridium Salts containing Hydrazine. L. Tschugaev (*Ber.*, 1923, **56**, [*B*], 2067—2068).—If potassium chloroiridiate be warmed in solution on the water-bath with excess of hydrazine hydrochloride, the solution assumes a reddish-brown colour and then contains the *complex acid*, $[Ir(N_2H_5)Cl_5]H$. The *platinitetrammine* salt,

$$[Ir(N_2H_5)Cl_5]_2[Pt(4NH_3)],$$

forms flesh-coloured platelets, and the *cæsium* salt, $[Ir(N_2H_5)Cl_5]Cs$, is also crystalline, and slightly more soluble in water than the former. The platinitetrammine salt is quantitatively converted into green Magnus's salt by treatment with excess of potassium chloroplatinite. H. H.

Mineralogical Chemistry.

New Lead-Copper Minerals from the Mendip Hills (Somerset). L. J. Spencer, with Analyses by E. D. Mountain (*Min. Mag.*, 1923, **20**, 67—92).—The only published analysis of Mendip minerals is that of mendipite by Berzelius (1823). A new analysis of this gave I, confirming the accepted formula $2PbO,PbCl_2$. Embedded in the mendipite from Higher Pitts, but in sparing amounts, are the two new minerals *chloroxiphite* (anal. II and III; $2PbO,PbCl_2,Cu[OH]_2$) and *diaboleite* (anal. IV;

$$Pb[OH]_2,PbCl_2,Cu[OH]_2).$$

Chloroxiphite, named from χλωρός, green, and ξίφος, a sword, is monoclinic ($ac = 62{\cdot}75°$) with a bladed habit and dull olive-green colour; the streak is a characteristic pale greenish-yellow; *H.* 2½. Parallel to *c* is a perfect cleavage and parallel to *a* a poorer cleavage. The pleochroism is strong (emerald-green and yellowish-brown); optically negative with axial plane perpendicular to the plane of symmetry. The mineral is readily soluble in nitric acid. When heated it decrepitates, giving off water and lead chloride, and it melts to a brown liquid, which solidifies to a bright-green glass. All the water is lost below 250°. Diaboleite, named from διά, apart or distinct from boleite, is tetragonal ($a:c=1:0·95$), with bright sky-blue colour and pearly lustre on the basal cleavage. It is optically uniaxial and negative with marked pleochroism (dark-blue to almost colourless); n 1·98, *H.* 2½. The mineral is soluble in nitric acid and behaves like chloroxiphite when heated.

By alteration, mendipite passes into hydrocerussite. This has hitherto been regarded as a rare mineral found only as films of minute pearly scales. The text-book formula is based on an analysis of the artificial crystalline material, which is identical with "white-lead" (*cerussa*). Large (5 cm.) rhombohedral crystals ($a:c=1:0·61$) from the Mendips have, however, been found in some old collections (*e.g.*, the Woodwardian collection, 1728, at Cambridge). There is a good cleavage with pearly lustre and snow-white colour parallel to the base, and the crystals are optically uniaxial and negative. When heated, the material decrepitates violently, breaking up into pearly scales and changing to orange yellow in colour. All the water is lost at 250°, and all the carbon dioxide on ignition (at 200° loss 0·87%, at 250° 2·76%). Analyses V and VI give the formula $2PbCO_3,Pb(OH)_2$. The presence of a little chlorine suggests an end-member $2PbCO_3,PbCl_2$ (distinct from phosgenite). By further alteration, hydrocerussite changes to cerussite ($PbCO_3$), and good pseudomorphs of cerussite after hydrocerussite have been found. Chloroxiphite alters to a mixture of hydrocerussite and malachite ($CuCO_3,Cu[OH]_2$), and in contact with the surrounding manganese-ore in which the nodules of lead-ore are embedded, has by further alteration given rise to crednerite ($CuMn_2O_4$ or CuO,Mn_2O_3).

Crednerite, hitherto regarded as a rare or doubtful mineral, has been found at Higher Pitts as radiating fan-like groups or hemispherical masses of thin plates with an iron-black colour and bright metallic lustre. It is perhaps monoclinic, but pseudo-hexagonal by twinning, and with perfect cleavages; opaque; streak, sooty black; *H.* 4. It is not attacked by nitric acid, but dissolves in strong hydrochloric acid with evolution of chlorine (oxygen equivalent in anal. VII 6·22%). Deducting from anal. VII 6·10% of malachite and 1·05% of cerussite, seen in micro-sections to be intimately intermixed with the crednerite, the figures under VIII give the above formula.

	PbO.	CuO.	Mn_2O_3.	Cl.	CO_2.	H_2O.	Total less O for Cl.	Sp. gr.
I.	92·51	—	—	9·35	—	—	99·75	7·240
II.	81·15	10·90	—	7·19	—	2·56	100·18	6·763
III.	79·82	10·47	—	8·97	—	2·52	99·75	—
IV.	72·09	12·90	—	10·89	—	6·14	99·56	6·412
V.	86·52	—	—	0·27	11·21	2·23	100·17	6·80
VI.	86·43	—	—	0·32	11·32	2·00	100·00	6·786
VII.	0·88	36·57	60·62	—	1·88		99·95	4·972
VIII.	—	34·68	65·32	—	—	—	100·00	5·03

Other minerals described from Higher Pitts are wulfenite ($PbMoO_4$) and mimetite ($3Pb_3As_2O_8,PbCl_2$). The "green ore" mined in the Mendips centuries ago, apparently in some quantity, is shown from specimens preserved in the Woodwardian collection (1728) to be pyromorphite. L. J. S.

Crystallised Sulphates from Huelva, Spain. Henry F. Collins (*Min. Mag.*, 1923, **20**, 32—38).—Pisanite resulting from the oxidation of cupriferous pyrites in the Rio Tinto mines gave analyses I—V, I—IV of well-developed monoclinic crystals and V of a stalagmitic mass, all agreeing with the formula

$$(Cu,Fe)SO_4,7H_2O.$$

Crystals with less than 7 or 9% CuO are light green, whilst those with more copper are blue in colour. Solutions containing more copper than the proportion 14% Cu to 8% Fe deposit chalcanthite together with the highly cupriferous pisanite. Chalcanthite is, however, less common than pisanite, owing to the usual excess of iron in the mine waters. Chalcanthite from the La Mimbrera mine near Zalamea gave VI.

In ancient (? Roman) workings in the Concepcion mine near Zalamea was found a cavity filled with mixed sulphates and fragments of partly sulphatised pyrites. Coquimbite as pinkish-violet crystalline masses, rarely as large, hexagonal prisms; anal. VII on material that had been dried over sulphuric acid, and the water consequently low for the formula $Fe_2(SO_4)_3,9H_2O$. Copiapite (VIII) as a friable aggregate of bright yellow, pearly scales. Voltaite (IX) as brilliant black or greenish-black octahedra, with $RO : R_2O_3 : SO_3 : H_2O = 3{\cdot}5 : 1 : 6{\cdot}5 : 10$. Pink tufts of an undetermined mineral resembling halotrichite gave X, with $RO : R_2O_3 : SO_3 : H_2O = 1 : 5 : 18 : 33$.

Roemerite (?) as white or yellowish silky tufts of acicular crystals on stalactites of pisanite from the Sotiel mine near Calañas gave XI, corresponding with $3(RO,SO_3)+R_2O_3,3SO_3+19H_2O$. Bloedite (?) as greenish, transparent crusts on old timbers in the abandoned Monte Romero mine gave XII. Goslarite as long, silky fibres hanging in bunches from the roof in the Almagrera mine at Tharsis gave XIII.

A large number of experiments are recorded on the crystallisation of mixed solutions of copper and ferrous sulphates in various proportions. In the monoclinic series of mixed crystals,

$$(Fe,Cu)SO_4,7H_2O$$

(pisanite), the maximum amount of copper that can be taken up is 14·65% Cu(=65·95% $CuSO_4,7H_2O$); and in the triclinic series, $(Cu,Fe)SO_4,5H_2O$ the maximum amount of iron is 0·84% Fe(=3·65% $FeSO_4,5H_2O$). L. J. S.

Scheelite of Traversella. G. CAROBBI (*Atti R. Accad. Lincei*, 1923, [v], **32**, ii, 79—83).—No complete analytical data for the scheelite of Traversella have yet been published. A brownish-yellow to honey-yellow crystal, carefully freed from impurities, gave on analysis:

Oligoclase from North Carolina. SEITARÔ TSUBOI (*Min. Mag.*, 1923, **20**, 93—107).—A cleavage mass of oligoclase from Hawke mine, Bakersville, gave:

SiO_2.	Al_2O_3.	Fe_2O_3(+FeO).	MgO.	CaO.	Na_2O.	K_2O.	Total.
61·70	23·99	0·43	0·40	5·09	8·81	0·17	100·59

This corresponds with orthoclase 0·9, albite 75·1, anorthite 24·0 mol.%. Detailed determinations are given of the optical constants of this and of some other intermediate plagioclases; and the results are applied (pp. 108—122) to a dispersion method of determining the chemical composition of small cleavage flakes of plagioclases by immersion in a mixture of cassia oil and clove oil. L. J. S.

A Peculiar Chlorite-rock from Derbyshire. CECIL S. GARNETT (*Min. Mag.*, 1923, **20**, 60—64).—An intrusive sill of olivine-dolerite ("toadstone") at Ible shows along one stratum an alteration into a chlorite-rock. This is soft and friable with a dark olive-green colour, and consists of a confused mass of lamellar and foliated aggregates. The foliated mineral has *d* 2·52, and gave analysis I. The surrounding dolerite is penetrated by numerous small veins filled with a fibrous mineral resembling chrysotile in appearance. This is dark olive-green with *d* 2·37 and gave anal. II. These minerals are compared with epichlorite, and they evidently owe their origin to hydrothermal action following the solidification of the dolerite.

The Dartmoor Granite. ALFRED BRAMMALL and H. F. HARWOOD (*Min. Mag.*, 1923, **20**, 20—26, 39—53).—Minute crystals of brookite and anatase, and rarely of rutile, are found in the sands of several streams and in the red pneumatolysed granite, but were not detected in the fresh grey granite of Dartmoor. They have presumably resulted from the decomposition by pneumatolytic processes of the original titanium-bearing minerals present in the grey granite, namely, ilmenite and sphene, and the more abundant biotite which contains up to 2·04% TiO_2. Biotite from the Haytor granite gave analysis I; after prolonged boiling in strong hydrochloric acid it gave II (partly bleached) and III (completely bleached). The residue is silvery-white and flaky (cf. "bauerite," A., 1913, ii, 868). From it the whole of the titania is readily extracted by a 2% solution of salicylic acid, and much of the silica by sodium carbonate solution.

Nine detailed analyses (TiO_2 0·04—1·11) are given of the different types of granite, which belong to sheets intruded at different periods (IV of the typical "blue granite" of Haytor), two of the associated slates ("killas"), and nine of the porphyritic crystals of felspar (V from Haytor). A red garnet isolated from the granite of Clinkwell Tor gave VI, corresponding with 20·9% of the spessartite molecule.

Some account is given of the heavy minerals (monazite, zircon, spinel, corundum, sillimanite, andalusite, cordierite, etc.) isolated from the normal granites and from the dark patches, the latter probably representing altered fragments of foreign rocks enclosed by the granite. L. J. S.

Meteorite of St. Sauveur, France. A. Lacroix (*Compt. rend.*, 1923, **177**, 561—565).—The material of this stone, which fell on July 10, 1914, at St. Sauveur in Haute-Garonne, is black, dull, and very fine-grained with but few chondrules; *d* 3·66. It closely resembles the Pillistfer, Daniel's Kuil, Khairpur, and Hvittis falls. Polished surfaces show grains of nickeliferous iron and of troilite; and thin sections show that the bulk of the stony material consists of an enstatite poor in iron, with small amounts of clino-enstatite, oldhamite (CaS), maskelynite (a fused felspar, optically isotropic, and with the composition of andesine, An 31%), and very little apatite (as crystals) and graphite. Analyses by Raoult of the portions soluble and insoluble in acid give the following bulk composition:

SiO_2.	Al_2O_3.	FeO.	MgO.	CaO.	Na_2O.	K_2O.	P_2O_5.	Loss at 105°.
33·40	3·29	0·21	17·00	1·12	0·96	0·21	0·17	0·09

Fe.	Ni.	Co.	Mn.	Cr.	Ca.	S.	C.	Total.
34·86	1·62	0·12	0·05	0·08	0·64	5·82	0·10	99·74

This corresponds with the mineralogical composition: pyroxenes 41·25, felspars 13·38, olivine 1·40, nickel-iron 27·49, troilite 14·26, oldhamite 1·15, daubreelite 0·22, apatite 0·34, graphite 0·10%. The metallic portion is present in unusually large amount and is very poor in nickel (Fe : Ni=16 : 1), whilst the enstatite is very poor in iron. L. J. S.

Analytical Chemistry.

A Quantitative Buchner Filter. R. J. Cross (*Ind. Eng. Chem.*, 1923, **15**, 910).—An ordinary Buchner funnel is provided with a glass or porcelain cylinder, which is held by a clamp into which the whole funnel fits, in such a way as to hold the filter firmly down on the perforated plate. The joint between this retaining cylinder and the perforated plate is made to fit accurately, by grinding an annular channel in the surface of the plate, slightly wider than the thickness of the retaining cylinder, the end of which is ground true. On the completion of the filtration, the clamp is loosened and slid back, a watch glass is placed over the cylinder, and the whole filter inverted, the filter and its contents being loosened by blowing through the stem of the funnel. A flat joint with a rubber gasket is used for connexion with the suction flask. [Cf. *J.S.C.I.*, 1923, 1104A.] H. C. R.

An Improved Methyl-orange. James Moir (*J. S. African Chem. Inst.*, 1923, **6**, 69—70).—The indicator proposed is *p*-sulpho-*o*-methoxybenzeneazodimethyl-α-naphthylamine; it changes from orange in alkaline solution to bluish-violet in acid solution, the range of p_H over the change being 4·9 to 3·5. The indicator is slightly sensitive to carbon dioxide by daylight, but not by artificial light. W. P. S.

Bromoxylenol-blue. A True-neutrality Point Indicator. Abraham Cohen (*Biochem. J.*, 1923, **17**, 535).—Bromoxylenol-blue (dibromoxylenolsulphonephthalein), $C_{23}H_{20}O_5Br_2S$, is prepared by adding bromine under constant shaking in the cold to xylenol-blue suspended in glacial acetic acid and keeping over-night. The filtered crystals are recrystallised from dry boiling toluene. It covers the same p_H ranges as bromothymol-blue but possesses the advantage that it is easy to prepare. Bromoxylenol-blue can have its working range halved by the addition of bromo-cresol-purple. The resulting mixed indicator can be used where a blue end-point of Sörensen value about 6·8 is desired in a titration. S. S. Z.

Apparatus for Electrometric Titrations. A. J. Pelling (*J. S. African Chem. Inst.*, 1923, **6**, 40—48).—In the apparatus described and illustrated oxygen is excluded completely from the electrodes during the titration, and the hydrogen is washed before entering the electrode vessel by first passing it through the bulk of the solution. The apparatus also permits the titration of substances which are decomposed by contact with platinum black saturated with hydrogen. W. P. S.

A Convenient Form of Burette for Exact Gas Analysis. HENRY JERMAIN MAUDE CREIGHTON (*Trans. Nova Scotian Inst. Sci.*, 1919—20, **15**, [2], 115—117).—The burette consists of two parallel limbs connected by a capillary tube through a T-piece with a stop-cock at the top. The larger limb is composed of bulbs connected by constricted portions on each of which there is a graduation mark. The capacity of the upper bulb and of that portion of the parallel limb which is above the top graduation mark is 70 c.c., that of each of the other bulbs is 5 c.c. The parallel limb is a straight tube of 5 c.c. capacity graduated to read each 0·01 c.c. At the base of each limb there is a stop-cock below which are connexions to a common reservoir and pair of levelling tubes. By alternate operation of the lower stop-cocks the major portion of the gas is measured in the large limb and the fraction of 5 c.c. in the small limb. [Cf. diagram, *J.S.C.I.*, 1923, 1045A.] H. HG.

Spectroscopic Methods in Analytical Chemistry. C. AUER-WELSBACH (*Sitzungsber. Akad. Wiss. Wien*, 1922, **131**, IIb, 339—355; from *Chem. Zentr.*, 1923, iv, 75—76).—An apparatus for the study of spark spectra is described. All elements under normal pressures, with the exception of oxygen, nitrogen, the inert gases, the halogens, arsenic, and the elements of the sulphur group give such spectra with characteristic lines. The limitations of the method are discussed. G. W. R.

Systematic Scheme for the Detection and Separation of the Acids. Z. KARAOGLANOV and M. DIMITROV (*Z. anal. Chem.*, 1923, **63**, 1—10).—The acids are divided into eight groups, the first consisting of those volatile by distillation with acetic acid, viz. carbonic, hydrocyanic, sulphurous, thiosulphuric, hyposulphurous, nitrous, and hypochlorous acids. The vapours are passed through a nitric acid solution of silver nitrate which gives a precipitate with hydrocyanic, hypochlorous, and hydrosulphuric acids; another portion is passed through barium hydroxide solution, which is rendered turbid by carbonic or sulphurous acids, and a third portion through iodide-starch solution, which is turned blue by nitrous or hypochlorous acid. Further portions of the gases from the distillation are then subjected to specific tests for each member of the sub-groups found to be present. The solution in the distilling flask is tested for group II acids (nitric and boric) by means of diphenylamine and turmeric, respectively. A second portion of the same solution is treated with barium and calcium acetates, which precipitate group III acids (sulphuric, hydrofluosilicic, chromic, hydrofluoric, oxalic, iodic, and tartaric). The precipitate is extracted with dilute nitric acid and the precipitate is tested for sulphate (charcoal test), iodate (blue colour with hydrochloric acid, zinc, and starch), and fluosilicate (sulphuric acid and water-drop test). The solution is treated with ammonium acetate and calcium and barium acetates and the precipitate is heated with sulphuric acid, the gases being passed through barium chloride, then through barium hydroxide solution; a cloudiness in the former indicates hydrofluoric, and in the latter, oxalic acid. If tartaric acid is present, the hydrofluoric and oxalic acids must be removed by means of calcium sulphate in acetic acid solution; the filtrate is then tested for chromic and tartaric acids as usual. The filtrate from the third group is made slightly alkaline with ammonia, and barium acetate is added to precipitate group IV acids (phosphoric, arsenic, and silicic) which are tested for as usual. The group V acids (hydriodic, arsenious, and hydroferrocyanic) are separated from the neutral, diluted filtrate by the addition of lead acetate; hydriodic acid is detected in the precipitate by boiling it with dilute acetic acid and adding chlorine water and starch to the solution after filtration; arsenious acid by separating the lead from this solution and passing hydrogen sulphide through it, and hydroferrocyanic acid by treating the material insoluble in dilute acetic acid with ferric chloride. The filtrate from group VI is made strongly ammoniacal and boiled with a large excess of lead acetate, which precipitates hydroferricyanic acid and the remainder of the arsenious acid. Group VII, consisting of hydrochloric, hydrobromic, and thiocyanic acids, is separated from the filtrate from group VI by addition of nitric acid and silver nitrate. The final filtrate contains only perchloric, chloric, and bromic acids; it is treated with sulphuric acid to separate lead, then with zinc and silver nitrate, which reduces the latter two acids to silver chloride and bromide. The filtrate is boiled with potassium hydroxide and filtered, and the alkaline liquid is boiled with ferrous sulphate, acidified with nitric acid, and treated with silver nitrate; a white turbidity indicates perchlorate. A. R. P.

New Gravimetric Method of Estimating the Relative Humidity of Air with the Help of a Flow Meter. JULIUS OBERMILLER and MARTHA GOERTZ (*Z. physikal. Chem.*, 1923, **106**, 178—190).—A method for estimating the relative humidity of air is described which consists in passing a current of air through a meter to determine the velocity and then dividing the stream into two exactly equal parts, one of which is sent through a phosphoric oxide drying tube and the other is saturated with moisture and passed through a similar drying tube. Both tubes are weighed, and the fraction: increase of weight of the first drier/that of the second drier gives the relative humidity. J. F. S.

Electrometric Titration of Iodate, Bromate, Chlorate, and Ferricyanide with Titanous Sulphate. W. S. HENDRIXSON (*J. Amer. Chem. Soc.*, 1923, **45**, 2013—2017).—Iodate, bromate, and chlorate may be titrated electrometrically with titanous sulphate at the ordinary temperature to an accurate end-point. There is no necessity to titrate back an excess of the reducing agent. The iodate is titrated best in sulphuric acid solution. There is a rise in potential of about 0·25 volt at the commencement of the titration, after which the *E.M.F.* remains steady until the end-point is reached, when the voltage drops sharply by about 0·3 volt. The change is represented by the equation $5Ti_2(SO_4)_3+2HIO_3+5H_2SO_4=10Ti(SO_4)_2+6H_2O+I_2$. If more titanous sulphate is added after the end-point is reached, the *E.M.F.* falls slowly to about 0·1 volt lower, and then there is a sudden drop of a further 0·1 volt, which indicates the completion of the reaction $Ti_2(SO_4)_3+I_2+H_2SO_4=2HI+2Ti(SO_4)_2$. Bromate may be titrated in sulphuric or hydrochloric acid solution. There is a sharp rise of about 0·3 volt on starting the titration, after which the voltage remains practically steady for some time; it then falls about 0·1 volt rapidly, followed by 0·05 volt slowly. After this there is a sudden drop of about 0·7 volt, which occurs at the end-point. In the case of chlorate, either sulphuric acid or hydrochloric acid may be used. The voltage rises rapidly about 0·5 volt with the first few drops of titanous sulphate, and remains practically constant until the reaction is complete, when it falls suddenly about 0·8 volt. Ferricyanide is titrated in the presence of sulphuric acid, and gives a sharp end-point. It may be estimated as accurately as any other form of iron. In all cases, the results by these methods are extremely accurate. J. F. S.

Estimation of Chlorine, Bromine, and Iodine in Organic Compounds. J. Heslinga (*Diss. Delft*, 1923, 1—72).—Hydrogenation of organic compounds in presence of various catalysts does not yield a quantitative formation of the halogen acids. Combustion in a stream of ammonia is satisfactory for all classes of organic halogen derivatives except aromatic compounds containing chlorine; the latter are completely decomposed by a mixture of ammonia and hydrogen at combustion temperatures. The decomposition is carried out in an empty quartz tube, of which one part is heated to redness; a plug of cotton wool inserted in the cool end is sufficient to retain all the ammonium halide. Cyanide is usually formed, and is destroyed before estimation of the ammonium halide in solution by boiling with acetic acid.

Very good results are also obtained by combustion in a stream of air containing ammonia, in presence of glowing ferric oxide. The resultant gases are passed through an alkaline sulphite solution, and the halogen is titrated after removal or oxidation of the sulphite.

Both methods are suitable for micro-determinations.

The removal of halogen by means of potassium hydroxide in presence of acetone may be used for estimations in some cases. Aliphatic halogen compounds also are decomposed by potassium hydroxide in alcoholic solution in sunlight in presence of *p*-benzophenone and other aromatic ketones; this method is quantitative for some aliphatic bromine and iodine compounds. S. I. L.

Estimation of Fluorine in Zinc Blende. L. da Rocha-Schmidt and K. Krüger (*Z. anal. Chem.*, 1923, **63**, 29—32).—One g. of finely powdered ore is mixed with 2 g. of freshly ignited and finely powdered quartz powder and 2 g. of carefully washed and ignited silver sand. The mixture is placed in the decomposition flask and covered with 10 g. of anhydrous chromium trioxide. The flask is connected to a Peligot tube containing 15 c.c. of 50% alcohol saturated with potassium chloride, and a current of perfectly dry air free from carbon dioxide is passed slowly through the apparatus. By means of a dropping funnel, 20 c.c. of anhydrous sulphuric acid (made by evaporating the concentrated acid to two-thirds its bulk and cooling in a desiccator) is allowed to flow into the flask, which is then heated on a paraffin-bath slowly to 130—140°, and maintained at that temperature for three hours. The contents of the Peligot tube are then titrated with *N*/10-sodium hydroxide solution, using cochineal as indicator; 1 c.c. of the standard solution=0·0057 g. of fluorine. For accurate results, absolute dryness of reagents and apparatus is necessary.

A. R. P.

Titration of Hydrofluoric and Hydrofluosilicic Acids in Mixtures containing Small Amounts of Hydrofluosilicic Acid. PAUL H. M. P. BRINTON, LANDON A. SARVER, and ARTHUR E. STOPPEL (*Ind. Eng. Chem.*, 1923, **15**, 1080—1081).—The results of the analyses of the same samples of commercial hydrofluoric acid by Scott's method in three different laboratories showed a wide divergence. This was traced to the effect of the silica in the standard alkali used. The use of sodium hydroxide made from sodium by the action of water vapour, the sodium hydroxide being caught in platinum and stored in bottles lined with ceresin, caused all discrepancies to disappear. The rapidly fading end-points of the cold titration were no longer in evidence, and sharp end-points in which the pink colour persisted for from one to four minutes were obtained. Electrometric titrations showed that in the absence of silica in the standard alkali solution the hydrolysis of the potassium fluosilicate in ice-cold solution was sufficiently slow to allow a ready reading of the cold end-point, whereas in the presence of appreciable amounts of silica in the alkali the change in the hydrogen-ion concentration on keeping was much more rapid, and the end-point colour correspondingly fleeting. If accurate results are desired by this method, estimations of silica must be made in even freshly prepared standard alkali solutions and corrections applied to the figures found for the two acids. The weight of silica added during the titration up to the cold end-point should be multiplied by 2·393 to find the weight of hydrofluosilicic acid to be deducted from that found in the mixture. To find the weight of hydrofluoric acid to be added to that found by analysis, the weight of silica added should be multiplied by 1·991.

H. C. R.

A Simple, Sensitive Process for the Detection of Oxygen by a Biochemical Method. HANS SCHMALFUSS (*Ber.*, 1923, **56**, [*B*], 1855—1856).—The process is based on the observation that a piece of filter-paper impregnated with worm blood and *l*-β-3 : 4-dihydroxyphenyl-α-alanine becomes blackened as the result of melanin formation when exposed to oxygen. The reaction is not influenced by the presence of nitrogen, hydrogen, carbon monoxide, or carbon dioxide, but bromine, chlorine, hydrogen sulphide, hydrocyanic acid, and sulphur dioxide must be removed. In the presence of 0·9% of oxygen, the paper becomes darkened within three minutes. H. W.

Colorimetric Estimation of Small Amounts of Oxygen. Percy George Terry Hand (T., 1923, **123**, 2573—2576).

Micro-sampling for the Determination of Dissolved Oxygen. R. V. Allison and J. W. Shive (*Soil Sci.*, 1923, **15**, 489—491).—A modified Winkler apparatus is described for the sampling of liquid media in which dissolved oxygen is to be estimated. G. W. R.

A Rapid Gasometric Method of Estimating Dissolved Oxygen and Nitrogen in Water. H. G. Becker and W. E. Abbott (*Sci. Proc. Roy. Dubl. Soc.*, 1923, **17**, 249—253).—Air dissolved in water is set free by dissolving in the water some highly soluble substances, of which potassium hydroxide has been found the most effective. An apparatus is described in which this fact is applied to the determination of the quantity of air dissolved in water. The water to be examined is saturated in a bulb with potassium hydroxide and the air liberated is measured. The oxygen is then absorbed in alkaline pyrogallol and the residual nitrogen is measured. The total air found by this method is slightly greater than by other methods, due to air in the potassium hydroxide, whilst the oxygen is slightly lower, through incomplete absorption. E. H. R.

A New Method of Estimating Sulphur, Arsenic, and Antimony in Organic and Inorganic Compounds by "Sinter-Oxidation." Fritz Feigl and Regina Schorr (*Z. anal. Chem.*, 1923, **63**, 10—29).—Sulphur, arsenic, and antimony are quantitatively converted into sulphate, arsenate, and antimonate by heating any organic or inorganic compound containing these elements with twice its weight of a mixture of equal parts of sodium carbonate and potassium permanganate under a layer of the same mixture in an iron crucible for one hour at a low red heat. The residue from this "sinter-oxidation" is boiled with water, the solution cooled and treated with one-half its volume of alcohol, and the insoluble material collected and washed with 30% alcohol. The solution is used for the estimation of sulphur as barium sulphate and of arsenic, either iodometrically or as magnesium ammonium arsenate. The residue is dissolved in hydrochloric acid and a little oxalic acid, and the antimony is estimated iodometrically in strong hydrochloric acid solution. The process is applicable to the estimation of these elements in sulphide, sulpharsenide, and sulphantimonide ores as well as in such organic substances such as phenylthiocarbamide, salvarsan, and arsinic acids. A. R. P.

Estimation of "Sulphonitric" and "Sulphonitrous" Acids. André Graire (*Compt. rend.*, 1923, **177**, 821—823).—The author discusses the disadvantages of the common methods of analysing sulphuric acid containing nitrous and nitric acids, etc. Nitrometer estimations may give low results owing to the presence of iron and copper salts, which hold back nitric oxide. This fact is demonstrated by oxidising with permanganate the acid remaining in the nitrometer (after displacing the usual nitric oxide formed), then treating with ferrous chloride, and measuring the second volume of nitric oxide formed. This supplementary method may be used to obtain accurate analyses of the acids in question. E. E. T.

The Influence of the Nature and Position of Substituents on the Kjeldahlisation of Aromatic Nitro-compounds. B. M. MARGOSCHES and WILHELM KRISTEN [with ERWIN SCHEINOST] (*Ber.*, 1923, **56**, [*B*], 1943—1950; cf. Margosches and Vogel, A., 1920, ii, 50; 1922, ii, 522).—The authors have greatly extended the scope of their examination of the kjeldahlisation of aromatic nitro-compounds which now includes nitro-phenols, -benzoic acids, -benzyl alcohols, -benzaldehydes, -anisoles, -phenetoles, -benzyl chlorides, nitroanilines, nitroacetanilides, and nitrotoluidines. The substance is treated with sulphuric acid alone or in the presence of potassium sulphate, copper oxide, or mercuric oxide.

Accurate results are obtained in the estimation of nitrogen with *o*-nitrophenol, *o*-nitrobenzoic acid, *o*-nitrobenzaldehyde, *m*-nitroaniline, *m*-nitroacetanilide, *m*-nitrodimethylaniline, and 2 : 6-dinitrophenol by treatment with sulphuric acid alone or in the presence of catalysts or substances which raise the boiling point of the acid.

The substituents may be arranged with regard to their behaviour on kjeldahlisation by sulphuric acid alone in the following classes: (*a*) the substituents, $\cdot OH$, $\cdot OMe$, $\cdot CO_2H$, and $\cdot CHO$, favour the accuracy of the process mainly when they are in the ortho-position to the nitro-group; (*b*) the residues, $\cdot NH_2$, $\cdot NHAc$, and $\cdot NMe_2$, have a similar action when in the meta-position; (*c*) the substituents $\cdot Me$, $\cdot CH_2\cdot OH$, and $\cdot CH_2Cl$ appear generally to be without influence. The effect of a nitro-group on a second nitro-group could not be established with certainty.

The effect of a substituent on the kjeldahlisation of the nitro-group appears to be explicable by the increase or diminution of the reactivity of the nitro-group induced by the presence of the substituent. H. W.

The Sulphate-Molybdate Method of Estimating Phosphoric Acid. V. A. BECKLEY and A. MARAIS (*J. S. African Chem. Inst.*, 1923, **6**, 35—39).—When this method is used, it is recommended that the phosphomolybdate precipitate be washed with 3% sodium nitrate solution, using 20 c.c. each time; the precipitate should be disturbed as little as possible. After the fifth washing, each quantity of filtrate should be tested and as soon as it yields a red coloration on the addition of 0·05 c.c. of *N*/10-sodium hydroxide solution, using phenolphthalein as indicator, the precipitate may be considered to be washed completely. W. P. S.

[Estimation of Phosphoric Acid and Potassium in Soils, etc.] H. F. L. Bischoff and B. de C. Marchand (*J. S. African Chem. Inst.*, 1923, **6**, 53—60).—The authors have investigated the effect of certain conditions, etc., on the accuracy of the estimation of potassium and phosphoric acid in soils and fertilisers. In the estimation of available potash in soils, ignition of the soil extract does not cause loss of potassium and the quantity of citric acid-soluble phosphoric acid found in basic slag is not affected appreciably when considerable variations are made in the time of shaking or in the volume of citric acid solution used. The solubility of bonemeal and rock phosphate in citric acid solution increases with the fineness of the material; samples of these substances should be analysed in the state in which they are received, and should not be ground previously to analysis. W. P. S.

Estimation of Minute Quantities of Arsenic. III. O. Billeter and E. Marfurt (*Helv. Chim. Acta*, 1923, **6**, 771—779).—Previous work on the detection of minute quantities of arsenic (cf. A., 1919, ii, 32; this vol., ii, 335) left two points still in an unsatisfactory state. The destruction of organic matter is not absolutely complete and the quantitative estimation of the arsenic by comparison of the mirrors is imperfect. The first difficulty may be overcome as follows. The organic matter to be tested is treated with fuming nitric acid and sulphuric acid as before, the nitric acid driven off, the sulphuric acid solution neutralised with sodium carbonate, and evaporated to dryness. There are then added, for 20 g. of organic matter, 2 g. of potassium perchlorate and 0·3 g. of potassium bromide and the mixture is transferred little by little to a platinum crucible heated to redness, finishing with a gentle fusion. The distillation with sulphuric acid is then carried out as before. The sensitivity of the Marsh apparatus is increased by forming the mirror in a capillary tube at a point which will just prevent the passage of a platinum wire 0·3 mm. thick.

For the estimation of the arsenic in the mirror, the portion of tube containing the mirror is treated with five to ten times the theoretical quantity of iodine solution and a little sodium hydrogen carbonate in a stoppered test-tube. After two or three hours the arsenic has all dissolved and the excess of iodine is titrated with thiosulphate, using starch as indicator. The solutions used are 0·005 to 0·01*N*, and the necessary degree of refinement is obtained by using special burettes, one of 0·5 c.c. capacity graduated to 0·002 c.c. and one of 2 c.c. graduated to 0·01 c.c. for larger quantities. Accuracy to 0·03 m.mg. of arsenic is claimed by this method. Experiments to determine the proportion of the original arsenic recovered in the mirror showed that the yield is greater the smaller the quantity of arsenic being dealt with. Starting with 100 m.mg. of arsenic, 92·5% was found in the mirror, whilst with 1 m.mg. or less, 99% was found. E. H. R.

Simple Method of Estimating Arsenic. Poussigues (*Ann. Chim. Analyt.*, 1923, **5**, 263—267).—Copaux's method of estimating phosphates by measuring the volume of the oily yellow liquid formed by their interaction with sodium molybdate solution in the presence of sulphuric acid and ether is slightly modified and extended to arsenic. Nitric acid (*d* 1·20) is used instead of sulphuric acid and the ether must be free from alcohol. A special graduated tube similar to a Gerber milk tube but larger in size is used for the estimation, and the liquid is deposited in the graduated end by centrifuging. The apparatus is calibrated by testing a solution of known arsenic content and a correction is applied for the solubility —which is considerable—of the oily liquid in the acid layer. If 100 c.c. of liquid, corresponding with 1 g. of the mineral, are taken, minerals containing less than 1·16% of arsenic give no oily deposit owing to the solubility of the latter, but this difficulty can be overcome by suitably concentrating the solution before testing. The density of the aqueous phase must be kept low or the yellow liquid will not sink. The presence of metals does not affect the results, but in the presence of antimony the mineral should be dissolved in hydrochloric and tartaric acids. Citric acid, alcohol, and too great excess of sulphuric acid are harmful, and phosphoric acid must be absent. Specimen analyses given agree well with gravimetric analyses of the same samples. H. C. R.

The Estimation of Arsenic as Silver Arsenate. W. Eschweiler and W. Röhrs (*Z. angew. Chem.*, 1923, **36**, 464—466).—The arsenate solution, obtained either by fusion of the material with sodium hydroxide and nitrate or by oxidation of an ammoniacal arsenic sulphide solution by means of hydrogen peroxide, is acidified with nitric acid and carefully neutralised to methyl-orange with ammonia. Two g. of ammonium nitrate and 1 g. of ammonium acetate are added, and the solution is heated to boiling. Silver nitrate solution is added drop by drop until the precipitate coagulates and settles, leaving the supernatant liquid quite clear. The precipitate is collected, washed with cold water, and either heated at 500° and weighed as Ag_3AsO_4 or dissolved in nitric acid and its silver content estimated by titration with potassium thiocyanate. If chlorides are present, the precipitate is dissolved in nitric acid and, after filtering off the silver chloride, reprecipitated as before. Large quantities of sulphates cause the results to be too high; addition of several g. of potassium nitrate prevents this interference. [Cf. *J.S.C.I.*, 1923, 1046A.]
A. R. P.

Estimation of Arsenic in Foods. R. M. Hann (*J. Assoc. Off. Agric. Chem.*, 1923, 7, 48—54).—The addition of potassium iodide is recommended in the estimation of arsenic by the Gutzeit method in order to ensure complete evolution of the arsenic. Hydrochloric acid may be used in place of sulphuric acid. W. P. S.

Direct Estimation of Arsenic in Toxicology. J. Lewis (*J. S. African Chem. Inst.*, 1923, 6, 65—68).—In the estimation of arsenic in toxicological specimens by Green's method (A., 1920, ii, 634) equally trustworthy results are obtained whether the organic matter is destroyed by evaporation with sulphuric acid and nitric acid or the material simply disintegrated by boiling with dilute sulphuric acid without oxidation. In both cases, the loss amounts to about 0·1 mg. when dealing with 1 mg. quantities of arsenic trioxide. W. P. S.

The Separation of Arsenic from Antimony and Tin. LUDWIG MOSER (*Z. anal. Chem.*, 1923, **63**, 40—41).—A criticism of Järvinen's paper (this vol., ii, 254) in which attention is directed to the earlier work of Moser and Ehrlich (this vol., ii, 315) showing that arsenic trichloride is removed completely from a solution saturated with hydrogen chloride by heating on a water-bath whilst passing a current of air through the liquid. The reduction of arsenic acid to arsenious acid by ferrous sulphate is complete only in strong hydrochloric acid solutions. Järvinen's statement that arsenic acid is volatile from hydrochloric acid solutions is incorrect; potassium chlorate does not oxidise arsenious to arsenic acid completely in these solutions, and it is the unoxidised portion of the arsenic that is volatilised. A. R. P.

Microanalytical Estimation of Carbon and Hydrogen by Pregl's Method. A. FRIEDRICH (*Z. angew. Chem.*, 1923, **36**, 481—482).—Too large an increase in weight in the absorption vessels may be traced to impurities given off by the rubber connexions or contained in the oxygen used. The rubber connexions should be reduced to a minimum, and should be previously washed for two hours in hot sodium hydroxide (40—50%), then washed free from alkali, and finally steamed out for two hours. Impurities in the oxygen may be removed by passing the gas over red-hot copper oxide and absorbing any carbon dioxide formed with 50% sodium hydroxide. New absorption vessels tend to lose slightly in weight when wiped with a moist cloth and should be boiled out before being used for the first time. Using lead peroxide asbestos, as described by Pregl, the combustion tube and contents require to be heated to redness for only two to three hours before use, and not for several weeks, as commonly supposed. W. T. K. B.

Analysis of Combustible Gases. ENRIQUE HAUSER (*Bull. Soc. chim.*, 1923, [iv], **33**, 1141—1232).—A lecture delivered, 23rd May, 1922, before the Société chimique de France. H. J. E.

The Application of Micro-analysis to the Elementary Analysis of Fuels. H. GAULT and MAURICE NICLOUX [with G. PFERSCH and R. GUILLEMET] (*Bull. Soc. chim.*, 1923, [iv], **33**, 1299—1304).—In carrying out estimations of the carbon and hydrogen content of a series of bituminous schists by the ordinary methods, inconsistent results were obtained. The method of micro-analysis was therefore tried, the quantities of material used being from 3—5 mg., and this gave concordant results; moreover, a considerable saving of time was effected. The authors are of opinion that these advantages would be gained by using the method in other cases of fuel analysis. H. J. E.

The "Pyro-Tannic Acid" Method for Estimating Carbon Monoxide in Blood and Air. R. R. SAYERS, W. P. YANT, and G. W. JONES (*U.S. Bur. Mines Repts. Investigations*, 1923, No. 2486; cf. Sayers and Yant, A., 1922, ii, 868).—Blood-standards not being permanent, standards are prepared from pigments for use in the method of estimation of carbon monoxide in blood whereby normal blood forms a grey suspension but blood containing carbon monoxide a light carmine precipitate when treated in aqueous dilution with a mixture of tannic acid and pyrogallol. Estimations with blood are accurate to $\pm 5\%$; calculations therefrom of the carbon monoxide content of air are accurate to 0·005% of the total volume when not more than 0·05% is present, or 0·03% when 0·18% is present.

CHEMICAL ABSTRACTS.

The Residue from Silica in Rock Analysis. M. AUROUSSEAU (*J. Washington Acad. Sci.*, 1923, **13**, 330—332).—The residue which remains after silica (obtained in the usual course of analysis) has been treated with hydrofluoric acid is usually quite small in quantity. The author has examined such a residue obtained during the analysis of a silicic andesite; it amounted to 0·52% of the mineral and contained Al_2O_3 12·7%, Fe_2O_3 24·7%, MgO 15·8%, TiO_2 30·0%, and SO_3 8·0%, together with small quantities of calcium, phosphoric acid, and manganese.

W. P. S.

Separation and Estimation of Potassium and Sodium. A Perchlorate Precipitation Process using Normal Butyl Alcohol. G. FREDERICK SMITH (*J. Amer. Chem. Soc.*, 1923, **45**, 2072—2080).—A method has been developed for the separation and estimation of sodium and potassium, which depends on the precipitation of potassium perchlorate from aqueous solution by the addition of a comparatively large volume of *n*-butyl alcohol. The method of procedure is as follows. The mixed chlorides of sodium and potassium, which must be free from sulphate, are evaporated to dryness with an excess of perchloric acid. Two or three c.c. of water are added and the perchlorate dissolved by heating; then 65 or 100 c.c. of *n*-butyl alcohol containing 0·5—1% of perchloric acid, the larger volume being taken when 3 c.c. of water are required to dissolve the perchlorates, are heated to boiling and added slowly with vigorous stirring to the perchlorate solution. This effects the precipitation of the potassium perchlorate, and after all has been precipitated the whole is gently boiled for half a minute and cooled to room temperature. The precipitate is collected on a Gooch crucible, washed with 10 portions of 1—2 c.c. of the precipitating solution, dried at 125—250°, cooled, and weighed. The filtrate and washings are evaporated to dryness and the sodium is estimated as sulphate. This process is rapid and gives excellent results. The solubility of potassium chlorate in anhydrous *n*-butyl alcohol, and in that containing various quantities of water and perchloric acid, has been determined at 25°. The amount dissolved is very small; the quantity dissolved in the solution used for precipitation is only 1 mg. per 100 c.c.

J. F. S.

Estimation of the Titratable Alkali of the Blood with Dinitrosalicylic Acid. JAMES B. SUMNER and ROGER S. HUBBARD [with LUCY L. FINNER] (*J. Biol. Chem.*, 1923, **56**, 701—709).—Greenwald and Lewman's method (this vol., ii, 87) has been modified, dinitrosalicylic acid being used in place of picric acid. This has the advantage that the total dinitrosalicylic acid in the filtrate may be readily estimated colorimetrically by means of the coloration produced with ferric chloride. E. S.

Comparative Tests of Various Volumetric Methods for the Estimation of Sodium Sulphide. ANON (*Chem. Ztg.*, 1923, **47**, 752—753).—Results obtained by the gravimetric method (oxidation with bromine water followed by precipitation of the liquid with barium chloride) of estimating sodium sulphide in various preparations of the salt were compared with those obtained by the following five volumetric methods: (1) Direct titration with iodine of the slightly acidified solution, (2) addition of excess of iodine to the acid solution followed by titration of the excess with thiosulphate, (3) direct titration without acidifying, (4) addition of excess of iodine without acidifying, followed by titration with thiosulphate, (5) direct titration with iodine in the presence of 0·5—2·0 g. of sodium hydrogen carbonate. Method (1) gave the most satisfactory results, methods (3) and (4) were quite good, but not so exact as (1), method (2) gave low and method (5) high results. The presence of carbonate up to 4% has practically no influence on the results obtained without acidifying, whereas 10% increases the sulphide figures by 1·2%. A. R. P.

The Micro-estimation of Magnesium. ST. GADIENT (*Helv. Chim. Acta*, 1923, **6**, 729—733).—The method is essentially that of Hammett and Adams (A., 1922, ii, 587), modified in some of its details. Exact directions for carrying out the estimation are given. When estimating magnesium in serum by this method, it is unnecessary first to remove the albumin. [Cf. *J.S.C.I.*, 1923, Nov.] E. H. R.

The Conductometric Titration of Alkaloids. W. D. TREADWELL and S. JANETT (*Helv. Chim. Acta*, 1923, **6**, 734—743).—The alkaloids brucine, quinine, narcotine, and morphine can be titrated accurately with hydrochloric acid by the conductometric method; caffeine is too weak a base to give a distinct break in the titration curve. To avoid the formation of non-conducting layers at the electrodes of the titration cell, when using direct current, a commutator was used giving alternations of 4—8 per second, and the solution was kept stirred with a current of nitrogen. The indicator was a high-resistance millivolt meter shunted between the battery and the commutator. The current used is a few milliamperes with an *E.M.F.* of eight volts. During titration, the titration curve, representing the change of current strength, rises gradually, flattening somewhat as the end-point is approached, and rises sharply as soon as free acid is present in solution. The break in the curve is quite sharp. E. H. R.

The Estimation of Zinc by Schaffner's Method with Repeated Precipitation of the Iron. C. BOY (*Chem. Ztg.*, 1923, **47**, 758).—In Schaffner's method for titrating zinc with sodium sulphide, the proportions of free ammonia in assay and standard must be the same. If the iron is precipitated several times with ammonia to remove the zinc completely, the amounts of free ammonia in a series of assays will vary. To rectify this, the solutions should be boiled until all free ammonia is expelled and a cloudiness due to precipitated basic zinc chloride is produced; 5 c.c. of 1 : 1-hydrochloric acid are added, followed by 15 c.c. of ammonia, and the whole is set aside over-night uncovered. Approximately equal quantities of ammonia will be contained in all the trials in the morning. A. R. P.

The Quantitative Treatment of Metals of the Ammonium Sulphide Group. G. LUFF (*Z. anal. Chem.*, 1923, **63**, 32—39).—Manganese may be separated from iron and aluminium by one precipitation with ammonia, zinc and nickel by two, and cobalt by three precipitations by operating as follows: Ten grams of ammonium chloride are added for every 100 c.c. of solution, followed by ammonia until neutral; the solution is boiled for fifteen minutes, then treated with ammonia drop by drop until it reacts just alkaline to litmus, and filtered. The precipitate is washed with a hot, dilute, faintly ammoniacal solution of ammonium nitrate, and, if necessary, redissolved in hydrochloric acid and the process repeated. A single precicitation of iron and aluminium by means of pyridine serves to separate these elements from manganese satisfactorily; in the presence of zinc, nickel, and, especially, cobalt, the precipitate contains appreciable quantities of these elements and should be redissolved in acid and reprecipitated with ammonia. The pyridine precipitation is carried out in the same manner as that by means of ammonia, 5 c.c. of pyridine being added to each 100 c.c. of solution containing 10 g. of ammonium chloride. A. R. P.

[Estimation of Manganese and of Zinc as Sulphates.] W. F. HILLEBRAND (*Z. anal. Chem.*, 1923, **63**, 41—42).—It is pointed out that contrary to Huber's statement (A., 1922, ii, 398) manganese sulphate is slowly decomposed at 600° and that the heating should be conducted at 450—500° (cf. Blum, A., 1912, ii, 1214). Gutbier and Staib's observation (A., 1922, ii, 396), that zinc sulphate, heated with an excess of sulphuric acid, tenaciously retains traces of free acid, is confirmed. A. R. P.

Volumetric Estimation of Iron. A New Method of Reduction. P. F. THOMPSON (*Proc. Australasian Inst. Mining Met.*, 1922, N.S., No. **47**, 343—346).—Zinc sulphide emulsion is prepared by passing hydrogen sulphide, with occasional additions of ammonia solution, into a solution of 100 g. of zinc sulphate in 2 litres of water until precipitation is complete, decanting, washing the precipitate a few times with very dilute sulphuric acid, and diluting to 2 litres. To a hot solution of ferric iron in dilute sulphuric acid, the emulsion is slowly added until a decided turbidity is obtained; the liquid is boiled until a drop, tested with thiocyanate, indicates complete reduction. If a brown sulphide is formed, the solution is filtered. After being boiled with dilute sulphuric acid and a little marble until the sulphur has become granular and hydrogen sulphide removed, the ferrous iron is estimated in the usual way.

CHEMICAL ABSTRACTS.

Quantitative Separation of Uranium from Thorium and the Rare Earths in Pitchblende by Means of Sodium Thiosulphate. W. RISS (*Chem. Ztg.*, 1923, **47**, 765—766).—The pitchblende is dissolved in nitric acid, the insoluble matter separated, and the filtrate evaporated to dryness several times to remove the acid. The residue is dissolved in water, exactly neutralised with dilute ammonia, and sodium thiosulphate added in excess. The solution is boiled for ten minutes, and left for twenty-four hours. If sufficient thiosulphate has been used, the supernatant liquid is almost colourless, and the precipitate contains all the thorium, the greater part of the uranium, and small quantities of rare earths (chiefly cerium). To separate the rare earths completely, the precipitate is redissolved in hydrochloric acid and reprecipitated. The precipitate is then dissolved in hydrochloric acid and the thorium precipitated with oxalic acid, ignited, and weighed as thorium oxide, which should be pure white. To determine uranium, the oxalic acid in the filtrate is destroyed by evaporating to dryness and heating the residue with concentrated sulphuric acid. The uranium can then be precipitated with ammonia. The filtrate, after the separation of the thiosulphate precipitate, is tested for thorium, and if this is absent, precipitated with oxalic acid, which removes the rare earths. Iron is precipitated with ammonium carbonate, and the rest of the uranium with ammonia, the two uranium precipitates being ignited and weighed together.

H. C. R.

Colorimetric Estimation of Small Quantities of Bismuth. L. CUNY and G. POIROT (*J. Pharm. Chim.*, 1923, **28**, [vii], 215—223). —The orange-coloured colloidal solutions of quinine iodobismuthate given by a standard bismuth solution and the solution to be estimated are compared colorimetrically. For the standard solution, 2·23 g. of bismuth oxide are dissolved in, and made up to 1 litre with, 10% nitric acid, and 25 c.c. of this solution are added to 175 c.c. of 10% nitric acid and made up to 1 litre with distilled water. To 5 c.c. of this solution are added 3 c.c. of a clear, 10% solution of gum arabic, then 1 c.c. of a solution containing 1 g. of quinine hydrate and 5 c.c. of 10% nitric acid per 100 c.c., and finally 1 c.c. of a 5% solution of potassium iodide. The solution under estimation, with additions as above, is compared with a thickness of 5 mm. of the standard, and the thickness required for matching the colour is arranged, by suitable dilution, to be between 4 and 7 mm. In a series of test estimations the maximum error was 3·5%. The presence of various substances, *e.g.*, hydrochloric, sulphuric, and acetic acids, and various metallic salts, vitiates the results. Coloured precipitates or colloidal solutions are given by salts of the following metals: silver (yellow), mercurous (dirty green, changing to red), mercuric (yellow), lead (light yellow), stannous (orange; but no reaction in presence of gum arabic), antimony (dark yellow), copper (brown), ferric (liberation of iodine and formation of quinine periodide), cadmium (white). Salts may also cause flocculation of the colloidal quinine iodobismuthate. W. T. K. B.

Tests of Officinal Vaselin, Liquid Vaselin, Paraffin, and Light Petroleum: Action of Cold Concentrated Sulphuric Acid. F. RICHARD (*J. Pharm. Chim.*, 1923, [vii], **28**, 209—214).—The author suggests the abolition from the French "Codex" of the vague directions for testing pharmaceutical vaselins, etc., with 60% sulphuric acid. It is preferable to triturate or agitate the material with twice its weight of cold concentrated sulphuric acid, after an hour's contact, with which no more than a pale yellow coloration should be obtained. The material should also have a neutral reaction to litmus and leave no ponderable ash or residue when calcined or evaporated on the boiling water-bath. W. T. K. B.

Use of the Salts of the Arylsulphonhalogenoamides in the Estimation of Phenols. ELWYN ROBERTS (T., 1923, **123**, 2707—2712).

The Effect of Phenol in the Estimation of Reducing Sugars by the Picramic Acid Methods. H. C. SWEANY (*J. Lab. Clin. Med.*, 1923, 8, 572—578).—Phenol, present at a concentration of 1 in 4,000, causes a two- to three-fold increase of colour in the estimation of sugar by Lewis and Benedict's or Benedict's method. The phenols present in normal blood cause a 10% error in the estimation of blood-sugar by the former, but not by the latter, method. It is likewise essential to eliminate phenols from urine before estimating the sugar by picramic acid methods which are also inapplicable in the case of sugar solutions preserved by phenols and many related substances. The phenol may possibly react with the decomposition products of dextrose to give a product which either is coloured or becomes reduced to picric or picramic acid. CHEMICAL ABSTRACTS.

The Chemical Analysis of Cotton. I. The Absorption of Methylene-blue by Cotton. CONSTANCE BIRTWELL, DOUGLAS ARTHUR CLIBBENS, and BERT P. RIDGE (*J. Text. Inst.*, 1923, **14**, T, 297—313).—An examination has been made of the relations between the absorption of methylene-blue by bleached cotton and (1) the ash content of the cotton, in view of the work by Rona and Michaelis (A., 1920, ii, 475), (2) the origin of the raw cotton, and (3) the nature of the bleaching process. Two analytical methods are described. The first, a colorimetric method, employs solutions of methylene-blue hydrochloride about 0·05 to 0·25 millimole per litre, made by diluting a solution containing 10 millimoles per litre, which is standardised by titration with titanous chloride. The cotton is shaken with the dye solution (usually 0·4 millimole per l.) for eighteen hours in a stoppered bottle and then the free liquid is compared in a Kober-Klett colorimeter with a standard about half as strong as the original (0·2 millimole per l.). The weight of cotton is so chosen that the colorimeter reading is nearly the same for the test as for the control, say, 17—23 as against 20, since the depths of colour of methylene-blue solutions are not strictly proportional to their concentrations. For normally-bleached American cotton, the quantity required, under the above conditions, is about 1·5—2 g. for 50 c.c. of dye; of bleached Egyptian cotton, 0·8—1 g. is sufficient.

The second analytical method is for more concentrated solutions of dye, about 2·5 to 3·5 millimoles per litre. The methylene-blue solutions are titrated with a solution of naphthol-yellow-S, which gives a reddish-brown precipitate, the supernatant liquid changing ultimately from blue to yellow. The yellow solution can be standardised against methylene-blue, or the dye itself, $C_{10}H_4O_8N_2SNa_2$, can be recrystallised from dilute alcohol and accurately weighed out. In order to use a high proportion of cotton relatively to the volume of methylene-blue, and to recover most of the liquid for titration, the cotton is placed in the bottom of a wide tube constricted in the middle, left immersed in the dye for eighteen hours, and then the tube is inverted into a wider tube and centrifuged for fifteen to thirty seconds at 1,500 r.p.m. Using about 2·5 g. of cotton and 15 c.c. of dye, it is possible to recover 12—13 c.c. of clear liquid for titration. The approach of the end-point when adding naphthol-yellow-S is detected by observing the colour of a drop of the liquid on a glass rod, and thereafter the tube is centrifuged after each addition until the blue gives place to yellow.

The first important result obtained is the proof that an increase in the ash content of the cotton, or, more strictly, in the alkalinity of the ash, causes an increased adsorption of methylene-blue, other factors being constant. In order to study other effects, it is necessary, therefore, to wash the cotton submitted for examination under controlled conditions before further tests. Agitation with 0·1*N*-acid for two or three hours, followed by washing with distilled water, finally on a centrifuge, until the washings are indifferent to an iodide–iodate–starch mixture, is recommended. A second result of general importance is the proof that Egyptian cotton, although bleached and washed by the same process, absorbs distinctly more methylene-blue than American cotton, even if the Egyptian cotton is grown in America. The other results have significance in the practice of bleaching, but it may be said that, from cotton material of known origin, the methylene-blue absorption offers a method of quantitatively following the progressive purification of cotton cellulose during bleaching, and ultimately of measuring the success of the bleaching operation, that is, of determining whether " overbleaching " or inefficient scouring have occurred. J. C. W.

Titrimetric Estimation of Formic Acid. Bror Holmberg and Sven Lindberg (*Ber.*, 1923, **56**, [*B*], 2048—2052).—The authors take advantage of the fact that when a formate reduces mercuric chloride to the mercurous form, one equivalent of hydrogen chloride is liberated. The solution to be tested is neutralised, excess of standard baryta added, and boiled for about an hour to complete the oxidation of the formate. Then sodium or potassium bromide solution is added to ensure the precipitation of the calomel, the solution is made acid with a known amount of hydrochloric acid, and boiled to expel the carbon dioxide. Finally, the solution is again neutralised with baryta. The difference between the acid added and the sum of the two portions of baryta obviously gives the amount of acid formed and is equivalent to the formate reduced. The method gives good results and can be used in the presence of acetates. H. H.

Estimation of Amino-acids by Electrometric Titration. ERIK M. P. WIDMARK and ERIK L. LARSSON (*Biochem. Z.*, 1923, **140**, 284—294).—Amino-acids behave during electrometric titration with strong alkali as weak acids devoid of amphoteric character. By measuring the increasing conductivity of amino-acid solutions during the gradual addition of small volumes of 1·0*N*-sodium hydroxide and plotting the results, it was found that the increase was linear up to a point corresponding with complete neutralisation, beyond which a much more rapid increase was noted. The amount of alkali used up to the point of break in continuity serves as a means of estimation. Dibasic acids show two such points, one corresponding with each carboxyl group. The method is applicable to dipeptides and to all the amino-acids examined with the sole exception of arginine. J. P.

Estimation of Small Quantities of Oxalic Acid. Application to Urine. J. KHOURI (*Ann. Chim. Analyt.*, 1923, [ii], **5**, 205—207).—The solution containing oxalic acid is evaporated, the residue obtained is treated with a known volume of alcoholic carbamide solution and again evaporated; the excess of carbamide is then extracted with ethyl alcohol or amyl alcohol, and, after the alcoholic solution has been evaporated, estimated by the hypobromite method. The difference between this quantity and that present originally (as estimated in another portion of the carbamide solution) gives the amount of carbamide combined with the oxalic acid as carbamide oxalate, $2CO(NH_2)_2,C_2H_2O_4$. In the case of urine, the oxalic acid which may be present is extracted with ether, the solvent is evaporated, and the residue obtained treated as described. W. P. S.

Estimation of *p*-Sulphamidobenzoic Acid in "Saccharin." O. BEYER (*Chem. Ztg.*, 1923, **47**, 744).—An investigation into the degree of accuracy of methods of estimating *p*-sulphamido-benzoic acid in commercial "saccharin" showed that the German official method (A., 1920, ii, 518) is capable of showing quantities of 1% and upwards when 10 g. of the sample are taken for analysis and may be considered sufficiently accurate for practical purposes. Hefelmann's method does not give such good results, and is not so convenient, because saccharin does not dissolve so readily in the 73% sulphuric acid prescribed as in the 25% hydrochloric acid prescribed in the official method. H. C. R.

Detection of Ethyl Phthalate in Brandy. S. Eilles (*Z. Unters. Nahr. Genussm.*, 1923, **45**, 379—381).—In the presence of concentrated sulphuric acid, pyrogallol gives a violet coloration with ethyl phthalate. In testing plain brandies, 20—50 c.c. of the sample are treated with 5 drops of 15% sodium hydroxide and evaporated to dryness before the test is applied. In the case of products containing sugar and extract matter such as formic acid, 20—50 c.c. of the sample diluted with an equal volume of water are extracted with 25 c.c. of light petroleum (b. p. 30—50°). Tinctures should be treated with the minimum necessary quantity of lead acetate and filtered before dilution and extraction with light petroleum. The light petroleum extract is evaporated to dryness without the addition of sodium hydroxide and the test applied to the residue. The test is sensitive to 0·01% of ethyl phthalate in straight brandies and to 0·1—0·4% in cases in which extraction with light petroleum is necessary. H. C. R.

Estimation of Phenolphthalein. S. Palkin (*J. Assoc. Off. Agric. Chem.*, 1923, **7**, 14—17).—The iodine method described previously by the author yields fairly trustworthy results, but there is a tendency for the figures obtained to be too low. An alternative method, in which the phenolphthalein is precipitated from its alkaline solution by the addition of hydrochloric acid and then extracted with ether and weighed, gives results which are slightly too high. W. P. S.

Estimation of Phenylcinchoninic Acid (Cinchophen, Atophan). William Rabak (*J. Assoc. Off. Agric. Chem.*, 1923, **7**, 32—34).—To estimate phenylcinchoninic acid in tablets or powders, 1 g. of the sample is extracted repeatedly with hot alcohol, the alcoholic extracts are filtered, the filtrate is treated with an excess of *N*/10-sodium hydroxide solution, and then titrated with *N*/10-hydrochloric acid, using phenolphthalein as indicator. Each c.c. of *N*/10-alkali solution is equivalent to 0·02491 g. of phenylcinchoninic acid. W. P. S.

Gravimetric Method for Estimating the Hydroxyl Value and the Acetyl Value [of Oils]. E. B. Elsbach (*Chem. Umschau*, 1923, **30**, 235—237).—The oil is heated at 100° in a flask provided with a tube sealed through the side of the neck and bent at right angles inside the flask, so that it passes downwards and terminates in a constriction close to the bottom of the flask. Dry carbon dioxide or nitrogen is passed through this tube into the oil, which is heated until constant in weight, 4—6 c.c. of acetic anhydride are then added, and the flask is again heated, a reflux condenser being used. When the acetylation is complete, the reflux condenser is removed and dry carbon dioxide again passed through the heated liquid until the excess of acetic anhydride is removed. If p denotes the percentage increase in weight, based on the original weight of the oil, the hydroxyl value is $p \times 13{\cdot}354$ and the acetyl value $p \times 13{\cdot}354/1+p/100$. The latter, being based on the weight of acetylated oil, is always less than the former. The determination takes two and a half to four hours. H. C. R.

Estimation of Formaldehyde in Presence of Substances Found in Formalin. P. BORGSTROM (*J. Amer. Chem. Soc.*, 1923, **45**, 2150—2155).—The iodometric method (this vol., ii, 590) can be used for the estimation of formaldehyde in the presence of methyl alcohol, formic acid, or pure methylal, but not in the presence of acetone or ethyl alcohol. The hydrogen peroxide method (*loc. cit.*) can be used if methyl alcohol, ethyl alcohol, formic acid, or methylal is present; if acetone is present in concentration equal to that of the formaldehyde, the figure obtained for the latter will be about 2% high. Methyl alcohol, ethyl alcohol, formic acid, or methylal does not affect the estimation of formaldehyde by the neutral sulphite method (*loc. cit.*), but acetone introduces an error which cannot readily be corrected. W. S. N.

Estimation of the Purity of Vanillin. S. B. PHILLIPS (*Analyst*, 1923, **48**, 367—373).—A volumetric method of estimating vanillin is described depending on the formation of an anhydro-derivative by the interaction of vanillin and *p*-toluidine dissolved in 80% alcohol. This compound contains the original hydroxyl group of the vanillin, and is therefore soluble in alkali, giving a yellow solution. A measured excess of standard alkali is added, followed by a comparatively large volume of cold water. The addition of standard acid first neutralises the excess of alkali, and then liberates the anhydro-derivative from its sodium salt. The first drop of acid which liberates the derivative gives a yellow turbidity, the free derivative being practically insoluble in the liquid phase. The volume of alkali required for the titration of the vanillin is thus obtained. Accurate results are obtained when benzoic acid is present as an adulterant in quantities up to 10%, but with higher percentages of acid it is advisable to use a gravimetric method. No sample of first class vanillin was found to contain more than 1% of acid (as vanillic acid) although some of the samples had been kept in cardboard containers for ten years. The gravimetric method suggested comprises the precipitation of vanillin as the semicarbazone from dilute acetic acid solution. The precipitate is easy to wash and filter, and may be dried in a water oven for six to eight hours without losing a weighable quantity by volatilisation. The vanillin may be separated from impurities such as piperonal by dissolving the semicarbazone in ammonium hydroxide solution. Vanillinsemicarbazone, by virtue of its hydroxyl group, forms a soluble ammonium salt giving a yellow solution, whilst piperonalsemicarbazone is insoluble. Test analyses in which piperonal was added to vanillin gave results agreeing with the actual percentage present to within 1 part in 450 parts. Details of the purification of the vanillin used in this work and of the *p*-toluidine used in the volumetric method are given. The oxidation of samples of purified vanillin exposed to air, moisture, and light was practically negligible. With vanillin in solution, however, oxidation proceeds much more rapidly, whilst solutions of vanillin in alkali behave similarly to alkaline pyrogallate solution. The following corrected melting points are given: vanillinsemicarbazone, 232°; piperonalsemicarbazone, 218°; vanillin *p*-nitrophenylhydrazone, 223°; vanillin-*p*-bromophenylhydrazone, 148°. H. C. R.

"Permutite" as a Reagent for Amines. JOHN C. WHITEHORN (*J. Biol. Chem.*, 1923, **56**, 751—764).—Bases with a dissociation constant of not less than 5×10^{-9} (for example, alkylamines, basic amino-acids, histamine, tyramine) may be removed almost completely from neutral, and less completely from acid or alkaline, solution in water by shaking with, or preferably by filtration through, permutite. Other solvents (ethyl alcohol, amyl alcohol, ether) may also be employed, but the same bases are not necessarily removed as from water. Recovery of the bases is best effected by treatment of the permutite with a saturated solution of potassium chloride. A study of the reaction with ammonium chloride has shown that the mass law is obeyed; in the expression $[NH_4Cl][\text{Na permutite}]=K[NH_4\text{ permutite}][NaCl]$, K has a value of 0·75. The temperature coefficient of the reaction between 0° and 17° is 1·6.

A colorimetric method for the estimation of adrenaline, based on its removal from interfering substances by means of permutite, is being worked out. E. S.

Determination of the Benzoylecgonine, Tropacocaine, and Ecgonine Yields of the Coca Leaf. A. W. K. DE JONG (*Indische Mercuur*, 1923, **46**, 305).—The benzene extract of the leaves is evaporated, treated with 1% acetic acid, then with alcohol, and the residue redissolved in benzene from which the benzoylecgonine crystallises. Ecgonine is estimated in the remaining benzene solution by polarimetry. For the estimation of tropacocaine, the benzene extract is shaken with 0·1*N*-hydrochloric acid, which is titrated with 0·1*N*-sodium hydroxide. CHEMICAL ABSTRACTS.

Estimation of Procaine (Novocaine). ALFRED W. HANSON (*J. Assoc. Off. Agric. Chem.*, 1923, **7**, 17—20).—The bromide–bromate method described previously (A., 1922, ii, 405) is trustworthy, and the presence of small amounts of nitrates does not interfere. When the substance is extracted from its ammoniacal solution and titrated, the results obtained tend to be too low. W. P. S.

Detection of *apo*Morphine. L. VON ITALLIE (*Pharm. Weekblad*, 1923, **60**, 1046—1049).—The method of Feinberg (*Z. physiol. Chem.*, 1913, **84**, 363) is not always trustworthy. In a neutral solution, in presence of oxidising agents, red, violet, or blue colorations are imparted to organic solvents by traces of *apo*morphine after keeping. Ammonium persulphate, after addition of pure sodium hydrogen carbonate, gives a strong reaction with one part of *apo*morphine in 100,000 parts. S. I. L.

Improved Method for the Estimation of Nicotine in Tobacco and Tobacco Extracts. O. M. SHEDD (*J. Agric. Res.*, 1923, **24**, 961—970).—One g. of tobacco extract (more if much lower than 40% grade) or 5 g. of dried and powdered tobacco are moistened with 2·5 c.c. of alcoholic sodium hydroxide solution (NaOH, 6 g.; water, 40 c.c.; 90% alcohol, 60 c.c.) For extracts twice this quantity is used, and enough calcium carbonate is added to make the whole into a moist mass. The mixture is extracted for five hours in a Soxhlet extractor with ether. The cooling water of the condenser should not be above 20° and the volume of solvent in the extraction flask should not be allowed to become less than 25 c.c. After extraction, excess of ether is removed, but the residual volume must not go below the minimum necessary to keep all extracted matter in solution. The ether extract is transferred to a separating funnel (washing out the flask first with ether and then with dilute hydrochloric acid) and washed with 4—6 portions (10 c.c. each) of cold dilute hydrochloric acid (1 : 4). A tendency to the formation of emulsions can be prevented by the addition of 1 c.c. of alcohol. Successive washings are filtered through glass wool into a 100 c.c. graduated flask. Washing with acid should be continued until no precipitate with the silicotungstic reagent is produced. The accumulated washings are made up to a standard volume, and an aliquot portion corresponding with about 0·25 g. of extract or 1—2 g. of tobacco, removed and diluted with water to 400—500 c.c. Sufficient hydrochloric acid (1 : 4) is added to ensure the presence of at least 3 c.c. per 100 c.c. of liquid. One c.c. of silicotungstic acid reagent (12% of the acid

$$4H_2O,SiO_2,12WO_3,22H_2O$$

—others are useless) is added for each 0·01 g. of nicotine presumed to be present. The mixture is stirred thoroughly until the crystalline precipitate will settle rapidly. A few drops of the supernatant liquid are tested to ensure that excess of the reagent has been added. After eighteen to twenty-four hours the precipitate is filtered, preferably through a Hirsch or Buchner funnel, and washed with dilute hydrochloric acid (1 : 1000), dried, and transferred without removal from the filter-paper to a platinum crucible. The latter is heated until all carbon is eliminated and finally ignited over a Teclu or Meker burner for not more than ten minutes. The weight of precipitate × 0·114 gives the weight of nicotine.

A. G. P.

[Analysis of] Potatoes with a High Content of Solanine. A. Bömer and H. Mattis (*Z. Unters. Nahr. Genussm.*, 1923, **45**, 288—291).—Solanine was estimated in potatoes by a variation of von Morgenstern's method, in which the extracted juice was made alkaline with ammonia, evaporated to dryness with 10 g. of kieselguhr, and extracted for five hours in Soxhlet's apparatus with 95% alcohol. The alcohol was evaporated off and the residue twice precipitated from warm dilute acetic acid solution with ammonia. The colourless product was weighed. The results obtained by this method were in some cases even higher than those given for the impure product of Schmiedeberg and Meyer's method, and were nearly twice those given by von Morgenstern's method for the same samples. They varied from 25·3 to 58·8 mg. per

100 g. for some samples of potatoes which were inedible, the values for normal potatoes being 2·0—7·5 mg. per 100 g. H. C. R.

Estimation of Pyramidone. Alfred W. Hanson (*J. Assoc. Off. Agric. Chem.*, 1923, **7**, 29—32).—Pyramidone may be extracted from its alkaline solution by chloroform, the extract then evaporated, the residue dried, and weighed. If desired, this residue may be converted into the hydrochloride, by evaporation with hydrochloric acid, and weighed as such, or the solution of the hydrochloride may be treated with silver nitrate solution and the silver chloride collected and weighed. The weight of silver chloride found is multiplied by 1·6131 to obtain the amount of pyramidone present. W. P. S.

The Estimation of Santonin in Flores Cinae (Tansy). L. M van den Berg (*Pharm. Weekblad*, 1923, **60**, 858—870).—After close examination of the methods of Katz (*Arch. Pharm.*, 1899, [*B*], 237) and others, a procedure was worked out, based on treatment of the hot aqueous suspension with dilute hydrochloric acid, extraction with chloroform, and recrystallisation from hot dilute alcohol. The santonin separated is not always pure, resin being usually present, especially when the santonin content of the powder is low. S. I. L.

Estimation of Methylene-blue. H. O. Moraw (*J. Assoc. Off. Agric. Chem.*, 1923, **7**, 20—29).—In the iodometric method described, 0·1 g. of the methylene-blue is dissolved in 100 c.c. of water, the solution is treated with 30 c.c. of glacial acetic acid, and 30 c.c. of *N*/5-iodine solution are added. After fifty minutes, the mixture is diluted with water to 200 c.c., filtered, and the excess of iodine is titrated in an aliquot portion of the filtrate. Each c.c. of *N*/10-iodine solution is equivalent to 0·007475 g. of methylene-blue. W. P. S.

Fluorescent Oxidation Products of Bilirubin and their Importance as Sources of Error in the Detection of Urobilin. H. K. Barrenscheen and O. Weltmann (*Biochem. Z.*, 1923, **140**, 273—278).—The commonly employed method of detecting urobilin by oxidation to a green fluorescent substance with iodine in the presence of zinc acetate does not give trustworthy results when applied to body fluids other than urine. The complications are ascribed to the presence of bilirubin. J. P.

Arsphenamine [Salvarsan]. I. A Colorimetric Method for the Estimation of Salvarsan in Blood and Tissues. A. C. Kolls and J. B. Youmans (*Bull. Johns Hopkins Hosp.*, 1923, **34**, 149—151).—A colorimetric method for the estimation of salvarsan is based on the diazotisation of the amino-groups, and the coupling of the diazotised product with orcin to produce a bright red substance. Details are given for the application of the method to whole blood, tissues, spinal fluid, blood plasma, and urine. Chemical Abstracts.

General and Physical Chemistry.

Improved Temperature Control for the Pulfrich Refractometer. T. M. LOWRY and R. G. PARKER (*J. Sci. Instrum.*, 1923, **1**, 16—21).—Particulars are given of tests of a Pulfrich refractometer in which the temperature control is improved by the provision of water passages of greater bore than usual, the avoidance of unnecessary lengths of tube of small bore in the flow system, and the use of an additional water-jacket surrounding on three sides the liquid under examination. J. S. G. T.

Volume of the Molecule and Refractive Index. RICHARD LORENZ and W. HERZ (*Z. anorg. Chem.*, 1923, **127**, 205—208, 369—371; cf. A., 1922, ii, 821).—The quotient, ψ, of molecular refractive power, $[R_L]$, by molecular volume for all substances should be ψ_s=0·331 at the boiling point, and ψ_0=0·4668 at absolute zero (calculated according to the law of corresponding states). These values are quoted for some thirty compounds, and are found to deviate more or less from the theoretical. If $(n^2-1)/(n^2+2)$ really represents the volume of the molecules of a medium of refractive index n, then there should be some correspondence between $[R_L]$ observed and that calculated from the known radius of the molecule and the Avogadro number. Satisfactory agreement between these values is obtained in the case of carbon dioxide, hydrogen, methyl chloride, and ethylene.

ψ_s should be calculable not only from n_s, the refractive index at the boiling point, but also from D_s, the dielectric constant at the boiling point. Calculated in this way, ψ_s approaches more nearly to 0·331, the theoretical value, except in the case of dipolar molecules, which must show anomalous dispersion. H. H.

Contraction of Volume and Refractive Index of Liquid Mixtures. L. COUNSON (*Arch. Sci. phys. nat.*, 1923, **128**, 361—369).—The author has determined the respective densities and refractive indices, at about 20°, of aqueous solutions of tartaric acid and ammonium heptamolybdate containing either 10 or 25 g. per litre, and of mixtures of these solutions. The results indicate that q and c in Pulfrich's relation $(R-R_v)/R=q(D-D_v)/D=qc$, in which D and R are, respectively, the actual values of the density and refractive index of the mixture, whilst D_v and R_v are the corresponding values calculated on the assumption that these properties are additive in nature (Pulfrich, *Z. physikal. Chem.*, 1889, **4**, 561), are of the same sign (positive). J. S. G. T.

Disposition of an Arc in a Vacuum permitting the Obtaining of Spectra of Metals using Very Small Quantities of Material. (MLLE) BERTHE PERRETTE (*Compt. rend.*, 1923, **177**, 876—879).—The original paper should be consulted for details (including a diagram of the apparatus used). The cathode, of tungsten (or tungsten-thorium), is maintained at a high temperature by an auxiliary current. The anode, a small disk of tungsten, contains a minute cavity in which the experimental material is placed. E. E. T.

Röntgen Spectrograph for Analytical Chemical Purposes. Paul Günther and Iwan Stranski (*Z. physikal. Chem.*, 1923, **106**, 433—441).—A description is given of an *X*-ray spectrograph, and its use for chemical purposes is illustrated by measurements with a mixture of the rare earths from monazite from which cerium and thorium have been removed. J. F. S.

The Dependence of the Intensity of Spectral Lines on Gas Pressure. L. Strum (*Z. Physik*, 1923, **18**, 372—378).—By application of the theory of probability to electronic orbits in their relation to the fields due to neighbouring atoms, an expression for the energy, E, emitted in the form of radiation of wave-length λ, by a gas at pressure p, through which a discharge passes, is deduced in the form $E=\delta p e^{-\gamma n^4 p^{2\,3}}/\lambda$, where n is the appropriate quantum number associated with the line in the series formula, and δ and γ are factors of proportionality. The formula is in accord with experimental results, more especially with the results obtained by Beatty (*Phil. Mag.*, 1917, [vi], **33**, 49; 1923, **45**, 1080) which indicate a maximum intensity of the line Hα when the gas pressure is 1·4 mm. J. S. G. T.

The Multilinear Spectrum of Hydrogen. II. With an Addendum on the Continuous Spectrum. E. Gehrcke and E. Lau (*Sitzungsber. Preuss. Akad. Wiss. Berlin*, 1923, **24**, 242—252).—In continuation of previous work (this vol., ii, 197), the authors describe an arrangement suitable for the excitation of the red and green Fulcher bands of the hydrogen spectrum. They find that, in contradistinction to other lines in the multilinear spectrum, these bands are more strongly excited by slow cathode rays than by fast rays. Wave-lengths of lines constituting the red, green, and blue bands are detailed, and the potentials necessary for their excitation and the relative intensities of lines in the respective bands discussed. Residual lines in the bands are classified in three groups, one of which forms an approximately symmetrical series having its centre at λ 9799·25, whilst the remaining two groups exhibit an approximately constant difference between corresponding members of the respective groups. The conditions of excitation of the continuous spectrum between $\lambda\lambda$ 360 and 230$\mu\mu$ resemble those for the excitation of the multilinear spectra. The possible origins of both these spectra are briefly discussed. J. S. G. T.

Excitation of the Spectra of Hydrogen and of Nitrogen in Low Voltage Arcs. O. S. Duffendack (*Physical Rev.*, 1922, **20**, 100).—The fact that in a two-element tube the lines and bands of hydrogen appeared with the arc, whereas the bands did not appear when the gas was dissociated in the tungsten furnace, is additional evidence that the lines are due to the atom and the bands to the molecule. In the case of nitrogen, both the first and second positive bands appeared with the arc; the former increased, and the latter decreased in intensity with increased voltage. The negative bands appeared one or two volts above the ionising potential, and increased markedly in intensity. Three new bands were observed at 5075, 5018, and 4961 Å. Four lines were observed at 5003, 5006, 5667, and 5680 Å., but never below 70 volts; at potentials above this, the arc became a "flare" with greatly increased conductivity. It is concluded tht the positive bands are due to the neutral molecule, the negative bands to the ionised molecule, and the lines to the atom, and that the molecule is ionised without dissociation. A. A. E.

The Distribution of Intensity in the Broadened Balmer Lines of Hydrogen. E. O. HULBERT (*Physical Rev.*, 1923, **22**, 24—36).—The broadening of the Balmer lines of hydrogen by condensed discharges was examined at various pressures, and the effect is ascribed to the large proportion of ionised atoms produced by the momentarily high current density. A. A. E.

The Effect of Crossed Electric and Magnetic Fields on the Hydrogen Spectrum. OTTO HALPERN (*Z. Physik*, 1923, **18**, 287—303).—The author develops a mathematical analysis showing how, by appropriate choice of variables, the Hamilton function associated with a hydrogen or singly-ionised helium atom in crossed electric and magnetic fields (combined Stark and Zeeman effects) may be expressed in the form of a convergent series capable of being quantised. It follows that, under such conditions, the hydrogen lines are split into a number of sharply defined lines and are not merely widened. J. S. G. T.

The Electron-affinity Spectrum of the Iodine Atom. WALTER GERLACH and FRITZ GROMANN (*Z. Physik*, 1923, **18**, 239—248).—According to Franck (*ibid.*, 1921, **5**, 428), the combination of an electron with an electrically neutral, electronegative atom should give rise to the emission of a continuous spectrum having a limiting frequency, ν_0, towards the red end equal to E/h, where E denotes the electron-affinity of the atom and h is Planck's constant. The authors suggest the identification of the continuous spectrum λλ 3460—3340 Å. emitted by dissociated iodine vapour with this electron-affinity spectrum. The value of the electron affinity of the iodine atom, calculated from this result is $81{\cdot}8+0{\cdot}2$ cal. per g.-mol., in close agreement with the mean value of about 82, calculated from the lattice energy of sodium iodide and potassium iodide by Born's lattice theory and with the same result deduced from the ionisation potential of hydrogen iodide. Evidence was obtained that the spectrum in the region λ 4800 Å., observed by Steubing (A., 1921, ii, 361), could not be identified with the electron-affinity spectrum of iodine vapour. J. S. G. T.

The Spectrum of Fluorine. HENRY G. GALE (*Physical Rev.*, 1922, **19**, 530).—Fluorine was prepared by Smythe's method (A., 1922, ii, 99), and its spectrum observed through a fluorite window at atmospheric or reduced pressure, using copper electrodes tipped with gold. Of fifty-two lines between λ 3470 and λ 7800, all except seven on the red side of λ 7400 are included in the tables of Exner and Haschek, Porlezza, Lunt, or Moissan. With a powerful spark, fifteen additional lines appear in the red and orange regions.

A. A. E.

New Spectra of Oxygen and Nitrogen in the Extreme Ultra-violet. J. J. HOPFIELD (*Physical Rev.*, 1922, **19**, 548).—By the use of a disruptive discharge at low pressure, the spectrum of oxygen has been extended to include lines between λ 508 and λ 1335. Nitrogen, examined in a discharge tube of the internal capillary type, gave a spectrum extending from λ 825 to λ 1400, lines at λ 307 and λ 362 being also photographed. The spectrum of air was obtained with the same tube at a pressure of 3 mm., with two minutes' exposure, to λ 1050. A. A. E.

The Vacuum Spark Spectrum of Silicon. R. A. SAWYER and R. F. PATON (*Physical Rev.*, 1922, **19**, 256—257).—Previous investigations on the spark spectrum of silicon have exhibited but little agreement, largely on account of the rapid oxidation of the element. Application of the vacuum spark method has resulted in the observation of fifty-five lines between λ 4085·25 and λ 6372·2 to an accuracy of ±0·3 Å., those in the range 4100—5202 being probably correct to ±0·1 Å. Several groups of pairs of constant frequency difference have been noticed and tabulated. A. A. E.

Intensities in the Helium Spectrum. A. LL. HUGHES and P. LOWE (*Proc. Roy. Soc.*, 1923, [*A*], **104**, 480—498).—The authors have investigated the dependence of the distribution of intensities in the helium spectrum, excited by impacts between electrons and atoms, on the energy of impact of the electrons, which ranged from 34 volts to 210 volts, whilst all other factors were maintained constant. The results indicate that the curve expressing the relation of the intensity of any spectrum line to the corresponding energy of impact is characteristic of the series to which the line belongs. In the doublet system, intensities decrease rapidly as the energy of impact is increased above 34 volts. The rate of decrease is greatest for the sharp series $1\pi-m\sigma$, and least for the diffuse series $1\pi-m\delta$. The principal series $1S-mP$ of the singlet system is characterised by a very great increase of intensity as the energy of impact is increased from 34 volts up to about 80 volts, beyond which little change occurs. Maximum intensity of the lines of the diffuse series $1P-mD$ corresponds with an energy of impact of about 75 volts, the rise to the maximum being progressively greater the higher the term number associated with the line. Lines of the sharp series $1P-mS$ exhibit a small initial increase of intensity as the energy of impact is increased to 60 volts, and thereafter show a slight decrease. The results are discussed in the light of the quantum theory, and the authors conclude that the transitions from one energy level to another within an atom struck by an electron, are to some extent affected by the presence of other atoms, ions, or electrons. J. S. G. T.

The Spectrum of Neutral Helium. C. V. RAMAN and A. S. GANESAN (*Astrophys. J.*, 1923, **57**, 243—247).—The ionising potential computed from Silberstein's formula $\nu=4N(1/n_1^2-1/m_1^2+1/n_2^2-1/m_2^2)$ is not in agreement with the experimental value. Moreover, there is no arrangement of lines as regards series relationship, division into singlet and doublet systems, or of intensities. A. A. E.

The Spectrum of Helium. LUDWIK SILBERSTEIN (*Astrophys. J.*, 1923, **57**, 248—250; cf. preceding abstract).—The author's formula covers twenty-three of the thirty so-called combination lines; the probability that the coincidences of the computed with the experimental values is fortuitous is stated to be of the order 10^{-13}. A. A. E.

Measurements of Wave-lengths in the Visible Spectrum of Helium, and the Interference Phenomena Employed in the Measurements. (MLLE) H. C. OFFERHAUS (*Arch. Néerland.*, 1923, **7**, 60—94).—Details are given of the application of an étalon spectrograph, calibrated by means of the cadmium line λ 6438·4696 Å., to determine the wave-lengths of nineteen lines in the helium spectrum between λλ 3888·650 and 7281·348 Å. Results are recorded to 0·001 Å., and agree very closely with corresponding results obtained by Merrill (A., 1917, ii, 434). J. S. G. T.

Positive Ray Analysis of Lithium, Zinc, and Calcium. A. J. DEMPSTER (*Physical Rev.*, 1922, **19**, 271, 431; cf. A., 1922, ii, 417).—Positively charged atoms are formed by vaporising the metal in an electrically heated capsule, and bombarding the vapour with electrons from a hot cathode. After falling through a definite potential, the particles are deflected through 180° by a magnetic field, the semicircular path being smaller for the lighter than for the heavier particles. The different atoms are observed by means of their charge. The components of lithium have atomic weights 6 and 7 present in varying proportions. Zinc isotopes of atomic weights 64, 66, 68, and 70 exhibit large variations in their relative proportions. The zinc lines were compared directly with those of calcium, of which the strong line at 40 was compared with a potassium line at 39 and a magnesium line at 24; a weak calcium component has atomic weight 44. A. A. E.

Vacuum Grating Spectrograph and the Zinc Spectrum. R. W. WOOD (*Phil. Mag.*, 1923, [vi], **46**, 741—750).—The construction and operation of a vacuum grating spectrograph, with which lines of short wave-length may be photographed with extreme sharpness, are briefly described. The grating employed is of 1 metre radius and is ruled with 15,000 lines to the inch, the ruled surface measuring 1 × 4 inches. The source of light used is the electron-arc (*Physical Rev.*, 1897), and a full exposure of the Schumann plates employed requires about twenty minutes. The sharpness of lines in the zinc spectrum photographed with this instrument is compared with that of corresponding lines given by Sawyer (A., 1921, ii, 363). Wave-lengths and intensities of twenty-one lines in the zinc spectrum between λλ 1601·15 and 1918·67 Å. and of forty lines between λλ 832·73 and 1307·32 Å. are tabulated and compared with values given by Sawyer. The values of wave-length determined are considered to be correct to 0·1 Å. Between λλ 1283 and 1500 Å., the author records 96 lines, compared with 14 given by Sawyer. No trace is found of ten lines recorded by the latter observer between λλ 1066 and 1165 Å. The carbon line 1036·1 Å. given by Sawyer is resolved into a clearly separated doublet λλ 1037·14 and 1037·50 Å. The carbon triplet, λλ 1561·32, 1560·67, 1560·16, resolved by Simeon (this vol., ii, 45), is considered to be a doublet with components of equal intensities and a separation of one Ångström unit. J. S. G. T.

Stages in the Excitation of the Spectra of Thallium. F. L. Mohler and Arthur E. Ruark (*J. Opt. Soc. Amer.*, 1923, **7**, 819—829).—In continuation of previous work (A., 1919, ii, 42; this vol., ii, 605), determinations have been made of the critical potentials, and the development of the spectrum with increasing voltage, in the case of thallium vapour. The first resonance potential has the value 0·9 volt, and the first ionisation potential the value 6·04 volts. The agreement between the latter value and the value, 6·082 volts, calculated for the level of greatest negative energy, confirms the view that $2p_2$ is a normal orbit of the atom. A higher critical potential, detectable by the photoelectric effect of the radiation, has the value 12·4 volts. With increasing voltage below the ionisation potential, successive lines of the two subordinate series in the thallium spectrum appear. Above 12 volts another line system, with strong lines in the ultra-violet, appears. It is suggested that this second spectrum is an arc spectrum resulting from a second type of single ionisation consisting in the removal of one of the two 6_1 electrons. Comparison of the critical potentials with the doublet series system of thallium indicates that the first ionisation potential is determined by the limit $2p_2$ and the first resonance potential by the difference $2p_2-2p_1$. The orbit $2p_1$ is meta-stable. Resonance potentials corresponding with frequencies $2p_2-ms$ and $2p_2-md$ give rise to the observed low voltage spectra. Corresponding critical potentials are calculated for aluminium, gallium, and indium. J. S. G. T.

Two New Lines in the Aluminium Spectrum and their possible Series Relations. G. D. Shallenberger (*Physical Rev.*, 1922, **19**, 398—399).—The application to aluminium electrodes of a high potential vacuum spark yields strong, well-defined lines at λ 4150·6 and λ 2907·4 (±0·3—0·4 Å.), respectively. Equations are given representing the frequencies of the lines, which can scarcely be due to impurities; certain numerical relations are also mentioned. A. A. E.

Pole Effects, Pressure Shifts, and Measurements of Wave-lengths in the Spectrum of Manganese. George Spencer Monk (*Astrophys. J.*, 1923, **57**, 222—233).—Pole effects, pressure shifts, and wave-lengths for the stronger lines of manganese between λ 4470 and λ 6021 have been measured. The evidence indicates a

correspondence between unsymmetrical broadening of the lines under pressure and pole effect. The use of a carbon pole bored and filled with manganese dioxide or of manganese poles gave moderate pole effects which were practically absent when manganese chloride was used. The wave-lengths of forty-one lines have been measured with an estimated accuracy of 0·002 Å., and tabulated.
A. A. E.

The Intensity of Röntgen Spectral Lines Excited by High Voltages. GUSTAV KETTMANN (*Z. Physik*, 1923, **18**, 359—371).—A method for determining photographically the intensities of Röntgen spectral lines is described, and measurements of the relative intensities of lines, excited at various voltages, in the *K*-series of chromium, copper, and silver, and in the *L*-series of lanthanum and lead, are detailed. At high voltages, the intensities of the lines attain a maximum value, owing to absorption of the rays by the anti-cathode. When absorption of the rays by the anti-cathode is very small, the respective intensities of the lines increase proportionally to the square of the voltage. The results are found to be in agreement with the theory proposed by Davis (*Physical Rev.*, 1918, **11**, 433).
J. S. G. T.

Spectra of Isotopes. A. L. NARAYAN (*Nature*, 1923, **112**, 651).—The structure of the tin lines 5631 and 4524 was carefully examined with a Lummer plate. Even when the pressure was of the order of 1 mm., both lines were simple in structure, the latter being especially sharp. McLennan's view (A., 1922, ii, 541, 728) that the spectral displacement for isotopes should be given by the atomic number multiplied by the displacement calculated on Bohr's theory, requiring in this case a difference for isotopes 116 and 124 of 0·07614, is therefore not supported. A. A. E.

The Optical Spectrum of Hafnium. H. M. HANSEN and S. WERNER (*Nature*, 1923, **112**, 618—619).—Both the arc and the spark spectra of hafnium have been investigated, using a preparation of hafnium containing (according to *X*-ray analysis) not more than about 1% of zirconium. The previous results (this vol., ii, 200) in the case of the arc spectrum have been confirmed and extended. Comparison of the results with those of Bardet (this vol., ii, 449) appears to indicate that the hafnium spectrum, like that of zirconium, differs according to the conditions of excitation. The wave-lengths between λ 2497·0 and 3505·2 and the intensities are tabulated.
A. A. E.

***X*-Ray Spectra of Hafnium and Thulium.** D. COSTER (*Phil. Mag.*, 1923, [vi], **46**, 956—963).—Particulars are given of physical methods employed in the discovery and investigation of the properties of the element of atomic number 72. The following wave-lengths (measured in *X*-units) have been determined in the *L*-series of the emission spectrum of hafnium: 1777·4, 1577·04, 1566·07, 1519·7, 1389·3, 1371·1, 1349·7, 1323·5, 1303·5, 1212·1, 1176·5, 1141·3, 1135·6, 1100·1. The estimated error is in all cases less than 0·4 *X*-unit. In addition, the following lines in the *L*-series of the absorption spectrum of hafnium were determined: 1097, 1151·5, 1293·0, and the following lines in the *M*-series: 7521, 7286. Values of the wave-lengths in the *L*-series of the spectrum of the element of atomic number 69 (thulium) have been determined as follows: 1951·1, 1733·9, 1722·8, 1692·3, 1541·2, 1526·8, 1511·5, 1502·3, 1460·2, 1352·3, 1312·7, 1271·2, 1265·3, 1226·4 *X*-units. The author discusses the identification of two *X*-ray lines found by Dauvillier in the spectrum of a preparation of rare-earth metals and ascribed to celtium, the presence of which was suspected by Urbain (A., 1922, ii, 463). J. S. G. T.

Critical Potentials of the Thorium *M*-Series Lines. P. A. Ross (*Physical Rev.*, 1923, [ii], **22**, 221—225).—The lines, α to ϵ, of Stenström, and a new line, ϵ_2, of wave-length 2·85 Å., were observed. The critical potentials were found to agree with the predicted values. A. A. E.

Trithiocarbonic Acid and Perthiocarbonic Acid. H. von Halban, A. Mackert, and W. Ott (*Z. Elektrochem.*, 1923, **29**, 445—457).—The absorption spectra of solutions of trithiocarbonic acid (H_2CS_3) and its ethyl ester have been obtained for solutions in chloroform, ethyl alcohol, light petroleum, ether, and toluene, and that of the barium salt in water. Similar measurements have been made with solutions of perthiocarbonic acid (H_2CS_4) in chloroform, toluene, and light petroleum, and the sodium salt has been measured in aqueous solution. Very large differences are found between the spectra of the acids and those of the salts. These differences are shown by changes in the colour, which are similar to those observed with indicators. The actual existence of the free acid is amply proved by the similarity of the absorption spectrum of a solution of the sodium salt with that obtained for a solution prepared by shaking an organic solution of the acid with sodium hydroxide. The absorption curves of the acids in various solvents differ relatively little from one another, and in no case are they similar to those of the salts. The curve for the ester is similar to that of the acid, but shows a considerable displacement, and in no case can the curve for the acid be made up from the curves for the salt and ester. The absorption spectra of ethyl-thiocarbonic acid in organic solvents and its potassium salt in water and alcohol solution have also been obtained. In this case also, a marked optical effect is observed on the formation of the salt. The introduction of the first and second ethyl groups into the trithiocarbonic acid molecule produces similar displacements of the absorption spectrum. *p*-Chloro- and *p*-bromobenzyl-trithiocarbonic acids have been prepared. These substances are solid and fairly stable. The absorption spectra of the chlorobenzyl acid and of its potassium salt have been obtained and show the same differences as those found in the case of the ethyl acid and its potassium salt. The chlorobenzyl acid has a normal molecular weight in benzene solution. The velocity of decomposition of trithiocarbonic acid, perthiocarbonic acid, ethyl-trithiocarbonic acid, and *p*-chlorobenzyl-trithiocarbonic acid has been determined in several organic solvents, and it is shown that the influence of the solvent on the decomposition is generally the same as in the case of the xanthic acids (A., 1913, ii, 312; 1918, ii, 222). The behaviour of the *p*-chloro- and *p*-bromo-benzyl acids towards the diazo-esters depends on the solvent in a way which is entirely different from that found by Hantzsch for oxygen acids (this vol., ii, 475). J. F. S.

Colour of Inorganic Compounds. W. BILTZ (*Z. anorg. Chem.*, 1923, **127**, 169—186, 372; cf. Meisenheimer, A., 1921, ii, 364). —An attempt to provide a theory of the colour and constitution of inorganic compounds. Unsaturation is shown to be the chief factor in determining such colour. "Mixed" compounds formed by the union of compounds of elements in different states of oxidation show a deeper colour than either of the parent compounds, whether the components contain the same element or not. Thus AuCl is bright yellow, and $AuCl_3$ is orange, whilst Au_2Cl_4 is nearly black. Similarly, ZnO and Al_2O_3 are both colourless, but ZnO,Al_2O_3 is violet. Magnetic power is also associated with colour—iron, cobalt, nickel, manganese, vanadium, copper, and chromium are all chromophores. Again, both "sub-" and "super-" compounds are coloured, and may be regarded as unsaturated. In the case of substances which contain elements of variable valency, it is found that the colour deepens as the valency decreases, if the normal valency is the highest, and conversely. Dissociation deepens colour because it increases unsaturation; and, in general, the stronger the linking between elements, the less the colour of the resulting compound. H. H.

Determination of Coefficients of Absorption. H. A. C. DENIER VAN DER GON (*Arch. Néerland.*, 1923, 7, 140—155).—Employing a thermopile and galvanometer to indicate the respective intensities of the incident and transmitted radiation, the author has determined the coefficients of absorption, at about 20°, of aqueous solutions of cupric chloride containing from 0·310 to 4·50 g.-mols. per litre, and of aqueous solutions of copper sulphate containing, respectively, 0·190 and 1·15 g.-mols. per litre, for radiation of wave-length from 411 $\mu\mu$ to 810 $\mu\mu$. The results indicate that in the case of the solutions of copper sulphate, Beer's law is approximately obeyed in the case of radiation of wave-length greater than 550 $\mu\mu$. A like result holds in the case of the solutions of cupric chloride for wave-lengths in the neighbourhood of 565 $\mu\mu$. In this region, the respective absorption curves, drawn by plotting the logarithm of the respective coefficients of absorption as ordinates against the corresponding wave-lengths as abscissæ, are coincident, whilst for radiation of greater wave-lengths, the curves differ only slightly. Absorption in these cases is attributable to the copper contained in the solutions. Each curve exhibits a well-marked minimum at a point corresponding with a shorter wave-length than that referred to. J. S. G. T.

Colour and Chemical Constitution. XVIII. Colourless Substances in Sulphuric Acid (Halochromy). JAMES MOIR (*Trans. Roy. Soc. S. Africa*, 1923, **11**, 91—93; cf. this vol., ii, 108).—A method has been discovered for predicting the colour produced when certain colourless substances are dissolved in concentrated sulphuric acid (halochromy). The laws are apparently simpler than for aqueous solution, a single set of colour factors applying to all substances. The absorption is generally above λ 360. The absorption can be calculated from that of a parent substance (*p*-hydroxybenzyl alcohol) by multiplying by colour factors depending on the difference of the compound from the parent substance. The absorption of *p*-hydroxybenzyl alcohol is λ 488. The substitution factors are: phenyl for hydrogen 0·96; phthalein or $C_6H_4 \cdot CO_2H$ for hydrogen, 1·01; hydroxyphenyl for hydrogen, 1·02; hydroxyphenyl for phenyl, 1·06; bridge oxygen, 0·87; hapton oxidation, *e.g.*, benzhydrol to benzophenone, 0·89 or 0·70. E. H. R.

The Colour of Monocyclic Substances Calculated by Assigning an Absorption Band to Each Possible Tautomeric Form. JAMES MOIR (T., 1923, **123**, 2792—2803.)

The Absorption Spectrum of Chloroform in the Near Ultra-red. J. W. ELLIS (*Physical Rev.*, 1922, **19**, 546).—Five distinct bands were observed with maxima at 1·140 μ, 1·385 μ, 1·660 μ, 1·835 μ, and 2·425 μ, the percentage of absorption being, respectively, 10, 16, 56, 35, and 88. The error may be ±100 Å. A. A. E.

The Ultra-violet Absorption of Anthracene and Benzene. J. M. HYATT (*Physical Rev.*, 1922, **19**, 391—393; cf. Howe, *ibid.*, 1916, **8**).—For a solution of anthracene in ethyl alcohol, fourteen bands having frequency numbers 2650, 2700, 2800, 2840, 2945, 2990, 3095, 3130, 3240, 3410, 3540, 3688, 3975, and 4115, respectively, were observed. The numbers fall into two series with mean frequency intervals of 147 and 142, respectively. For a solution of benzene in ethyl alcohol, ten bands were observed, as follows: 3720, 3780, 3830, 3920, 4015, 4120, 4210, 4295, 4365, 4465. A. A. E.

Radiochemistry and Fluorescence. JEAN PERRIN (*Compt. rend.*, 1923, **177**, 665—666; cf. this vol., ii, 714).—The thermal coefficient of the disappearance of new-methylene-blue in glycerol solution, in absence of air and under the influence of light, is 1·6 for temperatures between 19° and 81°, giving 9×10^{13} for the frequency of the infra-red rays which produce critical glycerol molecules. With constant illumination, for concentrations below 5%, the disappearance obeys the law of mass action at the above temperatures. That is, the concentration of critical mols. of dye is always proportional to the concentration of unactivated dye. New-methylene-blue disappears 1,200 times as rapidly as fluorescent-blue, the thermal coefficients, however, being the same. The second blue therefore reacts with the same kind of critical glycerol molecules, produced either by absorption of infra-red radiation or by equivalent intermolecular shocks. A previous deduction, that the direct action of a critical molecule (produced using external radiation) on a non-critical molecule should be unaffected by variations of temperature, is now proved for uranine and eosin (sodium salt), the disappearance-velocities of which are unaffected by temperature elevations of 60° and 90°, respectively. E. E. T.

The Luminescence of Solidifying Antimony. E. Karrer (*Physical Rev.*, 1922, **19**, 437—438).—When heated at a temperature above its melting point, antimony becomes bright red; on cooling, the brightness decreases with the temperature until solidification commences, when a sudden increase in brightness occurs, accompanied by an increase in temperature. Moreover, the brightness after the flash appears greater for a given temperature than the brightness at the same temperature before the flash. It thus appears to be a case of crystal-luminescence; the phenomenon is not due to oxidation of the antimony, since it takes place in hydrogen or in a vacuum. A. A. E.

Determinations of Structure in Conformity with the Electron Theory. C. J. Enklaar (*Rec. trav. chim.*, 1923, **42**, 1000—1016).—The author treats refractive dispersion from the point of view of valency electrons and considers that every atom in a saturated open-chain compound has the same number of dispersion electrons as it has valencies. Satisfactory agreement is found in many cases quoted. In benzenoid compounds, however, he finds that each carbon atom possesses twelve, instead of four, dispersion electrons, if it occurs in the nucleus, and, further, that the same is true of unsaturated carbon atoms in open-chain compounds. Determinations of the refractive dispersion of cyanogen lead to the adoption of the formula $N\vdots C\cdot C\vdots N$ for this compound. The theory is also applied to the determination of the structure of 1 : 3 : 5-trienes. H. H.

Mutarotation. II. C. N. Riiber (*Ber.*, 1923, **56**, [*B*], 2185—2194).—In continuation of previous work (A., 1922, ii, 807), it is shown that the change in refractive index of aqueous solutions of dextrose when preserved takes place exactly parallel to the alteration in specific rotation and in accordance with the equation for a unimolecular reaction. The velocity constant and the half period is the same as that deduced from measurement of specific rotation or change in volume of the solution, and the three phenomena are therefore attributable to the same cause.

The equilibrium between α-glucose, β-glucose, and glucose hydrate in aqueous solution has been fully examined; solutions of any modification containing 10% of anhydrous substance are identical after twenty-four hours as judged by density (d_4^{20} 1·037881), specific rotation ($[\alpha]_D^{24}+52\cdot1°$), or refractive index ($n_D^{20}$ 1·34778). If α- and β-glucose are actually in equilibrium in solution, it follows that the opposite physical changes must be observed on solution of the two varieties. This has been shown previously to be the case with the specific rotation, and is now found to be true for density, index of refraction, and heat of reaction. The actual establishment of an equilibrium is more firmly established by the observation that the half period of α-glucose is the same as that of β-glucose as determined by dilatometric, refractive, or polarimetric methods. Further, it is found that a solution of α-glucose (3·61 g.), and β-glucose (6·39 g.) in water (90 g.) does not change in density, refractive index, or specific rotation when preserved.

Glucose hydrate has frequently been considered to be an ortho-form of the true aldehyde, and not a hydrate in the usual sense. Trey's observation that solutions of glucose hydrate undergo contraction when preserved appears, however, to be erroneous, since a dilation takes place which is of the same magnitude as that observed with anhydrous glucose. Examination by the three methods has failed to disclose any difference between solutions of glucose and the hydrate which contain the same amount of anhydrous material and are of the same age. The author therefore draws the conclusion that there is no evidence of the existence of an appreciable amount of glucose hydrate or the ortho-form of glucose in aqueous solution, although the possibility is not excluded that it may be present in an amount too small to be detected by the physical methods employed, as is indicated by the behaviour of the solutions towards hydroxylamine and phenylhydrazine.

The opinion has been frequently expressed that mutarotation is impossible in the absence of a solvent. It is shown, however, that if dehydrated α-glucose is melted and cooled rapidly to the atmospheric temperature it has then an initial specific rotation of about 50° in water; the same result is observed when β-glucose is employed. Apparently, therefore, the fused masses are identical and consist (mainly) of an equilibrium mixture of the α- and β-forms. This is supported by the observation that the seeding of the under-cooled melt with α- or β-glucose induces the complete crystallisation of it as the α- or β-form, respectively, whereas a mixture of the two varieties is formed when a mixed seed is used.

Mutarotation, therefore, may be induced by melting an optically active substance, by bringing such a substance into solution, or by alteration in the concentration or temperature of the solution of the substance. H. W.

Magnetic and Natural Rotatory Dispersion in Absorbing Media. E. O. HULBERT (*Physical Rev.*, 1923, **22**, 180—187).—By a consideration of absorption of the radiation in a transparent medium, more complete formulæ for rotatory dispersion than those hitherto put forward have been derived. Certain approximations have been made, and simplified formulæ obtained which give the rotation for wave-lengths sufficiently removed from the critical wave-length, provided the refractive index and extinction coefficient conform to the Lorentz dispersion equations with one resonance frequency. In the case of carbon disulphide and 1-bromonaphthalene, the equation of magnetic rotation in isotropic media agrees closely with the experimental results. A. A. E.

Action of Red and Infra-red Radiations on Photo-luminescent Substances. MAURICE CURIE (*J. Chim. Phys.*, 1923, **20**, 292—307).—The action of red and infra-red radiation on photo-luminescent substances has been investigated in the case of zinc sulphide and calcium sulphide. In the case of zinc sulphide, it is shown that a black spot is formed on a background of brilliant luminescence at the point where the infra-red rays are concentrated. This fact indicates that these rays not only excite luminescence, but also destroy it. When the sulphide is removed from the rays, a very brilliant luminescence is seen at one spot followed by a very dark band. This reinforcement of the luminescence varies in intensity and in the time of its duration with the nature of the phosphorescent substance. With zinc sulphide containing copper, the colour is green, and it is maintained for a much shorter time than with zinc sulphide containing manganese, in which case the colour is yellow. There are no resonance phenomena observable in the present experiments. J. F. S.

Darkening of Zinc Sulphide by Light. ARTHUR SCHLEEDE [with M. HERTER and W. KORDATZKI] (*Z. physikal. Chem.*, 1923, **106**, 386—398).—Zinc sulphide prepared in various ways has been examined in connexion with its darkening under the influence of light. It is shown that precipitated and non-ignited zinc sulphide does not darken under any conditions of illumination. Ignited zinc sulphide which is free from materials with which it has been heated, shows a sensitiveness towards light from a quartz mercury lamp when the temperature of ignition is so high that measurable quantities of wurzite are formed. The zinc blende form of zinc sulphide is not affected by ultra-violet light from a mercury lamp. The presence of small quantities of heavy metals makes no change in the action of light in these cases. Crystallised zinc sulphide containing halogen compounds is sensitive to the long wave-length ultra-violet light, and the presence of small quantities of heavy metals intensifies the action. The sensitiveness of halogen containing zinc sulphide can be removed by washing the material, so far as the long wave-length ultra-violet light is concerned, but this has no effect on short wave-length ultra-violet light effect or on the phosphorescence. Sensitiveness to long wave-length ultra-violet light is apparently induced by fusing zinc sulphide (wurzite) with a halogen salt. J. F. S.

Temperature Coefficient of Photochemical Reaction Rate. RICHARD C. TOLMAN (*J. Amer. Chem. Soc.*, 1923, **45**, 2285—2296). —A theoretical paper in which, on the basis of the quantum hypothesis, a simple equation for the temperature coefficient of photochemical reaction velocities has been derived. The equation agrees with that previously obtained (A., 1921, ii, 99) by the author using the methods of statistical mechanics. The existing data on temperature coefficients of photochemical reactions have been successfully interpreted with the help of the equation. It has been shown that Plotnikov's division of photochemical temperature coefficients into three distinct classes is apparently not tenable. An equation for change in temperature coefficient with frequency has been derived and used successfully in interpreting existing data. The causes of apparent deviations from Einstein's law of photochemical equivalence have been discussed. J. F. S.

Theory of Radiation Transformation. II. Photochemical Chlorine Reaction. FRITZ WEIGERT (*Z. physikal. Chem.*, 1923, **106**, 407—432; cf. this vol., ii, 3).—A theoretical paper in which as an example of a photochemical chlorine reaction the decomposition of ozone in the presence of illuminated chlorine is discussed. The facts, that the velocity of the reaction is independent of the ozone concentration and that, according to Bodenstein and Bonhoeffer (*Z. Physik*, 1923, **13**, 94), it takes place in accordance with the quanta of light energy absorbed by the chlorine, show that an upper limit of the concentration of ozone exists at which the whole of the light energy absorbed by the chlorine is converted into chemical energy. The same case is found in the sensitisation of the hydrogen dissociation for the resonance lines of mercury by dilute mercury vapour. In this case, with a limiting pressure of hydrogen, practically the whole of the absorbed resonance energy is converted into chemical energy. The limiting pressures of the reacting molecular species, ozone 0·5 mm. and hydrogen 10 mm. of mercury, and their relationship to the pressure of the sensitising molecules (chlorine ½ atm., mercury 0·009 mm.) are widely different. The quantity relationship n_r/n_s in the case of the chlorine–ozone reaction is $1{\cdot}3 \times 10^{-3}$, and for the hydrogen–mercury reaction $1{\cdot}1 \times 10^{3}$. If, on the other hand, the number of molecules is calculated in layers which produce the same amount of weakening of the radiation, they will be found to be the same in the two reactions. It is therefore likely that in both processes the initial stage is the same. The hypothesis is advanced that the radiation absorbed by the excited molecules is at first re-emitted as resonance radiation in the normal manner, and that this absorption and emission process is repeated so often that at last the absorption leads, in a binary absorption system, to an internal photoelectric effect, whereon a chemical process or a translatory displacement of the particles follows. Whereas the resonance radiation with mercury, on account of the extremely strong absorption of the mercury vapour for the exciting resonance line, is easily observed, this can scarcely be expected in the case of chlorine with its hundred million times smaller absorption constant. But there are indirect reasons for the non-thermal absorption of pure chlorine. The thermal increase in volume during radiation is only to be observed in the presence of moisture or other impurities. According to this view, the transformation of absorbed energy to the chemical reacting system does not occur simultaneously with the absorption of the radiation; the process requires, on account of the repeated absorption and emission of a once absorbed energy quantum, a definite time before it is completed. The energy quantum remains, in a sense, in the reacting system until it is entirely used up. The measurement of such short retardations can be carried out by the new Weigert and Kellermann method (A., 1922, ii, 808). The application of this method to the photochemical chlorine–hydrogen reaction has shown a retardation of about 1/100 sec. It is, however, not certain that this measured delay is due to the above effect, since the yield in this reaction is much larger than Einstein's law demands. The delay can also be explained by assuming a long chain of reactions. Many such mechanisms have been put forward which are discussed. A special photoelectric effect is assumed, which may represent the primary process by which the chlorine–hydrogen reaction is started. This assumption does away with the necessity of assuming excited chlorine molecules and a splitting of the molecules into atoms. It may be concluded that ozone will be decomposed by long wavelength ultra-violet radiation in the absence of any other substance, and that perhaps the radiation absorbed by the chlorine falls in the ozone absorption band and that during the repeated absorption and re-emission it is used up in this weak absorption region.

The Photochemical Reactivity of Ozone in presence of Other Gases. I. ROBERT OWEN GRIFFITH and WILLIAM JAMES SHUTT (T., 1923, **123**, 2752—2767).

The Photochemical Reactivity of Ozone in presence of Other Gases. II. ROBERT OWEN GRIFFITH and JANE MACWILLIE (T., 1923, **123**, 2767—2774).

Decomposition of Ammonia by Ultra-violet Rays, and the Law of Photochemical Equivalence. W. KUHN (*Compt. rend.*, 1923, **177**, 956—957).—The decomposition of ammonia, prepared by heating its silver chloride derivative, has been studied in quartz vessels, monochromatic light of known wave-length (from 2025—2140) being used as the source of energy. (In complete light, the decomposition proceeds to completion, at a speed proportional to the energy absorbed. Aqueous solutions of the gas undergo no decomposition under similar conditions.) The number of quanta absorbed by 1 mol. of ammonia, undergoing decomposition, varies from 2—2·5, and is independent of the pressure (900—5 mm.). For temperatures of 10—20°, the speed of decomposition is independent of t, and, generally, this speed is not affected by the size of the quartz surfaces (whereas the thermal dissociation is accelerated by quartz surfaces). The speed of decomposition is also unaffected by the addition of metallic sodium, and is therefore independent of the action of minute traces of water. With monochromatic light of $\lambda = 2063$, the number of quanta necessary to decompose 1 mol. of ammonia is 3·4, or as many as 10 if the monochromatisation is very perfect. From the heats of dissociation for $N_2 = N + N(-140{,}000$ cal.), $H_2 = H + H(-84{,}000$ cal.), and $NH_3 = 0{\cdot}5N_2 + 1{\cdot}5H_2(-11{,}000$ cal.), whence $NH_3 = N + H_2 + H - 123{,}000$ cal., and $NH_3 = N + H + H + H - 207{,}000$ cal., it follows that a quantum $h\nu$ for the ray 2063 corresponds with 128,000 cal. per g.-mol. The energy furnished by the absorption of a quantum suffices for the first, but not for the second change. On these lines may be explained the facts that several quanta are required to decompose 1 mol. of ammonia, and that the speed of decomposition depends on the perfectness of monochromatisation of the ultra-violet radiation.

E. E. T.

The Photochemical Decomposition of Silver Bromide. II. ROBERT SCHWARZ and HEINRICH STOCK (*Z. anorg. Chem.*, 1923, **129**, 41—54; cf. A., 1921, ii, 614).—Attempts were made to find the relationship between the age and the photochemical decomposition of silver bromide, using the mercury lamp as a source of light. Very irregular curves were obtained, however, the irregularities being ascribed to (1) moisture, the loss of which decreased the rate of separation of bromine, and (2) grain size, which increased with age. Colloidal sols act as catalysts; silica is a positive and platinum, zirconium hydroxide, stannic acid, and gelatin negative catalysts. W. T.

The Formation of Organic Compounds from Inorganic by the Influence of Light. OSKAR BAUDISCH (*Science*, 1923, **57**, 451—456).—The observation that cholera bacilli rapidly reduce nitrates to nitrites, the velocity of the reaction being dependent on the bacterial iron content, led to a study of the catalytic effect of iron in the reduction of nitrates and nitrites. Dextrose in alkaline solution reduces nitrites, but not nitrates, and then only in the presence of traces of iron. Ferrous hydrogen carbonate or hydroxide does not reduce alkali nitrates even at 100° in the absence of oxygen; the presence of oxygen, however, causes immediate reduction to nitrite, and there is a direct relation between the amount of oxygen dissolved in the water and the amount of nitrite formed. This "fertilisation" process involves the production of a peroxidic iron compound, nitrite, and the reactive intermediate substance potassium nitrosyl, KNO. The latter substance reacts with aldehydes with the formation of hydroxamic acids, $OH{\cdot}CR{:}N{\cdot}OH$. It is considered that the magnetic properties of the peroxide are in direct relation to its great chemical activity. The action of potassium pentacyanoperoxoferroate, $K_3[FeO_2(NC)_5]$ in behaving as an oxygen carrier and activator is likened to a simple type of respiration. Whilst light of long wave-length brings about the formation of an alkaline aquo-base from potassium ferrocyanide solution, the reduction of alkali nitrates is effected only by light of short wavelength. In summer sunlight, alkali nitrates can be reduced to nitrite in a short time if small quantities of complex salts, *e.g.*, potassium ferrocyanide, are present. Formaldoxime and formaldehyde in sunlight form cyclic nitrogen compounds which contain pyridine and pyrrole rings and give the typical alkaloidal reactions. An aqueous solution of acetaldoxime and formaldehyde when exposed to sunlight gives a thick, dark brown syrup which has not been investigated. Nitromethane also unites with formaldehyde under the influence of light, or in weakly alkaline solution, *iso*-nitrobutylglycerol being formed intermediately. The author's observations of the formation of formhydroxamic acid, methylamine, alkaloids, and α-amino-acids have been confirmed and extended by Baly. Illumination of alkali nitrates with daylight in the presence of formaldehyde yields gases agreeing qualitatively with those formed by soil bacteria, and (in the presence of iron salts) formhydroxamic acid and formaldoxime. It is thought possible that many soil bacteria and also green leaves utilise nitrous oxide from the air for nitrogen nutrition. Although at considerable altitudes, or by the influence of silent electric discharges, carbon dioxide can be reduced to formaldehyde, which may then react with nitrous oxide from atmospheric nitrogen and oxygen to yield formhydroxamic acid, it is not thought possible that the reduction can be effected by sunlight at sea level without the aid of chlorophyll. A. A. E.

Relation between the Energies of Alpha-particles and the Atomic Numbers of the Elements. L. Myssowsky (*Z. Physik*, 1923, **18**, 304—306).—It is shown that the great majority of the radioactive elements can be arranged on four parallel and equidistant straight lines, drawn so that abscissæ represent atomic numbers, and ordinates the respective kinetic energies of the α-particles emitted from the elements. The position of thorium is uncertain. Thorium-*C*, actinium-*C*, uranium-II, and radium-*C* do not lie on the straight lines, and it is pointed out that at these elements the radioactive series branch. J. S. G. T.

Cathode-ray Furnace. Hans Gerdien and Hans Riegger (*Wiss. Veröffentl. Siemens-Konzern*, 1923, **3**, 226—230).—A cathode-ray furnace, employing an exhausted spherical glass flask of diameter up to 50 cm., silvered externally or surrounded by acidified water, and provided with a cylindrical neck is described. Cathode rays emitted normally from the external electrode described impinge radially on the material to be heated, supported at the centre of the sphere on a rod passing axially through the neck of the flask. The use of an external electrode permits the furnace being operated with high-tension high-frequency current.
J. S. G. T.

Cathodoluminescence of Heated Alumina. D. T. Wilber (*Physical Rev.*, 1922, **20**, 101).—Ordinary powdered alumina, built up into a fritted cone, when freshly prepared shows coloured bands under cathode rays. The component ruby, green, blue, and orange bands appear in areas within restricted temperature limits. The ruby bands are due to the presence of minute traces of chromium. A mixture of alumina and magnesia in molecular proportions with 1% of manganese gave a brilliant green band; alumina and lime with manganese as active metal gave a broad band in the yellow and green. Alumina and lime with copper gave a band in the blue.
A. A. E.

The Excitation of Characteristic *X*-Rays from certain Metals. Frank Horton, Ursula Andrewes, and Ann Catherine Davies (*Phil. Mag.*, 1923, [vi], **46**, 721—741).—The authors have investigated the voltages connected with some of the longer wavelength *X*-ray absorption limits in the case of the elements aluminium, iron, nickel, copper, and zinc, employing for this purpose the excitation potential method (cf. Kurth, A., 1922, ii, 410). The following respective critical values of the potential (expressed in volts) were determined: aluminium, 42, 66, and 107; iron, 73 and 166; nickel, 104 and 178; copper, 112 and 193; zinc, 119 and 200. By extrapolating the Moseley curves for the various absorption limits to low atomic numbers, it was found that the lower and higher values determined in the cases of the metals iron, nickel, copper, and zinc were respectively associated with $M^{\text{II, III}}$ and M^{I} levels. The changes in the slopes of the M^{I} and $M^{\text{II, III}}$ curves in passing through the observed points support the view that a change in the constitution of the M electronic group occurs during the passage from one of these elements to another. Likewise, the results indicate that the development of the second M sub-group from four electrons to six electrons does not commence before the element cobalt (atomic number 27), and that the similar development of the first M sub-group commences at a lower value of the atomic number. By similar extrapolation of the Moseley curves for the L absorption, it was found that the critical potentials 66 volts and 107 volts found in the case of aluminium are respectively associated with the $L^{\text{II, III}}$ and L^{I} levels. From analogy with the anomalous K absorption limits found by Fricke for titanium, vanadium, and chromium (A., 1921, ii, 6), it is probable that the value, 42 volts, found for aluminium is associated with the displacement of an electron from the second L sub-group to the first M sub-group.

J. S. G. T.

Luminescence Produced by Röntgen Rays. A. Jaubert de Beaujeu (*J. Phys. Radium*, 1923, **4**, 257—267).—Particulars are given of the principal wave-lengths and relative intensities of the fluorescence excited in various solid solutions of the rare earths, and in a large number of organic solid substances, by the incidence of Röntgen rays. Amongst the latter substances, aromatic compounds exhibit the phenomenon most markedly, and it is suggested that, in these cases, fluorescence is attributable to the presence of the benzene ring.

J. S. G. T.

The Secondary Corpuscular Rays produced by Homogeneous X-Rays. H. Robinson (*Proc. Roy. Soc.*, 1923, [*A*], **104**, 455—479).—In continuation of previous work (A., 1914, ii, 696), the author has investigated the "line spectra" of the secondary corpuscular radiation emitted from targets of bismuth, lead, gold, tungsten (metal and WO_2), barium ($BaCO_3$), iodine (LiI and AgI), tin, silver (metal and AgI), molybdenum, strontium ($SrCO_3$), copper, and various light atoms, including calcium, potassium, sulphur, magnesium, sodium, and oxygen, by the incidence of X-rays corresponding with the copper $K\alpha_1$ radiation. The various measurements are considered to be correct to within 1 part in 1000 parts. In general, the respective values of the energy levels of the emitted radiations agree very closely with those tabulated by Bohr and Coster. The apparatus enabled the three limits of L-radiation to be determined as far down as strontium (38). Five M rings were identified in the case of bismuth (83) and tungsten (74). The N-rings of bismuth were likewise identified. In the case of the heavier elements (barium to molybdenum), the L^{III} level is the most effective in the emission of secondary electrons and L^{I} the least effective, in agreement with deductions from X-ray data. With decreasing strength of binding, the differences between the effects of the different rings become appreciably less pronounced. In the case of strontium, the three L lines are of approximately equal intensity, whilst with copper L_1 is just perceptibly the strongest line. The *M* and *N* levels likewise show a similar changing over of high intensity from the "softer" to the "harder" subgroups. J. S. G. T.

Long-range Particles from Radium-active Deposit. GERHARD KIRSCH and HANS PETTERSSON (*Nature*, 1923, **112**, 687).—A reply to Bates and Rogers (this vol., ii, 720). The difference in brightness between the scintillations from α-particles and those from hydrogen particles, viewed under identical conditions, is so conspicuous that no mistake is possible. A small number of scintillations of the α-type was generally observed in addition to the much fainter hydrogen scintillations, especially at the lowest values of absorption. These particles are for the time being assumed to be identical with those found by Rutherford (A., 1919, ii, 258) to be expelled from oxygen. The former view, that the particles are hydrogen particles expelled by artificial disintegration of the glucinum, magnesium, silicon (and probably also lithium) atoms is upheld. A. A. E.

The Relative Activities of Radioactive Substances in an Unchanged Primary Uranium Mineral. W. P. WIDDOWSON and A. S. RUSSELL (*Phil. Mag.*, 1923, [vi], **46**, 915—929).—The work of Boltwood (A., 1908, ii, 454) on the relative activities of the radioactive constituents of an unchanged primary uranium mineral (pitchblende) has been carefully repeated. The results obtained agree with those previously obtained, indicating the lowness of the relative activity of the mineral to that of its uranium content, but disagree therewith as regards the relative activities of polonium, ionium, radium, and uranium. The values found for these agree closely with those deduced theoretically. The ratio of the activity of the actinium series to that of the radium series is found to be 0·29, in agreement with the result obtained by Hahn and Meitner (A., 1920, ii, 148). J. S. G. T.

The Relative Deposition of Radium and Barium Salts as a Function of Temperature and Acidity. W. B. PIETENPOL (*Physical Rev.*, 1922, **20**, 199).—It is found that the first crystals formed in a radium-barium solution contain a larger percentage of radium than succeeding crystals. The efficiency and rapidity of the separation by fractional crystallisation may be increased by separating the liquor from the crystals at a point above room temperature. With rapid cooling, a smaller percentage of radium is adsorbed than with slow cooling. A. A. E.

Ionisation and Resonance Phenomena. CHARLES B. BAZZONI (*J. Franklin Inst.*, 1923, **196**, 627—651).—Bohr's theory of atomic structure and the mechanism of radiation are briefly reviewed, and experimental determinations of resonance and ionisation potentials, more especially in the cases of helium and mercury, and the excitation of resonance spectra, critically examined in relation to the theory. The author concludes that the impact potentials of helium require further study. J. S. G. T.

The Fundamental Processes concerned in the Thermal Ionisation of Gases. RICHARD BECKER (*Z. Physik*, 1923, **18**, 325—343).—The author discusses the fundamental processes, viz., ionisation due to absorption of radiation, ionisation by electronic collisions, and the disappearance of electrons due to combination either with or without the emission of radiation, concerned in the establishment of equilibrium in a thermally-ionised system, and deduces the equilibrium equation relating to the thermal ionisation of monatomic and univalent gases by the application of statistical mechanics and the quantum theory. J. S. G. T.

New Evidence regarding the Interpretation of Critical Potentials in Hydrogen. P. S. OLMSTEAD (*Physical Rev.*, 1922, **19**, 532—533).—A relatively small amount of atomic hydrogen is produced when a close grid of tungsten wires, introduced close to the gauze in an ionisation tube of the Lenard type, is heated to incandescence. It is shown that the ionising potential of the hydrogen atom is 13·5 volts; the critical potential of ionisation of the molecule, probably without dissociation, is about 11·5 volts, and a weaker effect, ascribed to radiation from the atom, at about 10·2 volts. The strongest effect, dissociation of the molecule and ionisation of one of its parts, is put at 16 volts. A. A. E.

Critical Electron Energies in Hydrogen. FRANK HORTON and ANN CATHERINE DAVIES (*Phil. Mag.*, 1923, [vi], **46**, 872—896). —In continuation of previous work (A., 1920, ii, 215), the authors have made a detailed investigation of the effects of electron collisions with hydrogen, in order to determine more exactly the critical electron energy values, and to ascertain whether the radiation or ionisation occurring at a critical stage is of atomic or molecular origin. The results indicate that critical energy values (expressed in volts) are associated with respective processes as follows: 10·2, $H \longrightarrow H$(excited); 11·9, $H_2 \longrightarrow H_2$ (excited); 12·6, $H_2 \longrightarrow H+H$ (excited); 13·5, $H \longrightarrow H^+ +$ electron; 15·9, $H_2 \longrightarrow H+H^+ +$ electron; 22·8, $H_2 \longrightarrow H_2{}^+ +$ electron; 26·1, $H_2 \longrightarrow H^+ +$ electron$+H$ (excited); 29·4, $H_2 \longrightarrow 2H^+ +2$ electrons. These deductions are in agreement with the interpretation by Olmstead (this vol., ii, 367) of the critical values observed at 10·2, 12·6, 13·5, and 15·9 volts, but differ in respect of the interpretation of the critical energy stage included between 10·2 and 12·6 volts. The present authors' deduction in this matter is in accord with the value of the resonance potential of normal hydrogen (11·8 volts) deduced by Mohler, Foote, and Kurth (*Physical Rev.*, 1922, **19**, 414) from the consideration of inelastic collision curves. The present experiments establish the existence of a true molecular radiation as distinct from a radiation produced by electronic-molecular encounters at which dissociation and atomic excitation occur. They also support Pauli's suggestion (A., 1922, ii, 703) that the production of positively charged hydrogen molecules requires energy equivalent to about 23 volts. The spectroscopic results obtained are in general agreement with those of Duffendack (this vol., ii, 373), except for the observation of a number of lines of group II of Fulcher's classification, viz., λλ 5916·8, 5931·6, 5938·9, and 6028·2 Å., which were not observed by Duffendack at 23 volts. Moreover, a visible continuous spectrum of hydrogen can be produced in the absence of the Balmer series lines, and it is suggested that this spectrum originates owing to the formation of molecules (H_2 or possibly H_3) by the combination of neutral atoms. J. S. G. T.

The Lengths of the Free Paths of Slow-moving Electrons in the Rare Gases. H. Sponer (*Z. Physik*, 1923, **18**, 249—257).—Experiments showing that the respective lengths of mean free path of slow-moving electrons in the rare gases, argon, krypton, and xenon increase continuously with decreasing velocity of the electrons until a velocity corresponding with zero accelerating voltage is attained, are described. In the case of krypton at a pressure of 1·2 mm., maximum values of the mean free paths of electrons resulting from inelastic collisions occur when the exciting potential has the value 8·4±0·2 or 9·6±0·2 volts. The corresponding voltages in the case of xenon are 8·0 and 8·8 volts. The ionisation potential of krypton was found to be between 12 and 13 volts; that of xenon was between 11 and 12 volts. J. S. G. T.

The Lengths of the Free Paths of Slow-moving Electrons in the Vapours of Mercury and Cadmium. R. Minkowski (*Z. Physik*, 1923, **18**, 258—262).—The author shows that, as in the case of the rare gases (see preceding abstract and Ramsauer, A., 1921, ii, 324), the respective lengths of mean free path of the slowest-moving electrons in mercury and cadmium vapours depend, although to a considerably less extent, on the velocities of the electrons. In the case of mercury vapour, maximum values of the mean free paths of electrons resulting from inelastic collisions correspond with values of the exciting potential equal to 4·7, 4·9, 9·8, and 11·6 volts. In cadmium vapour, the corresponding values are 3·7, 3·8, 5·4, 7·4, and 7·6 volts. Attention is, in this connexion, directed to the occurrence in the case of cadmium vapour, of the exciting voltage 3·7 volts, correspondng with the series $1S-2p_3$, a result hitherto observed only in the case of mercury vapour. J. S. G. T.

Ionising Potentials of Helium and some Multiatomic Gases. C. A. Mackay (*Phil. Mag.*, 1923, [vi], **46**, 828—835).—The following values (volts) of the ionising potential have been determined for the respective gases: helium, 24·5; nitrogen, 16·3; hydrogen, 15·8; oxygen, 12·5; hydrogen chloride, 13·8; hydrogen bromide, 13·2; hydrogen iodide, 12·8; ammonia, 11·1; water vapour, 13·2. The value for helium is in agreement with the convergence limit of Lyman's spectroscopic series. The value for oxygen is considerably lower than the value, 15·5 volts, found by Foote and Mohler.
J. S. G. T.

The Scattering of Electrons by Aluminium. C. Davisson and C. H. Kunsman (*Physical Rev.*, 1922, **19**, 534—535; cf. A., 1922, ii, 251).—Analysis of the distribution curves below 200 volts indicates that the *L*-electrons of aluminium are at a distance of about 3×10^{-9} cm. from the atomic nucleus. Above 200 volts the distribution is complicated by the scattering effect of oxygen atoms on the surface of the target. A. A. E.

Relations between Supplied Energy, Spectral Intensities, and Alterations in Different Media. L. HAMBURGER (*Trans. Amer. Electrochem. Soc.* [advance copy], 1923, 307—318).—From the proportionality between the energy supplied to discharge tubes, the intensities of the spectral lines emitted and the pressure difference due to the transference of ponderable ions in the discharge, the author concludes that atoms both absorb and emit energy in quanta. The part played by partly ionised atoms in the phenomena of electroluminescence, effects due to collisions of slow-moving electrons with atoms, spectra excited otherwise than electrically, catalytic phenomena, and velocities of reaction are briefly referred to. The dependence of the reduction temperature necessary in the Bucher process for the fixation of nitrogen, on the nature of the carbonate employed is discussed with reference to the ionising and resonance potentials of the alkali and alkaline-earth metals. The unity of optical, chemical, and energy relations contemplated in the quantum theory and the Rutherford-Bohr interpretation of atomic structure indicates that chemical and physical changes do not differ essentially. J. S. G. T.

Problems of Hydrone and Water: the Origin of Electricity in Thunderstorms. G. C. SIMPSON (*Nature*, 1923, **112**, 620; cf. Armstrong, this vol., ii, 772).—It is held to be conclusively proved that if there are ascending currents exceeding eight metres per second in the atmosphere, there must be much breaking of rain drops; that when a water drop breaks there is a separation of electricity; that the broken water drops retain a positive charge; that the air attains a negative charge, and that a considerable excess of positive electricity is brought down by rain. Armstrong's views are considered to be completely untenable. A. A. E.

The Electrical Conductivity of Solid Orthophosphoric Acid. MARK RABINOWITSCH (*Z. anorg. Chem.*, 1923, **129**, 60—66).—The conductivity of orthophosphoric acid, $2H_3PO_4,H_2O$, was studied in the crystalline and supercooled states and found to be of the magnitude of 10^{-4} and 10^{-2}, respectively. The temperature coefficient was positive; a sudden change occurs on solidifying. The decomposition potential is given as 1·70 volts. The ratio of these conductivities is assumed to indicate the degree of loosening of crystal lattices (cf. Hevesy, A., 1922, ii, 623). The conductivity of anhydrous phosphoric acid decreases with the time; this change is associated with some change in the acid. W. T.

The Theory of Electrolytic Ions. XXVIII. The Conductivities of the Arsinic Acids. RICHARD LORENZ and ELISABETH BREHMER (*Z. anorg. Chem.*, 1923, **128**, 76—80).—Continuing previous work (A., 1920, ii, 465; this vol., i, 406), the dissociation or affinity constant has been determined for a number of substituted phenylarsinic acids. The constant K is calculated from the formula $\alpha^2/1-\alpha C\,.\,10^{-8}$, and is therefore related to Kohlrausch's constant c, which is in $C.G.S.$ units, thus: $c.10^5=K$. The following values are given for K at the molar concentration 1/256: phenylarsinic, 0·027; *p*-hydroxyphenylarsinic, 0·015; *p*-amino-*o*-tolylarsinic, 0·014; *m*-methoxyacetarsanilic, 0·029; *p*-nitrophenylarsinic, 0·137; *o*-nitrophenylarsinic, 0·037; 2-nitroarsanilic, 0·0086; 3-hydroxyarsanilic acid (at 1/512), 0·0067. In general, the affinity constant of phenylarsinic acid is affected in the same way by substituents as benzoic acid. An exception appears in the cases of *o*-nitrophenylarsinic acid and *o*-nitroarsanilic acid, where the expected augmentation of the affinity constant by the *o*-nitro-group is not realised. On account of the low solubilities of 2-nitroarsanilic and 3-hydroxyarsanilic acids, their conductivities and affinity constants could only be determined at high dilutions and, in the case of the latter, owing to its rapid decomposition at the electrodes, the result is only approximate. E. H. R.

Electrical Resistivity of Commercial Aluminium. LÉON GUILLET (*Compt. rend.*, 1923, **177**, 953—955).—The purest commercial aluminium has a resistivity of 2·8 micro-ohms per sq. cm./cm. Impurities may cause this figure to become even higher than 3·2 (for 89·5% metal). Silicon has a greater effect on the resistivity than iron, whilst mechanical treatment, even cold hammering, only increases the resistivity very slightly, particularly with the purer specimens of aluminium. In tempering, the more rapid the quenching, the higher the resistivity, probably owing to more silicon being retained in solution under these conditions. E. E. T.

Existence of Ions with a Dual Character. OTTO BLÜH (*Z. physikal. Chem.*, 1923, **106**, 341—365).—The dipole theory is briefly discussed, and on the basis of this it is shown that amphoteric electrolytes, so far as they form true ions of dual character, must raise the dielectric constant of the solution containing them. Measurements of the dielectric constant of aqueous solutions of sulphanilic acid, helianthin, *o*-aminobenzoic acid, *p*-aminobenzoic acid, hippuric acid, and benzoic acid show that such dual ions exist in aqueous solutions of amphoteric electrolytes. It is shown that an internal salt and a dual ion are not the same thing. New measurements of the dielectric constant of aqueous solutions of strong electrolytes show that this quantity is lower than that for pure water, a result which accords with the dipole hypothesis, and is opposed to the result of earlier measurements. Water is considered as an amphoteric electrolyte, and the high dielectric constant of this liquid is regarded as a consequence of the presence of dual ions. On the basis of such dual ions, a mechanism of the conduction of an electric current by acids and bases is developed. J. F. S.

Electrical Resistance of Quinoline–Water Systems. MARTIN H. FISCHER (*Kolloid Z.*, 1923, **33**, 208—215).—The electrical resistance of quinoline, solutions of water in quinoline, and of quinoline in water, of all concentrations up to a saturated solution, has been measured at 24°. The effect of the addition of acids, bases, salts, and ethyl alcohol on the electrical resistance has been measured at 22° and 23°. Pure quinoline has a resistance of 400,000 ohms at 24°, and this value falls regularly with the addition of water to the value 80,000 ohms for the saturated solution. The addition of *N*/50-hydrochloric acid decreases the resistance very much, the amount of decrease being greater the greater the amount of acid added. The addition of *N*/50-potassium hydroxide produces a similar, but smaller, decrease in the resistance. Comparing the effect of various acids on the resistance, it is found that sulphuric acid has the greatest effect, and this is followed in order by hydrochloric, oxalic, acetic, and lactic acids. Of the bases, potassium hydroxide has the greatest effect, and is followed in order by sodium, calcium, and ammonium hydroxides. Salts generally reduce the resistance in a marked degree, as also does ethyl alcohol. These results are practically the same for both the water and the quinoline phases. J. F. S.

Electrometric Measurements with Regard to Ionic Activity. LEONOR MICHAELIS and KOSAKU KAKINUMA (*Biochem. Z.*, 1923, **141**, 394—409).—Electrometric measurements have been made on acid and alkaline, salt and salt-free solutions with the view of determining the relation between ionic concentration and Bjerrum's activity coefficient (A., 1919, ii, 9; 1920, ii, 79) at varying dilutions. Measurements of the potential differences of pure solutions of hydrochloric acid against a standard acetate electrode showed that in concentrations below *M*/30 the activity coefficient of the hydrogen-ions is unity, and the activity is regarded as being equal to the concentration of the acid. The influence of rubidium, potassium, sodium, and lithium chlorides on the activity of the hydrogen-ions in buffered and unbuffered solutions of hydrochloric acid solutions is in the order given, rubidium showing the least and lithium the greatest influence in increasing the activity. Similar determinations of the influence of salts on the activity of hydrogen-ions in alkaline solutions showed the effect to be greater than that observed in acid solutions. For salt-free solutions of sodium hydroxide of concentrations less than *M*/30 the solute is fully dissociated and the activity of the hydroxyl-ions is unity. From the sum of p_H and p_{OH} of solutions of sodium hydroxide ranging in concentration from *M*/30 to *M*/3000 values of the dissociation constant of water were obtained; pk_w^{17} is given as 14·13 and pk_w^{18} as 14·10. It is concluded that on thermodynamical grounds neutral salts are without influence on the dissociation constant of water, but an exact experimental demonstration is not given. J. P.

Amphoteric Elements. J. KASARNOWSKY (*Z. anorg. Chem.*, 1923, **128**, 33—44).—The measurement of the normal potential of the system Te/Te″ presents difficulties which have not yet been surmounted, but by applying Nernst's heat theory to the reaction $H_2Te=H_2+Te+34,900$ cal. the value has been calculated to be about −0·913 volt. The *E.M.F.* of the system Te|1 mol. $Te^{\cdot\cdot\cdot\cdot}$|1 mol. Te″|Te would be 1·48 volts and the ion product $[Te^{\cdot\cdot\cdot\cdot}][Te'']^2$ 0·85 . 10^{-102}. For the reaction $Te_2'' \rightleftharpoons Te''+Te$, the value of the constant $K=[Te'']/[Te_2'']$ is 0·39 . 10^{-2}. In a similar manner, the normal potential of selenium with respect to its bivalent ion, Se/Se″, is calculated to be −0·771 volt. The increasing sensitiveness of sulphides, selenides, and tellurides to oxygen is seen to be in the order of the normal potentials of the three elements, the value for sulphur being −0·55. The value for polonium, extrapolated from that of tellurium, is probably about −1·0 volt. It follows from the extremely small value of the ion products, that a positive ion of an amphoteric element practically cannot exist in presence of negative ions, and *vice versa*. Amphoteric cleavage is a strongly endothermic process. For tellurium, the following values are calculated: $3Te \rightleftharpoons Te^{\cdot\cdot\cdot\cdot}+2Te''-136,000$ cal. and $5Te \rightleftharpoons Te^{\cdot\cdot\cdot\cdot}+2Te_2''-129,000$ cal. The formation of ditelluride can then be expressed by the equation: $Te''+Te=Te_2''+3,500$ cal.

E. H. R.

The Potential Surfaces of Ternary Alloys of Cadmium and Mercury with Tin or Lead. Robert Kremann, Hermann Prammer, and Ludwig Helly (*Z. anorg. Chem.*, 1923, **127**, 295—315).—The potentials of ternary alloys of cadmium, mercury, and tin and of cadmium, mercury, and lead were measured against a $Hg|N$-$CdSO_4$ electrode, and the results obtained are discussed with the aid of diagrams for which the original should be consulted.

H. H.

The Electrochemical Behaviour of Alloys of Iron–Chromium, Iron–Molybdenum, and Iron–Aluminium. G. Tammann and E. Sotter (*Z. anorg. Chem.*, 1923, **127**, 257—272).—The potentials of iron–chromium alloys in $N/10$-sulphuric acid were measured with anodic and cathodic polarisation. Up to 15% of chromium, the potential is negative to chromium in each case, but above that percentage of chromium the alloy is strongly electropositive to chromium with cathodic polarisation, and only slightly so with anodic polarisation. The end potential is not reached immediately, and for anodic polarisation the equation $t=t_0e^{\alpha(\pi-\pi_0)}$ is suggested, where π_0 is the potential at time t_0 and α is a constant. For cathodic polarisation, the case is more complex, there being apparently three distinct periods. Polishing with emery, and heating at 400° decrease the electro-positiveness of the alloys. The presence or absence of air bubbling through the solution affects the potential but little, but the presence of a reducing agent, such as pyrogallol, phosphorus, or quinol, reduces the electropositiveness of cathodically polarised iron–chromium alloys to a remarkable extent. Molybdenum–iron alloys are electronegative to molybdenum up to 65% molybdenum, and then slightly electropositive. For iron–aluminium alloys, the potential slowly falls with time when cathodically polarised, and rises when anodically polarised. It is suggested that passivity depends on the protection of the metal by a layer of oxygen, but that the density of this layer can vary within fairly wide limits.

H. H.

The Galvanic Tensions of Ternary Alloys of Antimony, Zinc, and Bismuth. Robert Kremann, August Langsbauer and Hermann Rauch (*Z. anorg. Chem.*, 1923, **127**, 229—238).—The

E.M.F. of some ternary alloys of zinc, antimony, and bismuth were measured against a Zn|*N*-$ZnSO_4$ element. By keeping the ratio bismuth/antimony constant, and varying the proportion of the other component, part of the ternary equilibrium diagram was constructed. Measurements were made with alloys which had been slowly cooled and with the same alloys tempered for twelve hours at 260°. Three cases are distinguished: (*a*) ternary alloys in which the ratio Sb/Zn is less than 40/60 atom.%, which show practically the potential of zinc; (*b*) ternary alloys in which the ratio Sb/Zn lies between 40/60 and 50/50 atom.%, which behave as mixtures of the binary compounds Zn_3Sb_2 and ZnSb with bismuth and show a potential about 50—100 millivolts more positive than zinc, and (*c*) ternary alloys in which the ratio Sb/Zn lies between 50/50 and 100/0 atom.%, which are less noble than zinc. By plotting isopotential lines on the triangular concentration diagram, it is shown that for alloys containing 50/50 atom.% of Zn/Sb, the *E.M.F.* is practically independent of the bismuth content, especially in the case of the tempered alloys. H. H.

The Galvanic Tensions of Ternary Alloys of Bismuth, Cadmium, and Lead. ROBERT KREMANN and AUGUST LANGBAUER (*Z. anorg. Chem.*, 1923, **127**, 239—243; cf. preceding abstract).—The *E.M.F.* of ternary alloys of bismuth, cadmium, and lead were measured against a Cd|*N*-$CdSO_4$ element. Triangular concentration diagrams on which isopotential lines were plotted, were constructed as before, and from the results obtained it is found that the potential of the alloy falls abruptly from that of cadmium to that of lead as soon as the percentage by weight of the former in the alloy falls below 4. Bismuth has very little effect on the *E.M.F.* until the Bi/Pb ratio rises to 98/2, when the *E.M.F.* again falls abruptly to that of bismuth. H. H.

A New Type of Reduction-Oxidation System. I. Cysteine and Glutathione. MALCOLM DIXON and JUDA HIRSCH QUASTEL (T., 1923, **123**, 2943—2953).

Membrane Potentials and Colloidal Behaviour. A. V. HILL (*J. Gen. Physiol.*, 1923, **6**, 91).—A reply to Hitchcock (this vol., ii, 530), in which the author's criticism (this vol., ii, 221) is reiterated. E. S.

Membrane Potentials and Colloidal Behaviour. DAVID I. HITCHCOCK (*J. Gen. Physiol.*, 1923, **6**, 93).—A reply to Hill (cf. preceding abstract). E. S.

Temperature Coefficients of Unsaturated Weston Cells. WARREN C. VOSBURGH and MARION EPPLEY (*J. Amer. Chem. Soc.*, 1923, **45**, 2268—2277).—The *E.M.F.* of unsaturated Weston cells has been investigated. It is shown that the *E.M.F.* increases in an approximately linear manner as the concentration of cadmium sulphate decreases. The *E.M.F.* values are linear functions of the temperature between 15° and 35°, but not between 35° and 45°. The temperature coefficient between 15° and 35° is found to be a

linear function of the *E.M.F.* It decreased from 0·0000028 volt per degree for cells with an *E.M.F.* of 1·01827 volts to −0·000013 volt per degree for cells with an *E.M.F.* of 1·0210 volts. Normal cells with electrodes made by saturating 0·015*M*-sulphuric acid solution with hydrated cadmium sulphate behave in accordance with Wolff's temperature formula. Mercurous sulphate prepared by reduction of mercuric sulphate with formaldehyde at 100° showed no difference in its behaviour in normal cells from the electrolytic salt. The differential heat of solution of hydrated cadmium sulphate in a slightly acid saturated solution has been calculated, and the following values have been obtained for 0·012*M*-sulphuric acid: 15°, −352 cal./mol., 18°, −431 cal./mol, and 25°, −605 cal./mol.
J. F. S.

Action of Light on Electrodes of Metals possessing Low Solution Pressures. RENÉ AUDUBERT (*Compt. rend.*, 1923, **177**, 818—821; cf. Buisson, A., 1900, ii, 519).—Experiments are carried out on the effect of illuminating one of two electrodes formed of the same metal and immersed in the same electrolyte, illumination being effected using an arc lamp (or nitrogen-filled tungsten lamp) with a condenser, and, in some experiments, light filters. Independently of the electrolyte, the illuminated electrode becomes the anode in the case of platinum, copper, and mercury, and the cathode in the case of silver and gold, unless secondary effects (photochemical decomposition of electrolyte, etc.) occur. Thus in presence of ferrous or ferric salts, the illuminated platinum electrode becomes negative or positive, according as oxidation or reduction is dominant, whilst a silver electrode, in hydrochloric acid solution, is covered with silver chloride when illuminated.

Blue rays are much more active than red ones. The sensitivity of metals varies inversely with their solution pressures, and for each metal there appears to be a threshold of excitation which, as metals more and more electropositive are considered, is displaced towards higher frequencies.

The effects produced are independent of the anion, and appear to depend on the layer of kations adsorbed on the electrode, and on the solution-pressure of the kation. E. E. T.

Intermittent Current Electrolysis. II. Overvoltage Study of the Lead Electrode. SAMUEL GLASSTONE (T., 1923, **123**, 2926—2934).

Note on Glasstone's Discussion of Over-voltage Measurement. HERBERT HAWLEY and HENRY JULIUS SALOMON SAND (T., 1923, **123**, 2891—2901).

Ions and Ionic Activity. P. DEBYE (*Chem. Weekblad*, 1923, **20**, 562—568).—A repetition of the criticisms already advanced against the theory of Ghosh by Prins (this vol., ii, 369) and the author (this vol., ii, 724). The conception of an "electrical atmosphere" round the ion is developed from considerations of energy and potential; the formulæ obtained give values different from, but of the same order of magnitude as those deduced by Ghosh. Mathematical treatment indicates that for a completely dissociated solution the osmotic pressure is determined not only by the concentrations, but also by the valencies of the ions. The addition of a second salt, *B*, to a system consisting of a saturated solution of one salt, *A*, with excess of undissolved *A*, is considered from the energy point of view, and equations are deduced. S. I. L.

Moving Boundary Method for Determining Transport Numbers. DUNCAN A. MACINNES and EDGAR REYNOLDS SMITH (*J. Amer. Chem. Soc.*, 1923, **45**, 2246—2255).—The Denison and Steele method of determining transport numbers (A., 1903, ii, 709; 1906, ii, 68, 329) has been investigated, and a modification developed which involves only a single moving boundary. It is shown that the boundaries move with the theoretical velocities only when the two solutions in contact at a boundary are adjusted to within about 5%, to the relation $C/T=C'/T'$, in which C and C' are the concentrations and T and T' are the transport numbers. The correct value of the transport number can therefore be obtained by a series of experiments approaching more and more closely to this relation. Unless the adjustment is obtained, the results are not independent of the composition of the indicator solution, or of the current passing through the apparatus, and may vary widely and erratically from the true values. The transport numbers at 25° have been determined for $0{\cdot}1N$-solutions of potassium chloride and potassium bromide, using lithium bromide as indicator solution. The transport number of potassium in potassium chloride is found to be $0{\cdot}492\pm0{\cdot}001$ at 25° and in potassium bromide 0·485. These values are compared with the values of Denison and Steele and others. It is shown that the conductivity of the potassium-ion is the same in these two solutions if the correction for viscosity is made.

J. F. S.

The Position of Tellurium in the Voltaic Series. J. KASARNOWSKY (*Z. anorg. Chem.*, 1923, **128**, 17—32).—When tellurium is used as cathode in the electrolysis of potassium hydroxide it dissolves as a univalent element, forming potassium ditelluride, K_2Te_2. On the other hand, used as anode in the electrolysis of hydrochloric acid, tellurium passes into solution as a quadrivalent metal, forming $TiCl_4$. The author has measured the normal potential of tellurium corresponding with the two ions Te_2'' and $Te^{\cdot\cdot\cdot\cdot}$. The potential of the system Te/Te_2'', determined in potassium hydroxide solution, varies with the concentration according to Nernst's equation; the normal potential is $-0{\cdot}818$ volt. The normal potential of the system $Te/Te^{\cdot\cdot\cdot\cdot}$ is $+0{\cdot}549\pm0{\cdot}001$ volt. This is the first example of the determination of the normal potentials of an amphoteric element with respect to its positive and negative ions. As a metal, tellurium comes between copper (0·34) and silver (0·80), whilst it is the "noblest" of the metalloids, so far as they have yet been measured. The hypothetical system $Te|N\text{-}Te^{\cdot\cdot\cdot\cdot}/N\text{-}Te_2''|Te$ should have an *E.M.F.* of 1·37 volts, and the ion product, calculated from van't Hoff's equation, is $[Te^{\cdot\cdot\cdot\cdot}][Te_2'']^2=10^{-95}$.

This gives a measure of the amount of dissociation of tellurium into positive and negative ions. E. H. R.

Electrolytic Separation [Deposition] of Alloys. A. H. W. Aten (*Rec. trav. chim.*, 1923, **42**, 931—938).—A theoretical discussion of the possibility of depositing an alloy by electrolysis. The problem resolves itself into one of discovering a solution of such a composition that the anode will dissolve in the same proportions as the metals are deposited on the cathode. It is not necessary that the anode shall have this composition. The author concludes that the problem, although difficult, may be capable of solution. H. H.

Chemical Effects Produced by Passing Electric Currents through Thin Artificial Membranes of High Resistance. R. S. Lillie and S. E. Pond (*Proc. Amer. Physiol. Soc., Amer. J. Physiol.*, 1923, **63**, 415—416).—An electric current corresponding with a potential of 10 volts flowing across a caoutchouc membrane of thickness 40 μ interposed between two electrolyte solutions, one of which is a mixture of ferrous chloride and potassium thiocyanate, causes oxidation of ferrous to ferric iron at the surface of the membrane facing the cathode. Chemical Abstracts.

Anomalies of Chromium and its Behaviour during Electrolysis by Alternating Current. N. Isgarischev and A. Obrutscheva (*Z. Elektrochem.*, 1923, **29**, 428—434).—The solubility of chromium electrodes in acid, alkaline, and neutral solutions, using direct and alternating current and both types of current simultaneously, has been investigated. The solubility of chromium in sulphuric acid at various temperatures and in the presence of various anions has also been investigated. It is shown that there is no definite transition point at which passive chromium passes into the active condition, as is the case in allotropic changes. The metal can become active at any temperature, the activation depending on the properties of the medium. Chromium is rendered passive by exposure to air, by the action of oxidising agents such as chromic acid, hydrogen peroxide, and potassium permanganate, and by the action of electrolytic oxygen; it is rendered active by electrolytic reduction and by mechanical purification of the surface. Consequently, the passivity of chromium is connected with the formation of a protecting oxide film on the surface. The protecting film is a transparent, colloidal substance, the density and permanence, and consequently the passivating action, of which depend on the nature of the medium, particularly on the presence of those ions, such as chloride- and bromide-ions, which bring about colloidal transitions. Chloride-ions have the greatest disturbing effect on the film and make it permeable to most reagents. Particles of passive chromium become active when brought into contact with active chromium, zinc, or magnesium. Since these metals are all more electronegative than passive chromium, this action is due to the formation of a galvanic element which liberates hydrogen and consequently reduces the oxide film. The oxide film is also the cause of the anomalies of chromium. Chromium dissolves as anode to give bi-, ter-, and sexa-valent ions, the amounts of the various types of ion depending on the conditions. J. F. S.

The Electrochemistry of the High Intensity Arc. PRESTON R. BASSETT (*Trans. Amer. Electrochem. Soc.* [advance copy], 1923, 319—338).—The phenomena exhibited by various types of electric arcs operated with currents ranging from 20 to 300 amperes are briefly described. The tendency to produce two arc flames, a positive and a negative, is present in practically all arcs, and in the high-intensity arc this tendency is enhanced, so that the two flames are separate and distinct, and each flame performs a separate function, the positive flame operating as light producer, and the negative as arc maintainer. The positive electrode consists of a core of cerium fluoride and carbon surrounded by a shell of non-graphitisable pure carbon. The negative carbon electrode contains a core of soft carbon. The arc is customarily operated with a current of 150 amperes. The intrinsic brilliance of the arc is from 500 to 1,000 candles per sq. mm., and its temperature about 4,700°. It is suggested that the high intrinsic brilliance of the arc is attributable to the formation of cerium carbide in the arc. J. S. G. T.

Thermal Conductivities of some Metals in the Solid and Liquid States. W. BYRON BROWN (*Physical Rev.*, 1923, **22**, 171—179).—In the guard ring method of measurement employed, a cylinder of the metal, electrically heated at one end, was surrounded by a slate tube and a hollow brass cylinder, also heated electrically at one end. The other ends were cooled with running water, and the conductivity calculated from the energy applied to the rod and the temperature gradient. Tables and curves are given for the conductivity of tin, cadmium, thallium, and tin–zinc, tin–lead, lead–antimony, and lead–bismuth alloys. For the pure metals, the following values are abstracted. Tin: 50°, 0·1428; 102°, 0·1404; 209°, 0·1297. Cadmium: 45°, 0·200; 99°, 0·209; 240°, 0·239. Thallium: 45°, 0·0934; 90°, 0·0958; 113°, 0·0976; 125°, 0·0919; 149°, 0·0927. A polymorphic change in thallium at 120° is thus indicated. A. A. E.

Entropy of Diatomic Gases and Rotational Specific Heat. RICHARD C. TOLMAN and RICHARD M. BADGER (*J. Amer. Chem. Soc.*, 1923, **45**, 2277—2285).—A direct mathematical method has been developed for determining the theoretical values of the constants S_2 and $C_{298\cdot1}$ in the equations for the entropy of diatomic gases, $S=7/2R\log_e T+3/2\log_e M-R\log_e p+R\log_e J+S_2$; $S_{(298\cdot1,\ 1\ \mathrm{atm})}=3/2R\log_e M+R\log_e JC_{298\cdot1}$. Six different hypotheses which have been proposed for rotational specific heat all based on the first form of quantum theory, but based on different hypotheses as to a priori probabilities and as to the lowest possible azimuthal quantum number, have been used to determine the theoretical values of S_2 and $C_{298\cdot1}$, and the results compared with the experimental values. In the absence of further evidence, the best values for S_2 and $C_{298\cdot1}$ are 64·92 and 104·57, respectively, the units being, entropy in calories, temperature in degrees centigrade absolute, pressure in atmospheres, molecular weight in g./mol., moment of inertia in g.cm.^{2}/mol. J. F. S.

The Form of the Melting-point Curves of Series of Binary Mixed Crystals, and the Lattice Parameters of their Components. Eustace J. Cuy (*Z. anorg. Chem.*, 1923, **128**, 241—244).—The maximum departure from the straight line joining the melting points of the components of the curve of the beginning of crystallisation, a temperature range ΔTm, has been plotted against the relative difference of the two lattice parameters, Δd, given by the expression $\Delta d=(d_A-d_B)/(d_A/2+d_B/2)$, where d_A and d_B are the parameters of the two components, A and B, for a series of pairs of halides of the alkali metals, and some alloys. The points found lie on a straight line, which for the value $\Delta Tm=0$ (*i.e.*, when the temperature of beginning of crystallisation lies on the line joining the melting points of the two components) cuts the Δd axis at the value 0·04. S. I. L.

Cryoscopy in $Na_2SO_4,10H_2O$. Molecular Magnitudes of Malates, Molybdates, and Molybdomalates. E. Darmois and J. Périn (*Compt rend.*, 1923, **177**, 762—765; cf. A., 1922, i, 220, 522; Löwenherz, A., 1896, ii, 149, and Boutaric and Leenhardt, A., 1912, ii, 1136).—Sodium sulphate decahydrate is used as a cryoscopic solvent, k being calculated from a study of the $\Delta t/c$–Δt curves for carbamide, sodium chloride, and sodium nitrate. The value of k so found, namely, 32, is then made use of in determining the molecular complexity of various sodium salts, the results being as follows: Sodium malate, $C_4H_5O_5Na$, sodium molybdate, Na_2MoO_4, sodium "acid" molybdate, $Na_6Mo_7O_{24}$; sodium dimolybdomalate (hexahydrate) (M found, 1010) is derived from a tetramolybdic acid whilst sodium molybdodimalate (M found, 427) is derived from 2 mols. of malic acid (cf. Klason, A., 1901, ii, 162). Whereas the sodium salts give true molecular weights in sodium sulphate solution, the corresponding ammonium salts are completely dissociated as in aqueous solution. E. E. T.

The Accurate Determination of Elevation of Boiling Point. Kazimierz Jabłczyński and Stanisław Kon (T., 1923, **123**, 2953—2963).

Vapour Pressure of Monatomic Elements. Russell W. Millar (*J. Amer. Chem. Soc.*, 1923, **45**, 2323—2329).—A theoretical paper in which a formula has been derived by means of which the pressure of a monatomic gas in equilibrium with the liquid or solid element can be calculated from specific heat data and one vapour pressure measurement, the latter being required to evaluate the integration constant Z. The equation in its general form is $\log p(\text{atm.}) = (2{\cdot}5 - [a - \beta]/R)\log T - 2{\cdot}303\beta/2R\,.\log T^2 + Z/T + 1/R[1{\cdot}5R\log w + \alpha\log T_0 + 2{\cdot}303\beta/2\,(\log T_0)^2 - (2{\cdot}63 + S_0 - (\alpha - \beta) + 2{\cdot}5R)/2{\cdot}303]$. This formula has been evaluated for mercury, zinc, sodium, and hydrogen. In the case of mercury, it takes the form $\log p(\text{mm.}) = -0{\cdot}8443\log T - 3319{\cdot}6/T + 10{\cdot}5134$, and reproduces the observed values with fair accuracy. For sodium, the equation is $\log p(\text{mm.}) = -1{\cdot}20 \log T - 5135/T + 11{\cdot}071$, and in this case the agreement of the calculated value with the experimental value is very much better at low temperatures than at higher temperatures. In the case of zinc, the equation is $\log p(\text{mm.}) = 4{\cdot}0583 \log T - 0{\cdot}7845 (\log T)^2 - 6823{\cdot}1/T + 3{\cdot}7555$, which reproduces the experimental values with fair accuracy up to 363°. Hydrogen, below 60° Å., has the heat capacity of a monatomic gas. The formula in this case is $\log p(\text{mm.}) = 7{\cdot}3725 \log T - 2{\cdot}0572 (\log T)^2 - 26{\cdot}8679/T - 1{\cdot}9280$, which gives fair agreement. J. F. S.

Free Energy of the Thiosulphate-ion. F. Russell Bichowsky (*J. Amer. Chem. Soc.*, 1923, **45**, 2225—2235).—A complete thermodynamic investigation of the reaction $S + CaSO_3,2H_2O = CaS_2O_3\ aq + 2H_2O$ has been carried out. The reaction is shown to be reversible, and the equilibrium constant has been determined at 141°, 122°, 110°, 100° and 79·8°. Calcium thiosulphate, $CaS_2O_3,6H_2O$ dissolves in water at 25° to the extent of 2·28 g. of the crystallised salt per 1,000 g. of solution. The heat of the reaction has been determined experimentally as well as the specific heat, freezing point, and heat of dilution of solutions of calcium thiosulphate. The solubility of the dihydrate of calcium sulphite has been determined at 25°, and the mean value 0·000037 g. mols. per litre obtained. Using the data obtained in the present investigation and other data, the free energy of formation, $\Delta F_{298°}$, of the thiosulphate-ion is calculated to be —125,110 cal. J. F. S.

The Heats of Combustion of Benzoic Acid, Naphthalene, and Sucrose. P. Schläpfer and W. Fioroni (*Helv. Chim. Acta*, 1923, **6**, 713—729).—The ratios between the heats of combustion of benzoic acid, naphthalene, and sucrose were determined with great exactitude for the purpose of using these substances as calorimeter standards. The heat of combustion of benzoic acid was taken as 6324 cal. per gram weighed in air, and this value was used for determining the water equivalent of the calorimeter. The value so obtained was used in determining the heats of combustion of naphthalene and sucrose both by the ordinary method and the adiabatic method. The most probable values are: naphthalene 9613·7, and sucrose 3945·7 cal. per gram. E. H. R.

The Adiabatic Cooling of Water and the Temperature of its Maximum Density as a Function of Pressure. Nicolai Antonovitch Pushin and Elijah Vasiljevich Grebenshchikov (T., 1923, **123**, 2717—2725).

Some Thermal Properties of Gases. I. Density of the Coexistent Phases of Dimethyl Ether. Ettore Cardoso and Augusto Acquaviva Coppola (*J. Chim. Phys.*, 1923, **20**, 337—346).—The density of the liquid and gaseous phases of dimethyl ether have been experimentally determined from 0·20° to 126·50°. Extrapolation of the value for 126·90°, that is, for the critical temperature, leads to the value 0·2714±0·0003 for the critical density. J. F. S.

Some Thermal Properties of Gases. II. Critical Constants and the Vapour Pressure of Dimethyl Ether. ETTORE CARDOSO and ALFREDO BRUNO (*J. Chim. Phys.*, 1923, **20**, 347—351; cf. preceding abstract).—The critical pressure and temperature and the vapour pressure of dimethyl ether have been determined at temperatures 126·9° to 0·0°. The following experimentally determined data are recorded: $t_c=126·90°\pm0·05°$, $p_c=52·00\pm0·05$ atm. vapour pressure at 122·20°, 47·67 atm.; 117·80°, 44·06; 116·82° 43·41; 113·75°, 41·24; 110·57°, 38·82; 99·90°, 32·14; 90·25° 26·80; 80·10°, 22·14; 64·68°, 15·95; 56·02°, 13·11; 49·75°, 11·22 46·13°, 10·31; 33·55°, 7·49; 25·40°, 6·05; 16·80°, 4·58; 9·25° 3·58; 0·00°, 2·52. The vapour pressure is expressed by the equation $\log p=0·40654+0·016082t-0·000069963t^2+0·00000019343t^3$. The differential coefficient is given by $dp/dt=p(0·037031-0·00032220t+0·0000013362t^2)$. J. F. S.

Wetting of Glasses by Mercury. EARLE E. SCHUMACHER (*J. Amer. Chem. Soc.*, 1923, **45**, 2255—2261).—An attempt has been made to cause mercury to wet glass and quartz after their surfaces have been freed from gas by heating at 550° in a vacuum. Fairly good wetting can generally be obtained on quartz after this treatment, but it can only be obtained occasionally on Pyrex glass and on lime soda glass. The difficulty in causing mercury to wet glass appears to become greater as the alkali-content of the glass becomes greater. The term "wetting" is used in the sense that wetting is complete when the angle of contact between liquid and solid is zero and the meniscus is concave, and that the liquid does not wet the glass in cases where the angle of contact is zero and the meniscus is convex. In the present work, wetting was considered to have taken place when the meniscus of the mercury was less convex at the conclusion of the experiment than it was at the start. J. F. S.

The Nature of Charcoal "Sorption." H. HORTON SHELDON (*Physical Rev.*, 1922, **19**, 253).—The dual nature of sorption (McBain, A., 1919, ii, 449) by charcoal is demonstrated by the fact that when the pressure–time curve for gases, or the concentration–time curve for solutions, is plotted, there are evidently two distinct parts separated by a bend. The second action, however, begins only after the first is nearly complete. Since solution should begin as soon as adsorption, it is suggested that the second part is due to diffusion into the more inaccessible channels; this cannot be expected to take place to any extent until the easily accessible or directly exposed portions are saturated. A. A. E.

Adsorption of Uranium-X_1 and Thorium by Charcoal. H. FREUNDLICH and MARIE WRESCHNER (*Z. physikal. Chem.*, 1923, **106**, 366—377).—Uranium-X_1 is completely adsorbed by charcoal from a solution of a uranium salt, but if a small quantity of a thorium salt is added the uranium-X_1 is not adsorbed at all. It was shown previously that if the thorium nitrate used in the above experiment is previously shaken with charcoal, it loses, to a great extent, its power of displacing the adsorption of uranium-X_1 (A., 1916, ii, 70). This result is confirmed in the present paper; it is also shown that a solution of thorium nitrate which has been shaken with charcoal behaves like a solution of thorium nitrate which has passed through a dialysis membrane or one from which the colloidal particles has been removed by cataphoresis. This leads to the view that the colloidal particles in thorium nitrate are responsible to a large extent for the displacement of the adsorption of uranium-X_1 by charcoal, and that when these particles are removed by adsorption, dialysis, or cataphoresis the displacing action of thorium nitrate ceases. This explanation is in keeping with the fact that when an acid, colloid-free solution of thorium nitrate after treatment with charcoal is evaporated to dryness and redissolved, it has the same displacing effect as an untreated solution of thorium nitrate. The explanation is that the colloid particles are not removed from acid solutions by charcoal, and on solution after evaporation these are again peptised. Uranium-X_1 is also partly adsorbed as colloidal particles, and this would explain the very long time required for setting up the adsorption equilibrium and the reversible nature of the displacement by thorium, whilst other adsorptives such as benzoic acid and strychnine nitrate are not reversibly displaced. J. F. S.

Adsorption. III. Peptisation and the Reversal of the Charge on some Hydroxides. K. C. Sen and N. R. Dhar (*Kolloid Z.*, 1923, **33**, 193—202; cf. A., 1922, ii, 205).—The peptisation of the hydroxides of iron, mercury, cobalt, copper, nickel, manganese, cadmium, thorium, and cerium by means of solutions of non-electrolytes such as sucrose, dextrose, lævulose, galactose, lactose, mannose, dextrin, starch, and glycerol, has been investigated, in most cases quantitatively. It is found that peptisation only takes place when the alkali hydroxide is added to a mixture of a salt of the metal and the peptising agent. In some cases, it is found that a slight excess of alkali over that required for the formation of the hydroxide assists the peptisation. An increase in the concentration of the salt requires a proportional increase in the peptising agent for complete peptisation. In all cases, the peptisation is chiefly specific, although there is a similarity in the action of the various peptising agents. It is found generally that the hydroxide prepared from sulphates, that is, in the presence of sulphat-ions, is less easily peptised than the same hydroxide in the presence of chloride- or nitrate-ions. Freshly precipitated ferric hydroxide passes into a negatively charged colloid in the presence of arsenious acid. In the presence of an excess of alkali and either glycerol or sucrose, the charge of the colloid is negative, but on adding the alkali slowly to a mixture of ferric chloride and sucrose or glycerol the colloid passes through three definite stages. At first it is positively charged, then it coagulates, and finally it passes into a negative colloid. J. F. S.

The Dissociation Constant of Lithium Hydroxide and the Second Dissociation Constant of Salicylic Acid. I. M. Kolthoff (*Rec. trav. chim.*, 1923, **42**, 969—972).—The "dissociation constant" of lithium hydroxide was found to be approximately 0·5. Sodium salicylate may be supposed to ionise in two stages: $OH\cdot C_6H_4\cdot CO\cdot OH \rightleftharpoons Na^{\cdot} + OH\cdot C_6H_4\cdot CO\cdot O'$ and $OH\cdot C_6H_4\cdot CO\cdot O' \rightleftharpoons O'\cdot C_6H_4\cdot CO\cdot O' + H^{\cdot}$. For the second of these equilibria, the dissociation constant is $3{\cdot}6\times10^{-14}$. H. H.

The [Second] Dissociation Constant of the Hydroxides of the Alkaline Earth Metals. I. M. KOLTHOFF (*Rec. trav. chim.*, 1923, **42**, 973—979).—The second dissociation constant, that for the equilibrium $MOH^{\cdot} \rightleftharpoons M^{\cdot\cdot} + OH'$, was measured for the hydroxides of barium, strontium, calcium, and magnesium. The values found were: $Ba(OH)_2$, 0·19±0·02; $Sr(OH)_2$, 0·15±0·01; $Ca(OH)_2$, 0·086±0·005; $Mg(OH)_2$, 0·004±0·001. H. H.

Nature of Non-dissociated Acids. H. VON HALBAN (*Z. Elektrochem.*, 1923, **29**, 434—444).—A theoretical paper in which the author discusses and criticises Hantzsch's theory of ionisation (this vol., ii, 475). It is shown that Hantzsch's conception of the pseudo-acid may not be extended to acids generally, nor may it be applied to electrolytes as a whole. J. F. S.

Kinetic Theory of Osmotic Pressure. GÉZA SCHAY (*Z. physikal. Chem.*, 1923, **106**, 378—385).—A theoretical paper in which, on the basis of van der Waals's views, a kinetic hypothesis of solutions of non-electrolytes is developed, and in this connexion it is shown that cause of the osmotic phenomena is not to be sought in a pressure exerted by the dissolved molecules, but rather in a pressure difference of the solvent. The osmotic pressure formula put forward by Sackur has been developed theoretically, and two other possible formulæ have been derived. J. F. S.

Concentrated Salt Solutions. R. O. HERZOG and W. BERGENTHUN (*Annalen*, 1923, **433**, 117—121).—The addition of a small quantity of sucrose to a solution of calcium chloride of about $7N$-concentration causes an increase in the boiling point which is less than that calculated by Raoult's equation. The boiling point of a more concentrated solution is, however, decreased, whilst for certain concentrations there is no effect. A depression of the boiling point is observed when lactose or mannitol is added to $8{\cdot}09N$-calcium chloride, or when dextrose is added to a $8{\cdot}09N$-solution; also by the addition of sucrose to solutions of lithium chloride or calcium thiocyanate. Very little departure from the calculated increase in boiling point is observed when sugar is added to $5{\cdot}3N$-sodium chloride solution. A series of figures is quoted for calcium chloride solutions. Since the work of dilution and the heat of dilution are practically equal, conclusions respecting the nature of the complexes formed cannot be drawn without the aid of further assumptions.

The distribution of cellobiose octa-acetate between chloroform and calcium thiocyanate of the normalities, 90·8, 8·68, and 7·90, has been measured. For a given concentration of salt solution the partition coefficient remains constant; the relative solubility in the aqueous solution decreases rapidly with the concentration of the salt. W. S. N.

X-Rays and Crystal Structure. SIR W. H. BRAGG (*Nature*, 1923, **112**, 618).—A brief discussion of the facts revealed by the *X*-ray method of crystal analysis, and the limitations of the method. The significance of the term "molecule" is considered in relation to crystal structure. A. A. E.

[X-Ray Analysis of Crystals.] SIR W. H. BRAGG (*J. Franklin Inst.*, 1923, **196**, 675—677).—In reply to adverse criticism by Wyckoff (this vol., ii, 300) of the results obtained by the method of *X*-ray analysis of crystals, on the ground that this method pays insufficient attention to the theory of space groups, the author points out that whereas the older methods, depending on observations of form, enable the class of a crystal nearly always to be determined, but not its space-group, the method of *X*-ray analysis likewise enables the crystal class to be determined, and in addition permits, in a large number of cases, data referring to the appropriate space group being ascertained. The conclusions of mathematical crystallography can only prove the possibility of what *X*-rays actually find, and the author contends that it is unreasonable to reject results because they have been obtained without the use of the terms of the theory of space-groups, since the terms naturally used in *X*-ray analysis are equally effective in expressing the laws of symmetry. The argument is supported by reference to resorcinol, assigned on the basis of its asymmetric molecular structure, ascertained by *X*-ray analysis to the space-group C_{2h}^{10}. In the absence of knowledge of the asymmetric character of the molecule, the crystal might equally well be assigned to the space group Q_h^{12}. J. S. G. T.

Stability, in Presence of Water, of a certain Number of Binary Mixtures. N. PERRAKIS (*Compt. rend.*, 1923, **177**, 879—882).—A determination of the quantity of water, which, added to a definite weight of a binary mixture, at constant temperature, causes the appearance of a second layer. The mixtures chosen were: (*a*) ethyl alcohol with one of the following: diphenyl ether, benzene, *o*-cresol, or phenol, (*b*) benzene with one of the following: methyl, ethyl, *iso*propyl, or *n*-butyl alcohols. The results are discussed in terms of miscibility and solubility relationships. E. E. T.

Liesegang Rings. III. Effect of Light and Hydrogen-ion Concentration on the Formation of Colloidal Gold in Silicic Acid Gel. Rhythmic Bands of Purple of Cassius. EARL C. H. DAVIES (*J. Amer. Chem. Soc.*, 1923, **45**, 2261—2268; cf. A., 1922, ii, 140).—A number of experiments are described which show that gels made with silicic acid and gold chloride and a reducing agent are remarkably affected by light, the effect being the production of a banded structure. The light of small wave-length is the active portion of the light in producing these effects. The results obtained in the present work remove Bancroft's objection ("App. Colloid Chemistry," p. 259), to Holmes's diffusion hypothesis of Liesegang ring formation (A., 1918, ii, 392). A further series of experiments shows that there is a distinct relationship between the hydrogen-ion concentration and the size of the "pockets" in which the gold is formed. The effect of light on the reduction of gold is well shown by the following experiment. To 25 c.c. of $3N$-hydrochloric acid, 2 c.c. of 1% solution of gold chloride are added, and then slowly and with shaking 25 c.c. of water glass (*d* 1·16). The liquid is filtered into test-tubes and allowed to set for three days. It is then covered with black paper and 5 c.c. of saturated oxalic acid solution are added to each tube, and placed in a dark room for three weeks for diffusion to take place. When a tube is brought into bright sunlight, when first opened there will be only a few crystals of gold, but after fifty seconds' exposure to light there will be a flash of colour in the tube. Narrow but rhythmic bands of purple of Cassius may be obtained as follows. To one of the tubes of gel described above add 3 c.c. of a mixture of 10 g. of anhydrous stannous chloride and 0·1 g. of stannic chloride in 90 c.c. of water, and allow to diffuse, when bands will be produced.

J. F. S.

High-speed Stirring as an Aid to Chemical Action. C. H. MILLIGAN and E. EMMET REED (*Ind. Eng. Chem.*, 1923, **15**, 1048—1049).—The speed of many chemical reactions depends on (1) the speed of mutual solution of the reagents, (2) the reaction velocity. If the former is greater than the latter, as in the action of sulphur dioxide on benzene in presence of aluminium chloride, then the progress of the reaction is unaffected by stirring. An investigation of the reverse case as exemplified by the absorption of ethylene in benzene in presence of aluminium chloride and the absorption of hydrogen in cotton-seed oil in presence of nickel gave results showing great acceleration; this is expressed by the equation $v=a+br$, in which v is the rate of gas absorption and r the rate of stirring. In these experiments, the speed of the stirrer head, which was a perforated disk with bell-shaped projection underneath, into which the gas was delivered, was varied between 0 and 14,000 r.p.m.

C. I.

The Radiation Hypothesis of the Velocity of Chemical Reaction. A. KISS (*Chem. Weekblad*, 1923, **20**, 585—589).—By applying to the recent results deduced from the quantum theory by Perrin and others the formula of Arrhenius for the dependence of reaction velocity on temperature, namely $k=se^{-a/T}$, where s and a are constants, the equation $Q/RT^2=\rho/T^2(\nu_2-\nu_1)$, where ν_2 and ν_1 are the frequencies of the radiations bringing about the forward and backward changes in a reversible monomolecular reaction, ρ is Planck's constant $0{\cdot}5\times10^{-10}$ (*C.G.S.*), and T the absolute temperature, is deduced. This equation for a reversible unimolecular change is independent of the nature or number of molecular collisions, but in applying the same reasoning to reactions of a higher order, the latter factors must be taken into account. From the kinetic theory, regarding molecules in collision as new molecules, equations can be deduced in the same way for these reactions also.

The frequencies of the activating radiations may thus be deduced from the heats of reaction, and checked by the absorption spectra.

The theory indicates that an exothermic reaction is much more sensitive to temperature change than an endothermic reaction.

A Homogeneous Gas Reaction. The Thermal Decomposition of Chlorine Monoxide. I. Cyril Norman Hinshelwood and Charles Ross Prichard (T., 1923, **123**, 2730—2738).

Two Heterogeneous Gas Reactions. Cyril Norman Hinshelwood and Charles Ross Prichard (T., 1923, **123**, 2725—2729).

The Velocity of the Action of Oxygen, Nitric Oxide, and Nitrous Oxide on Metals. E. Schröder and G. Tammann (*Z. anorg. Chem.*, 1923, **128**, 179—206).—The rate of oxidation of iron and nickel, as measured by the formation of films at high temperatures on thin plates (this vol., ii, 831), in an atmosphere of oxygen, is independent of the pressure, except at very low pressures; the initial velocity at the same temperature, plotted against the pressure of the gas, gives a curve very similar to the adsorption isotherm of gases by charcoal, indicating that the oxygen is adsorbed by the surface film of oxide. With copper, on the other hand, oxidation is more rapid at low pressures than at high pressures; whilst at the beginning the rate of formation of the oxide skin is lower at low pressures, this skin is permeable to the gas at low pressures, but becomes impermeable at high pressures, so that the velocity of oxidation rapidly falls off as the pressure rises.

At normal pressure, the rate of oxidation of iron in air, oxygen, or nitric oxide is the same at equal temperatures; in nitrous oxide, the rate is lower. The action of both nitric and nitrous oxides on nickel gives rise at first to a slightly permeable skin, which becomes permeable at a definite thickness, 280 $\mu\mu$ measured as air (to obtain absolute thickness, divide by the coefficient of refraction of the oxide film), after which the course of the action becomes similar to that in a mixture of oxygen and nitric oxide in which the partial pressure of the oxygen is greater than 150 mm. S. I. L.

The Discontinuity of the Hydration Process. William A. Davis and J. Vargas Eyre (*Proc. Roy. Soc.*, 1923, [*A*], **104**, 512—537).—The authors have determined the rates of hydration of very different substances, including salts, *e.g.*, calcium sulphate, copper sulphate, and gelatin and fibrous forms of cellulose. The results indicate that under the same conditions of relative humidity the hydration curves for different substances differ very considerably in character. Thus in the case of copper sulphate, the curve showing the percentage of moisture absorbed at short intervals is characterised by long linear portions and short parabolic arcs. The curve for calcium sulphate shows a preponderance of parabolic portions, whilst cellulosic materials are characterised by the almost complete absence of linear portions of the hydration curve. Substances exposed in an atmosphere saturated with water vapour give entirely different hydration curves from those obtained when the same substances are exposed in a drier atmosphere, *e.g.*, 88% humidity.

In some cases, hydration may proceed at a slower rate, over a long period of time, in the atmosphere of greater humidity. Notwithstanding the tendency of a powdery anhydrous salt to "set" to a hard cake as hydration proceeds, the rate of hydration is not affected. The "set" mass continues to absorb water, as though it existed in the form of an open-mesh structure freely permeable to water vapour. Empirical equations for successive parabolic portions of the hydration curves are deduced by simple graphical methods. J. S. G. T.

Chemical Dynamics of Autocatalytic Processes. Dynamics of the Oxidation of Arsenious Acid by Bromic Acid. JERZY STANISLAW CHODKOWSKI (*Roczniki Chemji*, 1923, **2**, 183—270).—It has been suggested by Schilov (A., 1903, ii, 276) that the oxidation of arsenious acid by bromic acid is too slow to be measurable except in the presence of sulphurous acid, although in the presence of excess of hydrogen-ions the reaction begins after a long period of induction. It is now shown that at 40°, in the presence of an excess of hydrogen-ions, the reaction proceeds spontaneously and at a measurable rate; the reaction is an autocatalytic one of the second order, according to the equation $dx^1/dt=kax^1\ (1-x^1)$; the velocity constant is equal to 9·7 at 30·7° and in presence of 1/10 mol. of sulphuric acid. The arsenious acid does not appear to exert any influence on the reaction and merely acts as an indicator of the reaction between bromic and hydrobromic acid; the products of this reaction, bromous and hypobromous acid, then oxidise the arsenious acid present. The initial production of hydrobromic acid must, however, be due to the interaction of arsenious acid with bromic acid. The action of sulphuric acid is proportional to the square of the concentration of hydrogen-ions; the addition of neutral sulphates which reduce this concentration retards the reaction. The addition of hydrogen bromide causes the reaction to proceed in accordance with the formula $dx^1/dt=ka(b^1+x^1).(1-x^1)$, where b^1 is the concentration of the hydrobromic acid, x the initial concentration of bromic acid; the velocity constant remains the same. Hydriodic acid has a similar although much greater action, whilst the addition of chlorine-ions has a much smaller effect; from experiments in which neutral potassium halides were added it can be concluded that the relative accelerating effects of potassium chloride, bromide, and iodide are as 1 : 15 : 3,000. The addition of hydrogen chloride, owing to the simultaneous influence of both hydrogen- and chlorine-ions, has a much greater effect than that of sulphuric acid, whilst arsenic acid, which is the final product of the reaction, also acts as a positive catalyst, although nine times weaker than an equivalent quantity of sulphuric acid. The thermal coefficient of the reaction is normal and amounts to 2·14. G. A. R. K.

The Mechanism of Reduction. III. H. J. PRINS (*Rec. trav. chim.*, 1923, **42**, 942—953; cf. this vol., ii, 548).—In continuation of his previous work, the author has studied the influence of the structure and purity of zinc on the reduction of nitrobenzene in acetic acid solution. The action is practically independent of the crystalline state of the metal, except in the case of the mechanically strained outer layer. At 53°, hydrogen is evolved during the reduction, with a velocity which is constant and independent of the reduction reaction, until about one-fourth of the surface of the metal becomes covered with reaction products.

The velocity of reduction is a linear function of the nitrobenzene concentration up to a critical value of the latter; in this region the surface of the metal remains bare. At higher concentrations a portion, θ, of the surface becomes covered with reaction products, and it is found that the equilibrium velocity is given by the equation $V_{eq}=K_1c(1-\theta)$, so that there can be no reaction on the covered part of the metal. It is supposed that the protective layer is zinc acetate adsorbed by the zinc. H. H.

Measurement and Calculation of Reaction Velocity. H. VON EULER and ERIK RUDBERG (*Z. anorg. Chem.*, 1923, **127**, 244—256; cf. A., 1922, i, 219, and ii, 40).—The influence of the concentration of hydrogen-ions on the velocity of hydrolysis of acetamide and of sucrose was studied. The first case was treated as a bimolecular reaction and the fall of hydrogen-ion concentration with time noted. Electrometric measurements with sulphuric acid and acetamide gave $K_b=3\times10^{-15}$ at the ordinary temperature, in good agreement with earlier values. An attempt was made, but unsuccessfully, by using sodium hydroxide, to measure K_a for acetamide.

Similarly, the effect of p_H on the hydrolysis of sucrose was studied, and it is pointed out that special precautions have to be taken with regard to absorption of carbon dioxide from the air or alkali from glass vessels, if the p_H lies above 4. In these cases, electrometric control is essential. From their results, the authors consider that sucrose has the dissociation constant $K_b=1\times10^{-19}$ or 10^{-20}, and they support Dushman's view (A., 1921, ii, 315) that $K=\nu e^{-h\nu/RT}$, where ν is a frequency probably associated with electrons within the molecule. H. H.

Kinetics of the Conversion of Creatine into Creatinine in Hydrochloric Acid Solutions. GRAHAM EDGAR and R. A. WAKEFIELD (*J. Amer. Chem. Soc.*, 1923, **45**, 2242—2245).—Measurements have been made of the rate of conversion of creatine into creatinine in hydrochloric acid solutions of concentrations 0·19*N*, 0·38*N*, and 0·76*N* at 25°, 57°, 78°, and 100°. The reaction is strictly unimolecular and the velocity increases with increasing concentration of acid. The temperature coefficient is given by Arrhenius's equation, in which the critical increment *E* has a mean value of 20,000 cal. and is independent of the acid concentration. The velocity constant can be expressed by the equations $\log_e K=-E/RT+C$ and $\log_{10}K=-4368/T+C^1$, where C and C^1 are constants depending on the concentration of the acid. J. F. S.

Catalytic Oxidation of Carbon Monoxide. I. Efficiency of the Catalysts Manganese Dioxide, Cupric Oxide, and Mixtures of these Oxides. J. A. ALMQUIST and WILLIAM C. BRAY (*J. Amer. Chem. Soc.*, 1923, **45**, 2305—2322).—Temperature-efficiency curves have been obtained for three series of partly hydrated porous catalysts of manganese dioxide and cupric oxide. A very definite improvement in the efficiency is caused by the addition of a small amount of either oxide to the other. Partial dehydration is necessary to bring a catalyst to a region of maximum activity, but the water content may then be lowered to a relatively small value by slow dehydration with but little change in the efficiency. Continued dehydration, however, finally lowers the efficiency, and causes loss of oxygen (except in the case of copper oxide). The efficiency of a catalyst is independent of the carbon monoxide concentration between 0·1 and 0·6%, and is practically unchanged by the presence at higher concentration of carbon dioxide, the product of the reaction. Water vapour has a marked poisoning effect which is reversible. It is probable that under steady state conditions the oxygen content of a catalyst is practically constant whether the catalyst is operating at low or high efficiency. A catalyst is reduced when treated with carbon monoxide in the absence of oxygen at a temperature at which it would act as a catalyst. The activity of a mixed catalyst is permanently impaired by this reduction, even when much of the lost oxygen is restored on subsequent operation as a catalyst. An hypothesis of the mixture effect in this case is put forward. J. F. S.

Catalysis. XVIII. The Phenomenon of Induction. N. R. Dhar (*Z. anorg. Chem.*, 1923, **128**, 207—211).—A discussion of the results of Skrabal (A., 1915, ii, 533; 1922, ii, 488), the author, and others on the reactions between iodic acid and hydriodic and sulphurous acid. The latter may be resolved into two reactions, (1) the reduction to hydriodic acid, which is slow but much influenced by change of temperature, and (2) oxidation of the hydriodic acid so formed by iodic acid left unchanged, which is very quick, but only slightly influenced by temperature; the second reaction is, however, slowed down by the presence of hydrogen-ions due to the formation of sulphuric acid in the first reaction. The whole reaction is therefore autocatalytic. If arsenious acid is used in place of sulphurous acid, the reduction (1) is much slower and even more strongly influenced by temperature. With other reducing agents there is no induction period, iodine being continuously liberated.

The reaction between a thiosulphate and salts of antimony, silver, bismuth, etc., has now been studied, and found also to have an induction period, depending on the temperature and concentrations; probably there are two reactions involved here also, thiosulphuric acid being first transformed into hydrogen sulphide and tetrathionic acid.

In the hydrogenation of unsaturated organic compounds in presence of colloidal metals, it is suggested that reaction of the hydrogen with oxygen adsorbed or occluded in the metal induces the reduction of the organic body. Similarly the observation of Venkataramaih (*Nature*, 1920, **106**, 46) that permanganate is reduced when a mixture of hydrogen and oxygen is exploded over it may be explained not by the formation of active hydrogen, but as a reaction induced by the reaction between the hydrogen and oxygen. S. I. L.

Catalysis. XIX. Photochemical Catalysis. A. K. SANYAL and N. R. DHAR (*Z. anorg. Chem.*, 1923, **128**, 212—217).—The reaction between mercuric chloride and ammonium oxalate in sunlight has been studied, and it is found that the velocity of reaction is independent of the concentration of the former, *i.e.*, the reaction is unimolecular, although in absence of light it is bimolecular (see Dhar, T., 1917, **111**, 750). With ferric chloride and ammonium oxalate, reaction is extremely slow in the dark, even on boiling, but proceeds normally at the ordinary temperature if the mixture has been exposed to light for a short time. Carbon dioxide retards both reactions. Iron salts exercise a strong positive catalytic effect on all reactions between oxalates and oxidising agents.

Many salts of lead, bismuth, and mercury are sensitive to tropical sunlight, darkening in colour; this effect is accelerated by foreign substances, especially those having the same anion as the salt employed. Halide salts of these metals show loss of the halogen after exposure, lead bromide losing 8—10% of its bromine after seventy-five hours' exposure.

Various mixtures of gases exposed to tropical sunlight react at the ordinary temperature. S. I. L.

Catalysis. XX. The Relation between the Order of a Reaction and its Temperature Coefficient. N. R. DHAR (*Z. anorg. Chem.*, 1923, **128**, 218—228).—The temperature coefficient diminishes with the order of reaction, being greatest for nil-molecular reactions, lower for unimolecular, and lower still for multimolecular reactions. Pseudo-unimolecular reactions are generally really bimolecular, and have moderately high temperature coefficients; the real and not the apparent order of reaction determines the temperature coefficient. S. I. L.

Catalysis. XXI. The Action of Neutral Salts. N. R. DHAR (*Z. anorg. Chem.*, 1923, **128**, 229—240).—The effect of various neutral salts on the reactions between (*a*) oxalic acid and chromic acid, (*b*) formic acid and chromic acid, (*c*) sodium formate and iodine, (*d*) sodium formate and mercuric chloride, and (*e*) sodium formate and silver nitrate has been studied. Some salts retard, others accelerate, the effect being specific for each salt, and more pronounced in dilute than in concentrated solutions; the order of reaction is not affected, nor is the temperature coefficient; the effect of the salt is not modified by change of temperature. S. I. L.

Catalytic Combination of Ethylene and Hydrogen in the Presence of Metallic Copper. II. Measurements of Reaction Velocity at 150°, 200°, and 250°. ROBERT N. PEASE (*J. Amer. Chem. Soc.*, 1923, **45**, 2235—2242; cf. this vol., ii, 472).—A continuation of previous work (*loc. cit.*). The velocity of combination of ethylene with hydrogen in the presence of copper has been determined at 150°, 200°, and 250°. The results show that in this range of temperature the reaction is more nearly bimolecular than at lower temperatures, the combination at 0° is approximately unimolecular with respect to hydrogen, and is somewhat inhibited by excess of ethylene. The more nearly normal character of the reaction at the higher temperature is believed to be due to the fact that in these circumstances the reacting gases are not adsorbed to a measurable extent by the catalysts. The temperature coefficient of the velocity is much smaller at the higher temperatures, and decreases with increasing temperature. These facts are explained in a qualitative manner by taking into account the decrease of adsorption with increasing temperature and the normal increase in the velocity of the surface action. J. F. S.

Studies of Electrovalency. III. The Catalytic Activation of Molecules and the Reaction of Ethylene and Bromine. RONALD GEORGE WREYFORD NORRISH (T., 1923, **123**, 3006—3018).

The Origin of the Chemical Elements. A. VON WEINBERG (*Z. angew. Chem.*, 1923, **36**, 525—529).—An account of Bohr's recent theory of the orbits of revolution of electrons in the atoms from Li=3 to U=92 is given. The 3rd, 4th, 5th, and 6th electrons (Li, Be, B, C) describe elongated ellipses, the figure in the last instance regaining the symmetry of a tetrahedron. On further addition of electrons, the latter in consequence of the forces now present describe circles within the figure and with 8 added electrons the completely symmetrical neon is obtained. Continuing, the 11th electron describes an ellipse related to the neon complex as the 3rd electron was related to the helium nucleus and period III of the periodic system is obtained. In period IV the 8 elements Sc to Ni are formed by addition of electrons to the inner orbit and then follows a series similar to that of the earlier periods, and similarly with series V. This theory does not attempt to afford an explanation of the origin of the different elements. In framing a theory of this process, it is necessary to assume a universe filled with hydrogen nuclei and electrons of mass $1{\cdot}649 \cdot 10^{-24}$ g. and $0{\cdot}8996 \cdot 10^{-27}$ g., respectively, and also to assume the validity of the ordinary conceptions of mechanics such as inertia and centrifugal force, also of the Coulomb conception of electrical charges. It is, however, doubtful whether the helium atom can properly be considered as made up of 4 hydrogen nuclei and 2 electrons, although the atomic weight relation 4 : 1·008 can be explained on Einstein's hypothesis by loss of energy in association. The author prefers to treat the helium nucleus as differing radically from other complex nuclei and develops a theory analysing the atoms of the different elements in terms of hydrogen and helium nuclei. Meitner's differentiation of the nuclei of radioactive elements into a central nucleus carrying the atomic charge and a neutral part is extended by him to all complex nuclei and the elements tabulated with the hydrogen and helium nuclei in the two parts shown separately. The nuclei in the neutral part are presumed to revolve around the central nucleus attended by their own electrons. Elements having odd atomic numbers will necessarily include a hydrogen nucleus in the central nucleus. Isotopes differ only in the components of the neutral part, and hence their chemical properties which depend on the orbits of the electrons about the central nucleus are identical. The elements from which Rutherford removed hydrogen nuclei by bombardment with helium nuclei (B, N, F, Na, Al, and P) are the simpler atoms having hydrogen nuclei in the neutral part, so that, strictly speaking, he only effected the interconversion of isotopes. Such isotopes as those of chlorine in which one helium nucleus in the neutral part is replaced by two hydrogen nuclei, could not be generated from each other, which is in accordance with the constant composition of chlorine in nature. This theory leads to the conception of the origin of the elements, not by the random encounter of complex nuclei with electrons, but by the combination of hydrogen and helium atoms, of which some remain intact in the neutral part and others, completely ionised, join the central nucleus, their electrons adding themselves to the main swarm. The non-existence of elements above uranium is explained as follows. The higher the charge of the nucleus, the smaller is the diameter of the innermost electronic orbit, both on account of the increased attraction of the nucleus and the increased repulsion of the outer electrons. In the case of uranium, the radius of this orbit has fallen to the order of $1 \cdot 10^{-13}$, which is about the radius of the nucleus itself, so that more complicated systems could have no stable existence. This synthetic view of the origin of the elements, which is also supported by the evidence of ionisation of elements at very high temperatures, as in stellar spectra, affords a rational explanation of the existence of radioactive elements in the world to-day. C. I.

The Bohr Atom. J. D. MAIN SMITH (*Chemistry and Industry*, 1923, **42**, 1073—1078).—The author discusses briefly the inadequacy of Bohr's theory of atomic structure and electron valency in its application to the explanation of chemical phenomena, instancing and illustrating the inability of the theory to explain the structure or the existence of certain simple compounds, *e.g.*, carbon monoxide, and its failure to account for the chemical activities of elements. Whilst the theory is incapable of general application in chemistry, it is applicable to all cases where simple atomic ions are concerned. The postulates concerning atomic linking and the number of co-valencies associated with an atom, introduced by Sidgwick in his extension of the Bohr theory to co-ordination compounds (T., 1923, **123**, 725) are examined critically, and the author concludes that they scarcely furnish a sufficient basis on which a consistent explanation of chemical phenomena can be built. Thus the author contends that there is no evidence to support the assumption of the existence of co-valencies, and shows, inter alia, that nine of the fourteen elements from lithium to chlorine are not in accord as regards respective values of the maximum co-ordination numbers predicted by application of the second postulate. Co-ordination numbers greater than 8, contrary to Bohr's theory, are rare in chemistry, and, where they do occur cannot be predicted by the postulate, which is regarded as being inconsistent with the fundamental feature of Bohr's theory, which determines the electronic path about the nucleus in terms of the principal and secondary quantum numbers. The resolution of the "actual number of electrons" attached to an atom into groups is admissible only when such number is equal to Bohr's ionic numbers; otherwise the groups have no necessary reality. The extended theory assigns an anomalous position to hydrogen, for it disposes two of the four co-valency electrons in orbits to which their quantum number does not relate. Difficulties attending the application of the co-valency postulate appear to originate in the assumption that two shared electrons can be simultaneously effective in two atomic structures. Shared electrons must react as if only one at a time were effective in any one quantum orbit, and provision must be made for a harmonic reaction between shared and unshared electrons having the same quantum number. J. S. G. T.

Application of the Adiabatic Hypothesis to the Model of Ortho-helium. OTTO HALPERN (*Z. Physik*, 1923, **18**, 344—351).—The author shows mathematically that Bohr's application of the adiabatic hypothesis (this vol., ii, 478) to the model of ortho-helium due to Landé, and comprising a coplanar system of electrons, is unjustifiable, and attributes to this misapplication the discrepancy between observed and calculated values of terms in the spectral series relating to ortho-helium. J. S. G. T.

An Explanation of the Theory of the Rotation of the Atomic Nucleus. IV. HERBERT HENSTOCK (*Chem. News*, 1923, **127**, 241—243, 259—260; cf. this vol., ii, 400, 477, 679).—The octet of the nitrogen atom is probably distorted as far as the number of electrons present will allow. Two such distorted atoms when placed in juxtaposition in such a manner that the nuclei are orientated at right angles to one another form a model of the nitrogen molecule. There are no free valencies, and since no cube face is opened up to form the triple bond, the molecule must be very stable. The shape of the positive nitrogen atom is identical with that of the distorted carbon atom in carbon monoxide. This similarity, and the equality of the number of electrons present in the two molecules, may account for the property which nitrogen has of absorbing energy when present in an explosive mixture of carbon monoxide and oxygen (Bone, Newitt, and Townsend, *Proc. Roy. Soc.*, 1923, [*A*], **103**, 205). Nitrous oxide appears as $N⋮N{:}O$, which explains its easy reduction to nitrogen and its non-formation of hyponitrous acid with water.

In the second paper the structures of the oxides of nitrogen are discussed from the point of view of the author's theory (this vol., ii, 400, 477, 679). E. H. R.

The Ion of the Hydrogen Molecule, according to the Quantum Theory. K. F. NIESSEN (*Arch. Néerland*, 1923, **7**, 12—59).—Considering the ion of the hydrogen molecule as constituted of an electron moving about two positive nuclei permanently at rest, the author, following the analysis developed by Jacobi in the analogous case of motion about two centres of force, determines mathematically the electronic trajectories which are mechanically possible. From such paths are selected those which are stable and conform with stability of the nuclei in accordance with classical mechanics; these may be quantised in accordance with the ideas developed by Bohr and Sommerfeld. It is shown that when three quantum numbers are associated with the trajectories, symmetrical paths about the nuclei are alone stable. An ion executing such a path does not emit a rotation spectrum, and whether the motion be symmetrical or asymmetrical. no vibration spectrum is emitted.

J. S. G. T.

Quantum Theory of the Hydrogen Molecule. L. Nordheim (*Z. Physik*, 1923, **19**, 69—94; cf. A., 1922, ii, 703).—Employing the method developed by Born and Pauli for the calculation of perturbed motions and utilising the principles applicable to degenerate dynamical systems as determined by Born and Heisen (this vol., ii, 478) and by Nordheim, the author discusses analytically the motion of two electrons each moving about its respective associated positive nucleus—a model representing the neutral hydrogen molecule. In the first part of the analysis, the distance between the nuclei is considered to be so large that each electron may be conceived as describing a Keplerian ellipse about the appropriate nucleus. Under these conditions it is shown that ten configurations of the electronic orbits are possible. Five of these are ruled out by the consideration that the energy associated with them is positive, indicating repulsion between them and the nuclei. Two of the remaining five electronic configurations comprise coplanar circular orbits executed either in the same or opposite directions about their respective nuclei. Two others comprise orbits inclined respectively both at 60°, or one at 60° and one at 120°, to the line joining the nuclei, whilst the remaining configuration consists of electronic orbits executed in parallel planes perpendicular to the line joining the nuclei. The respective positions of the electrons in their respective orbits are given. A consideration of the stability of dynamical systems leads to the conclusion, in agreement with the result found by Kramers (this vol., ii, 312), that no model of the hydrogen molecule consisting of two identical atomic systems can be inherently stable. A consideration of the perturbations in the respective electronic orbits in the various configurations due to the proximity of the second nucleus—a factor taken into account in the latter part of the analysis—leads to the conclusion that whilst three of the five electronic configurations referred to suffer perturbations in such manner as still to yield inherently stable systems, these three do not conform with experimental results in the matter of nuclear distance and molecular energy of combination. The greatest agreement is found in the case of the Bohr-Debye model, constituting one of the five models, and comprising two coplanar circular electronic orbits executed in the same direction by electrons having a relative phase difference of 180°. The remaining two models, which, regarded from the physical point of view, have most to commend them, are rejected, as the type of their electronic motions is entirely altered by perturbations prior to the establishment of equilibrium. J. S. G. T.

Radii of the Atoms of the Alkali Metal Vapours. S. H. ANDERSON (*Physical Rev.*, 1922, **20**, 200).—By assuming that the ionising potential is one-half of the potential of a point on the orbit of the valency electron, and that the distribution of the electrons in the kernel is that suggested by Bury (A., 1922, ii, 43) and Bohr (A., 1922, ii, 277), the radii of the valency electrons of the alkali metals are computed as follows: lithium, 1·379 × 10^{-8} cm.; sodium 1·80; potassium, 2·21; rubidium, 2·45; cæsium, 2·695. When plotted against the integral numbers 2, 3, 4, 5, and 6, these values are uniformly distributed about a straight line. On passing from one metal to the next higher in the periodic table, an extra electron shell is therefore added to the atomic structure, and the shells are evenly spaced. A. A. E.

The Radii of the Alkali- and Halogen-ions and of the Atoms of Inert Gases. WHEELER P. DAVEY (*Physical Rev.*, 1923, [ii], **22**, 211—230).—An analysis of the author's measurements (this vol., ii, 413) of the ionic distances in the lattices of the alkali halides leads to the following conclusions: (1) These ions are packed as if they were nearly spherical. (2) The heavier ions have packing radii which are nearly constant, *i.e.*, independent of the ions with which they are combined. (3) The radii of potassium-, rubidium-, and cæsium-ions are approximately equal to those of the negative ions with the same number of electrons, chlorine, bromine, and iodine, respectively. The approximation is the closer the greater the atomic number. Assuming that (1) and (2) hold rigidly, and that the radii of cæsium- and iodine-ions are equal, the radii of the ions (× 10^{-8} cm.) are computed to be as follows: cæsium and iodine, 1·974; rubidium, 1·679; bromine, 1·737; potassium, 1·548; chlorine, 1·589; sodium, 1·1 to 1·2; fluorine, 1·0 to 1·2. These values are in general agreement with those obtained by Landé, Richards, and Saha, but not by Bragg. If it is assumed that for each inert gas the radius is the mean of those for the alkali- and halogen-ions with the same number of electrons, the packing radii are computed to be as follows: xenon, 1·97; krypton, 1·71; argon, 1·57; neon, 1·15. These results are only 0 to 0·27 unit higher than those obtained by Rankine from viscosity measurements. Derived values for the "atomic volume per electron" are approximately constant for the inert gases except in the case of argon, where it is low. In a note, it is argued that Wyckoff's value of 1·081 Å. for the radius of the chlorine-ion (this vol., ii, 311) is actually that of the neutral atom of chlorine. A. A. E.

Theory of Residual Affinity and its Application to Organic Chemistry. I. The Fundamental Principles of the Theory. A. Orékhov (*Rev. gén. Sci. pur. Appl.*, **34**, 264—270; from *Chem. Zentr.*, 1923, iii, 279).—The author discusses Werner's theories of reciprocal desaturation of valencies in relation to simple, double, and treble linkings. It is concluded that in long carbon chains the linkings are variable and that periodic changes in properties occur. G. W. R.

The Electronic Theory of Valency. II. Intra-molecular Ionisation in Organic Compounds. III. The Transmission of Chemical Affinity by Single Bonds. T. Martin Lowry (*Phil. Mag.*, 1923, [vi], **46**, 964—976, 1013—1020).—II. In continuation of previous work (this vol., ii, 480), the author shows that the theory of intramolecular ionisation can be extended to organic compounds, if it be assumed that double bonds can assume a form in which one carbon atom carries eight *L*-electrons, and the other six only, one pair of electrons being shared. This type of double bond is thus constituted of one co-valency and one electrovalency. On this assumption, ethane, ethylene, and acetylene have the respective formulæ $\begin{matrix}\mathrm{CH_3{-}CH_3}\\ \mathrm{CH_3{-}CH_3}\end{matrix}$, $\begin{matrix}\overset{+}{\mathrm{C}}\mathrm{H_2{-}}\overset{-}{\mathrm{C}}\mathrm{H_2}\\ \mathrm{CH_2}\underset{\rightharpoondown}{-}\mathrm{CH_2}\end{matrix}$, $\begin{matrix}\overset{+}{\mathrm{C}}\mathrm{H{=}}\overset{-}{\mathrm{C}}\mathrm{H}\\ \mathrm{CH}\underset{\rightharpoondown}{=}\mathrm{CH}\end{matrix}$, the barb, $\rightharpoondown$, denoting an electro valency passing from the positively to the negatively charged atom This extension of the theory brings the reactivity of organic compounds into line with the activity of inorganic ions and makes it possible to regard all chemical action as ultimately ionic in character. The resting forms of molecules are not necessarily identical with their ionised or reactive forms. It is probable that organic compounds may be divided into two groups according as the normal structure of the molecule is polar and therefore reactive, or is non-polar and must undergo isomeric change into a polar form before it can react. Thus zinc methyl, sodium ethoxide, and methylethylaniline oxide probably have permanently ionised structures. In general, a compound which requires "activating" by heat or a catalyst, etc., before it will react is probably in a non-polar condition. It is pointed out that the theory of mixed double bonds affords a new interpretation, which is supported by experimental evidence, of the phenomena of conjugation discussed by Thiele, and of other phenomena. The properties of "multipolar ions," *i.e.*, ions which in addition to the electrification required to give the net charge of the ion possess additional positive and negative charges, afford a new interpretation of the phenomenon of tautomerism, and explain the readiness with which tautomeric ions yield co-ordination-compounds.

III. The author examines whether the two mechanisms discussed in previous parts are adequate to explain all the facts in reference to the transmission of chemical affinity through chains of atoms, or whether an additional mechanism is required. The existence of an unexplained residue of facts necessitating an additional mechanism is regarded as unproved, and the work of Lapworth

(T., 1922, **121**, 416) and of Flürscheim (T., 1909, **95**, 718) is examined in this connexion. It is pointed out that the reactivity of the methyl group in ethyl crotonate agrees with the theory of polar double bonds. It cannot be used as a proof of the existence of polarised single bonds, as it is interpreted simply in terms of Thiele's theory of conjugation. The small fluctuations observed in the strengths of unsaturated acids as the double bond is moved along the chain may be attributed to steric influences, depending on the configuration of the chain rather than on a reversal of polarity in alternate atoms. The fact that amino-acids are sometimes stronger than the acids from which they are derived is attributed to the acylous character of the amino-group: this is usually masked by the direct neutralising action of the basic group. The special mechanism devised by Flürscheim to explain the apparent anomaly is therefore unnecessary. The author concludes that alternate polarities are characteristic of conjugated systems, and it is not yet proved that they can be developed in chains of single bonds, where both acylous and basylous groups produce effects of constant sign. J. S. G. T.

Co-ordination and Acidity. T. M. Lowry (*Chemistry and Industry*, 1923, **42**, 1048—1052).—Hydrogen is unique in that its combination with other atoms can only be represented by a single type of valency. A naked proton cannot lead an isolated existence, but will probably attach itself to any octet which is not too fully occupied by other atoms. From this point of view, the water in aqueous hydrochloric acid functions as an acceptor of hydrogen-ions: $H_2O+HCl \rightleftharpoons \overset{+}{O}H_3+\overset{-}{Cl}$. It is now suggested that water may take a more active part in the ionisation of acids by combining with the anion to form a co-ordinated complex anion and expelling the hydrogen-ion in the same way as the chlorine-ions are successively expelled from the triammine $[CoCl_3,3NH_3]$ by molecules of ammonia, with eventual formation of $[Co,6NH_3]Cl_3$. The final stage in the ionisation of sulphuric acid might then be represented by $[SO_4,xH_2O]H_2$. This theory of the relation between hydration and ionisation accords with the hygroscopic character of strong acids. The theory may be regarded as an extension of Werner's theory of acids and bases. E. H. R.

The Polarisation of Double Bonds. A. Lapworth and R. Robinson (*Nature*, 1923, **112**, 722).—Thomson (this vol., ii, 682) suggests that in such a system as $\mathrm{Cl}-+\text{Ⓒ}_1-+\text{Ⓒ}_2-+\text{Ⓒ}_3-+\text{Ⓒ}_4-+\text{Ⓗ}$ the existence of the electrostatic doublet between Cl and C_1 will cause electrons to crowd into C_1 from C_2 and into C_3 from C_4, bringing about an alternating condition in the chain. For the same reason, however, that electrons pass from C_2 into C_1, it would appear that they should also pass from C_3 into C_2, and the effect would then be continuous, although diminishing in degree along the chain. If it is held that electrons may pass from one carbon atom to another if these are joined by a double bond, but not if they are joined by a single bond, the acceptance of Kekulé's benzene formula in its simplest form is necessary. Moreover, Thomson's method of deduction of the alternate effect leads in numerous cases to results which are negatived by experiment. In this connexion, the behaviour of vinyl chloride and that of the group $C_3{=}C_2{-}C_1{=}O$ are discussed. The classification of atoms as "chemically active" or "chemically inert," according as there is a defect or excess of electrons, respectively, is considered to be unsatisfactory, since both types appear to be reactive under the correct conditions. A. A. E.

A Useful Substitute for Ground Joints in Vacuum Technique. A. von Antropoff (*Ber.*, 1923, 56, [*B*], 2137—2138).—The principle of the mercury seal is utilised, but a fusible mixture of colophony, turpentine, and linseed oil is used as seal and is allowed to set solid before use. This mixture has the advantage of transparency. If the contents of the vacuum vessel must not come in contact with this mixture, a mercury seal covered with the colophony mixture may be employed. H. H.

Apparatus for Absorbing and Washing Gases. K. Keller (*Chem. Ztg.*, 1923, 47, 506).—The apparatus consists of a cylindrical tube, closed at the bottom and fitted with a rubber stopper; the inlet tube for the gas extends just below the stopper, whilst the exit tube reaches into the liquid contained in the lower part of the cylinder. The exit tube is provided with a bulb below the stopper, and a spiral tube extends from the side of this bulb to just below the surface of the liquid. The gas entering the apparatus is forced upwards through this spiral tube, carrying with it a quantity of the liquid; if any liquid reaches the bulb it passes downwards through the central part of the tube below the bulb, whilst the washed gas leaves the bulb through the upper part of the delivery tube. W. P. S.

Extraction Apparatus with Device for the Recovery of Solvent. Twisselmann (*Chem. Ztg.*, 1923, 47, 506).—A plain cylindrical tube (similar to the body of a Soxhlet extractor, but without a siphon tube) contains the substance to be extracted. The top of this tube is connected with a vertical condenser by a tapped tube provided with a large bulb above the tap, and a side tube (for the vapour of the solvent) extends from below the tap to the lower part of the condenser. During the extraction, the tap is open so that the condensed solvent passes through the substance in the extraction tube and thence to the extraction flask; when the extraction is complete, the tap is turned and the condensed solvent is collected in the bulb above the tap. W. P. S

The Filtration of Viscous Liquids. A. Gutbier and E. Sauer (*Z. anorg. Chem.*, 1923, **128**, 15—16).—For the filtration of highly viscous liquids, such as 10—20% glue solution, the so-called "cellulose filter" is particularly useful. The substance is obtainable in square tablets which must be broken up as small as possible and placed in a capacious flask with hot water, and shaken until a uniform pulp is obtained. As a support for the filter, a perforated porcelain plate or Buchner funnel may be used, covered with copper or nickel wire-netting. The pulped filter material is poured quickly on to the support, sucked dry, and well pressed down. The cake formed on the support should be 2—3 cm. thick. E. H. R.

A Simple Lecture Experiment for Obtaining Neon and Helium from the Air and Demonstrating the Absorbent Power of Charcoal. A. VON ANTROPOFF (*Ber.*, 1923, **56**, [*B*], 2135—2137).—A tube containing well-dried coconut charcoal is fused on to a vacuum tube fitted with electrodes. The other end of the charcoal tube is drawn out into a long, fine capillary and sealed. An induction coil is connected to the vacuum tube and the charcoal plunged into liquid air. Very soon the tube becomes luminous and then again dark as the air is condensed in the charcoal. Then the capillary is broken and air allowed to stream slowly into the tube through the cooled charcoal. The other components are absorbed and the spectrum of neon and helium may be demonstrated. H. H.

Inorganic Chemistry.

The Presence of Chlorine in Synthetic Hydrochloric Acid. B. NEUMANN (*Z. angew. Chem.*, 1923, **36**, 529—531).—A calculation of the theoretical temperature developed by the combination of equivalent volumes of hydrogen and chlorine gives the figure of 2648°, at which the degree of dissociation of hydrogen and chlorine may be 2%; but as the gases combine again very rapidly on cooling, this cannot account for the occasional presence of free chlorine in synthetic hydrogen chloride. It is due to the dilution of the chlorine with air and the employment of insufficient hydrogen to satisfy both the chlorine and oxygen present. In this case, the relation $K=[H_2O]^2[Cl_2]^2/[HCl]^4[O_2]$ obtains, and the value of K at different temperatures has been experimentally determined, log k at 25° being $=13{\cdot}28$, at $600°=0$, at $1984°=-4{\cdot}30$, according to Treadwell. There are also the relations $K=(x/2[1-x])^4 . 1/p_{O_2}$, in which x is the relative proportion of chlorine mols. to hydrogen chloride mols. (Haber) and $\log k=6034/T-6{\cdot}972$ (Treadwell). From these, for a gas mixture of given composition (initial and final) the value of T, the temperature of reaction, can be calculated. Results are tabulated for chlorine–air mixtures of various compositions, the hydrogen in each case being the equivalent of the chlorine. With excessive dilution, the heat of reaction will be insufficient to carry the reaction on, and the conclusion is drawn that for combustible mixtures the chlorine content of the final gas mixture will range between 0·5% and 5%. C. I.

Absorption of Atmospheric Gases by Water. J. H. COSTE (*Analyst*, 1923, **48**, 433—435; cf. A., 1917, ii, 463; 1918, ii, 265).—A graph is given showing the volumes of oxygen and nitrogen at *N.T.P.* dissolved by 1 litre of water of any salinity from 0 to 20 g. of chloride-ions per kg. of water. W. P. S.

A Simplified Graphical Representation of the Yield and Concentration Afforded by Ozone Apparatus. HANS BECKER (*Wiss. Veröffentl. Siemens-Konzern*, 1923, **3**, 243—247).—The yield, A, in g. of ozone produced per kw. hour is shown to be related to the concentration c and the limiting concentration C of ozone produced, by the linear equation $A=A_0(1-c/C)$. Moreover, the energy employed, W_Rt, per cubic metre of oxygen treated is given by $W_Rt=c/A$. These two linear relations are plotted on a diagram employing rectangular co-ordinates, the former appearing as straight lines drawn with values of A and c as ordinates and abscissæ respectively, whilst the latter is represented by a series of straight lines radiating from the origin and inclined to the axis of ordinates at respective angles given by $\tan^{-1} c/A$. From the diagram, the concentration of ozone, the yield and power employed in an apparatus for producing ozone may be read off directly. J. S. G. T.

Behaviour of Rhombic Sulphur at High Temperatures and Pressures. H. ROSE and O. MÜGGE (*Nach. K. Ges. Wiss. Göttingen*, 1922, **10**, 105—107; from *Chem. Zentr.*, 1923, iii, 288).—The deformability and plasticity of rhombic sulphur are not appreciably increased by heating at temperatures up to 281° under pressures of 1,000 to 19,600 kg. per sq. cm. The data of Tammann up to 3,143 kg. per sq. cm. pressure and 190° were confirmed by the authors. At higher pressures, the fusion curve of rhombic sulphur rises. At 19,300 kg. per sq. cm. it has m. p. 263°. G. W. R.

The Formation of Sulphur by the Action of Sulphur Dioxide on the Sulphides of Calcium, Zinc, and Iron. LOTHAR WÖHLER, F. MARTIN, and E. SCHMIDT (*Z. anorg. Chem.*, 1923, **127**, 273—294).—Sulphur dioxide acts on calcium sulphide at temperatures below 1,000° to give the sulphate and sulphur, but the reaction is soon brought to a standstill owing to the formation of a protective layer of sulphate on the pieces of sulphide. By working at temperatures above 1,000°, this can be avoided, as the reaction products are lime and sulphur. The low temperature reaction can, however, be accelerated by the addition of triferric tetroxide, which acts as a catalyst. Zinc blende reacts with sulphur dioxide to give the oxide and sulphur, but here again the reaction velocity rapidly diminishes owing to the formation of a protective layer, in this case of basic sulphide. Both sulphides of iron react with sulphur dioxide to give triferric tetroxide and sulphur. The reaction is rapid and complete, being catalytically accelerated by the oxide. H. H.

Sulphurous Acid and its Salts. I. The Decomposition of Sulphurous Acid and its Salts in Aqueous Solution. F. Foerster, F. Lange, O. Drossbach, and W. Seidel (*Z. anorg. Chem.*, 1923, **128**, 245—342).—The spontaneous decomposition of sulphurous acid, forming sulphuric acid and sulphur, proceeds extremely slowly, requiring at 100° several days and at 150° about two days for completion. The change is autocatalytic, being accelerated by the sulphur and retarded by hydrogen-ions; the latter effect masks the former as the change proceeds. Dilute solutions decompose more quickly and completely than concentrated solutions, whilst in acid solutions the decomposition is inhibited, being completely suppressed in 2*N*-hydrochloric acid solution.

The first stages in the decomposition are probably (*b*) $2HSO_3' \longrightarrow SO_4''+SO+H_2O$, and (*c*) $2SO+H_2O \rightleftharpoons S_2O_3''+2H^{\cdot}$, (*b*) being extremely slow. The positive catalytic action of sulphur is probably due to the formation of thiosulphate, (*d*) $HSO_3'+S \rightleftharpoons S_2O_3''+H^{\cdot}$, which is very rapid in comparison with (*b*) and (*c*), and gives rise to penta-, tetra-, and tri-thionic acids, thus, (*e*) $5S_2O_3''+6H^{\cdot} \longrightarrow 2S_5O_6''+3H_2O$, (*f*) $S_5O_6''+HSO_3' \longrightarrow S_4O_6''+S_2O_3''+H^{\cdot}$, (*g*) $S_4O_6''+HSO_3' \longrightarrow S_3O_6''+S_2O_3''+H^{\cdot}$, and finally to sulphuric acid, (*h*) $S_3O_6''+H_2O \longrightarrow SO_4''+S_2O_3''+2H^{\cdot}$, all these changes (*e*) to (*h*), proceeding very rapidly in comparison with (*b*); the intermediate polythionic acids increase rapidly in the solution at the beginning. The thiosulphuric acid formed is, however, transformed back to sulphurous acid by hydrogen-ions, $S_2O_3''+H^{\cdot} \longrightarrow HSO_3'+S$, which reaction prevents the changes (*d*) to (*h*) and brings the decomposition to a halt.

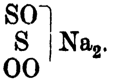
The strong positive catalytic effect of hydriodic acid on the decomposition is ascribed to the formation of complex ions. The decomposition of the metal hydrogen sulphites is different from that of the acid itself in that until the decomposition is far advanced the concentration of hydrogen-ions remains low, being that of a hydrogen sulphite–sulphurous acid solution; the change is therefore very strongly positively autocatalytic, and is greatly hastened by addition of sulphur or polythionates. If sulphur dioxide is allowed to escape from the solution, as by boiling a strong sodium hydrogen sulphite solution in an open vessel, polythionic acids are not formed, the mechanism following (*b*) and (*c*) above being $S_2O_3''+H_2O \longrightarrow SO_4''+H_2S$, $S_2O_3+2H^{\cdot} \longrightarrow SO_2+S+H_2O$, and $2H_2S+SO_2=3S+2H_2O$.

Selenium and selenious acid act as powerful positive catalysts, forming the selenosulphuric-ion $SeSO_3''$ in the solution. Potassium selenosulphate and selenodithionate have been prepared in the pure state, and indications of the existence of selenium analogues of the polythionic acids obtained. The mechanism of the series of changes (*c*) to (*h*) when selenium dioxide is substituted for sulphur dioxide has been examined.

Tellurium when free from selenium has no catalytic activity with regard to the decomposition of hydrogen sulphites. S. I. L.

Preparation of Sulphuryl Chloride. Sir William J. Pope (*Rec. trav. chim.*, 1923, **42**, 939—941; cf. T., 1920, **117**, 1410).—Bone charcoal or activated wood charcoal forms a most convenient catalyst for promoting the union of sulphur dioxide and chlorine to form sulphuryl chloride. Combination occurs instantaneously, and, provided that the reaction vessel is cooled to 30°, the chloride is condensed and may be drained away as rapidly as it is formed. There seems to be no limit to the life of the catalyst. H. H.

The Alteration of Thiosulphate Solutions. F. Feigl (*Ber.*, 1923, **56**, [*B*], 2086—2088; cf. this vol., ii, 483, and A., 1922, ii, 873).—It is suggested that the alteration of thiosulphate solutions on keeping may be due to the decomposition of the thiosulphate into sulphate and sulphur which, under the influence of hydrogen-ions or of carbon dioxide, combine to form the co-ordination complex,



$\left.\begin{matrix}SO\\S\\OO\end{matrix}\right]Na_2$. H. H.

The Preparation and Properties of Selenium Trioxide and Chloroselenic Acid. Richard Robert le Geyt Worsley and Herbert Brereton Baker (T., 1923, **123**, 2870—2875).

Ammoniates as Binary Systems. III. Water–Ammonia. Fritz Friedrichs (*Z. anorg. Chem.*, 1923, **127**, 228).—The author cannot confirm the existence of the two hydrates of ammonia described previously by Rupert (A., 1909, ii, 726). H. H.

The Catalytic Oxidation of Ammonia and Hydrogen Cyanide. I. Józef Zawadzki (*Roczniki Chemji*, 1923, **11**, 145—157).—A full summary is given of the work published on the subject by different authors and the results are compared and criticised. G. A R. K.

The Catalytic Oxidation of Ammonia and Hydrogen Cyanide. II. Józef Zawadzki and Jan Wolmer (*Roczniki Chemji*, 1923, **2**, 158—182).—The oxidation of ammonia and hydrogen cyanide was carried out in an electrically heated quartz tube containing platinum or ferric oxide as a catalyst, using concentrated sulphuric acid to absorb the products of the reaction.

Most of the experiments with ammonia were carried out with a platinum catalyst in the form of gauze (400 per sq. cm.); the ferric oxide catalyst did not give good results. The effect of different temperatures, rates of flow of gas, and partial pressures of ammonia were studied, and the results are expressed in the form of curves. These show that at temperatures below 750° the yield of oxides of nitrogen increases with an increase in the rate of flow, that is, with a shortening of the time of contact between the reacting gases and the catalyst; the increase in yield reaches a maximum and then diminishes (for rates of flow from 2 to 42 litres per hour), but at temperatures above 750° the increase is continuous. It is also found that the greater the rate of flow the higher the optimum temperature of the reaction. There seems to be no absolute optimum temperature for this reaction; a short contact with the catalyst and a high temperature appear to be the most favourable conditions. The effect of the partial pressure of ammonia in the reaction mixture is not very great. The relative amounts of nitric oxide and nitric peroxide formed depend entirely on the extent to which the nitric oxide in the reaction product undergoes oxidation.

The experiments with hydrogen cyanide in the presence of ferric oxide show that the yield of oxides of nitrogen increases with increase of temperature up to 780°; the rate of flow of the reaction mixture is of secondary importance; a few experiments carried out with the platinum catalyst mentioned above show that the yields are comparable with those obtained in the oxidation of ammonia under similar conditions, and an increase in the rate of flow of the gases is beneficial at high temperatures.

The mechanism of the catalytic oxidation of ammonia is discussed, and it is suggested that the first step is the dissociation of the ammonia into its constituent elements; the atomic nitrogen then combines with oxygen to form nitric oxide, provided the temperature is not too high to allow the existence of this compound; otherwise the reaction $N+N=N_2$ will proceed at the expense of the reaction $N+O=NO$, and it is on the relative rates of these two reactions that the yield of the desired product depends. The view put forward by Neumann and Rose (A., 1920, ii, 247) that the formation of nitrogen at higher temperatures is due to the direct oxidation of the ammonia to nitrogen and water is criticised, because in that case the reaction should be independent of the rate of flow of the gases and show a definite optimum temperature, whereas it is now shown that equally good results can be obtained with higher temperatures than those used by Neumann and Rose (500°), provided the flow is suitably accelerated. It is also shown that nitric oxide decomposes quite appreciably (12·2 % at 800°) under conditions similar to those used, and this decomposition is greatly assisted by contact with a platinum catalyst.

The reason of the poor yields at temperatures below 500° may perhaps be attributable to the reaction between ammonia and nitrogen trioxide and peroxide, whilst at higher temperatures these oxides dissociate into oxygen and nitric oxide. G. A. R. K.

Action of Sulphur Chloride on Ammonia, and on Organic Bases. ALEXANDER KILLEN MACBETH and HUGH GRAHAM (*Proc. Roy. Irish Acad.*, 1923, **36**, 31—40).—By adding an ice-cold chloroform solution of ammonia to sulphur monochloride in the same solvent, nitrogen sulphide is obtained according to the equation: $12SCl+16NH_3=N_4S_4+12NH_4Cl+4S_2$. Other sulphides of nitrogen, however, are formed, for after precipitation of the sulphide, N_4S_4, by the addition of alcohol, the mother-liquors may be concentrated to obtain nitrogen pentasulphide, N_2S_5, and also *hexasulphamide*, S_6NH_2, which crystallises in colourless, square plates, m. p. 105°, insoluble in water, but soluble in organic solvents. This compound gives a coloration with alcoholic potassium hydroxide and with alcoholic solutions of organic bases. It is thought that this coloration may be due to the formation of a salt of a nitrogen–sulphur acid, but attempts to obtain such an acid or its salts were unsuccessful. H. H.

Ammoniates as Binary Systems. II. Hydrazine–Ammonia. FRITZ FRIEDRICHS (*Z. anorg. Chem.*, 1923, **127**, 221—227; cf. A., 1921, ii, 503).—Carefully purified hydrazine has m. p. +1·8°, as determined by a dilatometric method. The three-dimensional pressure–temperature–concentration diagram for the system hydrazine–ammonia has been completely mapped out, and it is shown that no compound of the two components is formed.
H. H.

The Atomic Weight of Boron. ALFRED STOCK and ERNST KUSS (*Z. anorg. Chem.*, 1923, **128**, 49—75).—The accepted atomic weight of boron, 10·90, is probably too high. According to Aston, boron contains two isotopes of atomic weights 10 and 11, in such proportions that the experimental atomic weight should be about 10·75±0·07. Baxter and Scott have recently found 10·83±0·01 by analysis of the chloride and bromide (A., 1922, ii, 285), and Hönigschmid and Birckenbach (this vol., ii, 559) adopt the value 10·82, also from the chloride. The authors have now made use of the gaseous boron hydride, B_2H_6, for the atomic weight determination, by measuring the volume of hydrogen formed by reaction of a known weight of the gas with water: $B_2H_6+6H_2O=2H_3BO_3+6H_2$. This reaction is shown to proceed quantitatively. The hydride, B_2H_6, was prepared by heating B_4H_{10} to 95° for five hours, followed by fractional distillation at low temperatures. As a result of six concordant experiments, the atomic weight of boron is found to be 10·8055±0·0015. This is the lowest value so far obtained.

The atomic weight of silicon was determined in a similar manner, using the reaction of silicon hydride, with sodium hydroxide: $SiH_4+2NaOH=Na_2SiO_3+4H_2$. This work was carried out before the methods of precision finally adopted in the work on boron had been fully developed. Three closely agreeing experiments gave the mean atomic weight for silicon 28·15, which is considerably lower than the accepted value (28·3).

The Coefficients of Viscosity and Slip of Carbon Dioxide by the Oil Drop Method, and the Law of Motion of an Oil Drop in Carbon Dioxide, Oxygen, and Helium at Low Pressures. JAMES M. EGLIN (*Physical Rev.*, 1923, **22**, 161—170).—The coefficient of viscosity of carbon dioxide, determined by the oil drop method, is $1{\cdot}478\times10^{-4}$ at 23° and 760 mm.
A. A. E.

The Interaction of Potassium Tetroxide with Ice and with Dilute Sulphuric Acid. HERBERT HAWLEY and HENRY JULIUS SALOMON SAND (T., 1923, **123**, 2891—2896).

A Study of Secondary Valency by Means of *X*-Rays. GEORGE L. CLARK and WILLIAM DUANE (*Physical Rev.*, 1922, **20**, 85—86; cf. A., 1922, ii, 483).—Potassium tri-iodide, preserved against sensible decomposition, was analysed by the *X*-ray method and found to be centred cubic, with an iodine atom going to the centre of each of the original unit cubes of potassium iodide, thereby increasing

the edge length from 3·532 to 4·680×10^{-8} cm. The number of molecules per unit cube was found experimentally to be 0·4986.
A. A. E.

Promoter Action in the Decomposition of Potassium Chlorate. HARVEY A. NEVILLE (*J. Amer. Chem. Soc.*, 1923, **45**, 2330—2333).—The fact that commercial manganese dioxide is a more effective catalyst in the decomposition of potassium chlorate than the pure material is shown to be due to the presence of 8·8% of ferric oxide in the commercial article. Experiments with mixtures of these two oxides confirm this view, and show that each oxide is a promoter of the other. The action of cupric oxide and manganese dioxide as mutual promoters is also shown experimentally. J. F. S.

The Melting-point (Solidus) Curve for Mixtures of Potassium Nitrate and Sodium Nitrate. WALTER MATTHEW MADGIN and HENRY VINCENT AIRD BRISCOE (T., 1923, **123**, 2914—2916).

The Structure of Crystals of Sodium Bromate and Sodium Chlorate. L. VÉGARD (*Z. Physik*, 1923, **18**, 379—381)—The author replies to criticism by Kolkmeijer, Bijvoet, and Karssen (this vol., ii, 414) of the structures attributed by him to crystals of sodium bromate and sodium chlorate. Considerations of the relative numbers and intensities of lines in the respective *X*-ray spectra, and of the experimental determination of these intensities lead the author to conclude that the structures proposed by him are to be preferred to those suggested by his critics. J. S. G. T.

Investigation with *X*-Rays of the Structure of Crystals of Sodium Chlorate and Sodium Bromate. A. KARSSEN (*Rec. trav. chim.*, 1923, **42**, 904—930).—An attempt to decide between the models proposed by the author and others (A., 1921, ii, 200) and those proposed by Dickinson and Goodhue (A., 1922, ii, 145). It is concluded that with the present uncertain underlying assumptions no final choice can be made. H. H.

Heterogeneous Equilibria in the Ternary System Sodium Sulphite–Sodium Sulphate–Water. ALBERT CHERBURY DAVID RIVETT and NEIL BANNATYNE LEWIS (*Rec. trav. chim.*, 1923, **42**, 954—963).—Isotherms in the ternary system sodium sulphate–sodium sulphite–water were obtained at 0·1°, 17·5°, 25°, and 37·5°. The stable systems at the three lower temperatures show two series of mixed crystals, one between the heptahydrates, and one between the decahydrates of the salts. At 25°, there is also a metastable system of mixed crystals of the anhydrous salts. At 37·5°, the stable system is one in which there are three series of mixed crystals between the anhydrous salts. H. H.

X-Ray Investigation of the Crystal Structure of Lithium and Lithium Hydride. J. M. BIJVOET (*Rec. trav. chim.*, 1923, **42**, 859—903).—The elementary cell of lithium is found to be a centred cube with an edge of 3·50 Å., each cell containing two atoms: the "atomic domain" is 3·04 Å. in diameter. A lattice of stationary valency electrons does not explain the results obtained, and it is thought possible that the valency electron rotates round the nucleus, or possibly between the nuclei, in planes perpendicular to the trigonal axes.

Lithium hydride also crystallises in cubes with four LiH groups per unit cell of side 4·10 Å. Two models appear to fit the facts: (*a*) with atoms at the points of the lattice with radii of the same order of magnitude as found by Bohr for the free atoms: (*b*) with positive lithium-ions and negative hydrogen-ions at the points of the lattice, the electrons rotating round the nuclei in planes perpendicular to the non-intersecting trigonal axis. In this case, the radius of the lithium$^+$-ion is about 0·05*a*, and of the H$^-$-ion is about 0·58*a*. This structure, of course, implies a heteropolar binding in the hydride, as against a homopolar linking in the metal. H. H.

Crystal Structures of Lithium Iodide and Rubidium Fluoride. R. W. G. Wyckoff and Eugen W. Posnjak (*J. Washington Acad. Sci.*, 1923, **13**, 393—397).—An apparent discrepancy in the results obtained by the authors (A., 1922, ii, 214, 499) and by Davey (this vol., ii, 413) for the crystal structure of lithium fluoride as determined by *X*-ray analysis, is attributed to the probability that the material employed by the latter was not the anhydrous salt. Additional *X*-ray data referring to lithium iodide are given. It is pointed out that the observed intensities of the diffraction lines obtained with the material used are different from those calculated for the assigned structure, and that the calculated interatomic distances associated with this structure do not agree with those to be anticipated from a consideration of "atomic radii" determined by W. L. Bragg (A., 1920, ii, 537). The structure of lithium iodide, as determined by the authors from observations on the fused material, gives a "sodium chloride arrangement" of the atoms for which the atomic distance, Li to I, is in substantial agreement with that to be anticipated from the additive rule, viz., 3·015 Å. Accepting this structure, the only outstanding discrepancy between calculated and anticipated values of atomic distances amongst the alkali halides would be that associated with the crystal structure of rubidium fluoride, additional data for which are given. J. S. G. T.

Aqueous Solutions of Ammonium Hydrogen Carbonate. Claude Bonnier (*Compt. rend.*, 1923, **177**, 685—688).—A study of the effect, on the gaseous pressure produced in closed vessels, by aqueous solutions of ammonium hydrogen carbonate, of (1) the concentration of the solution, and (2) the relation between the volumes of liquid and gaseous phases (cf., also, Dibbits, A., 1875, 421, and Berthelot and André, A., 1887, 11). The results are expressed by means of curves, which should be consulted for details. E. E. T.

Rendering Thin Silver Films on Glass Visible. J. Estermann and O. Stern (*Z. physikal. Chem.*, 1923, **106**, 399—402).—Gerlach and Stern have shown previously that invisible silver films may be rendered visible by physical development (*Z. Physik*, 1921, **8**, 110; 1922, **9**, 349, 353). The present paper deals with experiments designed to ascertain the minimum thickness of silver which can be detected in this manner. The silver films were produced from a silver-plated platinum wire which on heating emits a stream of silver atoms; these pass through a small hole in a platinum screen and on to the glass. The thickness of the film may be calculated by the formula $d = d_0 . \rho^2/r^2$, where d_0 is the thickness of the silver on the platinum wire, ρ the radius of the hole in the screen, r the distance of the screen from the glass plate, and d the thickness of the film. The plate of glass after exposure is placed in a solution of 1—2% quinol containing a little gum arabic and then 1—2 drops of 1% silver nitrate are added. After a few minutes, the film commences to show. It is shown that the thinnest film detectable by this method is 2×10^{9} cm. Holding the film in cadmium vapour also develops it, the limit of the method being the same as above. Experiments with copper films produced in the same manner show that a film of this metal of the same thickness as the silver can be detected by the same method. J. F. S.

Structure of Thin Silver Precipitates. J. ESTERMANN (*Z. physikal. Chem.*, 1923, **106**, 403—406).—In an earlier paper (preceding abstract) a method is described whereby thin silver films were rendered visible by a physical development which consisted in depositing silver or cadmium on the film. It is now shown that the developed film in some cases could be removed as a foil, but in others it remained as mere spots of silver of a grey or brown colour. The silver films have therefore been examined ultramicroscopically. It is shown that films 3×10^{-9} cm. thick are made up of definite individual particles. Since an ultramicroscopic particle must consist of at least 1,000 atoms, it follows that these crystals cannot be formed from silver deposited in the position where the crystal is found. It is suggested that the silver atoms are adsorbed on the glass and that by collisions with other atoms in the adsorption layer the crystals are built up. The author's experiments indicate that the mean free path of the silver atoms is of the order of 100 atomic diameters. J. F. S.

Reduction of Silver Salts by Means of Manganous Salts. GIUSEPPE BARBERI (*Gazzetta*, 1923, **53**, 645—648).—The black, pulverulent precipitate formed on addition of 0·1*N*-ammoniacal silver nitrate solution to 0·1*N*-manganous sulphate solution at the ordinary temperature consists of a mixture of manganese dioxide and silver (cf. Wöhler, *Annalen*, 1837, **41**, 344). If the former solution contains only sufficient ammonia to dissolve the silver hydroxide first formed, the precipitate will have the composition $MnO_2 + 2Ag$. Rose's statement that the compound Mn_2O_3,Ag_4O is formed under these conditions (*Annalen*, 1857, **101**, 229) is erroneous. T. H. P.

The Action of an Aqueous Solution of Sodium Hyposulphite (Hydrosulphite) on Silver Chloride. The Recovery of Silver from Silver Chloride Residues. J. B. FIRTH and J. HIGSON (*J. Soc. Chem. Ind.*, 1923, **42**, 427—429T).—Solid silver chloride is acted on to a small extent by dilute solutions (2—6%) of sodium hyposulphite. Stronger solutions (12—24%) are more active, the action increasing with rising temperature up to about 50°, then falling off at still higher temperatures, probably on account of decomposition of the hyposulphite. Under the most favourable conditions, using a 24% solution at 50°, the product consists of 10·05% unchanged silver chloride, 88·92% of silver, and 1·95% of sulphur (as Ag_2S). The product is therefore a mixture of silver and silver sulphide. A solution of silver chloride in sodium thiosulphate is immediately reduced in the cold by sodium hyposulphite to silver sulphide, whilst an ammoniacal solution of silver chloride is reduced quantitatively to metallic silver. These two reactions can be applied for the recovery of silver from silver chloride residues. E. H. R.

Transference of the Acid Radicle in the Solid Phase. II. J. ARVID HEDVALL and JOSEF HEUBERGER (*Z. anorg. Chem.*, 1923, **128**, 1—14).—The displacement of a basic oxide from a salt by a more basic oxide, as observed in the case of carbonates when they are heated with an oxide more basic than that present in the salt (A., 1922, ii, 766) has now been found to occur with sulphates. The sulphates examined included those of strontium, calcium, magnesium, zinc, copper, cobalt, and iron (Fe″ and Fe‴) and the oxides used were those of barium, strontium, calcium, and magnesium. Reaction between the salt and oxide was detected from the heating curve. The reaction temperature was lowest with barium oxide, varying from 328—370° with different salts; with strontium oxide, it varied from 410—451°, and with calcium oxide from 516—584°, except in one case, with ferrous sulphate, when it was as low as 444°. Magnesium oxide required the highest temperatures as a rule, and these are not determinable with so high a degree of accuracy as in the other cases on account of the low heats of reaction. In all the cases observed, reaction occurs at a temperature much below the decomposition temperature of the salt. Reaction can only occur when the heat of reaction is positive, and is not reversible. The extent to which the reaction proceeds was determined in the case of copper sulphate. Using molecular proportions, with BaO, 12·2% remained unchanged, with SrO, 11·8%, and with CaO, 38·9%. When the proportion of oxide was increased, the proportion of copper sulphate left unchanged was correspondingly diminished. The reaction is to be regarded as a true solid phase reaction between space lattices in contact at a suitable temperature. E. H. R.

The Crystal Structure of Strontium Selenide. MABEL K. SLATTERY (*Physical Rev.*, 1922, **20**, 84).—Strontium selenide, prepared by heating the selenate to redness in a current of hydrogen, was examined by the powder method. The unit structure is a cube of dimensions 3·10 Å., the alternate corners being occupied by strontium- and selenium-ions. A. A. E.

Action of Barium Chloride on Sulphate in Fused Salts. HOWARD E. BATSFORD (*Ind. Eng. Chem.*, 1923, **15**, 1044).—If a small proportion of barium chloride is added to a fused mixture of sodium and calcium chlorides, any sulphate present as impurity is quantitatively precipitated and the freezing point of the fused mixture is unaltered. C. I.

Quantitative Decomposition of Natural Fluorspar by Fusion with Excess of Sodium Carbonate. C. C. Palit (*Z. anorg. Chem.*, 1923, **128**, 350—354).—Whilst freshly precipitated calcium fluoride is completely decomposed by the carbonate fusion within two hours, it was found that one fusion left a quantity of mineral fluorspar undecomposed, the amount so left varying with the degree of fineness of the pulverised mineral, the amount of sodium carbonate used, and the duration of the fusion. The residue from a single fusion of fluorspar was never less than 5·8% of the weight taken, but this residue may be completely decomposed by a second fusion with sodium carbonate. S. I. L.

The Vapour Pressure of Cadmium and its Alloys with Zinc. Alfred Charles Egerton and Frank Victor Raleigh (T., 1923, **123**, 3024—3032).

Constitution and Evolution of Oxides and Metallic Hydroxides. Paul Pascal (*Compt. rend.*, 1923, **177**, 765—768).—The measurement of specific magnetic susceptibility allows a clear distinction to be made between water present as (1) hydroxyl or (2) solvent of crystallisation, etc. In this way, the dehydration of various hydroxides has been studied. Cadmium hydroxide, when heated, passes irreversibly into the oxide, magnesium hydroxide, however, undergoing the corresponding change reversibly. In the case of zinc hydroxide, although dehydration is irreversible, water lost by the hydroxide is partly adsorbed by the oxide. Magnetic analysis enables these changes to be followed clearly, whereas they would not be detected by ordinary methods. Whilst zinc hydroxide, on drying at 160°, is partly converted into oxide, the latter, if resulting from the dehydration of the hydroxide at 205°, still retains 2—3% of water. E. E. T.

Cadmium Sulphide and the Estimation of Cadmium. Alfred Charles Egerton and Frank Victor Raleigh (T., 1923, **123**, 3019—3024).

The Isotopes of Lead. A. S. Russell (*Nature*, 1923, **112**, 619—620).—The author's analysis of the complexity of elements (this vol., ii, 748) leads to the somewhat surprising conclusion that common lead consists principally of mass-numbers 204, 205, 206, 207, 208, and 210, of which probably 206 and 208 are the chief. Of these isotopes, 206, 208, 210, and possibly 207 are end-products of radioactive series; consequently this analysis, if confirmed experimentally, can of itself neither confirm nor support the view that common lead may be of radioactive origin. The odd mass-number 205 may possibly be an isobare. Minor additions to and corrections of previous results are given. A. A. E.

Adsorption of Gases by Copper. Robert N. Pease (*J. Amer. Chem. Soc.*, 1923, **45**, 2296—2305).—The adsorption isotherms of hydrogen, ethylene, ethane, carbon monoxide, and nitrogen at 0° and up to one atmosphere pressure have been determined. The results are discussed and the specific character of the adsorption is pointed out. The effect of poisoning the copper with mercury on the adsorption of hydrogen, ethylene, and carbon monoxide and also of partly deactivating copper, by heating, on the adsorption of hydrogen and ethylene, has been ascertained. In both cases, it has been found that the strong adsorption at low pressures has been markedly decreased whilst the additional adsorption at higher pressures has been little affected. From these results and certain incidental observations, it is concluded that the adsorption is due to specific adsorbing centres on the copper surface rather than to the copper surface as a whole. These centres, it seems reasonable to suppose, are regions of high curvature, or "peaks," on the surface. J. F. S.

Metallic Cementation. H. Weiss (*Ann. Chim.*, 1923, [ix], **20**, 131—195; cf. this vol., ii, 678).—The rate at which alloys, initially not in equilibrium, attain homogeneity was studied in the cases of copper–tin, silver–antimony, and copper–arsenic, the last-mentioned being in the form of a prehistoric axe containing 1·25% of arsenic. The results obtained may be adequately expressed as an exponential function of the absolute temperature and for the temperature range covered by experiment by $v=1/\theta=K\alpha^T$, where θ is time, T absolute temperature and K and α are constants (cf. Tammann and Schönert, A., 1922, ii, 772). The author is of opinion that his experiments do not distinguish clearly between the influence of temperature and that of concentration, but that the latter appears to be one of the controlling factors in those temperature regions in which cementation occurs in practice. No tendency to the attainment of homogeneity could be observed initially in the prehistoric specimen, but a more delicate experimental method is required in order to justify extrapolation of results to include phenomena occurring at the ordinary temperature. The various causes which may impair the accuracy of the experimental work are discussed, together with their bearing on the results which might be obtained by extrapolation, and it is shown that a possible interpretation would indicate the cessation of penetration on reduction of the temperature to 280°. Five alloys (silver–antimony, copper–antimony, silver–tin, gold–antimony, gold–lead) in which penetration occurs in the form of propagation of a chemical reaction were studied from the point of view of the time factor, and the general conclusion drawn is embodied in the equation $\theta=mx+n/2.x^2$. As the time taken by the chemical reaction is negligible in comparison with that required for penetration, mx may be omitted and θ becomes $n/2.x^2$, where $n/2$ is the time required for formation of a homogeneous layer 1 mm. in thickness and x the thickness of the layer formed. The propagation of a zone of given concentration is thus proportional to the square root of the time if the conditions remain unchanged. The size of the crystals formed and the possibility of the existence of regions which differ in stability may affect the results obtained. The author states that he does not claim to have thrown light on the mechanism of penetration, but the results show that the phenomena observed appear to become capricious as the temperature decreases. A few observations, admittedly incomplete, on the mutual penetration of crystalline salts were made. H. J. E.

The Equilibrium Diagram of the System Cuprous Sulphide–Ferrous Sulphide. C. B. Carpenter and C. R. Hayward (*Eng. Mining J. Press*, 1923, **115**, 1055—1061).—The diagram is of the type obtained when the two components of the system are completely soluble in each other when liquid, but only partly so when solid. The two branches of the curve intersect at the eutectic point (995°, 68% FeS). Solid solutions are formed with limits of solubility at 92·5% FeS and 50% Cu_2S, respectively; compounds are not formed. Ferrous sulphide has f. p. 1163°, and cuprous sulphide has f. p. 1,128°. A transformation occurs in the solid state at 950°, due probably to a dimorphic change in the crystal habit of cuprous sulphide. In the range 15—45% FeS, if the mass is heated considerably above its melting point, loss of sulphur by volatilisation, and consequent interaction of iron with cuprous sulphide, leads to the separation of copper. A matte of 32% Cu (60% FeS) gradually lost sulphur when maintained at 1,100°. Photomicrographs are given, and the experimental procedure is described. Chemical Abstracts.

Separation of the Rare Earths by Basic Precipitation. V. Preparation of Cerium-, Lanthanum-, and Coloured Earths from Thorium-free Monazite Sand. Wilhelm Prandtl and Joseph Lösch (*Z. anorg. Chem.*, 1923, **127**, 209—214; cf. A., 1922, ii, 769).—The crude sand is dissolved in concentrated nitric acid and potassium bromate solution added to precipitate the cerium. The filtrates are concentrated, and this process is repeated until all the cerium is removed. The coloured earths (samarium, neodymium, and praseodymium) are then fractionally precipitated by the addition of ammonium and cadmium nitrates. The lanthanum appears in the final precipitates. H. H.

Double Carbonates of Sodium and Metals of the Cerium Group. F. Zambonini and G. Carobbi (*Atti R. Accad. Lincei*, 1923, [v], **32**, ii, 125—130).—Contrary to the statement of Meyer (A., 1904, ii, 734), these double carbonates are easily obtained crystalline and have the general formula $M_2(CO_3)_3,Na_2CO_3,12H_2O$. The lanthanum sodium compound forms microscopic spherolites which, left in the mother-liquor, change either to slender, microscopic needles, mostly united in parallel bundles, or to irregular lamellar aggregates. The cerium sodium compound forms minute spherolites changing, in the mother-liquor, to bundles of needles and lamellar aggregates. The praseodymium sodium compound forms either pale green complicated aggregates resembling minute lamellæ or bundles of needles. The neodymium sodium compound forms aggregates of needles. The samarium sodium compound, $SmNa(CO_3)_2,6H_2O$ (Cleve, A., 1885, 636, gave $8H_2O$), forms characteristic minute rosettes. T. H. P.

The Crystal Structure of Mercury. L. W. McKeehan and P. P. Cioffi (*Physical Rev.*, 1922, **19**, 444—446).—Hull's powder method was employed in connexion with a thin coat of minute mercury droplets condensed on the outer surface of a paraffin- or shellac-coated rotating glass capillary tube, the mercury being maintained at about —115° by the vapour from boiling liquid air. The lattice appears to be rhombohedral, with the axial ratio 1·94. The calculated density, if one atom is associated with each cell, is 13·97 g./cm.^{3}; that computed from Mallet's and Dewar's results is 14·29 g./cm.^{3}. The disparity may indicate that a closer packing of atoms can occur in large ingots than in microscopic droplets. A. A. E.

Dynamic Allotropy of Mercuric Iodide. A. Damiens (*Compt. rend.*, 1923, **177**, 816—818).—It is shown that Smits's theory of dynamic allotropy (cf. A., 1915, ii, 262, and A., 1917, ii, 174), as applied to mercuric iodide, is contradictory to the law of the displacement of equilibrium, and that the results of his experiments on the rapid cooling of heated mercuric iodide are incomplete. According to Smits, the speed of reconversion (into the red variety) of yellow mercuric iodide, heated at temperatures above the transition point (127°), and subsequently cooled in liquid air, is greater the higher the temperature of heating. Whilst this is now confirmed for a first heating and cooling of commercial or precipitated iodide, it is not confirmed for a second or third heating and cooling; with well-developed crystals of the iodide, or with a sample that has previously been fused, reconversion to the red form takes place instantaneously on cooling, independently of the temperature of heating, even where this is as low as 135°. Smits's results are readily explained; the higher the temperature at which heating of microcrystalline iodide is effected, the higher the percentage of large crystals in a sample, owing to increased sublimation, and hence the accelerated recovery on cooling. E. E. T.

Mechanism of the Reduction of Permanganate and its Physico-chemical Basis. VI. Mangani-manganate as an Intermediate Product of the Reduction of Manganate. Josef Holluta (*Z. physikal. Chem.*, 1923, **106**, 324—340; cf. A., 1922, ii, 771, this vol., ii, 744).—The absorption spectra of manganate and mangani-manganate have been investigated and it is found that absorption spectra of these two substances differ sufficiently for the measurement of the spectrum of a strong alkaline solution of these substances to indicate their presence or absence from a reaction mixture. It is shown to be likely that the measurements of the absorption spectrum of manganate made hitherto have been effected with solutions containing also mangani-manganate. The course of the reduction of manganate in strongly alkaline solution has been investigated, and it is found that in solutions which are 4·0*N* with respect to alkali an intermediate compound is formed, the bright blue solutions of which give a similar absorption spectrum to that given by mangani-manganate described by Auger and Billy (A., 1904, ii, 262). The appearance of this compound during the reduction coincides with the formation of quinquevalent manganese. The results of the previous paper (*loc. cit.*) have been confirmed from measurements in faintly alkaline solution. In strongly alkaline solution, the reduction of manganate occurs in two phases, which is explained by the formation of mangani-manganate as an intermediate stage. The first phase of the reduction, namely, the formation of mangani-manganate, is accelerated by hydroxyl-ions, whilst the second phase, namely, the reduction of the mangani-manganate, is retarded by hydroxyl-ions.

J. F. S.

The Corrosion of Iron in Water and in Neutral Salt Solutions. JOHN ALBERT NEWTON FRIEND (T., 1923, **123**, 2996—2999).

Ferric Oxide Sols Prepared from Iron Carbonyl. H. FREUNDLICH and S. WOSNESSENSKY (*Kolloid Z.*, 1923, **33**, 222—227).—A clear reddish-brown ferric oxide sol, which is very stable, can be prepared by the oxidation of iron pentacarbonyl. This is effected by shaking the pentacarbonyl with very dilute solutions of hydrogen peroxide. Since in the oxidation the only other products are carbon dioxide, carbon monoxide, and oxygen, the only electrolyte present is carbonic acid, and if this is removed or if the sol is boiled the sol coagulates readily. The coagulum obtained in this way can be readily peptised to form a positive sol by leading a stream of carbon dioxide through it, or by the addition of hydrochloric, nitric, or picric acid, aluminium chloride or ferric chloride. The positive sol can be converted into a negative sol by the addition of sodium hydroxide. The coagulum produced by the addition of electrolytes cannot be again peptised by carbon dioxide. The sol obtained directly from the pentacarbonyl gives the usual precipitation values of a positive sol, but these are considerably smaller than the values obtained with ferric oxide sols prepared by more usual methods. The latter are therefore more stable, and consequently, the sols obtained by peptising the coagulum from the pentacarbonyl sols with ferric chloride are much more stable than sols containing no ferric chloride. A similar result was obtained with sols obtained by using aluminium chloride as peptising agent, but in this case the sols were not so stable as the ferric chloride sols. The lack of stability was much more marked in the case of sols prepared by the use of lanthanum nitrate as peptising agent. The sol from iron pentacarbonyl can be sensitised by the addition of small quantities of albumin, but larger quantities of albumin peptise the ferric oxide coagulum to form a negative sol.

J. F. S.

The Oxidation of Iron Sulphate Solutions in Air. PRAMOD KISER BANERJEE (*Z. anorg. Chem.*, 1923, **128**, 343—349).—Oxidation of ferrous sulphate solutions exposed to air proceeds extremely slowly; by analysis of samples withdrawn at intervals over a period of sixty-two days, it was found that the order of the reaction approaches more nearly that of a unimolecular than that of a bimolecular reaction. Potassium sulphate exerts an accelerating effect, but the sulphates of all other metals tried, and sulphuric acid itself, exert retarding effects, the maximum retarding effect being that of copper sulphate. At higher temperatures, the reaction appears to be very nearly unimolecular. S. I. L.

Precipitation Reactions of Nickel and Cobalt Sulphate Solutions with Zinc or Cadmium at 100°. ROBERT KREMANN, FRANZ ANGELBERGER, FRANZ BAKALARZ, RUDOLF RÖHRICH, and CAMILLO STÖGER (*Z. anorg. Chem.*, 1923, **127**, 316—342).—Zinc or cadmium in the form of turnings or small cylinders was added to solutions containing about 1·4 mol /litre of nickel sulphate or about 0·09 mol./litre of cobalt sulphate. At room temperature, the precipitate contained both metals together with much hydroxide. At 100°, hydroxide is still produced, but in less quantity. It was found that the amount of hydroxide produced increases with the ratio precipitating metal/precipitated metal. It was also found that the surface of the precipitating metal influenced the composition of the precipitate in that as the surface of the precipitating metal increased the percentage of precipitated metal in the precipitate also increased. Measurements were also made of the *E.M.F.* of the precipitated metal/solution against a normal electrode. H. H.

β-Cobalt Iodide. ERWIN BIRK and WILHELM BILTZ (*Z. anorg. Chem.*, 1923, **128**, 45—48).—When ordinary anhydrous cobalt iodide is heated in an evacuated glass tube at 570—575°, at which temperature it boils, part of it sublimes, forming black crystals of the iodide, part decomposes, and a small quantity is deposited high up the tube as a yellow powder. The yellow powder is a second form of cobalt iodide, termed β-cobalt iodide. It is extremely hygroscopic, and dissolves in water to give a bright yellow solution from which chloroform removes free iodine, leaving a colourless solution. This solution will remain colourless for some time, but when warmed or concentrated it acquires the rose colour of an ordinary cobalt iodide solution. Attempts to prepare distinctive hydrates or ammoniates of the β-salt were not successful. E. H. R.

The Binary System Tungsten-Molybdenum. W. GEISS and J. A. M. VAN LIEMPT (*Z. anorg. Chem.*, 1923, **128**, 355—360).—The pure metals in powder form were compressed together in various proportions, and heated to sintering, the melting points of the alloys so obtained being determined by passing currents through filaments of standard cross-section. The melting points all lie on the straight line connecting the melting points of the pure elements, and the alloys all appear to have homogeneous structures, thus showing that a continuous series of mixed crystals is formed. This conclusion was confirmed by determinations of the temperature coefficients ($\alpha_{20}^{100^\circ}$) of the electrical conductivities, and is in agreement with the remarkable similarity existing between the elements in all respects.

The temperature coefficient may be used to estimate molybdenum in an otherwise pure tungsten; 1% by weight of the former reduces the coefficient by about 10%. S. I. L.

The Precipitation of Tungstic Acid [Tungsten Trioxide]. J. A. M. van Liempt (*Z. anorg. Chem.*, 1923, **127**, 215—220; cf. A., 1922, ii, 773).—The influence of temperature and concentration of acid on the precipitation of tungsten trioxide was studied. The precipitate consists of a mixture of the white and the yellow forms of the trioxide, together with an adsorption compound with water. Temperature has little effect on the precipitation, but in order to obtain the precipitate in a granular and easily manipulated form, it is advisable to use hydrochloric or nitric acid in high concentration, and in excess. H. H.

The Ammines of Bivalent Tin. Wilhelm Biltz and Wilhelm Fischer (*Z. anorg. Chem.*, 1923, **129**, 1—14).—The following compounds were investigated, the temperature at which the dissociation pressure equals 100 mm. and the heats of dissociation per molecule of ammonia having been determined. $SnCl_2,9NH_3$, −55°, 7·6 Cal.; $SnCl_2,4NH_3$, −15°, 9·3 Cal.; $SnBr_2,9NH_3$, −57°, 7·55 Cal.; $SnBr_2,5NH_3$, −2°, 9·8 Cal.; $SnBr_2,3NH_3$, 66°, 12·5 Cal.; $SnBr_2,2NH_3$, −102°, 13·6 Cal.; $SnI_2,10NH_3$ or $9NH_3$, −48°, 7·9 Cal.; $SnI_2,5NH_3$, 10°, 10·2 Cal.; $SnI_2,3NH_3$, 55°, 11·9 Cal.; $SnI_2,2NH_3$, 94°, 13·3 Cal.; SnI_2,NH_3, 157°, 16 Cal. Heats of solution in 1% hydrochloric acid of $SnCl_2$ +0·8 Cal., $SnBr_2$ −1·6 Cal., SnI_2 −5·8 Cal. Heats of formation were measured tensimetrically and calorimetrically and the results agreed well. Decrease in the stability of the complexes in passing from the chloride to the bromide and to the iodide was not observed. For the compounds with the higher co-ordination numbers, the authors suggest the formation of two shells of ammonia around the central atom, and in the case of stannous bromide the co-ordination numbers are assumed to be 3+2 and 3+6. The preparation of all the compounds is described. All except $SnCl_2,4NH_3$ and $SnI_2,2NH_3$ are new compounds. W. T.

The Binary Halides of the Quadrivalent Elements. I. Quadrivalent Tin. Mathias G. Räder (*Z. anorg. Chem.*, 1923, **130**, 325—332).—Examination of the melting-point curves of mixtures of pure stannic bromide and iodide, and analysis of the crystals first separated on cooling, show that no mixed halogen compounds as described in the literature really exist. The method given by Lenormand (A., 1899, ii, 33, 745) for the preparation of $SnBr_2I_2$ by heating stannous bromide with excess of iodine in sealed tubes at 100° is found in fact to yield an equimolecular mixture of stannic bromide and stannic iodide. S. I. L.

The Reduction of Inorganic Halides. II. The Reduction of Titanium Tetrachloride. OTTO RUFF and FRANZ NEUMANN (*Z. anorg. Chem.*, 1923, **128**, 81—95).—The reduction of titanium tetrachloride with different elements was studied. Sodium amalgam reduces it slowly to dichloride in the cold, but if the action is too prolonged, trichloride is formed by interaction of the dichloride with tetrachloride. Magnesium, zinc, aluminium, arsenic, and antimony reduce the tetrachloride to trichloride, the reaction being accelerated by a small quantity of anhydrous aluminium chloride; phosphorus and sulphur reduce the tetrachloride only in presence of aluminium chloride. Reduction of titanium tetrachloride with aluminium powder in presence of aluminium chloride affords a new and effective method for preparing titanium trichloride. The reaction is carried out in a closed, evacuated tube at 200—250°. The trichloride obtained, freed from tetrachloride and from aluminium chloride by distillation, is in a finely divided, non-crystalline form, of a bright violet colour. It is very sensitive to oxygen and moist air. When heated with sulphur, it forms titanium chlorosulphides of varying composition, $Ti_5Cl_4S_{12}$ to $Ti_4Cl_2S_{12}$, and it also forms similar compounds with selenium. When titanium trichloride is heated at 425° at less than 1 mm. pressure, it volatilises practically unchanged and the trichloride crystallises on the colder parts of the tube in dark violet prisms. At 450° and above, the trichloride decomposes (at <1 mm. pressure) into tetrachloride and dichloride. The dichloride remains as a black powder when the trichloride is heated at 475° and the tetrachloride vapour is pumped away as it is formed. Titanium dichloride is extraordinarily reactive, takes fire in moist air, and decomposes water at once with evolution of hydrogen. It is not volatile at 600° at very low pressures.

E. H. R.

Reduction of Inorganic Halides. III. The Reduction of Zirconium Tetrachloride. OTTO RUFF and RICHARD WALLSTEIN (*Z. anorg. Chem.*, 1923, **128**, 96—116).—Zirconium tetrachloride can be reduced by a number of metals and metalloids, including aluminium, magnesium, zinc, arsenic, antimony, lead, tin, mercury, bismuth, and phosphorus, to a greater or less extent, at temperatures above 250° in presence of aluminium chloride, in absence of air. The most suitable reducing agent is aluminium powder in presence of aluminium chloride at 300°. At this temperature, zirconium tetrachloride does not react with alumina, but zirconia reacts completely with aluminium chloride according to the equation: $3ZrO_2+4Al_2Cl_3 \longrightarrow 3ZrCl_4+2Al_2O_3$. When zirconium tetrachloride is heated in a vacuum at this temperature with the theoretical quantity of aluminium for the reaction $3ZrCl_4+Al=3ZrCl_3+AlCl_3$, and the aluminium chloride and unchanged zirconium tetrachloride are removed by sublimation, a residue is left consisting largely of *zirconium trichloride*, which, however, cannot be obtained in a pure condition. The trichloride is a brown, microcrystalline solid, d^{18} 3·0. It is rapidly oxidised by air to oxychloride and decomposes water with evolution of hydrogen and formation of $ZrOCl_2$. Concentrated hydrochloric acid retards the reaction with water, and a brown solution of zirconium trichloride is obtained which slowly loses its colour as oxidation proceeds. When heated in absence of air at about 330°, the trichloride decomposes into a mixture of di- and tetra-chloride: $2ZrCl_3=ZrCl_2+ZrCl_4$, and when the tetrachloride is removed as fast as it is formed by a vacuum pump, the *dichloride* remains as a black, amorphous substance, d^{18} 3·6. It is practically insoluble in air-free water, and is only slowly decomposed by moist air or water. It is oxidised by concentrated acids with evolution of hydrogen and formation of the quadrivalent zirconium salt. Above 600°, it decomposes into zirconium tetrachloride and zirconium.

E. H. R.

Crystal Structures of Vanadium, Germanium, and Graphite. Albert W. Hull (*Physical Rev.*, 1922, **20**, 113).—The powder method of examination shows that vanadium has a body-centred cubic lattice of side 3·04 Å., distance between nearest atoms 2·63 Å., ideal density 5·96. Germanium has the same crystal structure as diamond; corresponding values are 5·63 Å., 1·218 Å., and 5·36. It is confirmed that the lattice of graphite is of the hexagonal close-packed type, and not rhombohedral as found by Debye.

A. A. E.

Dispersoid Synthesis of Gold. I. P. P. von Weimarn (*Kolloid Z.*, 1923, **33**, 228—247).—A general preliminary communication in which after a discussion of dispersoid synthesis, an account is given of experiments on the dispersoid synthesis of gold by the formaldehyde method, the phosphorus method, the citrate or tartrate method, and the glycerol method. In the general discussion, the author examines the conditions which control the size of the colloidal particles, and the reversibility and the stability of sols. The influence of impurities and added foreign substances is also discussed. The stability, size of particles, colour, and other characteristics of gold sols prepared under various conditions by the above-named methods are discussed. J. F. S.

Mineralogical Chemistry.

Presence of Anhydrous Sodium Sulphate among the Products of the Present Activity of Vesuvius. Ferruccio Zambonini (*Atti R. Accad. Lincei*, 1923, [v], **32**, ii, 122—124).—The products of the present activity of Vesuvius include anhydrous sodium sulphate in the form of thénardite. T. H. P.

The Existence of Brochantite in Katanga. Alfred Schoep and Georges Buysse (*Bull. Soc. Belge Géol.*, 1923, **33**, 72—73; *Bull. Soc. Chim. Belg.*, 1923, **32**, 342—343).—Minute, greenish-blue needles on quartz crystals in a sample of copper ore have the optical constants of brochantite and gave:

CuO.	SO_3.	H_2O.	sp. gr.
69·11	17·07	13·81	3·88

L. J. S.

The Presence of Carnotite in the Congo. ALFRED SCHOEP and ÉMILE RICHET (*Bull. Soc. Belge Géol.*, 1923, **32** [for 1922], 150—152; *Bull. Soc. Chim. Belg.*, 1923, **32**, 340—341).—A yellow, crystalline powder in red sandstone from Katanga is proved to be carnotite. The minute crystals are rhombic scales with an angle of 77—78·5°; the optic axial plane is parallel to the shorter diagonal and the acute negative bisectrix normal to the plate. The material dissolves in hydrochloric acid to a blood-red solution, this colour (due to vanadium) being lost on heating. L. J. S.

A Black Mineral Associated with Carnotite from the Congo. ALFRED SCHOEP (*Bull. Soc. Belge Géol.*, 1923, **33**, 85—86; *Bull. Soc. Chim. Belg.*, 1923, **32**, 344—345).—A red, calcareous sandstone containing carnotite (preceding abstract) shows black lenticles and irregular stains. The lenticles dissolve in strong hydrochloric acid with evolution of chlorine yielding a green solution. Analysis gave:

SiO_2.	CoO.	Fe_2O_3.	Mn_3O_4.
44·15	2·18	4·70	3·60

The remainder being water and calcium and magnesium carbonates. The black colloidal material is compared with heubachite, transvaalite, etc. L. J. S.

Chinkolobwite. A New Uranium Mineral from Katanga. ALFRED SCHOEP (*Bull. Soc. Belge Géol.*, 1923, **33**, 87—88; *Bull. Soc. Chim. Belg.*, 1923, **32**, 345—346).—A specimen of massive soddite (A., 1922, ii, 451) from Chinkolobwe, is partly covered with a felt of fine needles of a canary-yellow colour. These at first sight resemble the prismatic type of soddite, but they show a lower birefringence and other differences in their optical characters. Microchemical tests show the presence of uranium and silica, and the mineral is perhaps dimorphous with soddite, $12UO_3,5SiO_2,14H_2O$. L. J. S.

Analytical Chemistry.

A New Absorption Pipette for Gas Analysis. SIDNEY WALTER SAUNDERS (T., 1923, **123**, 2826—2828).

Volumetric Analysis. M. EMM. POZZI-ESCOT (*Ann. Chim. Analyt.*, 1923, [ii], **5**, 293).—Fabaron has recently (*ibid.*, 161) suggested the use of graduated tubes for measuring the volumes of precipitates, but the author points out that he had described this method previously (A., 1908, ii, 539). W. P. S.

Replacement of Iodine by Ferric Chloride in Volumetric Analysis. KARL JELLINEK and LEO WINOGRADOFF (*Z. anorg. Chem.*, 1923, **129**, 15—32).—This new method is based on the reaction $2FeCl_3+Na_2S_2O_3=2FeCl_3+2NaCl+Na_2S_4O_6$, and can be employed for the estimation of oxidising and reducing agents. The titrations must be carried out with hot solutions and in an atmosphere of carbon dioxide. The solutions recommended are 0·1*N*-ferric chloride+0·2% hydrochloric acid and 0·1*N*-sodium thiosulphate+0·1% sodium carbonate. The ferric solution is kept at 50—60° and the thiosulphate solution run in from a burette; this causes the formation of a violet coloration probably due to the formation of the unstable ferric thiosulphate, which rapidly disappears; the end-point is reached when no further coloration is produced; the presence of more than 0·5% hydrochloric acid makes the colour very indistinct. Thiocyanate or potassium iodide starch paper cannot be employed as indicators for the complete reduction of ferric-ion in this case, but the disappearance of the characteristic colours with phenols gave good results, *e.g.*, 1 c.c. saturated solution of salicylic acid. The end-point was also sharply given by the decoloration of methylene-blue, this being due to the presence of thiosulphuric acid; still better results were obtained by using a mixture of methylene-blue and magenta (5 drops of a 0·5 % solution of aqueous methylene-blue and 3 drops of saturated aqueous magenta). Attempts to use as the end-point the decoloration of organic dyes by the sulphur dioxide formed did not give satisfactory results. Details are given of the estimation of potassium permanganate, potassium chlorate, manganese dioxide, tin (in white metal), and sulphides. Unsatisfactory results were obtained in the estimation of nitrates, hydrogen peroxide, and sulphites. W. T.

New Methods in Alkalimetry and Acidimetry, and in Oxidimetry. Hydrolytic Precipitation Analysis and Mercurimetry. K. JELLINEK and P. KREBS (*Z. anorg. Chem.*, 1923, **130**, 263—324).—In place of the usual organic colour indicators, the following inorganic salts may be used in titrations of acids and alkalis: (*a*) Lead salts for all alkalis, and for acids other than sulphuric; (*b*) copper salts for all acids with ammonia; (*c*) silver salts for all acids other than the halogen acids, and for all alkalis other than ammonia, and (*d*) ferric thiocyanate for all strong acids and alkalis. With (*a*), (*b*), and (*c*) the quantity of indicator used must be as small as possible; excess of alkali is added to the acid solution containing the indicator, and the excess titrated back until the cloudiness due to precipitation of the heavy metal hydroxide disappears. The average results with (*a*) are 0·6% too high in determining the alkali, with (*b*) 0·6% too high, and with (*c*) 2·5% too high; these average errors must be taken into account for very accurate estimations. Using (*d*), the average error is only 0·1%; the indicator is used in the form of 1 drop of a 0·25% ferric chloride solution and 10 drops of a 10% potassium thiocyanate solution.

A suitable method for the titration of ferrous and stannous salts consists in oxidation with hydrogen peroxide solution, using as indicator a titanic salt in presence of sulphuric acid. To reduce the coloration due to the ferric salt formed, orthophosphoric acid is added, the error being 0·5%; with tin salts, the average error is negligible. Ferrous salts are titrated in the cold, tin salts at a high temperature. The method is unsuitable for arsenic and antimony salts, and for oxalates.

A titration method for the estimation of cadmium and nickel consists in precipitating as hydroxide by means of excess of standard alkali at the boiling point. After cooling, a few drops of silver nitrate are added, and the liquid is titrated with standard acid until the yellow coloration disappears. A comparison solution is required in each case, and a separate determination of the amount of alkali required to make the original solution neutral must also be made. For cadmium, the results are very accurate; for nickel, the average error is +0·3%, probably due to oxidation.

The hydrolytic precipitation method described by Jellinek and Czerwinski (this vol., ii, 878) has been further examined for the estimation of (1) lead by means of potassium chromate, and extended to (2) disodium hydrogen arsenite, (3) disodium sulphide, (4) sodium carbonate, and (5) potassium cyanide as precipitation reagents. The solutions to be titrated must be exactly neutralised in each case. Method (2) was found unsuitable for zinc, but suitable for lead and cadmium, the discrepancies being within the limits of experimental error. Phenolphthalein is employed as indicator, and comparison solutions without indicator must be used. Precipitation is effected at the boiling point, and the arsenite solution must be standardised each time against the pure metal salt solution. With (3), very accurate results are obtained for zinc salts, and the analysis may be applied to the estimation of zinc in white metals and other alloys. The indicator used is methyl-red, and the sodium sulphide solution must be standardised by means of pure zinc at fortnightly intervals. The method is rapid and convenient. Both zinc and lead may also be estimated accurately with (4), using phenolphthalein as indicator; the neutralised solution is boiled with excess of the carbonate solution, the excess being titrated back at 100° with a standard zinc or lead solution, respectively, until the red coloration disappears. Comparison solutions must be employed. Neither of these metals can be accurately estimated by means of (5), but with silver excellent results are obtained; phenolphthalein is used as indicator, and precipitation carried out at the boiling point.

Mercuric salts may also be estimated by means of (5), the cyanide solution being added at the boiling point until the indicator, phenolphthalein, becomes rose-coloured. A constant error of 3·1% (low) is observed, but if the cyanide be standardised by means of a mercuric salt, this error automatically disappears. By reason of the slight dissociation of mercuric salts, these promise to be of great value in connexion with this method of analysis.

S. I. L.

Use of Calcium Carbonate in Volumetric Analysis. E. KORDES (*Z. anal. Chem.*, 1923, **63**, 117—120).—For the estimation of free chlorine in solutions which cannot be titrated directly, the chlorine may be expelled by generating carbon dioxide in the solution by the action of hydrochloric acid on thick pieces of calcium carbonate (marble) and collecting the evolved gases in potassium iodide. In estimating the available oxygen in manganese dioxide, for instance, a weighed quantity of the substance is introduced into a conical flask together with two thick pieces of marble and hydrochloric acid is dropped on to the dioxide by means of a dropping funnel. When the latter has dissolved, after gentle heating, if necessary, the flask is inclined so that the marble comes into contact with the liquid. The carbon dioxide evolved sweeps the chlorine formed in the first stage into receiving flasks containing potassium iodide and the liberated iodine is titrated as usual. The whole process takes ten minutes against the forty-five minutes consumed if carbon dioxide is passed through the apparatus in the usual way. A. R. P.

Use of the Mercury Electrode for Electrometric Titration of Halides, Cyanides, Sulphides, and Thiosulphates. I. M. KOLTHOFF and E. J. A. H. VERZYL (*Rec. trav. chim.*, 1923, **42**, 1055—1064).—Methods are described for the potentiometric estimation of chlorides, bromides, iodides, cyanides, sulphides, and thiosulphates. The alteration of the *E.M.F.* of the solution (Δa) in contact with a mercury electrode with a small change in concentration of mercuric chloride (Δc) is measured, and the end-point is indicated when $\Delta a/\Delta c$ reaches its maximum value. Chlorides and bromides can be determined, but not together in the same solution. Iodides can be estimated even in great dilution, but large quantities of bromides interfere. Cyanides and thiocyanates can be estimated. Sulphides may be estimated in great dilution, especially in alkaline solution, but strong solutions are best titrated with silver nitrate. Salts with bivalent anions depress the results slightly. Thiosulphates and sulphides may be estimated in mixtures of the two, provided neutral solutions are employed. H. H.

Estimation of Sulphur in Cast Iron SANSEI KITAJIMA (*Rikwagaku Kenkyujo Ihô*, 1923, **2**, 243—258).—The author has examined the usual method of estimating sulphur in iron, by dissolving in hydrochloric acid and determining the amount of hydrogen sulphide evolved, and finds that the rate at which the hydrochloric acid is added to the sample has a considerable effect on the result. Hydrochloric acid (*d* 1·19—1·20) diluted with twice its volume of water is to be used for the operation and 10 c.c. of cadmium chloride solution (prepared from 120 grams of cadmium chloride, 1,500 c.c. of water, and 600 c.c. of ammonia, *d* 0·90) diluted with 35 c.c. of water. The volume of the solution for the titration should be about 70 c.c. for 5 grams of the sample. If the evolved hydrogen sulphide is passed through a quartz tube heated to redness before entering the cadmium chloride solution, the result is slightly higher and more constant; in this case the results obtained by the titration and by weighing as barium sulphate after oxidising the cadmium sulphide with bromine water are almost identical. The solution and residue remaining in the flask after the evolution has ceased are almost free from sulphur. K. K.

Estimation of Sulphate at Great Dilutions by Hahn's Method. I. M. KOLTHOFF and M. J. VAN CITTERT (*Pharm. Weekblad*, 1923, **60**, 1177—1190).—A critical examination has been made of Hahn's method (this vol., ii, 39, 339). The present authors filter the barium sulphate through a wad of cotton, as suggested by Winkler (*Z. angew. Chem.*, 1917, **30**, 251), and carry out the final washing with alcohol. The method gives results 1·0—1·3% too low, but by working in acetic acid or neutral solution instead of in hydrochloric acid solution a high degree of accuracy is obtained. Barium chloride gives better results than barium nitrate.

The alkali metals and aluminium and ferric salts do not affect the results, but calcium interferes unless the precipitation is carried out in $N/10$-hydrochloric acid solution. Nitrates have little influence, but the presence of phosphates make the results too high. If the operation is carried out at atmospheric temperature, the errors are much higher; this is also the case if the reagents are heated in a sealed tube above 260°. S. I. L.

Limitations of the Reaction between Ammonia and Sodium Hypobromite. DINSHAW RATTONJI NANJI and WILLIAM SIMPSON SHAW (*Analyst*, 1923, **48**, 473—477).—Critical examination of the hypobromite method showed that it was untrustworthy for the estimation of ammonia, particularly for small quantities of the latter. When dealing with amounts of ammonia varying from 3 to 17 mg., the results obtained were from 2 to 7% too high. Traces of nitrates and nitrites were always formed as by-products of the reaction. W. P. S.

Cause of Error in the Jodlbauer Method of Estimating Total Nitrogen. JEAN BORDAS (*Compt. rend*, 1923, **177**, 696—697).—The Jodlbauer method gives a low result with complex fertilisers, etc., containing tannins. These, as well as pyrogallol, quinol, and pyrocatechol (but not resorcinol or non-reducing diphenols) effect partial reduction of nitrate in presence of concentrated sulphuric acid, perceptible evolution of nitrous fumes occurring. The methods of Dumas, of Salle, or of Devarda (followed by a Kjeldahl determination of nitrogen not present as nitrate) are to be preferred in these cases. E. E. T.

The Determination of Protein Nitrogen according to Stutzer. S. KOSTYTSCHEV (*Z. physiol. Chem*, 1923, **130**, 34—38).—Stutzer's method for determining protein nitrogen, in which the proteins are precipitated by heating with copper hydroxide, is inaccurate. Nitrogen other than protein nitrogen is precipitated by the reagent. W. O. K.

Analysis of Monosodium Phosphate and Phosphoric Acid. FRANK X. MOERK and EDWARD J. HUGHES (*Amer. J. Pharm.*, 1923, **95**, 671—678).—The following volumetric method is described: 40 c.c. of $N/10$-silver nitrate solution and 0·2 c.c. of methyl-red solution are treated with dilute sodium hydroxide solution until the red coloration changes to yellow; 10 c.c. of the phosphate solution (containing about 0·2 g. of the salt) are then added, and the mixture is titrated with $N/10$-sodium hydroxide solution. The reaction proceeds according to the equation $NaH_2PO_4+3AgNO_3+2NaOH=Ag_3PO_4+3NaNO_3+2H_2O$. One hundred c.c. of 10% sodium chloride solution and 0·2 c.c. of phenolphthalein solution are treated with sodium hydroxide solution until a distinct red coloration is obtained; the solution is divided into two equal parts, to one is added 10 c.c. of the phosphate solution and the mixture is titrated with $N/10$-sodium hydroxide solution until the coloration is equal to that of the reserved portion. The equation for this titration is $NaH_2PO_4+NaOH=Na_2HPO_4+H_2O$. If the two titrations yield the same percentage of monosodium phosphate, the sample is free from disodium phosphate and phosphoric acid; a higher percentage by the phenolphthalein method indicates the presence of free phosphoric acid, whilst a higher percentage by the methyl-red method denotes the presence of disodium phosphate in the sample. The quantities of free phosphoric acid and disodium phosphate may be calculated from the results obtained. The sodium chloride solution used must not contain calcium salts and the sodium hydroxide solution must be free from carbonate. The method may be applied to phosphoric acid. W. P. S.

Chemistry of the Reinsch Test for Arsenic and Antimony, and its Extension to Bismuth. B. S. EVANS (*Analyst*, 1923, **48**, 417—429).—The results obtained in an investigation of the Reinsch test favour the hypothesis that the reaction is due to reduction of the arsenic, antimony, or bismuth salt by a film of hydrogen on the surface of the copper, the hydrides formed in the first two instances combining with the copper to form arsenide or antimonide, respectively. When oxidation of the cuprous chloride formed is prevented by carrying out the test in an atmosphere of carbon dioxide, the deposition of the three elements is complete; in the case of relatively large amounts of antimony, the deposit may be so dense that the reaction ceases, and the solution may need to be treated with two or three successive pieces of copper foil. With small quantities (1 to 5 mg.) of bismuth better results are obtained by using acetic acid and sodium chloride in place of sulphuric acid and sodium chloride. W. P. S.

Estimation of Arsenic in Arsenobenzenes. F. DE MYTTENAERE [with VAN BOECKEL, MUSET, and DUMONT] (*Chim. et Ind.*, 1923, **10**, 403—410).—About 0·2 g. of the arseno-compound is dissolved in 5 c.c. of water, 10 c.c. of hydrogen peroxide (10 vols.), and 10 c.c. of 50% sulphuric acid are added and the mixture is boiled until the excess of peroxide is decomposed; a further 5 c.c. of hydrogen peroxide are then added, and the heating is continued until sulphuric acid fumes are evolved. After cooling, the mixture is diluted with 10 c.c. of water, a slight excess of 1% potassium permanganate solution is added, and the pink coloration is discharged by the addition of a drop of oxalic acid solution; 20 c.c. of 25% potassium iodide solution are added, the mixture is heated on a water-bath for twenty minutes, cooled, and decolorised exactly by the addition of *N*/10-sodium thiosulphate solution. Twenty-five c.c. of saturated sodium carbonate solution and an excess of sodium hydrogen carbonate are then added, and the solution is titrated with *N*/10-iodine solution. Each c.c. of the latter solution is equivalent to 0·003749 g. of arsenic. The quantity of arsenic present should be from 19 to 21%, and the ratio arsenic/nitrogen should not be less than 5·6. W. P. S.

A New Gas Combustion Furnace. THOMAS J. HEDLEY (*J. Soc. Chem. Ind.*, 1923, **42**, 432—433T).—A somewhat fuller description of the furnace previously described (T., 1921, **119**, 1242). E. H. R.

Estimation of Carbon Monoxide in Air. VIKTOR ANDRISKA (*Z. Unters. Nahr. Genussm.*, 1923, **46**, 43—46).—Weltzl's tannin reaction with defibrinated blood solution in which carbon monoxide has been absorbed from the air is developed into a quantitative method of determining carbon monoxide in air. The sensitiveness of the test was found to be 1% of the volume of blood solution (1 part of blood to 4 parts of water) employed, so that 100 c.c. of blood solution will detect 1 c.c. of carbon monoxide. Absorption vessels are not suitable for estimating small proportions of carbon monoxide in air, as losses occur. A more complete absorption is obtained by shaking up the blood solution with one hundred times its volume of air in a closed vessel. A hollow stopper capable of containing 50 c.c. of blood solution, which can be fitted to a 5-litre flask, is illustrated. This is so designed that the blood solution is projected into the flask in a thin stream, so as to effect a complete absorption of the carbon monoxide. After absorption is complete (3 hours), known volumes of the blood solution are diluted with known volumes of the fresh blood solution, the total volume of the mixture being in each case 5 c.c. Fifteen c.c. of a freshly prepared 1% tannin solution are added to each mixture and that mixture noted, the colour of which can just be differentiated from the blank test with fresh blood solution only, after remaining for twenty-four hours. In this way, accurate estimations of carbon monoxide in air are possible down to 0·02%. H. C. R.

A Microchemical Method for the Analysis of Carbonates. MIECZYSŁAW DOMINIKIEWICZ (*Roczniki Chemji*, 1923, **3**, 165—176).—Naturally occurring carbonates can be divided into two groups according to their behaviour on heating on platinum foil below red heat; the first group includes those which are not visibly changed by this treatment (calcite, aragonite, lublinite, dolomite, magnesite, witherite, strontianite, baryocalcite, etc.) and those which change colour under the same conditions (siderite, rhodochrosite, oligonite, ankerite, brennerite, cernosite, plumbocalcite, smithsonite, and calcites and dolomites containing iron or manganese); naturally coloured minerals such as malachite are not taken into consideration.

Of the minerals of the first groups only two—strontianite and witherite—are completely unaffected by heating; the remainder suffer some degree of dissociation with the formation of oxides which can be detected by suitable reagents. The grains of mineral are treated, after heating, with an alcoholic solution of alizarin (0·1%); those which contain an oxide are coloured bluish-red, whilst strontianite and witherite remain colourless. Dianil-green in aqueous solution can also be used for the same purpose, but the use of 1% alcoholic phenolphthalein is preferable because it allows a further distinction to be made between the minerals of this group. The coloured phenolphthalein salt formed with magnesium is insoluble in alcohol and only slowly dissolves in water, whilst the calcium salt is readily soluble. Magnesite is thus readily recognised because the grains of mineral become coloured, but the solution remains colourless; the solution slowly becomes pink in the case of dolomite, whilst an immediate coloration is obtained with calcite, etc. Dolomite can, moreover, be distinguished from magnesite, because the latter, when heated and then warmed for ten minutes with 5% aqueous sodium hydroxide followed by a 0·1% aqueous solution of the ammonium salt of 2 : 4 : 6 : 7-tetrahydroxyfluoran (Liebermann, A., 1901, i, 595), is coloured crimson, whilst dolomite remains colourless. Predacite, when heated on platinum foil for a few seconds below red heat and then treated with phenolphthalein, is coloured in places only, and the alcoholic solution remains colourless, as the mineral is composed of a mixture of calcite and brucite, the former of which is not decomposed by this treatment; staining with tetrahydroxyfluoran after treatment with alkali produces a similar effect. Calcite can be distinguished from aragonite by heating the mineral for two minutes with 0·25% aqueous cobalt nitrate (compare Meigen, A., 1901, ii, 692), washing, and staining with tetrahydroxyfluoran. On heating with dilute ammonia, aragonite remains crimson, whilst calcite is decolorised. Ferrous sulphate (1%) can replace cobalt nitrate in this test, the dye being used in alkaline solution; aragonite is coloured blue, but calcite remains colourless. Calcite, aragonite, witherite, and strontianite are coloured violet when treated after heating with 0·3% ferric chloride for twelve seconds, followed by a neutral solution of the dye and finally ammonia; dolomite is unaffected.

In order to distinguish witherite from strontianite, the mineral is warmed for one to two minutes with 0·5% chromic acid, when witherite is coloured yellow; the colour can be intensified by subsequent treatment with a lake-forming dye such as chromotrope-2*B*.

Of the minerals of the second group, siderite and rhodochrosite become black and lustrous on heating, and the former is also magnetic; calcites and dolomites containing iron or manganese become light brown to black; smithsonite shows a yellow coloration while hot, and becomes colourless or black on cooling, whilst cerussite is coloured light-brown and does not change on cooling.

They can also be distinguished by warming with 5% aqueous sodium hydroxide for fifteen to twenty minutes and with tetrahydroxyfluoran for five to ten minutes. The colours produced are: siderite, purplish-brown; rhodochrosite, brownish-crimson; smithsonite, orange. A further test consists in heating for ten to fifteen minutes with 5% sodium hydroxide and a drop of bromine, then with sodium hydroxide alone, and finally with a saturated solution of benzidine in acetic acid; minerals containing manganese are coloured an intense blue (*e.g.*, rhodochrosite).

In a few cases it was found that iron present in some dolomites and calcites was not detected by the tetrahydroxyfluoran test; it is suggested that the iron was present in the form of a definite double carbonate, similar to the calcium magnesium carbonate which constitutes dolomite.

Smithsonite can be recognised by Lemberg's method (*Z. deutsch. Geolog. Ges.*, 1887, 357) in addition to the above, and this also applies to cerussite. The latter and also plumbocalcite can, however, be recognised by the benzidine test described above; an intense blue coloration, changing to violet, is observed in these cases.

G. A. R. K.

Sodium 6-Chloro-5-nitro-*m*-toluenesulphonate—a New Reagent for Potassium. HERBERT DAVIES and WILLIAM DAVIES (T., 1923, **123**, 2976—2982).

Quantitative Analysis by Hydrolytic Precipitation. K. JELLINEK and J. CZERWINSKI (*Z. anorg. Chem.*, 1923, **30**, 253—262).—If to a slightly acid solution of barium chloride coloured red by addition of methyl-orange, excess of potassium chromate solution is added, the colour changes from red to yellow; as soon as the equivalent quantity of potassium chromate has been added, any excess is hydrolysed and the solution acquires an alkaline reaction. Consideration of the degrees of dissociation and of the hydrogen-ion concentrations of the common indicators shows that high degrees of accuracy may be expected by applying the principle to any case in which soluble combinations of weak acid with strong base or strong acid with weak base may be utilised. Thus barium chloride may be estimated by means of potassium chromate, using methyl-red, with an error of 0·06%; by adding a known excess of barium chloride, sulphates may be similarly estimated. Cadmium salts do not interfere. Similarly, lead nitrate may be estimated by means of potassium chromate, using methyl-red. The titrations are carried out in porcelain dishes. The new method allows of rapid and accurate titrations in many cases in which gravimetric analysis is tedious and difficult.

S. I. L.

The Separation of Magnesium from the Alkali Metals by Means of Organic Bases. GUNHILD HEMMING (*Z. anorg. Chem.*, 1923, **130**, 333—342).—A solution of guanidine (prepared by addition of a slightly insufficient amount of barium hydroxide to the carbonate) precipitates magnesia quantitatively in presence of the alkali metals if excess be used; ammonium salts interfere.

The method may be employed in titration, but since guanidine solutions do not keep well, standard solutions of the carbonate and baryta may be employed. Piperidine does not give quite such good results, but the solution may be kept without change. Aliphatic amines are not so suitable, the errors being greater.

S. I. L.

A New Microchemical Reaction for the Estimation of Zinc. G. Spacu and R. Ripan (*Bul. Şoc. Ştiinţe Cluj*, 1922, **1**, 576—580; from *Chem. Zentr.*, 1923, iv, 185; cf. this vol., ii, 699).—The double compound of the composition $[Zn(C_5H_5N)_2](CNS)_2$ formed by the reaction of ammonium thiocyanate and pyridine with a zinc salt is dissolved by repeated extraction with small quantities of chloroform. After evaporation to dryness of the chloroform solution, the residue is weighed. G. W. R.

The Electrometric Titration of Zinc and Cadmium. Friedr. Müller (*Z. anorg. Chem.*, 1923, **128**, 125—130).—In confirmation of the results of Hedrich (*Diss. Dresden*, 1919) it is found that zinc can be titrated electrometrically with potassium ferrocyanide, using a platinum indicator-electrode, with an accuracy of 0·2—0·3%; the precipitate is $K_2Zn_3(FeC_6N_6)_2$, and the results are best with hot neutral solutions. Cadmium may be similarly titrated, the precipitate being $K_2Cd(FeC_6N_6)$. With sodium ferrocyanide, cadmium gives accurate results, but with zinc poor results were obtained. No advantage is gained by addition of salts of rubidium, cæsium, or lithium. Zinc in presence of cadmium may be accurately titrated with potassium ferrocyanide, but the cadmium can be estimated in the solution only by the use of an empirical factor.

S. I. L.

Estimation of Zinc and Lead in Presence of Large Amounts of Carbon. W. Kahlbaum (*Eng. Min. J. Press*, 1923, **116**, 110—111).—The carbonaceous matter is destroyed in 0·5 g. of the material by heating with 5—10 g. of sodium peroxide in a mild steel bomb of Parr's type. The mass after reaction is extracted with water, and the insoluble hydroxides are dissolved in dilute acid. For the estimation of zinc, 5 g. of ammonium chloride, 20 c.c. of ammonia solution, and a little hydrogen peroxide are added, the liquid is filtered, and titrated with potassium ferrocyanide solution. Lead is estimated by the molybdate method or, if present in only a small quantity, electrolytically. Chemical Abstracts.

A New Reaction for Cadmium. G. Spacu (*Bul. Şoc. Ştiinţe Cluj*, 1922, **1**, 538—541; from *Chem. Zentr.*, 1923, iv, 187).—By the addition of potassium thiocyanate solution to an aqueous solution of a cadmium salt in the presence of pyridine, a white crystalline precipitate having the composition $[Cd(C_5H_5N)_2](CNS)_2$ is obtained. It is soluble in excess of pyridine and is decomposed by acids. By this reaction, 0·02 g. of cadmium per litre may be detected. G. W. R.

The Estimation of Lead as Cyanide. W. Herz and Eberhard Neukirch (*Z. anorg. Chem.*, 1923, **130**, 343—344).—Lead is precipitated quantitatively in the cold by gradual addition of considerable excess of normal sodium cyanide solution ; the precipitate is collected, dried, and weighed as $Pb(CN)_2$. Neither copper nor silver interferes. S. I. L.

Nature of the Oxide Produced on the Anode during the Electrolysis of Thallous Sulphate. A. GUTBIER and W. DIETERLE (*Z. Elektrochem.*, 1923, **29**, 457—467).—The authors have examined the methods of Heiberg (A., 1903, ii, 614) and of Gallo and Cenni (A., 1908, ii, 986) for the electrolytic estimation of thallium, which consists in the deposition of the oxide on the anode. It is shown that the oxide invariably contains sulphuric acid. Consequently, neither method is trustworthy for the exact estimation of thallium. It is shown that thallium may be estimated by the electro-deposition of oxide as follows : thallous sulphate is dissolved in 100 c.c. of water in a roughened platinum dish, 0·1—1·5 c.c. of 2*N*-sulphuric acid and 5—9 c.c. of ethyl alcohol are added, and the solution is electrolysed at 53—58°, when the oxide Tl_2O_3 is deposited quantitatively. It is shown that the anodic product is definitely Tl_2O_3, and not Tl_3O_5, as suggested by Gallo and Cenni (*loc. cit.*). J. F. S.

A New Specific Reagent for the Estimation of Copper. F. FEIGL (*Ber.*, 1923, **56**, [*B*], 2083—2085).—The name "Cupron" is proposed for benzoinoxime, which precipitates copper quantitatively from neutral or ammoniacal solution. The precipitate is sap-green in colour, and is insoluble in water, alcohol, dilute ammonia, acetic acid, or tartaric acid. It is easily soluble in dilute mineral acids, and fairly soluble in concentrated ammonia. The reagent is specific for copper in ammoniacal or tartrate solution, in that iron, lead, cobalt, nickel, zinc, and aluminium are not precipitated It is sensitive to one part of copper in 33,000 parts, and the annexed co-ordination formula  is proposed for the copper derivative. This contains 22·02% Cu and may be dried in the air oven at 110°. H. H.

Simultaneous Electrometric Estimation of Copper and Silver by Means of Potassium Thiocyanate. ERICH MÜLLER and ARTHUR RUDOLPH (*Z. anal. Chem.*, 1923, **63**, 102 -111).—Copper may be determined electrometrically by measuring the change of potential between a copper indicator electrode and the usual normal calomel electrode at 70° in a solution containing sodium hydrogen sulphite to which standard potassium thiocyanate is slowly added The solution must contain more copper than corresponds with a *M*/100-solution; the results are always about 0·7% too high. Silver gives good results when similarly titrated at the ordinary temperature, using a silver indicator electrode. As the presence of sulphites interferes with the simultaneous determination of both metals in a solution, the silver is titrated, first using a silver indicator electrode; the solution is then filtered, a copper electrode inserted, the requisite sodium hydrogen sulphite added, and the copper then titrated as above. By a compensation of errors the results for copper are quite good under these conditions.

A. R. P.

The Electrometric Estimation of Manganese. ERICH MÜLLER and OTTO WAHLE (*Z. anorg. Chem.*, 1923, **129**, 33—40).—Volhard's method of the titration of a manganous salt by means of permanganate $2MnO_4'+3Mn^{\cdot\cdot}+2H_2O=5MnO_2+4H^{\cdot}$ can be carried out electrometrically. The presence of a zinc salt, potassium nitrate, or another electrolyte is shown to be necessary (cf. Sarkar and Dhar, A., 1922, ii, 398). The values obtained are rather low. Near the end-point, an interval of seven minutes is necessary for a constant *E.M.F.* In the presence of hydrogen fluoride, the reaction is as follows: $MnO_4'+4Mn^{\cdot\cdot}+8H^{\cdot}=5Mn^{\cdot\cdot\cdot}+4H_2O$ (cf. Müller and Kopp, A., 1910, ii, 957). In this case, the end-point is sharp, but depends on the composition of the solution. The best results are obtained by using 10 c.c. of 4*N*-sulphuric acid and 8 g. of potassium fluoride per 100 c.c. of the solution. The authors hope to extend the applicability of this method to the analysis of a mixture of ferrous iron and manganese. W. T.

The Separation of Tin from Other Metals. N. HOWELL FURMAN (*Ind. Eng. Chem.*, 1923, **15**, 1071—1073).—An investigation of the precipitation of stannic tin by means of cupferron from such a solution as would be obtained in the McCay method of separating tin and antimony (A., 1909, ii, 351, 1910, ii, 1003) showed that this method of treatment is rapid and accurate. The precipitate on stirring for thirty to forty-five minutes becomes compact and brittle, and is then easy to filter and wash. Manganese, nickel, cobalt, and zinc, if present, remain in the filtrate.

The separation of tin and antimony by precipitation with hydrogen sulphide in dilute hydrofluoric acid solution is incomplete unless the antimony is all in the tervalent state. The method of electolytic precipitation of tin from the solution obtained in the McCay method, as recommended by Kling and Lassieur (A., 1920, ii, 452), has been found to be extremely slow and unsatisfactory. C. I.

Oxidimetric Studies on Antimony. J. KNOP (*Z. anal. Chem.*, 1923, **63**, 81—102).—A large number of titrations of antimony with potassium permanganate under varying conditions have been carried out in order to ascertain those giving the most satisfactory results. Under widely varying conditions of acidity either of hydrochloric or of sulphuric acid or of both, results were obtained which gave only 98·5% of the total antimony if the calculations were based on an atomic weight of 120·2. Every possible source of error was investigated without obtaining any more satisfactory result. Consequently, further series of tests were made by adding an excess of potassium dichromate solution and titrating this excess with ferrous sulphate, using diphenylamine as internal indicator or ferricyanide as external indicator. From the mean of many very concordant results, again only 98·5% of the antimony present was found and no possible source of error could be discovered. All the results obtained agree with the old atomic weight of 121·9 for antimony, and this seems to confirm the value of 121·8 given in the German atomic weight tables for 1922. A. R. P.

Tables for Sugar Analysis. G. D. ELSDON (*Analyst*, 1923, **48**, 435—443).—Tables are given showing the quantities of dextrose, lævulose, hydrated lactose, anhydrous lactose, maltose, invert-sugar, sucrose, and starch corresponding with weights of cupric oxide (also cuprous oxide and metallic copper) for every mg. from 100 to 460. The tables are based mainly on those published previously by Brown, Morris, and Miller (T., 1897, **100**, 281). W. P. S.

Estimation of Dextrose and Lævulose. F. LUCIUS (*Z. Unters. Nahr. Genussm.*, 1923, **46**, 94—95).—In the estimation of dextrose and lævulose by the method based on the inversion of the latter with dilute inorganic acids (A., 1920, ii, 132), the period of heating may be reduced to three hours by doubling the concentration of acid employed. Any further increase in acid concentration above this figure (20 c.c. of 5*N*-hydrochloric acid and 50 c.c. of sugar solution) leads to an appreciable decomposition of dextrose. A series of ten analyses carried out on mixtures of known composition using this method gave results for dextrose 95—96·7%, and for lævulose 96·1—101% of the amounts actually present. H. C. R.

Biochemical Characterisation of Galactose in a Mixture containing Galactose and Arabinose. MARC BRIDEL and JEAN CHARPENTIER (*Compt. rend.*, 1923, **177**, 908—910).—Emulsin acts on a mixture of galactose and arabinose in 70% alcohol, at 37°, to give β-ethylgalactoside, and galactose may therefore readily be identified, as, for example, in the products of hydrolysis of gum arabic (cf. this vol., i, 540). If the enzyme is renewed from time to time, some ethyl arabinoside is also formed, but, without such renewal, only the galactose is converted into a glucoside. E. E. T.

Estimation of Sugars in Mixtures of Sucrose, Invert-sugar, and Lactose. HANS JESSEN-HANSEN (*Comptes rend. Trav. Lab. Carlsberg*, 1923, **15**, No. 3, 21 pp.).—Sucrose when heated with an alkaline copper solution causes a deposition of cuprous oxide, although this deposition may be reduced to a minimum by a suitable choice of conditions. The quantity of cuprous oxide deposited by a mixture of sucrose and a reducing sugar, or of two reducing sugars, is not equal to the sum of the quantities which each sugar would deposit if it were the only constituent of the mixture. Series of analyses were therefore carried out to determine the amount of copper deposited under standard conditions (1) by pure invert-sugar, (2) by mixtures of sucrose and invert-sugar in which the total weight of sugar present was always equal to 0·240 g.; (3) by pure lactose; (4) by mixtures of 0·200 g. of sucrose with increasing quantities of lactose, and (5) by mixtures of 0·050 g. of lactose with increasing quantities of invert-sugar. In each case, a formula was calculated to cover the experimental results obtained. The following are the formulæ for the five different cases: (1) $\mathrm{Cu}=0{\cdot}20+1{\cdot}97122S-0{\cdot}000735S^2$; (2) $\mathrm{Cu}=1{\cdot}94+1{\cdot}97755S-0{\cdot}00079444S^2$; (3) $\mathrm{Cu}=0{\cdot}58+1{\cdot}25431L-0{\cdot}000008784L^2$. (4) $\mathrm{Cu}=1{\cdot}94+1{\cdot}2597L-0{\cdot}00000025L^2$. (5) $\mathrm{Cu}=-64{\cdot}91+1{\cdot}897912I-0{\cdot}00050226I^2$. From these formulæ, five sets of tables are calculated giving the number of mg. of the various sugars in question corresponding with quantities of copper of from 0 to 440 mg. The exact procedure used for obtaining the copper is as follows: 8·65 g. of potassium sodium tartrate, 25 c.c. of $3{\cdot}25N$-sodium hydroxide, and 25 c.c. of copper sulphate solution containing 69·278 g. of $\mathrm{CuSO_4,5H_2O}$ (=17·592 g. of copper) per litre were mixed just before use in a 150 c.c. conical flask. The sugar solution was added and the total volume made up to 100 c.c. with water. Hydrogen was passed through the flask until all the air was displaced, and the flask then placed in a large boiling water-bath so that the surfaces of the liquid inside and outside the flask were at the same level. The flask was allowed to remain in the bath for exactly five minutes, after which it was removed and the contents were immediately filtered through an Allihn's asbestos tube, using suction. The cuprous oxide was carefully washed with warm boiled water and alcohol and completely transferred to the asbestos tube, which was finally washed with absolute alcohol and ether, dried by suction, and the oxide reduced to metallic copper by passing a current of hydrogen through the tube, heated in an air oven. When completely reduced, the copper was allowed to cool in a current of hydrogen and weighed. In using the tables for the analysis of a mixture of sucrose and invert-sugar, a 2% solution of the sugar is made up, and 50 c.c. of this are inverted according to Nicol. The acid is neutralised and the volume made up to 100 c.c. The invert-sugar in this is obtained from table (1) (=a). The original solution is then analysed, taking a quantity corresponding with 240 mg. of invert-sugar, and from the amount of copper obtained and table (2) the original amount of invert-sugar (=b) is obtained. The original sucrose present is therefore 0·95 (a—b). In the case of mixtures of lactose and sucrose, the approximate quantity of lactose is first obtained from the weight of copper, using table (4). A solution containing about 1% of lactose is then prepared, and 50 c.c. of this are inverted by Nicol's method as above, neutralised, made up to 100 c.c. and the amount of copper obtained from 10 c.c. of this is weighed. The approximate quantity of invert-sugar present in this and consequently of sucrose in the original solution, can then be read off table (5). In order to obtain more exact values, a portion of the original solution containing exactly 200 mg. of sucrose is taken and the quantity of lactose present in this obtained from the weight of copper and table (4). A portion of the inverted solution containing, according to the last analysis, 50 mg. of lactose will then, by using table (5), give the true amount of invert-sugar present, and consequently of sucrose in the original mixture. Concrete examples are given which make the method of using the tables clear. H. C. R.

Estimation of Pentoses and Pentosans. I. Formation and Distillation of Furfuraldehyde. Norville C. Pervier and Ross A. Gortner (*Ind. Eng. Chem.*, 1923, **15**, 1167—1169).—Distillations of materials containing pentoses carried out according to the method of the Association of Official Agricultural Chemists take place from hydrochloric acid of 18—20% concentration instead of from 12% acid, as usually stated. Hydrochloric acid of this concentration has a considerable destructive effect on furfuraldehyde and this is partly responsible for the low yields of furfuraldehyde that are obtained from all pentoses when the official method is used. The passage of a slow current of steam through the distillation mixture is sufficient to carry off the furfuraldehyde as rapidly as it is formed, thereby avoiding its destruction by long contact with strong acid. Details of a method for the distillation of pentoses based on these considerations are given. By means of this method, theoretical yields of furfuraldehyde have been obtained from all the pure pentoses that have been tested. Representative data are given.

H. C. R.

Estimation of Acetyl and on Methylation. Karl Freudenberg (*Annalen*, 1923, **433**, 230—237).—[With Max Harder.]—Perkin's method (T., 1905, **87**, 107) for the estimation of the acetyl group is improved by the use of aromatic sulphonic acids, particularly of toluenesulphonic acid, instead of sulphuric acid. This procedure offers the following advantages. The hydrolysis requires less time, less charring or formation of by-products occurs, and, in alcoholic solution, the sulphonic acids exert great solvent action. The method is shown to give good results in the analysis of catechin penta-acetate, dextrose penta-acetate, maltose octa-acetate, cellobiose octa-acetate, methylmaltoside hepta-acetate, chloromaltose hepta-acetate, bromoglucose acetate, dichlorocatechin penta-acetate, dimethyl tartrate diacetate, silver acetate, acetanilide, trihydroxypenta-acetatochromic acetate, or dihydroxyhexa-acetatochromic chloride.

[With Ernst Cohn.]—Quercetin can be converted into its pentamethyl ether, and phloroglucinol into its trimethyl ether, in yields of, respectively, 75—80% and 80—85% of the theoretical, by conversion into the penta-acetate and triacetate, respectively, and treatment of the latter, in methyl-alcoholic solution, with a large excess of methyl sulphate, followed by the gradual addition of 50% aqueous potassium hydroxide solution (cf. Freudenberg and Purrmann, this vol., i, 697). W. S. N.

Polarimetric Estimation of Malic Acid. F. Auerbach and D. Krüger (*Z. Unters. Nahr. Genussm.*, 1923, **46**, 97—154).—The method depends on the large increase in the optical activity of malic and tartaric acids caused by uranium and molybdenum compounds. A suitable and constant excess of the compound used to increase the optical activity is employed and the hydrogen-ion concentration of the solution is kept constant at its optimum value by the use of mixtures of buffer salts. The relationship between optical activity and concentration for malic and tartaric acids was determined experimentally using the above conditions and a process was worked out for estimating these acids when present alone in the form of their sodium salts, with satisfactory accuracy. The molecular rotatory powers of uranium-malic and molybdenum-tartaric acids under the conditions chosen were found to be constant up to a concentration of 0·1 mol. per litre and to be equal to −700° and +1,044°, respectively. On increasing the concentration, the values obtained gradually fell. The molecular rotatory power of uranium-tartaric acid increased with the concentration up to a maximum of +650°, after which it fell slowly with increasing concentration. The molecular rotatory power of molybdenum-malic acid also increased up to a maximum of +1,020°, remaining, however, approximately constant at this figure on further increasing the concentration. The fact that the directions of rotation of uranium-malic and uranium-tartaric acids are opposed, whilst the rotations of the corresponding molybdenum acids are of the same sign enabled a purely polarimetric method of estimating malic and tartaric acids in mixtures to be worked out. Willaman's graphical method of obtaining the percentage of malic acid from the polarimeter readings of the uranium and molybdenum solutions (A., 1918, ii, 249) is adapted to the conditions employed by the authors. The influence of other organic acids on the molecular rotatory powers of these uranium and molybdenum acids was investigated. In the case of uranium-malic and molybdenum-tartaric acids, the alkali salts of other organic acids only slightly decreased the figures obtained. In the case of uranium-tartaric acid, a more considerable disturbance is produced In the case of molybdenum-malic acid the optical activity is considerably increased by the presence of salts of other hydroxy-acids, citrates almost doubling the molecular rotatory power. In the presence of citric acid, therefore, the polarimetric estimation of malic and tartaric acids in the same solution is impossible and when certain other organic acids are present, the estimation becomes untrustworthy. In determining malic acid polarimetrically in fruit juices and similar acid mixtures, it is therefore advisable not to attempt the simultaneous polarimetric estimation of tartaric acid and to carry out the removal of the sugars, pectins, and colouring matter in such a way that the greater part of the tartaric, citric, and other organic acids are separated from the malic acid at the same time. This can be effected by aid of the different solubilities of the respective barium salts in water and alcohol, by which means the malic acid is obtained as barium malate in aqueous solution containing only small quantities of barium tartrate and barium citrate. The malic acid can be estimated polarimetrically in this solution in the same way as in sodium malate solution. The molecular rotatory power of barium malate in the presence of uranium is somewhat lower than that of sodium malate under similar conditions and increases slowly with the concentration. In the presence of molybdenum, the molecular rotatory power is lower in low concentration and higher in high concentration than is the case with sodium malate. In order to make the estimation independent of the small quantity of tartrates and citrates present in the barium malate solution, the solution was always saturated with these salts. The relationship between the small quantities of tartrate and citrate present and the polarimeter readings was calculated and that between the concentration of malic acid and the polarimeter readings under these conditions obtained both by experiment and by calculation. By these means malic acid can be estimated with sufficient accuracy from two independent polarimetric measurements even in the presence of tartaric and citric acids. H. C. R.

Analysis of Crude Tartar and Argol. CHEMISCHE FABRIK VORM. GOLDENBURG, GEROMONT & CIE (*Z. anal. Chem.*, 1923, **63**, 111—116).—The solution of the substance in hydrochloric acid is boiled with an excess of potassium carbonate and the filtered liquid is evaporated to a small bulk, treated with potassium chloride, and made exactly neutral to phenophthalein with hydrochloric acid. The liquid is then acidified with diluted acetic acid, digested on the water-bath for a few minutes, and set aside over-night. The precipitate of potassium hydrogen tartrate is collected on a vacuum filter, washed with 20% potassium chloride solution saturated with potassium hydrogen tartrate, and dissolved in 200 c.c. of water. The solution is titrated with sodium hydroxide, using phenolphthalein as indicator.

The above method has been tested in the Chem. Lab. Fresenius (*ibid.*, 116—117) and found to give excellent results. It is cheaper and simpler to carry out than the older method involving precipitation of the potassium hydrogen tartrate by means of alcohol followed by titration as above, but using litmus-paper as indicator. [Cf. *J.S.C.I.*, 1923, Dec.] A. R. P.

The Bromine Number. PAUL BECKER (*Z. angew. Chem.*, 1923, **36**, 539).—A few drops of linseed oil were spread in a thin layer on a sheet of glass (4·5 by 15 cm.) which was then inserted in a horizontal glass tube of 4·6 cm. diameter. A watch-glass containing a few drops of bromine was placed under the glass plate and the tube corked at both ends. After a time, air was passed through the tube, and finally the glass plate was heated in an oven at 50—60° to remove excess of bromine and the increase in weight noted. As an alternative, the glass plate and containing tube may be placed vertically over pieces of glass rod between which a few drops of bromine have been poured. The addition of bromine was complete within half an hour and concordant results were obtained which, when calculated as iodine values, agreed well with those found directly by Wijs's method. W. T. K. B.

New Method of Estimating the Iodine Value of Oils and Fats by using Pyridine Sulphate Dibromide. K. W. ROSENMUND and W. KUHNHEIM (*Z. Unters. Nahr. Genussm.*, 1923, **46**, 154—159).—A solution of pyridine sulphate dibromide in glacial acetic acid can be used for determining the iodine value of oils and fats. The solution is of about the same stability as the Hanus iodine bromide solution and has the advantages that the results given by it are independent of the amount of excess of the reagent used, that the reaction progresses more rapidly than in the case of the Hanus solution in the case of oils of high iodine values, and that a considerable economy is effected, especially when the excess of reagent is titrated with arsenious acid solution. The reaction is complete in 5 minutes even in the case of linseed oil, and the results obtained agree with those given by Hanus's method within the limits of experimental error. The excess of the reagent can either be treated with potassium iodide and titrated with thiosulphate, or titrated directly with arsenious acid, the two methods giving identical results. Phenol and arsenic may also be estimated by titration with pyridine sulphate dibromide in glacial acetic acid.

H. C. R.

Estimation of the Acetyl Value (of Fats and Oils). Jessie R. Powell (*Ind. Eng. Chem.*, 1923, **15**, 622).—The André-Cook method (A., 1922, ii, 324) is trustworthy, but concordant results cannot be obtained by methods involving the separation of the acetic acid by filtration or distillation. W. P. S.

Detection of Adulterants in Cacao Butter. Marcel Pichard (*Ann. Falsif.*, 1923, **16**, 197—215).—The method proposed depends on the differences observed in the rise of temperature during the solidification of cacao butter and other fats. Fifty g. of the fat are melted at 50°, placed in a vertical tube provided with a thermometer, and surrounded by a jacket through which a current of air at 10° is circulated, and the temperature is noted at definite intervals during the solidification of the fat. The temperature at first falls to a point at which solidification commences, then rises gradually to a maximum, and afterwards falls again. The curve showing the temperature during the solidification of cacao butter is distinctly different from that obtained with other fats. W. P. S.

Benzidine as a Reagent for Aldehydes. P. N. van Eck (*Pharm. Weekblad*, 1923, **60**, 1204—1208).—A large number of aldehydes give good colour reactions in presence of benzidine dissolved in glacial acetic acid. Fatty aldehydes give yellow to orange colorations. Benzaldehyde gives a yellow, crystalline solid, cuminaldehyde an orange solid, anisaldehyde yellow-orange crystals, and phenylacraldehyde dark, blood-red crystals; microchemical tests detect these readily. Vanillin gives a dark, orange-red colour, which becomes red on adding water; the reaction is extremely sensitive.

S. I. L.

Detection and Characterisation of Small Quantities of Vanillin. H. Hérissey and P. Delauney (*J. Pharm. Chim.*, 1923, [vii], **28**, 257—262).—When aqueous solutions of vanillin are oxidised with ferric chloride, a blue coloration is formed, which, when the mixture is heated for five minutes in the boiling water-bath and then cooled, disappears and is replaced by a precipitate (thin, microscopic, colourless needles, m. p. 302—305°) of dehydrodivanillin, $[C_6H_2(CHO)(OMe)\cdot OH]_2$. This precipitate may be observed, and collected by centrifuging, in solutions containing as little as 0·01% of vanillin. Vanillin is somewhat difficultly volatile in steam, but may be detected and characterised in plant extracts containing as little as 0·05%, as follows. Twenty c.c. of the solution to be tested are heated in a bath containing a solution of calcium chloride at 130—140°, and two fractions of 10 c.c. of distillate are collected. Further quantities of 10 c.c. of water are added to the residue and again distilled off, this being repeated until nine or ten such fractions have been collected. The presence of vanillin in these fractions is then determined as above with ferric chloride.

W. T. K. B.

The Salt Error of Nitramine (Picrylmethyl Nitroamine). I. M. Kolthoff (*Rec. trav. chim.*, 1923, **42**, 964—968; cf. A., 1922, ii, 222).—Using nitramine as an indicator, the salt error of electrolytes with univalent ions is −0·09 (in p_{OH}) in seminormal solution. In normal solution, the error depends on the salt, and is greater for potassium than for sodium salts. The error increases with rising valency of the anion. Thus the correction for *N*-KCl is +0·16, for *N*-K_2SO_4, +0·30, and for *N*-$K_4Fe(CN)_6$ it is +0·34 in p_{OH}. H. H.

Review of Methods for the Estimation of Acetanilide. Edward S. Rose (*Amer. J. Pharm.*, 1923, **95**, 743—754).—Both Seidell's tribromoaniline method (A., 1907, ii, 914) and the acetyl radicle method, in which the acetic acid liberated by hydrolysis with dilute sulphuric acid and distilled off is titrated, give good results in estimating acetanilide. When interfering substances have to be removed, the former method is somewhat more rapid. One method may be made a check on the other by distilling off and titrating the acetic acid and titrating the acid residue containing the aniline with bromide–bromate solution as in the tribromoaniline method. With preparations containing such substances as solid and powdered extracts, alkaloids and their salts, antipyrine, or pyramidone, the acetyl radicle method is more advantageous as it can be applied directly to the residue from the chloroform extraction. When phenacetine is present, it should be removed as periodide (Emery, *A.*, 1914, ii, 755). H. C. R.

The Triketohydrindene Reaction. V. S. Sadikov and N. D. Zelinski (*Biochem. Z.*, 1923, **141**, 105—108).—In contradistinction to the coloration formed by ninhydrin and hydroxy-compounds, that produced in the presence of amino-acids is resistant to boiling, to decinormal alkali, and to 1% phosphoric acid, and is soluble in amyl alcohol. Methylalanine gives the reaction after prolonged boiling. The ninhydrin pigment is unstable and slowly disappears, even when air is excluded. The esters of monocarboxylic amino-acids and dicarboxylic imino-acids give a carmine-red pigment insoluble in amyl alcohol, and after hydrolysis with acid an amyl alcohol soluble blue pigment. Free methylaspartic acid gives the reaction, but its ester does not. 3-Amino-1-methyl*cyclo*pentanecarboxylic acid gives a violet colour extractable by amyl alcohol.

It is concluded that a number of types of reaction between amino-acids and the ninhydrin reagent are possible. J. P.

Estimation of Hydrogen Cyanide in Cyanogenetic Plants. E. KOHN-ABREST and J. RICARDONI (*Compt. rend.*, 1923, **177**, 771—773).—The powdered plant material is digested with water at 37° for four hours, or at the ordinary temperature for twenty hours. Purified air is then blown through the resulting mixture and then through standard potassium hydroxide solution, the hydrogen cyanide absorbed by the latter being estimated in the usual manner. The results of analyses of various specimens of *Phaseolus lunatus* (eleven varieties) show the method to be as satisfactory as the ordinary (distillation) method. E. E. T.

Qualitative Scheme for the Detection of Cyanamide and Related Compounds. G. H. BUCHANAN (*Ind. Eng. Chem.*, 1923, **15**, 637—640).—Systematic directions are given for the detection of ammonia, cyanamide, cyanide, dicyanodiamide, guanidine, guanyl carbamide, nitrate, thiocyanate, thiocarbamide, and carbamide in fertiliser mixtures containing any or all of these compounds. W. P. S.

An Iodometric Method for Estimating Uric Acid in Urine. OTTO FÜRTH, JOSEPHA URBACH, and PAUL WERMER (*Biochem. Z.*, 1923, **141**, 236—247).—The authors have devised a rapid method for estimating uric acid in urine which does not necessitate lengthy and troublesome filtrations and washings. Five c.c. of urine, measured into a 50 c.c. centrifuge tube, are made alkaline by the addition of sodium carbonate and 5 c.c. of 30% ammonium chloride are added. The tube is left for two hours, centrifuged for five minutes, and after separation of the supernatant liquid, the precipitated ammonium urate is stirred with 5 c.c. of 10% ammonium sulphate and again centrifuged for six or seven minutes. The washed precipitate is dissolved in 50 c.c. of 0·1*N*-sodium hydroxide, 20 c.c. of 0·01*N*-iodine solution are added, the solution is at once acidified by the addition of 70 c.c. of 0·1*N*-sulphuric acid, and the excess of free iodine is titrated with 0·01*N*-sodium thiosulphate. Under the conditions employed, 1 mol. of uric acid takes up 3·5 atoms of iodine. The estimation is completed in two and a half hours, including the two hours allowed for separation of the ammonium urate. J. P.

The Relationship between Colour and Constitution in Azo-dyes. MIECZYSŁAW DOMINIKIEWICZ (*Roczniki Chemji*, 1923, **2**, 314—335).—A theoretical paper in which the known facts relating to azo-dyes are reviewed and discussed mainly from the point of view of the quinonoid theory. For the "colour analysis" of various dyes, a method is suggested whereby any given colour is matched by mixing three fundamental colours (blue, red, and yellow) and the quantities of each are noted. The dyes chosen as standard are patent blue V, rhodamine B, and quinoline yellow O; the standard aqueous solutions of these should contain 0·6350, 0·4785, and 0·8658 g. per litre, respectively. G. A. R. K.

A Nephelometric Method for Estimating Small Amounts of Proteins. P. RONA and H. KLEINMANN (*Biochem. Z.*, 1923, **140**, 461—477).—For the nephelometric estimation of proteins, to 5 c.c. of the protein solution are added, in the order given, 5 c.c. of 25% hydrochloric acid, 8 c.c. of a 20% solution of sodium sulphosalicylate, and the whole is diluted to 20 c.c. The resulting turbidity, which is measured against suitable standards in a Kleinmann-Schmidt and Haensch nephelometer, reaches a maximum in three minutes and is permanent for at least an hour. Its intensity is directly proportional to the amount of protein present. A 20% increase in the acidity of the solution, or the addition of ammonium sulphate, magnesium sulphate, or thymol, is without influence on the results, nor does the presence of the soluble products of peptic hydrolysis interfere with the determination. The method may be used for the estimation of quantities of protein as small as 0·06 mg.

J. P.

The Estimation of Fibrinogen. WILHELM STARLINGER (*Biochem. Z.*, 1923, **140**, 203—229).—A lengthy critical survey of the various gravimetric, Kjeldahl, and refractometric methods hitherto employed in estimating fibrinogen, which is chiefly based on refractometric measurements on native hirudin, citrate, oxalate, and fluoride plasmas and sera. In place of the "recalcification" method of Leendertz, the author has employed a new process dependent on refractometric determinations on citrated plasma, and on the serum after separation of the precipitate of fibrinogen produced by heating for five minutes to 56°. The determination can be carried out on 0·5 c c. of plasma. J. P.

Estimation of Fibrinogen by Precipitation with Sodium Sulphate compared with the Precipitation of Fibrin by the Addition of Calcium Chloride. PAUL E. HOWE (*J. Biol. Chem.*, 1923, **57**, 235—240).—Results in good agreement with those given by Cullen and Van Slyke's method (A., 1920, ii, 398) have been obtained for the fibrinogen content of blood by estimating the nitrogen content before and after precipitation with 10·6% sodium sulphate (or certain other salts) at 37°. Similar results were obtained by Gram's (A., 1922, ii, 240), Foster and Whipple's (*Amer. J. Physiol.*, 1921—1922, **58**, 393), and Wu's (A., 1922, ii, 406) methods. E. S.

The Estimation of Fibrinogen in Blood Plasma. STEFAN RUSZNYÁK and I. BARÁT (*Biochem. Z.*, 1923, **141**, 476—478).—A nephelometric method for the estimation of fibrinogen in blood plasma is described. 0·1 C.c. of citrate plasma is treated with 50 c.c. of an acid solution of ammonium sulphate (1 part of 0·2*N*-hydrochloric acid, 1 part of saturated ammonium sulphate), and the resulting opalescence, which is due to the total plasma proteins, is compared with that produced by fibrinogen alone when 0·4 c.c. of the plasma is treated with 25 c.c. of a 27% saturated ammonium sulphate solution. J. P.

A Micro-method for the Estimation of the Protein Fractions of Plasma. Stefan Rusznyák (*Biochem. Z.*, 1923, **141**, 479—482).—The proteins of separate small volumes of plasma are fractionally precipitated and estimated nephelometrically using the total protein fraction as the standard. The total proteins and fibrinogen are precipitated as already described (cf. preceding abstract) and the other fractions are obtained as follows: globulin+fibrinogen by treating 0·1 c.c. of citrate plasma with 25 c.c. of half-saturated ammonium sulphate, euglobulin+fibrinogen by the addition to 0·4 c.c. of the plasma of 25 c.c. one-third saturated ammonium sulphate, ψ-globulin I and II by treating 0·1 c.c. plasma with 40% saturated ammonium sulphate. J. P.

A New Permanent Standard for Estimation of Hæmoglobin by the Acid Hæmatin Method. Edwin E. Osgood and Howard D. Haskins (*J. Biol. Chem.*, 1923, **57**, 107—110).—The standard consists of 32 g. of ferric sulphate +80 mg. of chromic sulphate in 100 c.c., and when set at 15 mm. in a colorimeter should match a 1% acid hæmatin solution set at 10 mm. The intensity of its colour changes with temperature. E. S.

A New Permanent Standard for Sahli's Hæmoglobinometer. Howard D. Haskins (*J. Biol. Chem.*, 1923, **57**, 111—113; cf. preceding abstract).—This consists of a mixture of solutions of ferric and cobalt sulphates. It must be standardised against a 1% acid hæmatin solution. E. S.

A Method for the Estimation of the Bile Acids in Duodenal Juice. Ernst Christoph Meyer (*Biochem. Z.*, 1923, **140**, 356—367).—As a result of the study of the influence of dilution, hydrogen-ion concentration, and the presence of salts, mucin, and other substances on the drop number of pure bile salt solutions and of duodenal juice, a method is given for the estimation of the bile acids in the latter. The slightly alkaline duodenal juice is suitably diluted from ten to one hundred times, made slightly acid to Congo-red by the addition of one or two drops of 15% hydrochloric acid, and from the drop number of the resulting solution, which should lie within the limits 105 to 135, the milligram percentage of sodium glycocholate is obtained directly from a curve which is given. J. P.

Estimation of Ash, Arsenic, Copper, and Zinc in Gelatin. R. M. Mehurin (*Ind. Eng. Chem.*, 1923, **15**, 942—943).—Undesirable features of published methods for estimating small quantities of arsenic, copper, and zinc are pointed out and rapid and accurate methods for estimating these elements and the ash in gelatin are described. The arsenic is estimated by a modification of Gutzeit's method, the ash by incinerating 20—40 g. in an electric muffle at 500—550° for four to five hours, the copper is estimated colorimetrically with potassium ferrocyanide against a standard copper solution, and the zinc by precipitation with hydrogen sulphide in acetic acid solution containing sodium acetate and weighing as oxide. Attention is directed to sources of error against which precautions must be taken. H. C. R.

The Estimation of Pepsin and the Behaviour of Pepsin in the Body. KÄTHE VOIGT (*Biochem. Z.*, 1923, **142**, 101—107).—For the estimation of peptic activity, to 1 c.c. of blood serum are added 8 c.c. of 0·1N-hydrochloric acid and 1 c.c. of the pepsin solution. After twenty-four hours' incubation 0·3 c.c. of the mixture is treated with 20 c.c. of water and 2·5 c.c. of 10% sulphosalicylic acid and the resulting opalescence, caused by the residual unhydrolysed protein, is measured in a nephelometer. Using this method of detecting the enzyme, it is found that pure pepsin (Witte) injected intravenously into dogs undergoes a very rapid destruction, which also occurs with blood serum–pepsin mixtures in vitro. The destruction of the enzyme is ascribed in the main to the reaction of the blood. J. P.

The Recognition of Trypsin and its Natural Inhibitor in Serum. H. PFEIFFER and F. STANDENATH (*Fermentforsch.*, 1923, 7, [1], 14—53).—Under carefully chosen conditions, the Fuld-Gross method for the detection of trypsin is very sensitive. [illegible] this method, the authors have sought to determine whether [illegible] adsorbed by charcoal can be estimated by its digestion [illegible] casein, and whether in serum an excess of trypsin or antitrypsin can be recognised by use of charcoal. It is found that charcoal adsorbs trypsin and casein, but not the antitrypsin of serum, but if mixtures of trypsin and antitrypsin be treated with charcoal, the filtrate loses both its tryptic and inhibitory properties. H. K.

Estimation of Diastase in Blood. G. M. FYFE (*Brit. J. Exp. Path.*, 1923, **4**, 127—131).—By an estimation of blood-sugar by Maclean's method (A., 1919, ii, 434), followed by a second estimation after 0·2 c.c. of blood has been incubated for half an hour at 37° with 1 c.c. of 0·1% starch solution, almost concurrent readings of the blood-sugar and blood diastase figures may be obtained using a small amount of blood. CHEMICAL ABSTRACTS.

A Colour Test for Water-soluble [Vitamin]-*B*. ALADÁR JENDRASSIK (*J. Biol. Chem.*, 1923, **57**, 129—138).—Extracts containing vitamin-*B* have been found consistently to reduce ferric ferricyanide with the formation of a blue colour. Similar extracts made from foods which do not contain this vitamin did not give this reaction. E. S.

Microscopic Estimation of Soil Colloids in Soil Separates. WILLIAM H. FRY (*J. Agric. Res.*, 1923, **24**, 879—883).—After removing the clay fraction from soil by the ordinary means of mechanical analysis, an ultra-microscopic examination of the separated fractions revealed much undispersed colloidal matter. By using a squared eye-piece it was found possible to estimate the relative proportion of mineral and colloidal aggregate by direct observation of the field. Inaccuracies due to difference in shape and density of particles, etc., were shown to be small. From 30—60% of the clay fraction of soils was found to remain undispersed among mineral particles after thorough washing and rubbing in weak ammonia solutions. A. G. P.

Foote, *Harry Ward*, equilibrium in the systems, nickel chloride, cobalt chloride, cupric chloride–hydrochloric acid–water, A., ii, 326.

Foote, *Paul D.*, and *Fred L.* **Mohler**, inelastic collisions of electrons in vapours of certain compound molecules, A., ii, 5.

Foote, *Paul D.* See also *Fred L.* **Mohler**.

Forbes, *George Shannon*, *John C.* **Woodhouse**, and *Reginald S.* **Dean**, partial and consecutive reactions in the photosensitive system; quinine sulphate, chromic and sulphuric acids, A., ii, 675.

Forcrand, *Robert de*, the thallous alkyloxides, A., i, 84.
  the hydrates of krypton and argon, A., ii, 239.
  thallous hydroxide, A., ii, 420.

Fordyce, *J. A.*, *Isadore* **Rosen**, and *Chester Newton* **Myers**, syphilis. IV. The arsenic content of the blood at various intervals after intravenous injection of salvarsan, A., i, 1263.

Foresti, *B.*, catalysis by the action of subdivided metals. I. Heat of adsorption of hydrogen on finely-divided nickel, A , ii, 747.

Foresti, *B.*, and *R.* **Martorelli**, absorption spectra of sulphuric and nitrated solutions of phenanthroxazine and phenanthrazine, A., ii, 450.

Foresti, *B.* See also *Maurizo* **Padoa**.

Forestier, *Hubert*, an improvement in the colorimetric estimation of manganese in carbon steels, A., ii, 582.
  a rapidly-constructed, cheap, internally-wound electric furnace, A., ii, 610.

Forrest, *W. Devereux*, *W.* **Smith**, and *L. B.* **Winter**, change in the nature of the blood-sugar of diabetics caused by insulin, A., i, 513.

Fosse, *Robert*, *Ph.* **Hagène**, and *Raphael* **Dubois**, xanthyl derivatives of amino-acids, A., i, 938.

Fosse, *Robert*, and *A.* **Hieulle**, xanthyl derivatives of allophanic acid, thiosinamine, and allantoin, A., i, 860.
  xanthylallantoin, A., i, 938.

Foster, *G. L.*, carbohydrate metabolism. I. Some comparisons of blood-sugar concentrations in venous blood and in finger blood. II. An interpretation of the blood-sugar phenomena following the ingestion of dextrose, A., i, 503.

Foster, *G. L.*, and *Carl L. A.* **Schmidt**, separation of the hexone bases from certain protein hydrolysates by electrolysis, A., i, 963.

Foster, *John Stuart*, relative intensities of the Stark effect components in the helium spectrum, A., ii, 198.

Fouassier, *Marc*, influence of copper on lactic fermentation, A., i, 422.
  influence of moisture on the diminution in the solubility of casein by the action of lactic acid, A., i, 962.

Foulk, *Charles W.*, and *Marion* **Hollingsworth**, precision measurement of the composition of the constant boiling mixture of hydrogen chloride and water, A., ii, 482.

Fouque, *Gustave*, and *J.* **Lacroix**, preparation of aromatic sulphones, A., i, 817.

Fourneau, *Ernest*, *A.* **Navarro-Martin**, and (*M.*) and (*Mme*) **Tréfouel**, derivatives of phenylarsinic acid (quinquevalent arsenic) in treatment of experimental trypanosomiasis and spirollosis; relation between the therapeutic action of the aromatic arsinic acids and their constitution, A., i, 983.

Fourneau, *Ernest*, and *José* **Puyal**, the synthesis of ephedrine, A., i, 238.

Fourneau, *Ernest*, and *G.* **Sandulesco**, the resolution of phenoxypropionic acid and *o*-nitrophenoxypropionic acid into their active components, A., i, 35.
  the resolution of *p*- and *m*-nitrophenoxypropionic acids, A., i, 572.

Fowler, *Alfred*, the series spectrum of trebly-ionised silicon (Si^{IV}), A., ii, 447.

Fox, *E. J.*, and *Walter J.* **Geldard**, estimation of urea alone and in the presence of cyanamide by means of urease, A., ii, 591.

Fox, *Francis William*, and *John Addyman* **Gardner**, the sterol content of cow's milk, A., i, 510.

Fränkel, *Sigmund*, and *Maria* **Fonda**, the hormone of the placenta and of the corpus luteum and the lipoids of the corpus luteum, A., i, 1257.

Fränkel, *Sigmund*, and *Katherine* **Gallia**, the products of prolonged tryptic digestion of casein, A., i, 398.

Fränkel, *Sigmund*, *Otto* **Herschmann**, and *Charlotte* **Tritt-Zirming**, halogen derivatives of quinine, A., i, 360.

Fränkel, *Sigmund*, *Charlotte* **Tritt-Zirming**, and *Lily* **Gottesmann-Grauer**, quitenimone, A., i, 126.

Fraenkel, *Walter*, and *K.* **Snipischski**, the equilibrium in the reduction of tin dioxide by carbon monoxide, A., ii, 78.

Francesconi, *Luigi*, and *Adolfo* **Ciurlo**, new syntheses of hydrocyanic acid by means of the silent electric discharge, A., i, 764.
  new syntheses from hydrocyanic acid by means of the silent electric discharge; behaviour of pinene, A., i, 1022.
  syntheses from hydrocyanic acid by means of the silent electric discharge. III. Behaviour of amylene, A., i, 1067.
  syntheses of amines by means of the silent discharge, A., i, 1067.

François, *Maurice*, and *Louis Gaston* **Blanc**, method of preparation of some crystalline alkaloidal bismuthic iodides, A., i, 830.

Franke, *Adolf*, and *Rudolf* **Dworzak**, mechanism of the reactions of alkyl halides, A., i, 528.

Franke, *Adolf*, and *Hermann* **Hinterberger**, trimethylacetaldehyde [*αα*-dimethylpropaldehyde], A., i, 537.

Franke, *Adolf*, and *Fritz* **Lieben**, the oxidation of *αδ*- and *αε*-oxides, A., i, 10.

Franke, *Adolf*, and *Otto* **Liebermann**, the action of sulphuric acid on the higher diprimary glycols, A., i, 530.

Frankel, *F. H.* See *A. I.* **Ringer**.

Frankenburger, *W.*, spectral sensitiveness of silver bromide and the influence of adsorbed substances on the sensitiveness, A., ii, 599.

Frankenburger, *W.* See also *Kasimir* **Fajans**.

Franklin, *Edward Curtis*, hydrocyanic acid; an ammono-carbonous acid, an ammono-formaldehyde, and a formic anammonide, A, i, 447.

Franzen, *Hartwig*, extraction apparatus for large amounts of liquids, A., ii, 683.

Franzen, *Hartwig*, and *Fritz* **Helwert**, the chemical constituents of green plants. XXII. The presence of succinic acid and of oxalic acid in the currant (*Ribes rubrum*), A., i, 77.
  the chemical constituents of green plants. XXIV. Citric acid, A., i, 520.
  the chemical constituents of green plants. XXVI. Tartaric acid, A, i, 520.
  the chemical constituents of green plants. XXV. The acids of the apple (*Pyrus malus*), A., i, 637.

Franzen, *Hartwig*, and *Hans* **Kaiser**, the chemical constituents of green plants. XXVIII. The acids of the tamarind (*Tamarindus indica*) precipitable by lead acetate, A., i, 1045.

Franzen, *Hartwig*, and *Ernst* **Keyssner**, the constituents of green plants. XXIII. Malic acid in plants, A., i, 427.
  the chemical constituents of green plants. XXIX. Some water-soluble constituents of the leaves of the bramble (*Rubus fruticosus*), A., i, 1045.

Franzen, *Hartwig*, and *Rudolf* **Ostertag**, the chemical constituents of green plants. XXVII. Succinic acid, A., i, 636.

Fraps, *George Stronach*, organic constituents of the soil, A, i, 640.
  the fixation of phosphoric acid by the soil, A., i, 1167.

Fraser, *Ronald*, constitution of benzene, T., 2712.

Fraser, *Ronald*, and *James Ernest* **Humphries**, the problem of substitution in the benzene nucleus and the Thomson–Lewis–Langmuir theory of co-valence, A., i, 450.
  the octet theory of induced alternate polarities; the domains occupied by octet-stable and octet-unstable centres, A., ii, 627.

Fraser, *Ronald*. See also *William* **Thomas**.

Frazer, *Emmett B.*, effect of magnesium sulphate on the secretion of bile, A., i, 270.

Frazer, *Joseph Christie Whitney*. See *Arthur* **Grollman**.

Fred, *Edwin Broun*, *W. H.* **Peterson**, and *J. A.* **Anderson**, the fermentation of arabinose and xylose by certain aerobic bacteria, A., i, 1157.

Olsen, *Carsten*, hydrogen-ion concentration of the soil and its significance to the vegetation, especially to the natural distribution of plants, A., i, 522.

Olson, *Axel R.*, *Elmer* **Dershem**, and *H. H.* **Storch**, *X*-ray absorption coefficients of carbon, hydrogen, and oxygen, A., ii, 365.

Olson, *Axel R.*, and *George* **Glockler**, the critical and dissociation potentials of hydrogen, A., ii, 455.

Olson, *Axel R.* See also *H. H.* **Storch.**

Olson, *George Alfred*, factors affecting the nitrogen content of wheat and the changes that occur during the development of wheat, A., i, 1164.

Olson, *O. R.*, effect of *X*-rays on chemical reactions, A., ii, 4.

Olsson, *Urban*, poisoning of starch amylase; starch liquefaction. III., A., i, 497.

Onnes, *Heike Kamerlingh*, equilibrium of liquid and gaseous phases of helium at low pressures, A., ii, 633.

Onnes, *Heike Kamerlingh*, and *W.* **Tuyn**, relative measurement of the electrical resistance of thallium in the region of the temperature of liquid helium, A., ii, 724.

relative measurements of the electrical resistance of ordinary lead and lead from uranium at temperatures below 14° *K*, A., ii, 724.

Onnes, *Heike Kamerlingh.* See also *L. C.* **Jackson**, *H. A.* **Kuypers**, *J. Palacios* **Martinez**, and *Émile* **Mathias.**

Ono, *Kashichi*, the reaction between α-pinene and acids. I. α-Pinene and sulphuric acid, A., i, 1022.

Ono, *Kashichi.* See also *Rikô* **Majima.**

Onslow, *Muriel Wheldale*, oxidising enzymes. VI. Tyrosinase, A., i, 723.

Oparin, *Alexander*, the influence of oxygen on the formation of ferments in germinating wheat grains, A., i, 425.

Oparin, *Alexander.* See also *Alexis* **Bach.**

Oparin, *A. I.*, the estimation by Van Slyke's method of free amino-groups in plant globulins, A., ii, 511.

Oparina, (*Mlle*) *M. P.* See *Alexei Eugenievitsch* **Tschitschibabin.**

Opel, *Eugéne.* See *Alexei Eugrafovitsch* **Favorski.**

Oppenheimer, *Carl*, nomenclature of proteases, A., i, 495.

Orcel, *J.*, bavalite from Bas-Vallon, Brittany, A., ii, 647.

Orékhov, *Alexandr Pavlovitsch*, syntheses in the indene series. V., A., i, 454.

theory of residual affinity and its application to organic chemistry. I. The fundamental principles of the theory, A., ii, 848.

Orékhov, *Alexandr Pavlovitsch* [with *V.* **Schapir**], syntheses in the indene series. IV., A., i, 454.

Orékhov, *Alexandr Pavlovitsch.* See also *Marc* **Tiffeneau.**

Orelkin, *Boris Petrovitsch*, space formulæ of benzene, naphthalene, and anthracene, A., i, 1082.

Orelkin, *Boris Petrovitsch*, *Vitalius G.* **Chlopin**, and *Ilja Iljitsch* **Tscherniaev**, the preparation of hydrazine sulphate and sodium azide, A., ii, 406.

Orient, *Julius*, influence of amines on fermentation, A., i, 171.

Orlova, *Lidie.* See *Agnes* **Ivanitzkaja.**

Ormandy, *William R.*, and *E. C.* **Craven**, free sulphur in motor fuels, etc., A., ii, 504.

Orndorff, *William Ridgely*, and *M. L.* **Nichols**, dinitrosoresorcinol, A., i, 782.

dinitrosoresorcinol as a reagent for the estimation of cobalt in the presence of nickel and other metals of the iron group, A., ii, 584.

Orndorff, *William Ridgely*, and *F. W.* **Sherwood**, phenolsulphonephthalein and some of its derivatives, A., i, 340.

Orndorff, *William Ridgely*, and *S. T.* **Yang**, the structure of phenolphthaleinoxime, A., i, 1016.

Orr, *P. F.* See *J.* **Bronfenbrenner.**

Ortodocsu, *Andrei P.*, and (*Mlle*) *Marcelle* **Ressy**, new characteristic microchemical reaction for the detection of antimony and tin, A., ii, 659.

Ortodocsu, *Andrei P.* See also (*Mlle*) *Marcelle* **Ressy.**

Orton, *Kennedy Joseph Previté*, and *John Edwin* **Bayliss**, substituted phenyldichloroamines, T., 2790.

Orton, *Kennedy Joseph Previté*, *Herbert Ben* **Watson**, and *John Edwin* **Bayliss**, the interaction of bromine with acetic anhydride, T., 3081.

Orzelski, *T.* See *Karol* **Dziewoński**.

Osaka, *Yukichi*, and *Ryohei* **Yoshida**, the system, sodium sulphate–sodium chromate–water. II., A., ii, 163.

Osato, *Shungo*, the isoelectric point of globin, A., i, 160.

Osato, *Shungo*. See also *Hermann* **Steudel**.

Osborne, *E. D.*, pharmacology and therapeutics of iodides, A., i, 73.

Osgood, *Edwin E.*, and *Howard D.* **Haskins**, a new permanent standard for estimation of hæmoglobin by the acid hæmatin method, A., ii, 891.

Osterberg, *Emil*. See *Stanley Rossiter* **Benedict**.

Osterburg, *Johannes*. See *Daniel* **Vorländer**.

Osterhof, *Gerard G.* See *Edward* **Mack**.

Osterhout, *Winthrop John Vanleuven*, some aspects of selective absorption, A., i, 76.

chinkolobwite; a new uranium mineral from Katanga, A., ii, 870.

Schoep, *Alfred,* and *Georges* **Buysse,** the existence of brochantite in Katanga, A., ii, 869.

Schoep, *Alfred,* and *Émile* **Richet,** the presence of carnotite in the Congo, A., ii, 870.

Schoepfle, *Chester S.,* the nitration of 1:1′-dinaphthyl, A., i, 776.

Scholder, *Rudolf.* See *Rudolf Friedrich* **Weinland.**

Scholl, *K.* See *Gunter* **Scheibe.**

Scholl, *Roland, Heinrich* **Dehnert,** and *Hans* **Semp,** a new class of free organic radicles. IV., A., i, 807.

Scholl, *Roland,* and *Herbert* **Hähle,** a new class of free organic radicles. II. and III., A., i, 584, 689.

Scholz, *E.* See *Fritz* **Arndt.**

Schoorl, *Nicolaas,* system, sucrose–sodium chloride-water and the combination of these constituents, A., i, 899.
use of helium light in refractometry, A., ii, 445.

Schorger, *A. W.,* abietic acid, A., i, 677.

Schorigin, *Paul,* the decomposition of ethers by metallic sodium, A., i, 207.

Schorr, *Regina.* See *Fritz* **Feigl.**

Schotte, *Herbert.* See *Max* **Bergmann.**

Schottländer, *Friedrich.* See *Wilhelm* **Traube.**

Schotz, *P.* See *Hermann* **Staudinger.**

Schoutissen, *H. A. J.,* the structural formula for benzene, A., i, 196.
the benzene formula of Lely, A., i, 451.

Schrader, *Hans,* stability of sodium formate, acetate, and oxalate towards oxidation under pressure, A., i, 87.

Schrader, *Hans.* See also *Franz* **Fischer.**

Schramm, *Walter.* See *Julius* **Meyer.**

Schrauth, *Walther,* lignin, A., i, 443.
the chemical structure of coal, A., ii, 502.

Schrauth, *Walther,* and *Kurt* **Görig,** hydrogenated polycyclic ring systems. II. The stereoisomerism of dicyclohexane, A., i, 1084.

Schrauth, *Walther,* and *Kurt* **Görig,** hydrogenated polycyclic ring systems. III. Perhydro-9:10-benzophenanthrene, A., i, 1086.

Schrauth, *Walther, Wilhelm* **Wege,** and *Fritz* **Danner,** hydrogenated polycylic ring systems. I. The hydrogenation of phenol and the by-products which are formed thereby, A., i, 204.

Schreinemakers, *Franz Antoon Hubert,* non-, uni-, and bi-variant equilibria. XXII. and XXIII., A., ii, 137, 546.

Schreiner, *Erling, Ivar Bull* **Simonsen,** and *Ole H.* **Krag,** the electromotive behaviour of silver–cadmium alloys, A., ii, 8.

Schröder, *E.,* and *Gustav* **Tammann,** the velocity of the action of oxygen, nitric oxide, and nitrous oxide on metals, A., ii, 838.

Schroeter, *Georg,* and *Chr.* **Seidler,** the spontaneous decomposition of cyanoacetyl chloride, A., i, 1124.

Schryver, *Samuel Barnett,* and *Ethel Mary* **Thomas,** the hemicelluloses. II. The hemicellulose content of starch, A., i, 1066.

Schryver, *Samuel Barnett.* See also *Harold William* **Buston,** *Donald Herbert Frank* **Clayson,** and *John* **Knaggs.**

Schtschukarev, *Alexander Nicolaevitsch,* the magneto-chemical effect, A., ii, 235, 289.

Schubert, *Max.* See *Hans* **Fischer.**

Schübel, *Konrad,* the botulinus toxin, A., i, 516.

Schüler, *R.,* and *F.* **Thielmann,** can aliphatic diamines be obtained from normal and nephritic urine by means of picric acid and sodium chloride? A., ii, 1261.

Schütz, *Franz,* primary tar. I., A., i, 195.
nature of the hydrocarbons present in primary tar light oils, A., i, 452.
occurrence of ketones and aldehydes together with sulphur compounds in primary tar light oil, A., i, 452.

Schütz, *Franz, Wilhelm* **Buschmann,** and *Heinrich* **Wissebach,** low temperature tar. II. and III., A., i, 525, 1080.
low temperature coal tar and the products of its superheating, A., i, 665.

Schütz, *P.* See *Hermann* **Matthes.**

Schütze, *Max.* See *Jakob* **Meisenheimer.**

Schulek, *E.,* the iodometric estimation of small quantities of cyanides and thiocyanates, A., ii, 591.

Schultheiss, *Adam.* See *Julius von* **Braun.**

Schultis, *Carltheo.* See *Emil* **Fromm.**

Schultze, *H.* See *Fr.* **Krollpfeiffer.**

Schulz, *Alfred P.* See *Wilhelm* **Traube.**

Schulze, *Alfred*, behaviour of cadmium amalgam in relationship to the Weston normal element, A., ii, 607.

Schulze, *Alfred.* See also *William Minot* **Guertler.**

Schulze, *Ferdinand*, and *Stanislav* **Landa**, estimation of abietic acids and of colophony, A., ii, 96.

Schumacher, *Earle E.*, wetting of glasses by mercury, A., ii, 833.

Schumacher, *Hans.* See *August* **Hagenbach.**

Schumacher, *Josef*, the oligodynamic action of metals, A., i, 424.

Schumacher, *Richard.* See *Erich* **Schmidt.**

Schumb, *Walter Cecil*, dissociation pressures of certain salt hydrates by the gas current saturation method, A., ii, 219.

Schumm, *Otto*, the natural porphyrins, A., i, 631.

Schur, *Milton O.* See *Robert E.* **Wilson.**

Schuster, *C.* See *Herbert* **Freundlich.**

Schuster, *Karl.* See *Heinrich* **Lüers.**

Schwabe, *H.* See *Hans* **Einbeck.**

Schwarz, *A.* See *M.* **Bockmühl.**

Schwarz, *Adolf.* See *Martin* **Freund.**

Schwarz, *Eugen.* See *Max* **Busch.**

Schwarz, *J.* See *Willi* **Löffelbein.**

Schwarz, *Robert*, and *Albert* **Brenner**, synthetic aluminium silicates and their relationships to kaolin, A., ii, 569.

Schwarz, *Robert*, and *Walter* **Krönig**, the catalytic decomposition hexamminecobaltichloride, A., ii, 168.

Schwarz, *Robert*, and *Adolf* **Mathis**, the ammines of silicic acid, A., ii, 318.

Schwarz, *Robert*, and *Heinrich* **Stock**, the photochemical decomposition of silver bromide. II., A., ii, 815.

Schweigardt, *F.* See *Georg* **Grube.**

Schweizer, *Robert.* See *Otto* **Dimroth.**

Scott, *A.* See *Kasimir* **Fajans.**

Scott, *Alexander*, isolation of the oxide of a new element, T., 311, 881.

Scott, *John Richard*, sulphonation of *p*-substituted phenylcarbamides, T., 3191.

Scott, *John Richard*, and *Julius Berend* **Cohen**, the condensation of aromatic aminosulphonic acids with *iso*cyanic acid, phenylcarbimide, and cyanamide, T., 3177.

Scripture, *E. W., jun.* See *Gregory Paul* **Baxter.**

Scurti, *Francesco*, arable soil; natural zeolites, A., i, 1047.

Šebor, *Johann.* See *Julius* **Stoklasa.**

Sedelinovich, *Vl.* See *Volkmar* **Kohlschütter.**

Seekles, *L.*, aldehydes derived from cinchonine, quinine, and their acyl compounds, A., i, 237.
  phthalaldehyde, A., i, 931.

Seelen, *K. von.* See *Julius* **Tröger.**

Seeley, *Ernest Arthur.* See *Christopher Kelk* **Ingold.**

Seemann, *Jon.* See *Julius von* **Braun.**

Segur, *J. B.* See *Roger* **Adams.**

Seidel, *W.* See *Fritz* **Foerster.**

Seidler, *Chr.* See *Georg* **Schroeter.**

Seifert, *Karl.* See *Walter* **König**, and *Hans Hugo* **Pringsheim.**

Seifriz, *William*, the reaction of protoplasm to some reagents, A., i, 1043.

Seil, *Harvey A.*, composition of *Nectandra coto*, A., i, 886.

Seiler, *H.* See *Wilhelm* **Eller.**

Seiler, *K.* See *Leopold* **Rosenthaler.**

Seitz, *Fritz.* See *Richard* **Willstätter.**

Seka, *Reinhard*, substituted indole derivatives. I., A., i, 1125.

Seka, *Reinhard.* See also *Ernst* **Philippi.**

Selig, *E.* See *Edmund* **Speyer.**

Selivanova, (*Mlle*) *A. S.* See *Sergei Semenovitsch* **Nametkin.**

Selle, *Hermann*, velocity of sound in nitrogen peroxide, A., ii, 297.

Semenovitsch, (*Mlle*) *V. A.*, the question of the cadaverine content in aqueous extracts of autolysed pancreatic glands, A., i, 628.

Semmens, *Elisabeth Sidney*, some biochemical effects of polarised light, A., ii, 718.

Semon, *Waldo L.*, the preparation of hydroxylamine hydrochloride and acetoxime, A., ii, 155.

Semp, *Hans.* See *Roland* **Scholl.**

Sen, *H. K.*, the fermentation of α-keto-*n*-hexoic acid, A., i, 1159.

Sen, *K. C.*, and *Nilratan* **Dhar**, adsorption. III. Peptisation and the reversal of the charge on some hydroxides, A., ii, 834.

Sen, *K. C.* See also *Nilratan* **Dhar.**

Sen, *Nirmal Kumar.* See *Sikhibhushan* **Dutt.**

Senden, *Pierre*, the fusion curves of binary mixtures of α-nitronaphthalene with the three dihydroxybenzenes and of the dihydroxybenzenes with each other, A., i, 461.

Senden *Pierre*, the ternary eutectic point of the three systems, resorcinol–*a*-nitronaphthalene–pyrocatechol; quinol–resorcinol–pyrocatechol; quinol–*a*-nitronaphthalene–pyrocatechol, A., i, 921.

Senderens, *Jean Baptiste*, catalytic dehydration of alcohols in the wet way. I. Olefines and cyclenes, A., i, 9.
  catalytic dehydration of alcohols by dilute sulphuric acid, A., i, 432.
  preparation of methyl and ethyl ethers, A., i, 742.

Senderens, *Jean Baptiste*, and *Jean* **Aboulenc**, catalytic dehydration of alcohols in the wet way. II. Esterformation, A., i, 9.
  catalytic preparation of amino*cyclo*hexanols, A., i, 919.

Senseman, *C. E.*, and *O. A.* **Nelson**, vapour pressure of carbazole, A., i, 605.

Senseman, *C. E.* See also *O. A.* **Nelson**.

Sensi, *Guglielmo*. See *Mario* **Betti**.

Sepp, *Johanna*. See *Fr.* **Boedecker**.

Settimi, *M.* See *Guido* **Bargellini**.

Severjanov, *L. A.* See *P. P.* **Rubcov**.

Severy, *Hazel W.*, occurrence of copper and zinc in certain marine animals, A., i, 415.

Sewell, *William Gawan*. See *Arthur George* **Perkin**.

Seydel, *O.* See *Karl von* **Auwers**.

Seyer, *W. F.*, and *V.* **Dunbar**, solubility of *cyclo*hexane in liquid sulphur dioxide, A., i, 313.

Seyewetz, *Alphonse*, and *G.* **Miodon**, the electrolytic oxidation of benzene to *p*-benzoquinone, and the electrolytic reduction of quinone, A., i, 583.

Seymour-Jones, *F. L.*, the electrophoresis of chromic solutions, A., ii, 289.

Seymour-Jones, *F. L.* See also *Arthur W.* **Thomas**.

Shaffer, *Philip Anderson*, antiketogenesis. IV. The ketogenic-antiketogenic balance in man and its significance in diabetes, A., i, 166.
  intermediary metabolism of carbohydrates, A., i, 1254.

Shah, *Madhavlal Sukhlal*. See *Andrew Norman* **Meldrum**.

Shallenberger, *G. D.*, two new lines in the aluminium spectrum and their possible series relations, A., ii, 806.

Sharpe, *John Smith*, estimation of choline in blood, A., ii, 444.

Shaver, *W. W.*, arc, spark, and absorption spectra of argon, A., ii, 199.

Shaw, *Brian Duncan*, bromination of aliphatic acids, T., 2238.

Shaw, *Leon Irwin*. See *F. G.* **Jackson**.

Shaw, *R. H.* See *J. M.* **Sherman**.

Shaw, *William M.* See *Walter Hoge* **MacIntire**.

Shaw, *William Simpson*. See *Dinshaw Rattonji* **Nanji**.

Shearer, *George*, an *X*-ray investigation of certain organic esters and other long-chain compounds, T., 3152.
  relation between molecular and crystal symmetry as shown by *X*-ray crystal analysis, A., ii, 223.

Shearer, *George*, and *W. T.* **Astbury**, molecular and crystal symmetry, A., ii, 468.

Shearer, *George*. See also *Alex* **Müller**.

Shedd, *Oliver March*, improved method for the estimation of nicotine in tobacco and tobacco extracts, A., ii, 798.

Sheldon, *H. Horton*, the nature of charcoal "sorption," A., ii, 833.

Shemtschushni, *Sergei F.* See *Nicolai S.* **Kurnakov**.

Shenstone, *Allen G.*, ionisation potentials of copper and silver, A., ii, 605.

Sheppard, *Samuel Edward*, and *G. S.* **Sweet**, interfacial tension between gelatin solutions and toluene, A., ii, 136.

Sherman, *Henry Clapp*, an investigation of the chemical nature of two typical enzymes: pancreatic and malt amylases, A., i, 621.

Sherman, *Henry Clapp*, and *Mary L.* **Caldwell**, influence of amino-acid in protecting amylase from inactivation by mercury, A., i, 261.
  influence of lysine on the hydrolysis of starch by purified pancreatic amylase, A., i, 262.

Sherman, *Henry Clapp*, and *Nellie M.* **Naylor**, influence of some organic compounds upon the hydrolysis of starch by salivary and pancreatic amylases, A., i, 262.

Sherman, *Henry Clapp*, and *Florence* **Walker**, effect of amino-acids in retarding the hydrolytic decomposition of an enzyme (pancreatic amylase), A., i, 1033.

Sherman, *J. M.*, and *R. H.* **Shaw**, the propionic acid fermentation of lactose, A., i, 985.
  the production of carbon dioxide and volatile acids by propionic bacteria, with special reference to their action in cheese, A., i, 1041.

Sherrard, *E. C.*, and *G. W.* **Blanco**, mannose from white spruce cellulose, A., i, 441.

Sherrard, *E. C.*, and *A. W.* **Froehlke**, the action of concentrated hydrochloric acid on different celluloses, A., i, 900.

Sherwin, *Carl P.* See *J. G. M.* **Bullowa**, *J. H.* **Crowdle**, *J. A.* **Muldoon**, and *George J.* **Shiple**.

Sherwood, *F. W.* See *William Ridgely* **Orndorff**.

Shibaev, *N.* See *Alexei Eugrafovitsch* **Favorski**.

Shibata, *Keita*, *Shôjiro* **Iwata**, and *Makoto* **Nakamura**, baicalin, a new flavone–glycuronic acid compound from the roots of *Scutellaria baicalensis*, A., i, 591.

Shibata, *Yuji*, and *Kenshô* **Kimotsuki**, the absorption spectra of vegetable dyes of the flavone series. I., A., ii, 360.

Shikata, *Keiichi*, and *Shigeru* **Saruhashi**, estimation of carbon dioxide in dilute concentration, A., ii, 86.

Shikata, *M.* See *Isidor* **Traube**.

Shilling, *William George.* See *James Riddick* **Partington**.

Winter, *A. R.* See *Charles H.* **Hunt.**

Winter, *L. B.*, and *W.* **Smith,** an enzyme responsible for alteration of the rotatory powers of glucose and fructose ; some evidence for the existence of polysaccharides in the blood of diabetics ; the lowering of the blood-sugar by an extract of yeast, A., i, 513.

effect of insulin on blood-sugar concentration, A., i, 727.

use of yeast extracts in diabetes, A. i, 982.

Winter, *L. B.* See also *W. Devereux* **Forrest.**

Winterstein, *Ernst*, and *A.* **Guyer,** taxine. II., A., i, 942.

Winterstein, *Ernst*, and *O.* **Huppert,** the nitrogen compounds of skimmed milk cheese, A., i, 1260.

Winterstein, *Hans.* See *Elisabeth* **Hecker.**

Wintersteiner, *O.* See *Hans* **Lieb,** and *Robert* **Müller.**

Wintgen, *Robert*, composition of micellæ. I. Stannic acid peptised by alkali, A., ii, 78.

Wintgen, *Robert.* See also *A.* **Ehringhaus.**

Winther, *Christian*, photochemical decomposition of hydrogen peroxide, A., ii, 50.

a simple method for the measurement of absorption in the ultra-violet, A., ii, 519.

Wise, *Clarence R.*, solubilities of certain metallic chlorides in selenium oxychloride, A., ii, 484.

Wishart, *George Macfeat*, estimation of urea by urease, A., ii, 666.

Wissebach, *Heinrich*. See *Karl von* **Auwers**, and *Franz* **Schütz**.

Withey, *W. H.*, the estimation of magnesium in aluminium alloys, A., ii, 88.

Withrow, *James Renwick*. See *Paul M.* **Giesy**.

Witte, *Charlotte*. See *Max* **Bergmann**.

Wittwer, *Max*. See *Hans* **Lecher**.

Wlodek, *Jean*, the influence of chemical fertilisers on the chlorophyll coefficient, A., i, 1160.
  the influence of light and of chemical fertilisers on the chlorophyll coefficient, A., i, 1161.

Wöber, *Artur*. See *Friedrich* **Pichler**.

Wöhler, *Lothar*, and *R.* **Günther**, equilibrium of steam in the presence of iron and tungsten and oxides of these metals, A., ii, 471.

Wöhler, *Lothar*, *F.* **Martin**, and *E.* **Schmidt**, the formation of sulphur by the action of sulphur dioxide on the sulphides of calcium, zinc, and iron, A., ii, 852.

Wohl, *Alfred*, and *Karl* **Freudenberg**, the nomenclature of steric series, A., i, 182.

Wolf, *Emil*. See *Georg von* **Kereszty**.

Wolf, *Lisbeth*. See *Benjamin Max* **Margosches**.

Wolf, *Maurice*, importance of calcium and potassium in the pathological physiology of cancer, A., i, 879.

Wolferts, *Ernst*. See *Daniel* **Vorländer**.

Wolff *L. K.*, *N. J. M.* **Vorstman**, and *P.* **Schoenmaker**, estimation of small quantities of aluminium, A., ii, 341.

Wolff, *(Mlle) Nellie*, furfurylidene- and difurfurylidene-4-methyl*cyclo*hexanones, A., i, 937.
  furfurylidene and furfuryl compounds of camphor and of some *cyclo*hexanones, A., i, 1109.

Wolff, *Ottomar*, measurement of adsorption processes by means of an interferometer, A., ii, 128.

Wolff, *Paul*. See *Julius von* **Braun**.

Wolff, *R.* See *(Mme) P.* **Jung**.

Wolff, *W. Walter*. See *Max* **Bergmann**.

Wolffenstein, *Richard*, and *V.* **Makow**, estimation of persulphuric acids, A., ii, 652.

Wolffenstein, *Richard*, and *E.* **Oeser**, cellulose xanthates, A., i, 541.

Wolfram, *Arthur*. See *Wilhelm* **Steinkopf**.

Wollman, *E.*, and *(Mme) E.* **Wollman**, comparative value of the dialysis reaction (Abderhalden) and the reaction with *Bacterium coli* for the detection of proteolysis, A., i, 615.

Wollman *(Mme) E.* See *E.* **Wollman**.

Wolmer, *Jan*. See *Józef* **Zwadzki**.

Wolter, *R.* See *Siegmund* **Gabriel**.

Wong, *San Yin*, use of persulphate in the estimation of nitrogen. I. By the Arnold-Gunning modification of Kjeldahl's method. II. By Folin's direct nesslerisation method, A., ii, 431.
  colorimetric estimation of iron and hæmoglobin in blood, A., ii, 435.

Wood, *Arthur Samuel*. See *Jocelyn Field* **Thorpe**.

Wood, *C. C.* See *John* **Mellanby**.

Wood, *Charles Edmund*, and *Mervyn Arthur* **Comley**, the Grignard synthesis of aldehydes, A., i, 1176.

Wood, *Charles Edmund*, *John Edward* **Such**, and *Frank* **Scarf**, rotatory dispersion of the esters of lactic acid. I. Normal esters, T., 600.

Wood, *John Kerfoot*. See *George Ernest* **Collins**, *Charles* **Lea**, and *A. M.* **Morley**.

Wood, *Robert Williams*, dialysis of small volumes of liquid; the lily-pad dialyser, A., ii, 541.
  vacuum grating spectrograph and the zinc spectrum, A., ii, 805.

Woodhouse, *John C.* See *George Shannon* **Forbes**.

Woodward, *Elsie*. See *Charles Edwin* **Corfield**.

Woodward, *Ida*, the structure of halogen salts based on their compressibility, A., ii, 414.

Woog, *Paul*, hydration of hydrocarbons, A., i, 890.

Woolwich, Research Department, determination of the viscosity of cellulose, A., i, 999.

Worcester, *D. K.* See *M.* **Knobel**.

Wormall, *Arthur*. See *Henry Stanley* **Raper**.

Woronkov, *G.* See *N.* **Uspenski**.

Wosnessenski. See **Vosnessenski**.

Worrell, *Stanley Wilson*. See *Henry Julius Salomon* **Sand**.

Worsley, *Richard Robert Le Geyt*, and *Herbert Brereton* **Baker**, the preparation and properties of selenium trioxide and chloroselenic acid, T., 2870.

Wouseng, *Sung*. See *René* **Locquin**.

Wrede, *Fritz*, *Emil* **Banik**, and *Otto* **Brauss**, the constitution of the glucoside, sinigrin, A., i, 589.

Wreschner, *Marie*. See *Herbert* **Freundlich.**

Wright, *Robert*, selective solvent action by the constituents of aqueous alcohol. II. The effect of some alcohol-soluble semi-solutes, T., 2493.

Wu, *Hsien*. See *Donald D. Van* **Slyke.**

Wünsche, *F.* See *Max* **Cloetta.**

Wüterich, *W.* See *Alexander* **Gutbier.**

Wulf, *Oliver R.*, *Farrington* **Daniels**, and *Sebastian* **Karrer**, oxidation of nitrogen tetroxide by ozone, A., ii, 23.

Wulf, *Oliver R.* See also *Farrington* **Daniels**, and *Sebastian* **Karrer.**

Wurmser, *René*. See *E.* **Aubel.**

Wyckoff, *Ralph W. G.*, the crystal structure of ammonium chloride, A. ii, 26.
- the crystal structure of hydrazine dihydrochloride, A., ii, 155.
- the crystal structure of the alums, A., ii, 243.
- a survey of existing crystal structure data, A., ii, 300.
- the hypothesis of constant atomic radii, A., ii, 311.
- the alleged anomalous reflection of X-rays in crystals, A., ii, 743.

Wyckoff, *Ralph W. G.*, and *Eugen W.* **Posnjak**, crystal structures of lithium iodide and rubidium fluoride, A., ii, 858.

Wylam, *Birkett*. See *Walter Norman* **Haworth.**

X.

Xenophontova, *W. Ja.* See *Boris I.* **Slovtzov.**

Y.

Yamada, *Mituo*, the occlusion of hydrogen by palladium, A., ii, 81.

Yamaguchi, *Seitaro*. See *Shigeru* **Komatsu.**

Yamaguchi, *Shozo*. See *Shigeru* **Komatsu.**

Yamamoto, *Ken-ichi*. See *Kyahei* **Kobayashi.**

Yamamoto, *Ryo*, the insecticidal principle of *Chrysanthemum cinerariæfolium*. II. and III. Constitution of pyrethronic acid, A., i, 1010.

Yamasaki, *Eiichi*, chemical kinetics of heterogeneous systems. IV. The mechanism of chemical reaction, when noble metals dissolve in potassium cyanide solution, A., ii, 63.

Yanagisawa, *Hidekichi*, and *Norikazu* **Takashima**, Japanese birdlime. III., A., i, 1008.

Yang, *S. T.* See *William Ridgely* **Orndorff.**

Yannakis, *N.*, vapour tensions of mixtures of hydrochloric acid and water, A., ii, 611.

Yant, *W. P.* See *R. R.* **Sayers.**

Yao, *Y. T.*, the low-voltage arc in mercury vapour and its relation to fluorescence, A., ii, 361.

Yntema, *L. F.*, rare earths. XIII. absorption spectra, A., ii, 358.

Yntema, *Theodore O.* See *Worth H.* **Rodebush.**

Yoder, *Lester*, urethanes from chlorine-substituted secondary and tertiary alcohols, A., i, 309.

Yoder, *Lester*. See also *Arthur Wayland* **Dox.**

Yoe, *John H.*, and *Graham* **Edgar**, reduction of an indanthrene dye by means of sodium hyposulphite, A., i, 236.

Yoshida, *Ryohei*. See *Yukichi* **Osaka.**

Yoshimura, *Kiyohisa*, nitrogenous constituents of the fruit of chayote (*Sechium edule*), A., i, 78.

Youmans, *J. B.* See *A. C.* **Kolls.**

Young, *J. B.* See *William H.* **MacIntire.**

Young, *J. F. T.*, application of the theory of magnetism to the calculation of atomic diameters, A., ii, 213.
- the crystal structure of various Heusler alloys, by the use of X-rays, A., ii, 640.

Young, *L. H.* See *Frederick G.* **Keyes.**

Young, *Sydney*, azeotropic mixtures, A., ii, 736.

Yovanovitch, *Alexandre*. See *Georges* **Fontès.**

Yu, *Chai-Lan*. See *Arthur W.* **Thomas.**

Z.

Žáček, *August*, the L-series of hafnium, A., ii, 449.

Zacepina, (*Mlle*) *E. V.* See *Alexei Eugenievitsch* **Tschitschibabin.**

Zadek, *F.* See *David* **Holde.**

Zahn, *Karl*, halogenated derivatives of ketodihydro-1:4-benzthiazines and the products of their transformations; conversion of thiazine into thiazole compounds, A., i, 375.

Zaleski, *Ivan Adamovitsch*. See *A.* **Sachnóvska.**

Zalkind, *Juli Sigizmundovitsch*, the formation of geometrical isomerides by the reduction of acetylene derivatives, A., i, 176.

Zalkind, *Juli Sigizmundovitsch*, addition of hydrogen to acetylene derivatives. XI. Addition of hydrogen to alcohols having two triple linkings, A., i, 333.
  addition of hydrogen to acetylene derivatives. VIII., A., i, 434.
  velocity of catalytic reactions, A., ii, 398.

Zalkind, *Juli Sigizmundovitsch*, and *N.* **Cicianova**, addition of hydrogen to acetylene derivatives. X. Addition of hydrogen to diphenylphenylacetylenylcarbinol, A., i, 332.

Zalkind, *Juli Sigizmundovitsch*, and (*Mlle*) *Z.* **Neischtab**, addition of hydrogen to acetylene derivatives. XII. Addition of hydrogen to diphenylbutinenediols and to the acetyl ester of diphenylbutinenediol, A., i, 335.

Zalkind, *Juli Sigizmundovitsch*, and (*Mlle*) *M. S.* **Peschekerova**, union of hydrogen with acetylene derivatives. XIII. Mechanism of the catalytic hydrogenation of dimethylhexinenediol, A., i, 8.

Zalkind, *Juli Sigizmundovitsch*, and (*Mlle*) *M. A.* **Vilenkina**, addition of hydrogen to acetylene derivatives. IX. Addition of hydrogen to acetylenic γ-alcohols, A., i, 529.

Zambonini, *Ferruccio*, isomorphism of potassium fluoborate and permanganate, A., ii, 70.
  thorium molybdate, $Th(MoO_4)_2$, A., ii, 499.
  normal thorium molybdate, $Th(MoO_4)_2$, A., ii, 691.
  presence of anhydrous sodium sulphate among the products of the present activity of Vesuvius, A., ii, 869.

Zambonini, *Ferruccio*, and *Guido* **Carobbi**, Baskerville and Catlett's lanthanates, A., ii, 765.
  double carbonates of sodium and metals of the cerium group, A., ii, 863.

Zander, *Heinz*. See *Hermann* **Leuchs**.

Zander, *Herbert*. See *Hermann von* **Siemens**.

Zanella, *B*. See *Maurizio* **Padoa**.

Zannini, *A. Masetti*. See *Gino* **Scagliarini**.

Zappelli, *E*. See *G*. **Charrier**.

Zarin, *E. J*. See *E. N*. **Pavlovsky**.

Zavaricki, *N. N*. See *Michail Stepanovitsch* **Vrevski**.

Zawadzki, *Józef*, the catalytic oxidation of ammonia and hydrogen cyanide. I., A., ii, 854.

Zawadzki, *Józef*, and *Jan* **Wolmer**, the catalytic oxidation of ammonia and hydrogen cyanide. II., A., ii, 854.

Zaykowski, *Janusz*, the rotation and molecular weight of casein, A., i, 718.

Zdobnický, *Wenzel*. See *Julius* **Stoklasa**.

Zechmeister, *László*, optical rotatory power of sugars in hydrochloric acid, A., i, 183.
  the action of acetyl bromide on cellulose, A., i, 306.

Zechmeister, *László*. See also *Niels* **Bjerrum**.

Zechner, *Ludwig*. See *Franz* **Lanyar**.

Zeeman, *Pieter*, and *H. W. J*. **Dik**, relation between the spectra of ionised potassium and of argon, A., ii, 670.

Zega, *A*., and *Lilli* **Zega**, estimation of fat in milk, A., ii, 590.

Zega, *Lilli*. See *A*. **Zega**.

Zega, *Zorka*. See *Paul* **Karrer**.

Zeglin, *H*. See *Friedrich* **Auerbach**.

Zeh, *L*. See *Emil* **Heuser**.

Zeide, *O. A*., 6-amino-2-methylpyridine, A., i, 600.

Zeide, *O. A*. See also *Alexei Eugenievitsch* **Tschitschibabin**.

Zeidler, *Friedrich*. See *Alfred* **Stock**.

Zeiss, *R*. See *Otto* **Hönigschmid**.

Zeitfuchs, *Edward H*. See *Charles August* **Kraus**.

Zelinski, *Nikolai Dmitrievitsch*, further experiments on the catalytic dehydrogenation of hexahydroaromatic hydrocarbons, A., i, 549.
  naphthenes in their behaviour towards catalytic dehydrogenation; the nature of petroleum, A., i, 907.
  decahydronaphthalene and its behaviour towards catalytic dehydrogenation, A., i, 910.
  contact polymerisation of acetylene, A., i, 1169.

Zelinski, *Nikolai Dmitrievitsch*, [with (*Frl.*) *N*. **Delzova**], the behaviour of 1:1-dimethyl*cyclo*hexane towards catalytic dehydrogenation, A., i, 907.

Zelinski, *Nikolai Dmitrievitsch*, and *P. P*. **Borissow**, the activation of oxygen and hydrogen peroxide by palladium hydride, A., ii, 149.

Zelinski, *Nikolai Dmitrievitsch*, and *N*. **Pavlov**, kinetics of catalytic dehydrogenation, A., i, 767.

Zelinski, *Nikolai Dmitrievitsch*, and *Vladimir Sergievitsch* **Sadikov**, fission of proteins by formic acid, A., i, 721.
  the hydrolysis of proteins by dilute acids, A., i, 867.
  the peptisation of amino-acids under the action of acids and alkalis, A., i, 1185.

Zelinski, *Nikolai Dmitrievitsch.* See also *Vladimir Sergievitsch* **Sadikov.**
Zellmann, *R.* See *Max* **Le Blanc.**
Zellner, *Julius.* See *Lucie* **Bard.**
Zemmin, *H.* See *K.* **Dresel.**
Zemplén, *Géza*, synthesis of an acid of the digitoxonic acid group, A., i, 437.
Zemplén, *Géza*, and *Alfons* **Kunz**, the sodium compound of dextrose and the hydrolysis of acylated sugars, A., i, 897.
Zerbe, *C.* See *Franz* **Fischer.**
Zerner, *Ernst*, the oxidation of stearic acid and related compounds by oxygen, A., i, 994.
Zerweck, *Werner.* See *Hans* **Fischer.**
Zetzsche, *Fritz.* See *Karl W.* **Rosenmund.**
Ziegenspeck, *Herm.* See *K.* **Alpers.**
Ziegler, *Karl*, and *Fritz* **Thielmann**, alkali metal as a reagent for weakened valencies in organic compounds, A., i, 921.
Ziegler, *Karl*, and *Paul* **Tiemann**, synthesis of certain primary alcohols from unimolecular formaldehyde and Grignard's reagents, A., i, 30.
Ziegner, *Heinrich.* See *Helmuth* **Scheibler.**
Zies, *Emanuel George.* See *Eugene Thomas* **Allen.**
Zimmerlund, *G.*, and *Olof* **Svanberg**, micro-estimation of sulphuric acid and sulphur in organic substances by the benzidine method, A., ii, 177.
Zintl, *Eduard*, and *Hermann* **Wattenberg**, potentiometric titration of arsenic and antimony, A., ii, 253.
Zipf, *K.* See *Ernst J.* **Lesser.**
Zivy, *L.* See *Louis Jacques* **Simon.**
Zlatarov, *As.*, new colour reaction for detecting nitrous acid, A., ii, 505.
Zobel, *Friedrich.* See *Julius von* **Braun.**
Zocher, *Hans.* See *Herbert* **Freundlich**, and *E.* **Keeser.**
Zoff, *Alfred.* See *Robert* **Kremann.**
Zoller, *Harper F.*, oxalyl chloride in the synthesis of the triphenylmethane dyes, A., i, 51.
Zolotarev, *P. V.*, an electrical fuse for a calorimetric bomb, A., ii, 612.
Zolotarev, *P. V.* See also *P. P.* **Budnikov.**
Zschoch, *Fritz.* See *Hans* **Stobbe.**
Zucker, *T. F.*, and *M. B.* **Gutman**, the distribution of inorganic phosphate of the blood between plasma and cells, A., i, 972.
Zunini, *E.* See *M.* **Garino.**
Zunz, *Edgard*, and *Alexis* **Delcorde**, the effect of codeine on the digestion of meat by dogs, A., i, 412.
Zunz, *Edgard*, and *Paul* **György**, heteroalbumose, A., i, 259.
Zwehl, *Gustav von.* See *Hans Heinrich* **Schlubach.**
Zweigle, *A.* See *Alexander* **Gutbier.**

INDEX OF SUBJECTS.

TRANSACTIONS AND ABSTRACTS.

1923.

(Marked T., and A., i and A., ii respectively.)

A.

Abies pindrow, essential oil from (Schimmel and Co.), A., i, 49.
Abietic acid (Schorger), A., i, 677.
  action of heat on (Ruzicka and Schinz), A., i, 1203.
  sodium salt, surface tension of solutions of (Lorenz), A., ii, 614.
Abietic acids from pine resin (Ruzicka and Schinz), A., i, 818.
  estimation of (Schulze and Landa), A., ii, 96.
Absorption of radiation. See under Radiation.
Absorption apparatus. See Gas-absorption apparatus.
Absorption spectra. See under Spectra.
Acenaphthene, substitution in (Dziewoński and Stôłyhwo; Dziewoński, Glasnerówna, and Orzelski), A., i, 775.
Acenaphthene, bromo-derivatives (de Fazi), A., i, 775.
  chloroamino-, and 3-chloro-4-nitro- (Farnell), T., 60.
Acenaphthylene, polymerisation of (Dziewoński and Olesiówna), A., i, 776
2-Acenaphthylquinoline-4-carboxylic acid (v. Braun and Wolff), A., i, 144.
Acetal, catalytic preparation of (Adkins and Nissen), A., i, 301.
Acetals, catalytic synthesis of, and their halogenation (Reichert, Bailey, and Nieuwland), A., i, 753.
  cyclic, preparation of (Hibbert and Hill), A., i, 439.
Acetals, amino-, reaction of, with phenols and phenolic ethers (Hinsberg), A., i, 555.
Acetaldehyde, formation of, from bacterial degradation of carbohydrates and their acids (Nagai), A., i, 1267.
Acetaldehyde, preparation of (Wertheim), A., i, 14.
  production of, in blood, from pyruvic acid (Stepp and Behrens), A., i, 625.
  density and refractive index of mixtures of water or ethyl alcohol and (van Aubel), A., i, 181.
  adsorption of, by animal charcoal (Abderhalden and Glaubach), A., i, 518; (Abderhalden and Stix; Abderhalden and Suzuki), A., i, 519.
  oxidation of, with hydrogen peroxide (Reiner), A., i, 1176.
  condensation of, with ammonia in presence of alumina (Tschitschibabin, Moschkin, and Tiashelova), A., i, 1122.
  equivalence of glycerol and, in fermentation products (Gehle, Neuberg, Hirsch, and Reinfurth), A., i, 171.
  action of yeast on (Lieben), A., i, 424.
  in muscle (Hirsch), A., i, 415.
  estimation of (Blair and Wheeler), A., ii, 268.
Acetaldehyde, bromo-, semicarbazone (Hibbert and Hill), A., i, 439.
Acetaldehydes, *tri*thio-, isomeric (Mann and Pope), T., 1178.
Acetaldehydesulphonic acid, chloro-, and its sodium salt (Chemische Fabrik vorm. Weiler ter Meer), A., i, 1060.
Acetamide, equilibrium of acetic anhydride and (Kremann, Mauermann, and Oswald), A., i, 336.
  velocity of reaction of benzoic anhydride and (Kremann, Auer, Oswald, and Zoff), A., ii, 227.
Acetamide, cyano-, condensation of aldehydes with (Curtis, Day, and Kimmins), T., 3131.
  thio-, condensation of benzonitrile with (Ishikawa), A., i, 926.

Acetanilide (*antifebrin*), estimation of (Rose), A., ii, 888.
Acetanilide, amino-, formyl derivative (Usherwood and Whiteley), T., 1086.
4-chloro-2-bromo-3-nitro, dimorphism of (de Angelis), A., i, 319.
nitro*di*chloro-derivatives (Wheeler and Smith), A., i, 948.
Acetanilides, substituted, freezing-point curves of binary mixtures of (Owen), T., 3392.
Acetanilides, *o*- and *p*-nitro-, separation of (Matsuo and Kaisha), A., i, 553.
Acetic acid, refractive index of (Elsey and Lynn), A., ii, 349.
electrolysis of (Baur), A., i, 436.
activity of hydrogen-ion in hydration of (Lewis, Merriman, and Moran), A., i, 435.
velocity of reaction of benzoic anhydride and (Kremann and Rösler), A., ii, 227.
binary critical solution temperatures as criteria of the purity of (Jones), T., 1374.
differentiation of, from acetic anhydride (Levine), A., ii, 96.
Acetic acid, salts, electrolysis of, in benzoic acid (Schall), A., ii, 120.
chromic and ferric salts, compounds of acid amides with (Weinland and Hachenburg), A., i, 445.
basic glucinum salt, structure of (Meyer and Mantel), A., i, 11; (Bragg), A., i, 532; (Sidgwick), A., i, 744.
lead tetra-salt, use of, as an oxidising agent (Dimroth and Schweizer), A., i, 741.
and silver di-salt (Schall and Melzer), A., i, 87.
mercuric salt, action of carbon disulphide on (Bernardi and Rossi), A., i, 744.
methylmercuric salt (Sneed and Maynard), A., i, 194.
potassium salt, action of, on alkyl-bromides (Mereshkowsky), A., i, 643.
sodium salt, oxidation of, under pressure (Schrader), A., i, 87.
uranyl salt, action of, on malic acid (Kopatschek), A., i, 745.
Acetic acid, acetomethylamidophenyl ester (Clarke), A., i, 327.
acetylcarbinyl esters and their semicarbazones (Dimroth and Schweizer) A., i, 745.
*di*bromoacetamidoaryl esters (Raiford and Iddles), A., i, 326.
Acetic acid, cellulose ester (Knoevenagel and König), A., i, 95.
viscosity of solutions of (Mardles), T, 1951.
swelling of (Knoevenagel), A., i, 757; (Knoevenagel and Volz), A., i, 306.
swelling and partition of, in organic solvents (Knoevenagel, Hogrefe, and Mertens), A., i, 17.
ultra-filters of (Fricke and Klempt), A., ii, 752.
cetyl ester (Thomas and Flaschenträger), A., i, 1257.
β-chloroethyl ester (Chemische Fabrik Kalk and Oehme), A., i, 746.
βγ-diphthalimidopropyl ester (Philippi, Seka, and Ableidinger), A., i, 1185.
ethyl ester, hydrolysis of (v. Euler and Rudberg), A., ii, 547.
interaction of potassium and (Scheibler, Ziegner, and Peffer), A., i, 82.
linalyl and *α*-phenylethyl esters (Laboratoire-Usine), A., i, 110.
methoxymethyl ester, velocity of hydrolysis of (Skrabal and Belavić), A., ii, 143.
naphthylcarbinyl esters (Szperl), A., i, 1191.
nitro-*m*-tolyl esters (Gibson), T., 1272.
Acetic acid, amino-, glutaryl derivative, ethyl ester, and its derivatives (Curtius and Hechtenberg), A., i, 1069.
bromo-, ethyl ester, addition of, to pyridine (Dexter, McCombie, and Scarborough), T., 1236.
*di*bromoamino- and *di*chloroamino-, ethyl esters (Traube and Gockel), A., i, 190.
*mono*chloro-, preparation of (Simon and Chavanne), A., i, 177, 894.
interaction of aniline and (Nodzu and Komatsu), A., i, 200.
mono- and *di*chloro-, and chlorobromo-, and their esters and acid chlorides, molecular refractions of (Vanderstichele), T., 1225.
*di*chloro-, and chlorobromo-, isomorphism of amides of (McKie), T., 2213.
di- and *tri*-chloro-, *o*-toluidine, *α*-naphthylamine and *m*-nitroaniline esters (Wheeler and Smith), A., i, 994.

Acetic acid, *tri*chloro-, retardation of reduction with reducing sugars by (Margosches and Steindler), A., i, 998.
compound of, with hexamethylenetetramine (Debucquet), A., i, 1185.
chloroiodo-, and its amide, anilide, and phenyl ester (Crompton and Carter), T., 576.
cyano-, condensation of, with aldehydes (v. Auwers, Jordan, Meissner, and Seydel), A., i, 662.
and its methyl ester and nitrile, interaction of phenyl styryl ketone and (Kohler and Souther), A., i, 244.
mono- and *di*-fluoro-, nitriles of (Swarts), A., i, 190.
*tri*fluoro-, and its salts and derivatives (Swarts), A., i, 292.
Acetic acids, α- and β-chloro-, binary systems of phenols with (Mameli and Cocconi), A., i, 555.
Acetic anhydride, velocity of hydrolysis of (Skrabal), A., ii, 305.
equilibria of, with acetamide and benzamide (Kremann, Mauermann, and Oswald), A., i, 336.
oxidation of benzaldehyde and, with oxygen (Jorissen), A., ii, 629.
interaction of bromine with (Orton, Watson, and Bayliss), T., 3081.
action of, on furfurylideneanthranilic acids (Ekeley and Rogers), A., i, 66.
action of, on uric acid (Biltz and Schmidt), A., i, 489.
differentiation of, from glacial acetic acid (Levine), A., ii, 96.
estimation of (Spencer), A., ii, 588.
Acetic anhydride, *hexa*fluoro- (Swarts), A., i, 292.
Acetimidomethyl sulphide, *tri*chloro-, and its hydrochloride (Steinkopf and Müller), A., i, 1078.
Acetoacetic acid, ethyl ester, synthesis of (Meyer), A., i, 436.
detection of, in diabetic urine (Favrel), A., ii, 97.
Acetoacetic acid, *mono*- and *di*-bromo-, and *mono*- and *di*-chloro-, ethyl esters, action of hydrazine on (Macbeth), T., 1125.
Acetobenzylphenacylamide (Staub), A., i, 141.
cis- and *trans*-**Aceto-*o*- and -*p*-methylcyclohexylamides** (Skita, Häuber, and Scharenberg), A., i, 671.
Aceto-β-naphthalide, bromonitro-derivatives (Veselý and Dvořak), A., i, 918.
Aceto-β-naphthalide, 1:5-*di*nitro- (Veselý and Jakeš), A., i, 918.
Acetone, action of light on, with borneol, geraniol, and menthol (Scagliarini and Giuseppina), A., i, 587.
sugar derivatives of. See *iso*Propylidene.
semioxamazone, and its sodium derivative (Wilson and Pickering), T., 395.
detection of, in urine (van Ketel), A., ii, 665.
estimation of, volumetrically (Ionescu, Spirescu, and Popescu), A., ii, 666.
estimation of, in mixtures with ethyl alcohol (Bushill), A., ii, 665.
estimation of, in methyl alcohol (Bates, Mullaly, and Hartley), T., 401.
estimation of, in blood and urine (Lublin), A., ii, 268.
Acetone substances, fats as precursors of (Hubbard), A., i, 631.
Acetone-benzilic acid (Willstätter and Königsberger), A., i, 1173.
Acetone-erythritol. See Erythritol *iso*propylidene ether.
Acetone-glycollic acid (Willstätter and Konigsberger), A., i, 1172.
Acetone-mandelic acids (Willstätter and Konigsberger), A., i, 1173.
Acetone*iso*propylhydrazine (Lochte, Noyes, and Bailey), A., i, 26.
Acetonethiosemicarbazone, reactions of, with α-halogenated esters (Wilson and Burns), T., 800.
Acetonitrile, action of organometallic derivatives of magnesium on (Bruylants), A., i, 310.
condensation of thiobenzamide with (Ishikawa), A., i, 926.
Aceto-*p*-nitroanilide, *mono*- and *di*-chloro- (Wheeler and Smith), A., i, 994.
5-γ-Acetophenetidinopropyl-5-*iso*amylbarbituric acid (Dox and Yoder), A., i, 950.
γ-Acetophenetidinopropyl*iso*amylmalonic acid, ethyl ester (Dox and Yoder), A., i, 950.
Acetophenone, bromination of (Ward), T., 2207.
semioxamazone, and its potassium derivative (Wilson and Pickering), T., 396.
Acetophenone, *p*-amino-, *di*bromo-, *di*bromoamino-, and bromonitro-, and their acetyl derivatives, and their ketazines, phenylhydrazones, and semicarbazones (Bruining), A., i, 227.

Acetophenone, *o*-chloro- (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1182.
  m-iodoso-*p*-hydroxy- (Bogert and Curtin), A., i, 1102.
Acetophenones, ring-substituted, formation of ketazines, phenylhydrazones, and semicarbazones of (Bruining), A., i, 226.
Acetophenone-*p*-arsinic acid (Lewis and Cheetham), A., i, 408.
Acetophenone-*o*-tolil (Bogert and Herrera), A., i, 240.
Aceto-*p*-toluidide-2-sulphinic acid (Johnson and Smiles), T., 2386.
Acetovanillone, ω-chloro- (Pratt and Robinson), T., 753.
Acetoveratrone, ω-hydroxy-, and its dehydrodiphenylhydrazone (Pratt and Robinson), T., 756.
Acetoxime, preparation of (Semon), A., ii, 155.
Acetoxyacetic anhydride (Dimroth and Schweizer), A., i, 744.
Acetoxyacetoacetic acid, ethyl ester, and its semicarbazone (Dimroth, Schweizer, and Schaaf), A., i, 745.
1-Acetoxyanthraquinone, 4-amino-, acetyl and benzoyl derivatives (Grandmougin), A., i, 117.
Acetoxy 2-benzenesulphonyl-β-naphthapyrones (Tröger and Dunkel), A., i, 356.
o-**Acetoxybenzoic acid** (*acetylsalicylic acid; aspirin*), liberation of salicyl from and its excretion (Hanzlik and Presho), A., i, 879.
  quinine salt, and its hydrochloride (Farbenfabriken vorm. F. Bayer & Co.), A., i, 939.
  iodoalkyl esters (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 795.
o-**Acetoxybenzoic acid,** 3.4-*di*hydroxy- (Pacsu), A., i, 340.
1-Acetoxy-1:2:3-benzotriazole, 6-nitro- (Brady and Day), T., 2266.
α-**Acetoxybenzoylacetic acid,** ethyl ester (Dimroth, Schweizer, and Schaaff), A., i, 745.
4-Acetoxy-2:1-benzthiopyran (Lesser and Mehrländer), A., i, 828.
o-**Acetoxybenzylacetamide** (Raiford and Clark), A., i, 925.
o-**Acetoxybenzylbenzamide** (Raiford and Clark), A., i, 925.
Acetoxy-2-*p*-chlorobenzenesulphonyl-β-naphthapyrones (Tröger and Dunkel), A., i, 356.
α-**Acetoxycinnamic acid,** ethyl ester (Gault and Weick), A., i, 36.
Acetoxydimethoxy-1-methyl-3:4-dihydro*iso*quinoline (Späth), A., i, 479.
1-Acetoxyindole-2-carboxylic acid, ethyl ester, and its derivatives (Gabriel, Gerhard, and Wolter), A., i, 704.
2-Acetoxy-3-keto-2:3-dihydro-1:4-benzthiazine (Zahn), A., i, 876.
10-Acetoxy-1:2:6:7-tetramethoxyanthracene (Bistrzycki and Krauer), A., i, 1211.
10-Acetoxy-3:7:8-trimethoxymethylanthracenes (Bistrzycki and Krauer), A., i, 1210.
Aceto-*p*-xylidide-6-sulphinic acid (Johnson and Smiles), T., 2387.
Aceto-*p*-xylidide-6-sulphonanilide (Johnson and Smiles), T., 2387.
Aceto-*p*-xylidide-6-sulphonyl chloride (Johnson and Smiles), T., 2387.
1-Acetoxymercurimethyl-1:2-dihydrobenzfuran, 4-bromo- (Mills and Adams), A., i, 971.
1-Acetoxymercurimethyl- 5- and -6-methyl-1:2-dihydrobenzfuran (Mills and Adams), A., i, 971.
3-Acetoxymercurisalicylaldehyde, 3- and 5-nitro- (Whitmore and Middleton), A., i, 726.
1-Acetoxymethyl-1:2:3-benzotriazoles, 4- and 6-nitro- (Brady and Day), T., 2262.
6-Acetoxy-2-methyl-5-methylbenzoxazole (Heinrich, Suntheimer, and Steinmann), A., i, 145.
γ-**Acetoxy-β-methylpropylene,** αα-*di*bromo- (Mereshkowsky), A., i, 528.
2-Acetoxy-1:4-naphthaquinone, 3-chloro- (Fries and Ochwat), A., i, 843.
1-Acetoxy-2-phenylisatogen, 6-nitro-2-hydroxy- (Ruggli, Bolliger, and Leonhardt), A., i, 834.
α-**Acetoxy-β-phenylpropionic acid,** ethyl ester (Gault and Weick), A., i, 36.
4-Acetoxy-1-phenylpyrrole-3-carboxylic acid (Benary and Konrad), A., i, 241.
Acetoxystearic acid (Radcliffe and Gibson), A., i, 177.
2′-Acetoxystilbene, 4-nitro- (Cullinane), T., 2058.
11-Acetoxytetrahydrocarbazolenine (Perkin and Plant), T., 689.
β-**Acetoxytetrahydronaphthalene-*o*-carboxylic acid** (Tetralin G. m. b. H.), A., i, 37.
Acetoxy-2-*p*-toluenesulphonyl-β-naphthapyrones (Tröger and Dunkel), A., i, 356.
3-Acetoxy-*m*-toluic acid, quinine salt (Farbenfabriken vorm. F. Bayer & Co.), A., i, 939.

Acetyl bromide, action of, on cellulose and starch (Zechmeister), A., i, 306.
chloride, cyano-, spontaneous decomposition of (Schroeter and Seidler), A., i, 1124.
groups, migration of, from oxygen to nitrogen (Raiford and Iddles), A., i, 326.
estimation of (Freudenberg), A., ii, 884.
value, estimation of (Powell), A., ii, 887.
Acetylacetonedianil, derivatives of (Scheibe, Pflock, Scholl, and Friedel), A., i, 251.
Acetylacrylic acid. See Methyleneacetoacetic acid.
Acetyl-β-anilinoacrylic acid, *N*-chloro-, ethyl ester (Benary and Konrad), A., i, 241.
Acetyl-*p*-anisidine, chloro-, action of potassium hydroxide on (Reverdin), A., i, 714.
chloronitro-derivatives (Reverdin), A., i, 320.
l-**Acetylasparagine**, and its derivatives (Karrer and Schlosser), A., i, 660.
Acetylation (Fernández and Torres), A., i, 797.
Acetylbenzylcysteine (Shiple and Sherwin), A., i, 673.
Acetyl-*p*-bromo-*o*-toluidide, and oximino- (Ressy and Ortodocsu), A., i, 833.
Acetylbutyl alcohol, δ-bromo-, and δ-hydroxy-, and its derivatives (Bergmann and Miekeley), A., i, 1053.
p-**Acetylcarbamidotoluene-*m*-sulphonic acid** (Scott), T., 3195.
Acetylcinchoninal, and its salts and derivatives (Seekles), A., i, 237.
Acetylcinchonine ozonide (Seekles), A., i, 237.
8-Acetyldihydropentindole, and 4-nitro- (Perkin and Plant), T., 3245.
3-Acetyl-5-dimethylaminoacetyl-2:4-dimethylpyrrole (Fischer and Schneller), A., i, 943.
ω-Acetyl-*ωω′*-dimethylbiuret (Biltz and Jeltsch), A., i, 1075.
1′-Acetyl-7:7′-dimethyldihydroindigotin, 1-nitroso-2-hydroxy- (Posner and Heumann), A., i, 954.
5-Acetyl 2:4-dimethyl-3-ethylpyrrole, 5-chloro- (Fischer and Schubert), A., i, 708.
2-Acetyl-1:2-dimethyl*cyclo*pentan-3-one, and its semicarbazone (Godchot), A., i, 582.
1-Acetyl-3:5-dimethylpyrazole (Morgan and Ackerman), T., 1316.
3-Acetyl-2:4-dimethylpyrrole, semicarbazone (Fischer and Schubert), A., i, 708.
3-Acetyl-2:4-dimethylpyrrole, 5-amino- and its picrate (Fischer and Rothweiler), A., i, 392.
5-Acetyl-2:4-dimethylpyrrole, 5-chloro- (Fischer, Weiss, and Schubert), A., i, 703.
3-Acetyl-2:4-dimethylpyrrole-5-carboxylamide (Fischer and Schubert), A., i, 709.
3-Acetyl-2:4-dimethylpyrrole-5-carboxylic acid, ethyl ester, hydrazone (Fischer and Schubert), A., i, 708.
3-Acetyl-2:4-dimethylpyrrole-5-carboxylic acid, 3-chloro-, ethyl ester (Fischer, Weiss, and Schubert), A., i, 704.
4-Acetyl-2:5-dimethylpyrrole-3-carboxylic acid, 4-*di*chloro-, ethyl ester (Fischer and Schneller), A., i, 943.
3-Acetyl-2:4-dimethylpyrrole-5-*p*-nitroazobenzene (Fischer and Rothweiler), A., i, 392.
2-Acetyl-1:4-diphenylsemicarbazide (Busch, Müller, and Schwarz), A., i, 866.
Acetylene, contact polymerisation of (Zelinski), A., i, 1169.
density of (Sameshima and Fukaya), A., i, 1169.
solubility of, in blood and water (Schoen), A., i, 727.
reaction between aniline and, at high temperatures (Majima, Unno, and Ono), A., i, 135.
preparation of oxalic acid from (Kearns, Heiser, and Nieuwland), A., i, 437.
action of, on zinc ethyl (Durand), A., i, 449.
reaction of zirconium tetrachloride with (Venable and Deitz), A., ii, 170.
Acetylenic acids, reduction of, with hydrogen (Williams and James), A., i, 533.
Acetylene compounds, hydrogenation of (Zalkind and Peschekerova), A., i, 8; (Zalkind and Cicianova), A., i, 332; (Zalkind), A., i, 333, 434; (Zalkind and Neischtab), A., i, 335; (Zalkind and Vilenkina), A., i, 529.
application of the Grignard reaction to (Wilson and Hyslop), T., 2612.
ω-Acetyl-*ms*-ethylbiuret (Biltz and Jeltsch), A., i, 1075.
1-Acetyl*cyclo*hexan-1-ol, and its derivatives (Locquin and Wouseng), A., i, 302.

Acetylhydrindamine (Ingold and Piggott), T., 1484.

9-Acetyl-10:11-*di*hydroxyhexahydrocarbazole (Perkin and Plant), T., 688.

2-Acetyl-3-hydroxyindazole (Heller and Kohler), A., i, 851.

***N*-Acetyl-*o*-hydroxymethylbenzhydrazide** (Teppema), A., i, 257.

8-Acetyl-9-hydroxytetrahydropentindole, 10-nitro- (Perkin and Plant), T., 3246.

Acetylides, metallic (Durand), A., i, 1170.

Acetylindazyl ether (Heller and Köhler), A., i, 851.

Acetylindigotinmalonic acid, ethyl ester (Posner and Pyl), A., i, 253.

ω-Acetylmethanetriacetic acid, ethyl ester (Dreifuss and Ingold), T., 2967.

5-Acetyl-2-methoxyazidobenzene (Bogert and Curtin), A., i, 1102.

γ-Acetyl-γ-methoxybutyric acid (Bergmann and Miekeley), A., i, 1054.

δ-Acetyl-δ-methoxybutyl alcohol (Bergmann and Miekeley), A., i, 1054.

5-Acetyl-2-methoxydiazobenzene *per*-bromide (Bogert and Curtin), A., i, 1102.

Acetylmethylbiurets (Biltz and Jeltsch), A., i, 1074.

Acetylmethyl*iso*borneol (Nametkin and Chuchrikova), A., i, 586.

δ-Acetyl-γ-methylhexoic acid, and its ethyl ester (Godchot), A., i, 582.

Acetylmethylmalol (Sando), A., i, 991.

3-Acetyl-5-methyl-1:2:4-oxadiazole oxime, and its benzoyl derivative (Ponzio and Ruggeri), A., i, 854.

2-Acetyl-1-methyl*cyclo*pentan-3-one, and its disemicarbazone (Godchot), A., i, 582.

5-Acetyl-2-methylpyrrole-3-carboxylic acid, 4-hydroxy-5-chloro-, ethyl ester (Fischer and Loy), A., i, 719.

***N*-Acetylmethyl-*p*-toluidide** (Cassella & Co.), A., i, 917.

δ-Acetyl-γ-methylvaleric acid, and its ethyl ester and semicarbazone (Godchot), A., i, 582.

1-Acetyl-β-naphthol, autoxidation of (Fries and Ehlers), A., i, 825.

***N*-Acetyl-5-nitro-2-hydroxymethylbenzhydrazide** (Teppema), A., i, 257.

Acetylnitromethylnoropianic acid acetate (Wegscheider and Müller), A., i, 1204.

Acetyloxaloacetic acid, ethyl ester (Goss, Ingold, and Thorpe), T., 355.

***p*-Acetylphenylarsinic acid**, and 3-nitro-1-hydroxy-, and their derivatives (Albert), A., i, 70.

γ-Acetyl-β-phenylbutyric acid, α-cyano-, ethyl and methyl esters (Kohler and Allen), A., i, 1006.

1-Acetyl-5-phenyl-5-ethylhydantoin (Chemische Fabrik von F. Heyden), A., i, 848.

Acetylphenylhydrazine (Humphries, Bloom, and Evans), T., 1772.

5-Acetyl-2-phenyl-4-methylpyrimidine, and its semicarbazone (Mitter and Bardhan), T., 2182.

3-Acetyl-5-phenyl-1:2:4-oxadiazole oxime, and its benzoyl derivative (Ponzio and Ruggeri), A., i, 854.

Acetyl-ψ-phthalonic acid (Kuroda and Perkin), T., 2106.

3-Acetylpropionylchloromethane, copper salt (Morgan and Reeves), T., 449.

Acetylpropionylmethane, selenium and tellurium compounds (Morgan and Reeves), T., 444.

Acetylquininal, and its salts and derivatives (Seekles), A., i, 238.

Acetylquinine ozonide (Seekles), A., i, 238.

Acetylsalicylic acid. See *o*-Acetoxybenzoic acid.

Acetylstrychninolone-*c* (Leuchs and Nitschke), A., i, 132.

5-3-Acetyltetronylidene-4-keto-2-methylpyrrole-3-carboxylic acid, methyl ester (Küster and Maag), A., i, 242.

Acetyl-2-thiobenzimide (McClelland and Longwell), T., 3314.

5-Acetyl-2-*p*-tolyl-4-methylpyrimidine, and its semicarbazone (Mitter and Bardhan), T., 2182.

5-Acetyl-2:2:4-triethyltetrahydronaphth-αβ-hydrindene, and its *p*-nitrobenzylidene derivative (Fleischer and Retze), A., i, 221.

9-Acetyl-2:6:8-trioxy-8-methyl-8:9-dihydropurine (Biltz and Schmidt), A., i, 490.

Acetylvanillyl chloride (Rosenmund, Zetzsche, and Weiler), A., i, 799.

Acetylvanillyl-amide and **-anilide** (Rosenmund, Zetzsche, and Weiler), A., i, 799.

***p*-(Acetylvinyl) phenylarsinic acid** semicarbazone (Albert), A., i, 70.

Achras sapota, *d*-quercitin in the seeds of (van der Haar), A., i, 277.

Achroodextrin II (Lintner and Kirschner), A., i, 304.

Acid, $C_5H_{11}O_2NS$, and its derivatives from hydrolysis of casein (Mueller), A., i, 869.

Acid, $C_8H_{10}O_6$, and its silver salt and diethyl ester, from bromination of pentane-αγδ-tricarboxylic acid (KÜSTER and HUGEL), A., i, 1207.
- $C_8H_{10}O_7$, and their salts, from bromination of pentane-αγδ-tricarboxylic acids (KÜSTER and HUGEL), A., i, 1207.
- $C_8H_{16}O_4$, and its derivatives, from wood spirit oil (PRINGSHEIM and LEIBOWITZ), A., i, 1053.
- $C_9H_7O_7N$, from oxidation of 6-nitrohydrindone (INGOLD and PIGGOTT), T., 1498.
- $C_{10}H_6O_4$, from αα′-dibromo-*o*-phenylenediacetyl chloride and sodium hydroxide (CHALLENOR and INGOLD), T., 2076.
- $C_{10}H_{14}O_2$, from oxidation of longifolic acid (SIMONSEN), T., 2658.
- $C_{10}H_{18}O_2$, and its salts, from reduction of pyrethronic acid (YAMAMOTO), A., i, 1011.
- $C_{10}H_{18}O_4$, and its salts, from oxidation of buchu-camphor (CUSMANO), A., i, 587.
- $C_{15}H_{18}O_6$, and its ethyl ester, from oxidation of α-selinene (RUZICKA and STOLL), A., i, 1216.
- $C_{10}H_7O_2N$, and its salts, from phosphorus pentachloride and β-naphthaquinoneoxime (BECKMANN, LIESCHE, and DIETRICH), A., i, 232.
- $C_{11}H_{11}O_4N$, and its salts, from oxidation of benzylidenemethyl*iso*oxazolone (BETTI and VIANSINO), A., i, 1024.
- $C_{12}H_{12}O_2$, and its ethyl ester, from α-ketotetrahydronaphthalene, zinc and ethyl bromoacetate (V. BRAUN, GRUBER, and KIRSCHBAUM), A., i, 108.
- $C_{11}H_{10}O_3N_4$, from methylenebismalononitrile and hot water (DIELS and CONN), A., i, 1076.
- $C_{11}H_{12}O_4N_4$, from methylenebismalononitrile and hot water (DIELS and CONN), A., i, 1076.
- $C_{15}H_{14}O_{10}$, from bromo-*o*-phenylene diacetic ester and ethyl sodiomalonate (CHALLENOR and INGOLD), T., 2078.
- $C_{15}H_{24}O_3$, and its semicarbazone, from *d*-longif-1:2-dione and hydrogen bromide (SIMONSEN), T., 2664.
- $C_{15}H_{23}O_2N$, and its salts, from *d*-longif-1:2-dionemonoxime and benzenesulphonyl chloride (SIMONSEN), T., 2665.
- $C_{16}H_{14}O_{12}$, from dibromo-*o*-phenylenediacetic ester and ethyl sodiomalonate (CHALLENOR and INGOLD), T., 2077.
- $C_{16}H_{18}O_{10}$, and its potassium salt, from interaction of indigotin and ethyl malonate (POSNER and PYL), A., i, 252.
- $C_{16}H_{13}O_4N$, and its amide, from oxidation of 3-phenyl-4-benzylidene*iso*oxazolone (BETTI and VIANSINO), A., i, 1025.
- $C_{20}H_{18}O_5N$, and its salts, from βγ-diketo-δ-phenylvaleronitrile, acetic acid and hydrochloric acid (DIELS), A., i, 825.
- $C_{21}H_{28}O_9,H_2O$, from pyrobiloidanic acid (WIELAND and SCHLICHTUNG), A., i, 41.
- $C_{21}H_{20}O_8N_2(+H_2O)$, from oxidation of acetylstrychninolone-*c* (LEUCHS and NITSCHKE), A., i, 132.
- $C_{22}H_{20}O_5$, from ethyl sodiomalonate and benzylidenebenzoylacetone (VORLÄNDER, OSTERBURG, and MEYE), A., i, 683.
- $C_{22}H_{38}O_4$, and its anhydride, from oxidation of cholesterol (WINDAUS, ROSENBACH, and RIEMANN), A., i, 1205.
- $C_{23}H_{32}O_7$, from *iso*cilianic acid and sulphuric acid (WIELAND and FUKELMAN), A., i, 1206.
- $C_{23}H_{38}O_3$, and its methyl ester, and semicarbazone, from oxidation of cholesterol (WINDAUS, ROSENBACH, and RIEMANN), A., i, 1205.
- $C_{23}H_{38}O_6$, and its trimethyl ester, from oxidation of cholesterol (WINDAUS, ROSENBACH, and RIEMANN), A., i, 1205.
- $C_{24}H_{40}O_3$, methyl ester, from oxidation of cholesterol (WINDAUS, ROSENBACH, and RIEMANN), A., i, 1205.
- $C_{24}H_{40}O_6$, methyl ester, from oxidation of cholesterol (WINDAUS, ROSENBACH, and RIEMANN), A., i, 1205.
- $C_{24}H_{42}O_2$, from reduction of cholesterol acids (WINDAUS, ROSENBACH, and RIEMANN), A., i, 1205.
- $C_{25}H_{44}O_2$, methyl ester, from reduction of cholesterol acids (WINDAUS, ROSENBACH, and RIEMANN), A., i, 1204.
- $C_{26}H_{20}O_{15}N_4$ and its barium salt, from barbituric acid and benzoquinone (BOCK), A., i, 65.
- $C_{34}H_{68}O_2$, and its derivatives, from American cotton (FARGHER and PROBERT), A., i, 279.
- $C_{48}H_{70}O_7$ from condensation of dehydrodeoxycholic acid (SHIMIZU), A., i, 40.

Acids, reduction at the cathode in electrolysis of solutions of (TAMMANN), A., ii, 289.

- **Acids**, non-ionised, nature of (Hantzsch), A., ii, 475; (v. Halban), A., ii, 835.
  - affinity constants of, in neutralisation (Bourion), A., ii, 126.
  - diffusion of, in aqueous solution (Öholm; Loeb), A., ii, 15.
  - poisoning by. See Poisoning.
  - electrometric titration of, with the antimony electrode (Uhl and Kestranek), A., ii, 648.
  - estimation of, with the quinhydrone electrode (Harris), T., 3301.
  - estimation of, polarimetrically (Groot), A., ii, 649.
  - aliphatic, distribution of, between water and benzene (Brown and Bury), T., 2430.
    - bromination of (Shaw), T., 2233.
  - aminocarboxylic (Mannich and Ganz), A., i, 19.
  - aromatic, salts, precipitation of (Ephraim), A., i, 32; (Smits), A., i, 676.
  - *di*basic, electrolytic dissociation of (Larsson), A., ii, 55.
    - open-chain, relative stability of, containing odd and even numbers of carbon atoms (Challenor and Thorpe), T., 2480.
  - *poly*basic, dissociation constants of (Bjerrum), A., i, 1059.
  - *mono*carboxylic, action of methyl sulphate and potassium methyl sulphate on (Simon), A., i, 290.
    - unsaturated, and their derivatives, spectrochemistry of (v. Auwers), A., ii, 513.
  - *di*carboxylic, thermal decomposition of (Windaus and Ehrenstein), A., i, 895.
    - preparation and rotation of di-*l*-menthyl esters of (Hall), T., 105.
  - cyclic carboxylic (Skita), A., i, 460.
  - fatty, structure of, by means of *X*-rays (Müller), T., 2043.
    - and their salts, cohesion pressure and surface activity of (Traube), A., ii, 126.
    - aromatic, oxidation of, by alkaline potassium permanganate (Prshevalski), A., i, 567.
      - piperidides of (Staudinger and Müller), A., i, 363.
    - higher, silver salt gels (Whitby), A., ii, 18.
  - α-halogenated, esters, action of acetonethiosemicarbazone on (Wilson and Burns), T., 800.
- **Acids**, hydroaromatic, of the glutaric acid series, degradation of (Windaus, Klänhardt, and Reverey), A., i, 111.
    - dicarboxylic, thermal decomposition of (Windaus, Hückel, and Reverey), A., i, 220.
  - *o*-hydroxycarboxylic, aromatic, preparation of halogen alkyl esters of (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 794.
  - organic, catalytic decomposition of (Maihle), A., i, 293.
    - oxidation of, and their iodine absorption in presence of chloroform (Ray), A., i, 882.
    - salts, acid–alkali-solution equilibrium in (Prideaux), T., 1624.
      - solubilities of (Ephraim), A., i, 32.
    - estimation of, by extraction (Pinnow), A., ii, 44.
  - unsaturated, electrolysis of (Bouis), A., i, 1052.
  - volatile, detection of (Karaoglanov), A., ii, 250.
  - weak, distribution of, in a two-phase system (Murray), A., ii, 622.
- **Acid chlorides**, catalytic reduction of (Rosenmund, Zetzsche, and Weiler), A., i, 799.
- **Acid albumin**, reaction of neutral salts with (Matsumura and Matula), A., i, 395.
- **Acid radicles**, transference of, in solids (Hedvall and Heuberger), A., ii, 860.
- **Acid taste** (Paul), A., i, 167.
- **Acidimetry**, new methods in (Jellinek and Krebs), A., ii, 871.
- **Acidity** and co-ordination (Lowry), A., ii, 849.
- **Aconite alkaloids** (Weidemann; Brunner), A., i, 126.
- *Aconitum paniculatum*, alkaloid from (Brunner), A., i, 126.
- *Aconitum septentrionale*, alkaloids of (Weidemann), A., i, 126.
- **Acraldehyde** (*acrolein*), transformations and antioxygenisers of (Moureu and Dufraisse), A., i, 91; ii, 308.
- **Acridine**, preparation of derivatives of (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1130, 1131, 1132.
- **Acridine**, 5-amino-, sulphate and 3-chloro-5-amino- (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1132.

Acridine, 5-*mono*- and 2:5-*di*amino-, *tri*amino-5-chloro-2-nitro-, 2-nitro-5-amino, and *di*nitro-5-amino- (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 1130.

Acridine colouring matters, chemotherapy of, in tuberculosis (SMITH), A., i, 422.

Acridine-5-carboxylamide, and 3-chloro- (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 1132.

Acridine-5-carboxyl-azide, and **-hydrazide** (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 1132.

Acridine-5-carboxylic acid, 3-chloro-, and its derivatives (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 1132.

Acridone-10-acetic acid, and *di*bromo-, and *di*nitro-, and their salts and derivatives (FREUND and SCHWARZ), A., i, 1132.

Actinia equina, toxin from (ACKERMANN, HOLTZ, and REINWEIN), A., i, 1155.

Actinium, relation of, to uranium (RUSSELL), A., ii, 497, 719.

Activity coefficients, relation between osmotic pressure and (BJERRUM), A., ii, 467.

Additive reactions, and tautomerism (USHERWOOD), T., 1717.

Address, presidential (WALKER), T., 939.

Adenine nucleotide in human blood (JACKSON), A., i, 1255.

Adenylic acid, isolation of (STEUDEL and PEISER), A., i, 720.

Adhesion in solutions (VOSNESSENSKI), A., ii, 295, 619.

Adipatodipentamminecobaltic nitrate (DUFF), T., 568.

Adipic acid, $\beta\beta'$-*di*- and $\alpha\alpha'\beta\beta'$-*tetra*bromo-, esters, and $\beta\beta'$-*di*chloro-, and $\beta\beta'$-*di*chloro-$\alpha\alpha'$-*di*bromo-, ethyl ester (FARMER), T., 2539.

meso-**Adipic acid,** $\alpha\delta$-*di*bromo-, benzyl ester (V. BRAUN and SEEMANN), A., i, 1117.

Adrenaline (*suprarenine; epinephrine*) in blood (ASHER and SCHNEIDER), A., i, 410.
effect of, on the respiratory exchange and blood-sugar curves (LYMAN, NICHOLLS, and MCCANN), A., i, 1035.
effect of, on the metabolism of muscle (GRIFFITH), A., i, 1154.
derivatives of (FUNK and FREEDMAN), A., i, 938.
melanins from (SACCARDI), A., i, 126.
estimation of (KODAMA), A., ii, 100.

Adrenaline (*suprarenine; epinephrine*), estimation of, colorimetrically (WHITEHORN), A., ii, 798.

Adsorption (DHAR and SEN), A., ii, 391; (CHATTERJI and DHAR; DHAR, SEN, and CHATTERJI), A., ii, 615; (FODOR and SCHOENFELD), A., ii, 616; (SEN and DHAR), A., ii, 834; (RAKOVSKI), A., ii, 383.
theory of (BERÉNYI), A., ii, 539.
measurement of, by the interferometer (WOLFF), A., ii, 128.
two types of (LACHS), A., ii, 540.
and corresponding states (LORENZ and LANDE), A., ii, 13.
by electro-affinity (RHEINBOLDT and WEDEKIND), A., ii, 130.
at interfaces (KING), A., ii, 381.
on metal surfaces (V. EULER and RUDBERG), A., ii, 13.
by carbon (FIRTH), A., ii, 464.
by charcoal (SHELDON; FREUNDLICH and WRESCHNER), A., ii, 833.
by sugar charcoal (BARTELL and MILLER), A., ii, 464.
by precipitates (CHARRIOU), A., ii, 540.
of colouring matters by wool and mordants (REINMUTH and GORDON), A., ii, 616.
of gases by haemoglobin (HILL), A., i, 869; (ADAM), A., i, 870.
by oxide catalysts (BENTON), A., ii, 383, 384.
by solids (EVANS and GEORGE), A., ii, 296.
of ions by manganese dioxide (GANGULI and DHAR), A., ii, 58.
of solutions (GUSTAVER), A., ii, 57; (OSTWALD and DE IZAGUIRRE), A., ii, 128.
simultaneous positive and negative (RAKUZIN and PEKARSKAJA), A., ii, 296.
negative (RAKUZIN and HENKE), A., i, 870; (RAKUZIN and GÖNKE; RAKUZIN), A., ii, 465.
lecture experiment illustrating (TANNER), A., ii, 234.

Æsculetintetra-acetylglucoside (GLASER and KRAUS), A., i, 820.

Æsculin, synthesis of (GLASER and KRAUS), A., i, 820.

Affinity, chemical (SYRKIN; WEGSCHEIDER), A., ii, 751.
transmission of, by single bonds (LOWRY), A., ii, 848.
residual, theory of (ORÉKHOV), A., ii, 848.
and co-ordination (MORGAN and REEVES), T., 444; (MORGAN and SMITH), T., 1096.

Affinity, residual, and electrical conductivity (ARMSTRONG), A., ii, 531.
Agar-agar, swelling of (FAIRBROTHER and MASTIN), T., 1412.
jellies, physico-chemical analysis of (SAMEC and ISAJEVIČ), A., i, 18.
action of ammonium chloride solution on (RAKUZIN and GÖNKE), A., ii, 465.
Agglutinins (FUJIWARA), A., i, 1151.
Aggregation (HARRIES), A., i, 693.
Air. See Atmospheric air.
Alabaster, synthesis of (COPISAROW), T., 796.
Alanine, oxidation of, to pyruvic acid (SIMON and PIAUX), A., i, 545.
β-Alanine, synthesis of (CURTIUS and HECHTENBERG), A., i, 1072.
Albumin, density of solutions of (RAKUZIN and FLIEHER), A., i, 259.
dialysis of solutions of (REITSTÖTTER), A., i, 393.
coagulation of (LEPESCHKIN), A., i, 394.
precipitation of (OTTENSOOSER), A., i, 1143.
sols, ultra-visible, preparation of (FODOR), A., i, 394.
change of, into globulin (RUSZNYÁK), A., i, 1143.
antagonism of, to globulin (BROSSA), A., i, 397.
rate of digestion of (FRIEDERICH), A., i, 493.
acid. See Acid albumin.
egg, action of ultra-violet light on (CLARK), A., i, 67.
crystalline salts of (SÖRENSEN and PALITZSCH), A., i, 1243.
serum, precipitation of, by copper salts (MATSUMURA and MATULA), A., i, 395.
detection of (RAKUZIN), A., ii, 511.
detection of, in urine (EXTON), A., ii, 511.
estimation of (BÉNARD and LABORDE), A., ii, 271.
estimation of, in urine (BOLOTOV), A., ii, 511.
Albumose from wool (MARCHLEWSKI and NOWOTNÓWNA), A., i, 870.
Alchemilla alpina, constituents of (VOGL), A., i, 990.
Alcohols, ultra-red absorption spectra of (BONINO), A., ii, 711.
ionisation of (WILLIAMS and TRUESDAIL), A., ii, 532.
mutual solubility of glycerol and (McEWEN), T., 2284.
catalytic dehydration of (SENDERENS), A., i, 9, 432; (SENDERENS and ABOULENC), A., i, 9.
Alcohols, action of, on anilides (MAILHE), A., i, 199.
identification and separation of, with bromomethylphthalimide (HOPKINS), A., i, 340.
aliphatic, purification and physical properties of, on (BRUNEL), A., i, 646.
interaction of βγ-dibromopropylthiocarbimide and (HANN), A., i, 375.
aromatic, action of phenols with, in presence of aluminium chloride (HUSTON), A., i, 30.
cyclic, stereochemistry of (SKITA), A., i, 460.
primary, synthesis of (ZIEGLER and TIEMANN), A., i, 30.
etherification of (POPELIER), A., i, 532.
Alcohols, *poly*hydroxy-, synthesis of, from cyclic ketones and formaldehyde (MANNICH and BROSE), A., i, 565.
nitro-, aliphatic (WILKENDORF and TRÉNEL), A., i, 288.
α-Alcohols, secondary-tertiary, dehydration of (DANILOV), A., i, 680.
Aldehydes, formation of, from cinchonine and quinine (SECKLES), A., i, 237.
Grignard synthesis of (WOOD and COMLEY), A., i, 1176.
absorption spectra of vapours and solutions of (PURVIS), T., 2515.
mutual solubility of glycerol and (McEWEN), T., 2284.
catalytic hydrogenation of (v. BRAUN and KOCHENDÖRFER), A., i, 1197; (CAROTHERS and ADAMS), A., ii, 310.
by means of platinum black (FAILLEBIN), A., i, 92.
oxidation of (WIELAND and WINGLER), A., i, 650.
condensation of ammonia with (TSCHITSCHIBABIN), A., i, 1121, 1122.
reaction between aniline and (ODDO and TOGNACCHINI), A., i, 225.
reactions of, with benzidine (VAN ECK), A., ii, 887.
condensation of cyanoacetamide with (CURTIS, DAY, and KIMMINS), T., 3131.
action of cyanoacetic acid on (v. AUWERS, JORDAN, MEISSNER, and SEYDEL), A., i, 662.
condensation of, with *o*-halogenoketones (BODFORSS), A., i, 41.
reaction of, with keto-enolic substances (KOHLER and CORSON), A., i, 1014.

- **Aldehydes**, reaction between sulphites and (Estalella), A., ii, 98.
  - α-oxides from (v. Braun), A., i, 1186.
  - aromatic, preparation of (Barrett Co.), A., i, 1018.
  - cyclic, stereochemistry of (Skita), A., i, 460.
  - unsaturated, preparation of (Rosenmund, Zetzsche, and Weiler), A., i, 799.
  - detection of, by Schiff's reaction (Josephson), A., ii, 664.
  - estimation of (Rosenthaler and Seiler), A., ii, 590.
  - estimation of, in vegetable oils (Bennett and Bateman), A., ii, 665.
  - origin and estimation of, in wines (Estalella), A., i, 882.
- **5-Aldehydoacridine**, 3-chloro- (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1132.
- **2-Aldehydo-4′-dimethylaminodiphenyl** sulphide, 4-nitro-, and its hydrochloride (Fries and Brothuhn), A., i, 842.
- **Aldehydodimethylpyrrole-3-carboxylic acids**, and their derivatives (Fischer and Zerweck), A., i, 365.
- **2-Aldehydo-4:5-diphenylthiazole** methiodide, *p*-dimethylamino-anil of (Smith), T., 2295.
- **Aldehydo-1-methyl*cyclo*hexanes**, and their semicarbazones (Skita, Häuber, and Schönfelder), A., i, 461.
- **2-Aldehydo-2-methylpyrrole-4-carboxylic acid**, 4-hydroxy-, ethyl ester, and its derivatives (Fischer and Loy), A., i, 719.
- **2-Aldehydo-4-methylthiazole** methiodide, *p*-dimethylamino-anil of (Smith), T., 2295.
- **2-Aldehydo-4-phenyl-5-methylthiazole** methiodide, *p*-dimethylamino-anil of (Smith), T., 2295.
- **β-*o*-Aldehydophenylpropaldehyde**, and its dianil (v. Braun and Zobel), A., i, 1208.
- **2-Aldehydophenylsulphur** bromide, 4-nitro- (Fries and Brothuhn), A., i, 842.
- **Aldol reaction** (Usherwood), T., 1717.
- **Aldoses**, estimation of, iodometrically (Kolthoff), A., ii, 346.
- **Aleuritic acid**, salts of (Harries and Nagel), A., i, 120.
- **Alicyclic compounds** stereochemistry of (Nametkin), A., i, 811.
- **Alkali** azides, properties and electrolysis of (Briner and Winkler), A., ii, 485.
- **Alkali**, carbonates, action of ammonia on (Pauly), A., ii, 557.
  - chlorates, electrolytic preparation of (Grube and Pfunder), A., ii, 319.
  - *per*chlorates (Willard and Smith), A., ii, 239.
    - crystalline (Vorländer and Kaascht), A., ii, 487.
  - cyanides, oxidation of, in aqueous solution (Hess), A., i, 762.
  - halides, crystal structure of (Davey), A., ii, 413; (Clark), A., ii, 469.
    - pyramidal crystals of (Kunz-Krause), A., ii, 161.
    - **ammines** of (Biltz and Hansen), A., ii, 760.
  - *per*manganates, electrolytic preparation of (Grube and Metzger), A., ii, 319.
    - thermal decomposition of (Crespi and Moles), A., ii, 161.
  - metals, preparation of (Buou), A., ii, 634.
    - radii of the atoms of (Anderson), A., ii, 847.
    - radii of ions of (Davey), A., ii, 847.
    - electrolytic deposition of, from pyridine solutions (Müller, Holzl, Pontoni, and Wintersteiner), A., ii, 287.
    - decomposition potentials of (Heyrovský), A., ii, 119.
    - alloys with mercury, preparation of (Giesy and Withrow), A., ii, 70.
      - relative intensities of the absorption spectra of (Newman), A., ii, 46, 103.
    - as reagents for the detection of weakened valencies in organic compounds (Ziegler and Thielmann), A., i, 921.
  - nitrates, miscibility of, with mercuric iodide (Bergman), A., ii, 568.
  - phosphates, change of reaction in conversion of, into pyro- and metaphosphates (Murschhauser), A., ii, 563.
  - metaphosphates, insoluble, constitution of (Pascal), A., ii, 563.
  - phosphotungstates (Kehrmann and Mellet), A., ii, 497.
    - analysis of (Mellet), A., ii, 579.
  - sulphates, conversion of, into chlorides (Hahn, Dornauf, and Otto), A., ii, 39.
  - hydrogen sulphates (Dunnicliff), T., 731.
  - polysulphides (Thomas and Riding), T., 1726.

Alkalis, paths of the series electrons of (VAN URK), A., ii, 479.
  reduction at the cathode in electrolysis of solutions of (TAMMANN), A., ii, 289.
  estimation of, in rocks (WALKER), T., 2336.
Alkalimetry, new methods in (JELLINEK and KREBS), A., ii, 871.
Alkaline-earth *per*chlorates (WILLARD and SMITH), A., ii, 239.
  hydroxides, second dissociation constant of (KOLTHOFF), A., ii, 835.
  *per*manganates (CRESPI and MOLES), A., ii, 565.
  metals, explosion spectra of (SAWYER and BECKER), A., ii, 448.
    decomposition potentials of (HEYROVSKÝ), A., ii, 119.
    heat of oxidation of (GUNTZ and BENOIT), A., ii, 126.
    metabolism of. See Metabolism.
  selenides, molecular volumes of (HENGLEIN and ROTH), A., ii, 320.
  sulphates, reduction of, by heating with iron or iron sulphide (MARTIN and FUCHS), A., ii, 66.
Alkaloids, formation of oxides of (FERNÁNDEZ and PIZARROSO), A., i, 236.
  crystalline bismuth iodides of (FRANCOIS and BLANC), A., i, 830.
  toxicity of, towards protozoa (HENRY and BROWN), A., i, 986.
  aconite. See Aconite alkaloids.
  of the calabar bean. See Calabar bean.
  from coca leaves. See Coca leaves.
  ergot (DALE and SPIRO), A., i, 420.
  *iso*quinoline. See *iso*Quinoline.
  detection of, with potassium ferrocyanide (COLE), A., ii, 703.
  containing benzoyl groups, detection of (PECKER), A., ii, 667.
  detection of, by their iodo-antimonates (CAILLE and VIEL), A., ii, 443.
  estimation of, by the conductometric method (TREADWELL and JANETT), A., ii, 790.
  secondary, estimation of, in opium (MANCINI), A., ii, 444.
Alkyl bromides, action of potassium acetate on, to determine their constitution (MERESHKOWSKY), A., i, 643.
    compounds of, with aluminium bromide and phosphorus bromides (PLOTNIKOV), A., i, 430.
  chlorites, preparation of (LEVI), A., i, 434.
  halides, mechanism of reactions of (FRANKE and DWORZAK), A., i, 528.
Alkyl hypochlorites (CHATTAWAY and BACKEBERG), T., 2999.
αβ-Alkylacylcarbamides, preparation and chlorination of (ROBERTS), T., 2779.
Alkylallyl alcohols (DELABY), A., i, 84, 85, 741.
Alkylamides of aromatic sulphonic acids, preparation of (BADER and NIGHTENGALE), A., i, 317.
Alkylation (ISMAILSKI and RAZORENOV), A., i, 770.
Alkylbarbituric acids, hydrolysis of xanthyl derivatives (FABRE), A., i, 486.
Alkylenediamines, substituted, preparation of carboxylic acid esters of (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 1090.
Alkylglucosides, enzymatic hydrolysis of (COLIN and CHAUDUN), A., ii, 230.
β Alkylglucosides, molecular weights of (COLIN and CHAUDUN), A., i, 897.
Alkylglycerols (DELABY), A., i, 84, 85, 741, 993, 1055, 1171.
  bromo-derivatives of (DELABY), A., i, 289.
Alkylhydrobenzoins, semi-pinacolinic transformation of (TIFFENEAU and ORÉKHOV), A., i, 113.
  influence of alkyl groups on dehydration of (TIFFENEAU and ORÉKHOV), A., i, 333.
Alkylvinylcarbinols. See Alkylallyl alcohols.
Allantoin, estimation of (MORE), A., ii, 348.
Allelotropy (LOWRY), T., 828.
Allene, α-bromo-, action of magnesium on a mixture of cuminol and (VOLKOV), A., i, 564.
Allophanic acid, esters (AVENARIUS), A., i, 460.
    alkyl derivatives of (BILTZ and JELTSCH), A., i, 1074.
    γ-chloropropyl ester (DOX and YODER), A., i, 483.
  ethyl ester, *O*-ethyl derivative, pharmacology of (BASTERFIELD), A., i, 420.
  xanthyl derivative (FOSSE and HIEULLE), A., i, 860.
Allotropy (DE PAUW), A., ii, 151.
Alloxantin, constitution of, and its action with diazomethane (BILTZ and PAETZOLD), A., i, 1233.
Alloxantins, hydrogenation potential of of (BIILMANN and LUND), A., ii, 605.
Alloys, electrolytic deposition of (ATEN), A., ii, 829.
  electrical conductivity and constitution of (GUERTLER and SCHULZE), A., ii, 418, 772.

Alloys, brittleness of (Tammann and Dahl), A., ii, 321.
  eutectic, recrystallisation of (Tammann and Dahl), A., ii, 284.
    effect of the velocity of cooling on the hardness and structure of (Kurnakov and Achnasarov), A., ii, 57.
  estimation of tin in (Jílek), A., ii, 436.
Allyl chloride, β-chloro-, synthesis of (Hill and Fischer), A., i, 8.
  cyanide, constitution of (Bruylants), A., i, 191.
    spectroscopy of (v. Auwers, Jordan, Meissner, and Seydel), A., i, 662.
Allylacetone, amino-, and its hydrochloride (Sarasin), A., i, 712.
α-**Allylacrylic acid**, and its salts (Mannich and Ganz), A., i, 20.
Allylarsinic acid, sodium salt. See Arsylene.
Allylbarbituric acids, imino-, bromination of (Diels, Werner, Bernhardt, and Bohricht), A., i, 950.
Allyl-Δ^β-butenylaniline, and its salts (v. Braun and Schirmacher), A., i, 287.
m-**Allylcinnamic acid**, *p*-hydroxy-, and its methyl ester (Mills and Adams), A., i, 971.
Allyldeoxybenzoin, and its derivatives (Danilov), A., i, 680.
1-**Allylglyoxaline**, 5-chloro-, and its picrate (Sarasin), A., i, 711.
Allylhydrazinecarboxylic acid, ethyl ester (Diels), A., i, 1078.
Allylhydrobenzoin, dehydration of (Danilov), A., i, 786.
Allylmalonic acid, chloro-, diethyl ester (Hill and Fischer), A., i, 8.
p-**Allyloxycinnamic acid**, methyl ester (Mills and Adams), A., i, 971.
9-**Allyl**-*n*- and ψ-**uric acids** (Moore and Gatewood), A., i, 254.
N **Allylveronal** (Diels, Werner, Bernhardt, and Röhricht), A., i, 950.
Almonds, bitter, detection of amygdalin and emulsin in (Rosenthaler and Seiler), A., i, 278.
Altitudes, high, effect of, on physiological processes (Barcroft), A., i, 501.
Alums, crystal structure of (Wyckoff), A., ii, 248.
  vapour pressures of saturated solutions of (Macischevski), A., ii, 292.
Aluminioxalic acid, sodium salt, dissociation of (Burrows and Walker), T., 2741.
Aluminium, spark spectra of (Paschen), A., ii, 672; (Shallenberger), A., ii, 806.
  spark spectrum of, and the arc spectrum of sodium (Fues), A., ii, 353.
  scattering of electrons by (Davisson and Kunsman), A., ii, 821.
  commercial, electrical resistivity of (Guillet), A., ii, 823.
  equilibrium in the system, magnesium, silicon, zinc, and (Sander and Meissner), A., ii, 641.
Aluminium alloys, estimation of magnesium in (Withey), A., ii, 88; (Otani), A., ii, 89.
  light, estimation of phosphorus in (Losana and Rossi), A., ii, 696.
  with antimony (Sauerwald), A., ii, 172.
  with copper, ultra-violet spark spectra of (Waché), A., ii, 518.
    polymorphism of (Stockdale), A., ii, 766.
  with iron (Kurnakov, Urasov, and Grigoriev), A., ii, 75, 423.
    electrochemistry of (Tammann and Soiter), A , ii, 825.
  with magnesium and silicon (Portevin and Chevenard), A., ii, 166.
  with tin (Crepaz), A., ii, 323.
  with tin and zinc (Crepaz), A., ii, 641; (Losana and Carozzi), A., ii, 766.
  with titanium (van Erckelens), A., ii, 569.
  with zinc (Fedorov), A., ii, 422.
Aluminium antimonides (Urazov), A., ii, 495.
  bromide, compounds of, with alkyl and phosphorus bromides (Plotnikov), A., i, 430.
  chloride, electrical conductivity of, during melting (Biltz and Voigt), A., ii, 324.
    sublimation of (Biilmann), A., ii, 642.
    compounds of hydrocarbons with (Schleicher and Büttgenbach), A., i, 1083.
  halides, constitution of (Biltz and Voigt), A., ii, 324.
  hydroxide (Willstätter and Kraut), A., ii, 167, 493.
    adsorption by (v. Euler and Erikson), A., ii, 465.
    colloidal, adsorption and replacement of nutritive salts in (Lichtenwalner, Flenner, and Gordon), A., i, 888.
    precipitation of (Charriou), A., ii, 261.

Aluminium hydroxide, action of, on proteins, ferments, and toxins (RAKUZIN), A., i, 867.
oxide (*alumina*), cathode luminescence of (WILBER), A., ii, 817.
crystal structure of (DAVEY and HOFFMAN), A., ii, 27.
as an absorbent for water in combustion analysis (FISHER, FAUST, and WALDEN), A., ii, 83.
adsorption of saccharase by (v. EULER and MYRBÄCK), A., i, 620.
as a catalyst, and its selective activation (ADKINS and NISSEN), A., ii, 309.
disperse (KOHLSCHÜTTER and NEUENSCHWANDER), A., ii, 494.
phosphate, assimilation of, by plants (BRIOUX), A., i, 79.
silicates, synthetic (SCHWARZ and BRENNER), A., ii, 569.
sulphate, basic (WILLIAMSON), A., ii, 324.
Aluminium organic compounds:—
triethyl, trimethyl, and tri-*n*-propyl etherates (KRAUSE and WENDT), A., i, 289.
complex salts with aliphatic hydroxy-acids (GOLDMAN), A., i, 300.
Aluminium estimation and separation:—
estimation of (LUNDELL), A., ii, 91; (WOLFF, VORSTMANN, and SCHOENMAKER), A., ii, 341.
estimation of silicon in (GUERIN), A., ii, 180.
separation of, from manganese (LUNDELL and KNOWLES), A., ii, 341.
Aluminium anode. See Anode.
Alvite, hafnium in (GOLDSCHMIDT and THOMASSEN), A., ii, 174.
Amalgams. See Mercury alloys.
Amanita muscaria, constituents of (BARD and ZELLNER), A., i, 987.
Amber, constituents of (TSCHIRCH, AWENG, DE JONG, and HERMANN), A., i, 351.
Amides, reduction of (KINDLER, BURGHARD, FINNDORF, DEHN, GIESE, and KÖRDING), A., i, 568.
conversion of oximes into (BECKMANN and BARK), A., i, 1112.
hydrolysis of, in the animal body (FISKE), A., i, 515.
acid, synthesis of, in plants (SMIRNOV), A., i, 636.
Amides, thio-. See Thioamides.
Amidines, tautomerism of (BURTLES and PYMAN), T., 361; (PYMAN), T., 367, 3359.
Amidines, condensation of, with ethoxymethylene derivatives of β-ketonic esters and of β-diketones (MITTER and BARDHAN), T., 2179.
open-chain, alkylation of (PYMAN), T., 367.
Amine, $C_{12}H_{2}$ N, and its salts, from 2:3-trimethylenequinoline (v. BRAUN, PETZOLD, and SCHULTHEISS), A., i, 837.
Amines, photosynthesis of (SNOW and STONE), T., 1509.
syntheses of, by the electric discharge (FRANCESCONI and CIURLO), A., i, 1067.
oxidation of (KINDLER, BURGHARD, FINNDORF, DEHN, GIESE, and KÖRDING), A., i, 568.
equilibrium of dinitrotoluenes with (KREMANN, HÖNIGSBERG, and MAUERMANN), A., i, 908.
chloroplatinites of, and their double salts with mercuric chloride (STRÖMHOLM), A., i, 658.
influence of, on fermentation (ORIENT), A., i, 171.
permutite as a reagent for (WHITEHORN), A., ii, 798.
aliphatic, catalytic decomposition of formyl derivatives of (MAILHE), A., i, 545.
aromatic, action of ferrous chloride on the hydrochlorides of (CUMMING), A., i, 553.
hydroferrocyanides of (CUMMING), T., 2461.
chlorosulphonyl derivatives of (JOHNSON and SMILES), T., 2384.
cyclic, preparation of (MAILHE), A., i, 199.
colour of, in relation to structure (v. BRAUN and SEEMANN), A., i, 1242.
action of sodammonium on (PICON), A., i, 199.
primary, action of 2-dithiobenzoyl with (McCLELLAND and LONGWELL), T., 3310.
proteinogenic, physiological action of (ABELIN), A., i, 874, 1265.
relation between constitution and physiological action of (CLOETTA and WÜNSCHE), A., i, 515.
tertiary, synthesis of (G. M. and R. ROBINSON), T., 532.
picrates of (KOMATSU and TAKIMOTO), A., i, 777.
Amino-acids, occurrence of, in nature (ABDERHALDEN), A., i, 1269.
in blood (MARINO), A., i, 1036, 1251.
synthesis of, in the organism (CROWDLE and SHERWIN), A., i, 632.

Amino-acids, constitution of (Bjerrum), A., i, 444.
configuration of (Karrer and Schlosser), A., i, 660.
resolution of (Abderhalden and Goto), A., i, 1069.
peptisation of (Zelinski and Sadikov), A., i, 1185.
equilibrium between formaldehyde and (Svehla), A., i, 181.
reaction between sugars and (Kostyschev and Brilliant), A., i, 659.
effect of, on the respiratory exchange (Krzywanek), A., i, 420.
metabolism of. See Metabolism.
salts, compounds of, with polypeptides and (Pfeiffer), A., i, 308.
esters, physiological action of (Arai), A., i, 515.
tertiary, action of yeast on (Kurono), A., i, 423.
unsaturated, preparation of (Diels, Gärtner, and Kaack), A., i, 24.
estimation of (Revoltella), A., ii, 269.
estimation of, electrometrically (Widmark and Larsson), A., ii, 795.
estimation of, with the quinhydrone electrode (Harris), T., 3294.
estimation of, in plant globulins (Oparin), A., ii, 511.
Amino-alcohols, displacement of acyl groups in (Bergmann and Brand), A., i, 841.
aromatic optically active, preparation of (Society of Chemical Industry in Basle), A., i, 923, 924.
tertiary, elimination of the amino-group from (McKenzie and Richardson), T., 79.
Amino-carboxylic acids (Mannich and Ganz), A., i, 19.
Aminohydroxydicarboxylic acids, synthesis of (Mannich and Bauroth), A., i, 22.
Amino-sulphonic acids, aromatic, condensation of, with *iso*cyanic acid, phenylcarbimide and cyanamide (Scott and Cohen), T., 3177.
Ammines, complex metallic (Duff), T., 560.
Ammonia, synthesis of (Storch and Olson), A., ii, 631.
spectrum of (Rimmer), A., ii, 516.
decomposition of, by ultra-violet light (Kuhn), A , ii, 815.
ionising potential of (Mackay), A., ii, 821.
boiling point of (Bergstrom), A., ii, 56.
freezing point of (Keyes, Townshend, and Young), A., ii, 376.
Ammonia, specific volume of the saturated vapour of (Cragoe, McKelvy, and O'Connor), A., ii, 557.
liquid, specific volume of (Cragoe and Harper), A., ii, 23.
thermal properties of solutions of (Vrevskí and Kaígorodov), A., ii, 738; (Vrevski and Zavaricki), A., ii, 739.
application of Henry's law to aqueous solutions of (Calingaert and Huggins), A., ii, 385.
purification and constants of (McKelvy and Taylor), A., ii, 557.
existence of hydrates of (Friedrichs), A., ii, 854.
equilibrium of ammonium nitrate with (Halla and Hirschko), A., ii, 761.
equilibrium of hydrazine and (Friedrichs), A., ii, 856.
catalytic oxidation of (Decarrière), A., ii, 155, 631; (Inaba), A., ii, 631.
catalytic oxidation of (Zawadzki; Zawadzki and Wolmer), A., ii, 854.
condensation of aldehydes with (Tschitschibabin), A., i, 1121, 1122; (Tschitschibabin, Moschkin, and Tiashelova), A., i, 1122; (Tschitschibabin and Oparina), A., i, 1123.
action of, with alkali carbonates (Pauly), A., ii, 557.
compounds of, with silicates (Schwarz and Mathis), A., ii, 318.
action of sodium hypochlorite on (Joyner), T., 1114.
action of sulphur monochloride on (Macbeth and Graham), A., ii, 855.
compounds of tin halides with (Biltz and Fischer), A., ii, 867.
assimilation of, by higher plants (Prianichnikov), A., ii, 1159.
excretion of (Hubbard and Munford), A., i, 169.
reaction of, with sodium hypobromite (Nanji and Shaw), A., ii, 874.
detection and estimation of, in hydroxylamine hydrochloride (Gros), A., ii, 84.
estimation of (Revoltella), A., ii, 269.
estimation of, volumetrically (Tillmans and Kruger), A., ii, 36.
estimation of, in urine (Ljungdahl; Mestrezat and Janet; Levy-Simpson and Carroll), A., ii, 654.
Ammoniates (Friedrichs) A., ii, 854, 856.

Ammonium lithium (Benoit), A., ii, 635.

Ammonium compounds, cyclic, tautomerism and fluorescence of (Izmailski), A., ii, 521.

Ammonium salts, acid reaction of, to litmus (Gillet), A., ii, 416.
- action of bromine on (Simpson), A., ii, 684.
- toxicity of (Underhill and Kapsinow), A., i, 169.
- quaternary, formation of (Barnett, Cook, and Driscoll), T., 503.
  - velocity of formation of (Dexter, McCombie, and Scarborough), T., 1229.
  - perhalides of (Chattaway and Hoyle), T., 654.

Ammonium hydrogen carbonate, aqueous solutions of (Bonnier), A., ii, 858.
- chloride, crystal structure of (Wyckoff), A., ii, 26.
  - intensive drying of (Smits), A., ii, 628.
  - equilibrium in the system, ferric chloride, water, and (Clendinnen), T, 1338.
  - equilibrium of manganous chloride dihydrate and (Clendinnen and Rivett), T., 1344.
  - equilibria in the systems, water, manganese, iron, cobalt, nickel, or copper chlorides and (Rivett and Clendinnen), T., 1634.
  - spontaneous decomposition of (Fairbrother), A., ii, 27.
  - action of agar-agar on solutions of (Rakuzin and Gonke), A., ii, 465.
- tantalum fluoride (Hahn and Pütter), A., ii, 773.
- *di*chromate (Moles and González), A., ii, 635.
- hydroxide, reaction of mercurous bromide with (Druce), A., ii, 421.
- hydroxides, quaternary, decomposition of (Demjanov and Dojarenko), A., i, 1193.
- iodide, equilibrium of lead iodide and (Demassieux), A., ii, 565.
- bismuthochloroiodide (Vournazos), A., i, 759.
- molybdate, action of micro-organisms on (Levine and Jahr), A., i, 1267.
- nitrate, properties of (Perman and Saunders), T., 841; (Perman and Howells), T., 2128.
  - allotropy of (Mondain-Monval), A., ii, 635.
  - equilibrium of ammonia with (Halla and Hirschko), A., ii, 761.

Ammonium chloropalladite, crystal structure of (Dickinson), A., ii, 25.
- sulphate, equilibrium in the system, sulphuric acid, lithium sulphate, water, and (van Dorp), A., ii, 621.
  - effect of, on the growth of plants, and on the availability of iron (Jones and Shive), A., i, 1843.
- sulphates, action of ethyl alcohol on (Dunnicliff), T., 476.
- hydrogen sulphate (Dunnicliff), T., 731.
- sulphides (Thomas and Riding), T., 1181.
- *poly*sulphides (Thomas and Riding), T., 1726.
- tetranitrodiamminecobaltiate (Thomas), T., 617.
- **Ammonium organic compounds**, quaternary bases, physiological action of (Külz), A., i, 983.

Ammonium radicle (Schlubach and v. Zwehl; Schlubach and Miedel), A., i, 1068.

Ampholytes, constitution of (Bjerrum), A., i, 444.

Amygdalic acid, barium phosphate and sulphate of (Helferich, Löwa, Nippe, and Riedel), A., i, 898.

Amygdalin, constitution of (Kuhn), A., i, 589.
- detection of, in plant tissues (Rosenthaler and Seiler), A., i, 278.

tert-**Amyl** hypochlorite (Chattaway and Backeberg), T., 3002.

5-*iso***Amyl-2-acetothienone**, and its semicarbazone (Steinkopf, Augestad-Jensen and Donat), A., i, 125.

Amylase in plants (Sjöberg), A., i, 275.
- complement of (Pringsheim and Fuchs), A., i, 965.
- hydrolysis of starch by (Sherman and Caldwell; Sherman and Naylor), A., i, 262.
- protection of, by amino-acids, from inactivation (Sherman and Caldwell), A., i, 261.
- malt and pancreatic (Sherman), A., i, 621.
- pancreatic (Willstätter, Waldschmidt-Leitz, and Hesse), A., i, 507.
  - effect of amino-acids on the activity of (Sherman and Walker), A., i, 1033.

*iso***Amyl-γ-bromopropylmalonic acid**, ethyl ester (Dox and Yoder), A., i, 950.

*iso***Amyldeoxybenzoin. See αβ-Diphenyl-ε-methylhexan-α-one.**

Amyldihexylamine, and its derivatives (Rupe and Glenz), A., i, 100.

9-*iso***Amyl-9:10-dihydroanthracene**, 9-hydroxy- (Krollpfeiffer and Branscheid), A., i, 912.

Amylene, behaviour of, with hydrocyanic acid under the electric discharge (Franceschoni and Ciurlo), A., i, 1067.
  action of selenium oxychloride on (Frick), A., i, 890.

n-**Amylethylene.** See Δ^{α}-Heptene.

1-*iso***Amylglyoxaline**, 5-chloro-, and its picrate (Sarasin), A., i, 711.

*iso***Amylhydrobenzoin.** See $\alpha\beta$-Diphenyl-ϵ-methylhexane-$\alpha\beta$-diol.

Amylodextrin (Reychler), A., i, 656.

Amylodisulphuric acid, and its potassium salt (Tamba), A., i, 1181.

Amylopectin, nature of (Ling and Nanji), T., 2666.

Amylose, polymerised, nature of (Ling and Nanji), T., 2666.

8-*iso***Amyloxyacridine**, 2:5-*di*amino-, and its hydrochloride, and 2-nitro-5-amino- (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 1131.

1-*n*-**Amylpiperidine**, and its picrate (G. M. and R. Robinson), T., 541.

3-*n*-**Amylquinoline**, and its salts (v. Braun, Petzold, Seemann, and Schultheiss), A., i, 137.

3-*n*-**Amyl-1:2:3:4-** and **-5:6:7:8-tetrahydroquinolines**, and their salts and derivatives (v. Braun, Petzold, Seemann, and Schultheiss), A., i, 137.

5-*iso***Amylthiolanthraquinone-1-butylsulphone** (Hoffman and Reid), A., i, 934.

1-*iso***Amylthiol***iso***propylthiolanthraquinones** (Hoffman and Reid), A., i, 933.

β-**Amyrin** from Manilla elemi resin (Rollett and Bratke), A., i, 588.

β-**Amyrin**, *mono*bromo-, acetate, and *di*bromo- (Rollett), A., i, 476.

Anacardium occidentale, oil from the seeds of (Patel, Sudborough, and Watson), A., i, 995.

Anæsthetics, inhalation, narcosis by (Meyer and Hopff), A., i, 682.

Anæsthetic action in relation to chemical constitution (Graf), A., i, 1265.

Analysis, errors in (Hahn, Dornauf, and Otto), A., ii, 39.
  use of sodium peroxide in (Sternberg), A., ii, 40.
  colorimetric, Ostwald colour standards for (v. Hahn), A., ii, 657.
  combustion (Lant), A., ii, 331.
    of volatile hygroscopic liquids (Shoesmith), A., ii, 254.

Analysis, combustion, absorption of water by alumina in (Fisher, Faust, and Walden), A., ii, 83.
  electrolytic precipitation (Kolthoff), A., ii, 88, 256, 257, 260.
  electrometric, apparatus for (Pelling), A., ii, 779.
    vessel for (Bovie), A., ii, 175.
    use of the mercury electrode in (Kolthoff and Verzyl), A., ii, 873.
    in bimetallic electrode systems (Willard and Fenwick), A., ii, 83.
    with ferrocyanides (Treadwell and Chervet), A., i, 764.
  elementary volumetric (Hackspill and de Heeckeren), A., ii, 578.
  gravimetric (Winkler), A., ii, 40, 90.
  hydrolytic precipitation (Jellinek and Krebs), A., ii, 871; (Jellinek and Czerwinski), A , ii, 878.
  microchemical (v. Szent-Gyorgyi), A., ii, 330.
  qualitative, of acids (Karaoglanov and Dimitrov), A., ii, 780.
    of principal anions (Fernandes and Gatti), A., ii, 429.
    of metals of the iron group (Hufferd), A., ii, 262.
    use of textile fibres in (Cole), A., ii, 94.
  quantitative, by means of the degree of supersaturation (Roder), A., ii, 83.
  spectroscopic (Meggers, Kiess, and Stimson), A., ii, 81; (Welsbach), A., ii, 247, 780.
    use of the oxy-acetylene blowpipe in (de Gramont), A., ii, 429.
  volumetric (Pozzi-Escot), A., ii, 870.
    determination of the end-point in (Muller), A., ii, 82.
    use of amalgams in (Kano), A., ii, 699, 700.
    use of bromates in (Smith), A., ii, 573.
    replacement of iodine by ferric chloride in (Jellinek and Winogradoff), A., ii, 871.

Andropogon Jwarancusa, essential oil from (Simonsen and Rau), A., i, 48.

Anemoninic acid, synthesis of (Fujita), A., i, 535.

Anethole dithiocyanate. See α-*p*-Methoxyphenyl-$\alpha\beta$-*di*thiocyanopropane.

Anhalonidine, synthesis of (Späth), A., i, 479.

Anhalonium alkaloids. See Cactus alkaloids.

Anhydrite, hydration of (Weissenberger), A., ii, 241.

Anhydro-8-aminohexahydrocarbazole-9-acetic acid (Perkin and Riley), T., 2405.
Anhydro-8-aminotetrahydrocarbazole-9-acetic acid (Perkin and Riley), T., 2404.
Anhydro-5-bromoindoxyl-α-4′-bromoanthranilide (Heller and Lauth), A., i, 852.
Anhydro-5-bromoisatin-α-4′-bromoanthranilide (Heller and Lauth), A., i, 852.
Anhydrodiketohydrindenes, coloured, constitution of (Radulescu and Tanasescu), A., i, 1211.
Anhydroecgonine hydrochloride, pentamercurichloride of (de Jong), A., i, 1222.
Anhydro-epiglucosamine hydrochloride (Levene and Meyer), A., i, 445.
Anhydromethylglucoside oleate (Gilchrist), A., i, 297.
Anhydrophenylacetylindigotinmalonic acid, ethyl ester (Posner and Pye), A., i, 253.
α- and **β-Anhydropilocarpic acids**, and their hydrochlorides and derivatives (Max and Michel Polonovski), A., i, 129.
Anhydroyohimbic acid, sulphuric ester (Barger and Field), T., 1041.
Anilides, catalytic decomposition of (Mailhe), A., i, 777.
  action of alcohols on (Mailhe), A., i, 199.
Aniline, ultra-violet absorption spectra of (Klingstedt), A., ii, 106.
  action of sunlight on aqueous solutions of (Kunz-Krause and Manicke), A., i, 199.
  melting-point curves of binary mixtures of crotononitrile, vinylacetonitrile, and (Lafortune), A., i, 1193.
  reaction between acetylene and, at high temperatures (Majima, Unno, and Ono), A., i, 135.
  reaction between aldehydes and ketones and (Oddo and Tognacchini), A., i, 225.
  interaction of chloroacetic acid and (Nodzu and Komatsu), A., i, 200.
Aniline, *p*-nitro-, diazotisation of (C. and H. Sunder), A., i, 861.
  *tetra*nitro-, solubility of, in organic solvents (Taylor and Rinkenbach), A., i, 672.
    reactions of (Davies and James), A., i, 552.
Anilines, substituted, velocity of reaction between chloronitrohydrocarbons and (Linke), A., i, 553.
Aniline-*p*-sulphonic acid, *o*-bromo-, and its aniline salt (Scott and Cohen), T., 3185.
Anilinoacetyl-*p*-anisidine, 3-nitro- (Reverdin), A., i, 321.
β-Anilino-α-chloroacetylacrylic acid, ethyl ester (Benary and Konrad), A., i, 241.
Anilinodiazo-2-methylquinoline, and *p*-nitro-, hydrochlorides (Adam), A., i, 1129.
β-Anilino-αα-diphenoxy-β-anisoylpropionic-β-lactam (Staudinger and Schneider), A., i, 466.
β-Anilino-αα-diphenoxy-β-phenylpropionic-β-lactam (Staudinger and Schneider), A., i, 466.
Anilinodiphenyl, aminonitro-, bromonitro-, and *di*nitro-derivatives (García Banús and Guiteras), A., i, 202.
4-Anilino-1:3 diphenyltriazolone (Busch, Müller, and Schwarz), A., i, 865.
β-Anilinoethyl alcohol, and *o*- and *p*-chloro- (Adams and Segur), A., i, 458.
α-Anilino-α-hydroxy-4:5-dimethoxyhomophthalanilic acid, aniline salt (Kuroda and Perkin), T., 2104.
α-Anilino-α-hydroxyhomophthalanilic acid, aniline salt (Kuroda and Perkin), T., 2107.
β-Anilino-α-hydroxy-α-methylpropionic acid (Les Établissements Poulenc Frères), A., i, 1001.
2-Anilino-5-hydroxy-1:4-naphthaquinone, chloro-derivatives (Wheeler, Dawson, and McEwen), A., i, 1020.
5′-Anilino-2′-hydroxy-2-phenylphenanthriminazole (A. C. and G. C. Sircar), T., 1564.
Anilinoketo-(αβ-benzcoumaronylidene)-dihydronaphthalenes (Fries and Ehlers), A., i, 830.
Anilinoketo(5′-bromo-αβ-benzcoumaronylidene)dihydronaphthalenes (Fries and Ehlers), A., i, 830.
Anilinolactic acid, preparation of homologues of (Les Établissements Poulenc Frères), A., i, 1001.
***p*-Anilinomethylenecamphor**, chloro- (Rupe and Diehl), A., i, 117.
Anilinomethylglyoxime, and its nickel salt (Ponzio and Avogadro), A., i, 855.
1-Anilinonaphthalene, 2-nitro- (Veselý and Dvořák), A., i, 551.
2-Anilino-1:4-naphthaquinone, 3:2-*p-di*chloro- (Fries and Ochwat), A., i, 843.

1-Anilino-β-naphthol, and its hydrochloride and methyl ether (WAHL and LANTZ), A., i, 210.

3-Anilino-2-*o*-nitrophenylthiol-1:4-naphthaquinone (FRIES and OCHWAT), A., i, 842.

β-Anilino-α-phenoxy-ββ-diphenyl-α-ethylpropionic-β-lactam (STAUDINGER and SCHNEIDER), A., i, 465.

β-Anilino-β-phenyl-αα-dibenzylpropionic-β-lactam (STAUDINGER, SCHNEIDER, SCHOTZ, and STRONG), A., i, 469.

Anilinophenylfurazan (PONZIO and AVOGADRO), A., i, 855.

α-Anilinophenylglyoxime, and its derivatives (PONZIO and AVOGADRO), A., i, 855.

β-Anilinophenylglyoxime, and its salts and diacetyl derivative (PONZIO and AVOGADRO), A., i, 855.

Anilinophenyl-lactic acid (LES ÉTABLISSEMENTS POULENC FRÈRES), A., i, 1001.

4-Anilino-1-phenyl-3-methyltriazolone, and its nitroso-derivative (BUSCH, MÜLLER, and SCHWARZ), A., i, 866.

4-Anilino-2-phenylphenanthriminazole, 3′-nitro- (A. C. and G. C. SIRCAR), T., 1564.

β-Anilino-α-2-phenylquinolylethanol (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 149.

γ-Anilinopropyl alcohol, and *o*- and *p*-chloro- (PIERCE and ADAMS), A., i, 484.

2-Anilinopyridine picrate (TSCHITSCHIBABIN), A., i, 598.

3-Anilino-4:1:2-thiodiazole (FROMM, LAYER, and NERZ), A., i, 1240.

3-Anilino-5-thiol-4-phenyl-1:2:4-triazole, derivatives of (FROMM, LAYER, and NERZ), A., i, 1240.

3-Anilino-5-thiol-4:1:2-thiodiazole, derivatives of (FROMM, LAYER, and NERZ), A., i, 1240.

4-Anilinothionaphthacoumarin, and 3-chloro- (SMILES and HART), T., 2912.

4-Anilo-2-hydroxy-1-(oxythionaphthenylidene)dihydronaphthalene (FRIES and EHLERS), A., i, 829.

Animals, age and chemical development in (MOULTON), A., i, 1256.
  marine, copper and zinc in (SEVERY), A., i, 415.
    chemistry of oils from (ANDRÉ), A., i, 878.

Animal products, sublimation of (VIEHOEVER), A., ii, 585.
  tissues, heat-stable catalyst in (CLIFFORD), A., i, 1147.

Animal tissues, effect of insulin on glycogen in (DUDLEY and MARRIAN), A., i, 978.
    absorption of potassium salts by (STANTON), A., i, 508.

Anions, detection of (FERNANDES and GATTI), A., ii, 429.

Anisic acid, esters of (RADCLIFFE and BRINDLEY), A., i, 110.

***p*-Anisidinomethylenecamphor**, and its acetyl derivative (RUPE and DIEHL), A., i, 118.

1-*o*-Anisidino-β-naphthol (WAHL and LANTZ), A., i, 210.

Anisole (*phenyl methyl ether*), influence of, on the Grignard reaction (MAJIMA and KOTAKE), A., i, 482.

Anisole, bromoamino-, bromonitro-, and nitroamino- derivatives of (HELLER and GEORGI), A., i, 1092.
    *tri*nitro-, equilibrium of picryl sulphide with (CHAUMEIL and THOMAS), A., i, 673.

Anisoles, nitro-, preparation of (VAN ERP), A., i, 208.

Anisole-2:3-quinone-3-diazide, 5-nitro- (HELLER and GEORGI), A., i, 1092.

1-Anisoyl-9-oxanthronyl (SCHOLL, DEHNERT, and SEMP), A., i, 808.

***l*-Anisylasparagine** (LUTZ), A., i, 457.

***p*-Anisylcarbamic acid**, γ-chloropropyl ester (PIERCE and ADAMS), A., i, 484.

***p*-Anisyl-β-dimethylaminoethylcarbinol**, and its derivatives (MANNICH and LAMMERING), A., i, 44.

***p*-Anisyldimethylcarbinol** (SKRAUP and FREUNDLICH), A., i, 669.

4-*p*-Anisyl-2:6-dimethylpyranhydrone (SCHNEIDER and JACOBI), A., i, 1112.

4-*p*-Anisyl-2:6-dimethylpyrylium salts (SCHNEIDER and JACOBI), A., i, 1112.

α-Anisyl-α-ethylbutaldehyde, and its semicarbazone (TIFFENEAU and LÉVY), A., i, 788.

α-Anisyl-β-ethylbutane-αβ-diol (TIFFENEAU and LÉVY), A., i, 788.

Anisylideneacetylacetone hydrochloride (VORLÄNDER, OSTERBURG, and MEYE), A., i, 683.

Anisylidene-*p*-aminoazotoluene, isotropic forms of (GAUBERT), A., i, 491.

Anisylideneaniline, compound of benzylideneaniline and (PASCAL), A., i, 1090.

4-*p*-Anisylidenehydantoin-3-α-propionic acid, and its ethyl ester (HAHN, KELLEY, and SCHAEFFER), A., i, 487.

***p*-Anisylpropionic acid**, α-oximino- (GRÄNACHER, GERÖ, OFNER, KLOPFENSTEIN, and SCHLATTER), A., i, 707.

β-*p*-Anisylpropylene (SKRAUP and FREUNDLICH), A., i, 669.

- **2-*p*-Anisylquinoline**, 3-hydroxy-, and its salts (BARGELLINI and BERLINGOZZI), A., i, 488.
- ***p*-Anisylthioacetodiethylamide** (KINDLER, BURGHARD, FINNDORF, DEHN, GIESE, and KÖRDING), A., i, 572.
- ***o*- and *p*-Anisylthiocarbimides** (DAINS, BREWSTER, and OLANDER), A., i, 324.
- ***p*-Anisyl vinyl ketone** and its dibromide (MANNICH and LAMMERING), A., i, 44.
- **Annual General Meeting**, T., 922.
- **Anodes**, aluminium, electrolysis with (JEFFREY), A., ii, 729.
- **Anthocyanins** in plants, (JONESCO), A., i, 77.
  - formation of, from flavonols (NOACK), A., i, 937.
- **Anthracene**, constitution of (CHALLENOR and INGOLD), T., 2066.
  - formula of (ORELKIN), A., i, 1082.
  - crystalline structure of (BRAGG), A., i, 551.
  - molecular refraction of (KROLLPFEIFFER), A., ii, 102; (v. STEIGER), A., ii, 349.
  - spectrochemistry of (v. AUWERS and KROLLPFEIFFER), A., ii, 101.
  - ultra-violet absorption spectra of (HYATT), A., ii, 810.
  - vapour pressure and latent heat of vaporisation of (NELSON and SENSEMAN), A., i, 774.
  - action of sulphur chloride on (FRIEDLÄNDER and SIMON), A., i, 109.
- **Anthracene**, *di*hydroxy-derivatives (HALL and PERKIN), T., 2032.
  - *meso*thio-, derivatives of (HEILBRON and HEATON), T., 173.
- **Anthracene series**, studies in the (BARNETT and MATTHEWS), T., 380, 2549; BARNETT, COOK, and MATTHEWS), T., 1994; (BARNETT and COOK), T., 2631.
- **9-Anthracyl** mercaptan, and its sodium salt and methyl ether (PETRI and STARK), A., i, 775.
  - sulphide (PETRI and STARK), A., i, 775.
- **1:2-Anthradiol** (HALL and PERKIN), T., 2035.
- ***iso*Anthraflavic acid**, preparation of (HALL and PERKIN), T., 20.
- **Anthragallol anthranol**, preparation and derivatives of (BREARE and PERKIN), T., 2606.
- **Anthragallol dianthrone**, and its hexa-acetyl derivative (BREARE and PERKIN), T., 2608.
- **Anthragallol dianthronequinone** (BREARE and PERKIN), T., 2609.
- **Anthranilic acid**, methyl ester, in grapes (POWER and CHESNUT), A., i, 280.
  - toluene-*p*-sulphonate (HELLER and GRUNDMANN), A., i, 246.
- **Anthranilic acid**, 4-chloro-, methyl ester and benzoyl derivative (HUNN), A., i, 467.
- **Anthranol alkyl ethers** (BARNETT, COOK, and MATTHEWS), T., 2002.
- **Anthranol blue**, constitution of (MASON), T., 1548.
- **Anthranol dianthranol**, octa-acetyl derivative (BREARE and PERKIN), T., 2608.
- **β-Anthranolsulphonic acid**, sodium salt, and its use in textile printing (BATTEGAY and BRANDT), A., i, 1103.
- **Anthranyl** phosphate (BARNETT, COOK, and MATTHEWS), T., 2007.
- **α-Anthrapinacolin** (BARNETT and MATTHEWS), T., 391.
- **Anthraquinone**, vapour pressure and latent heat of vaporisation of (NELSON and SENSEMAN), A., i, 774.
  - sulphonation of, with mercury as catalyst (CLOUGH), A., i, 46.
  - compounds, β halogen-substituted (ATACK), A., i, 345.
  - monoxime, Beckmann transformation in, and its derivatives (BECKMANN, LIESCHE, and v. PHILIPPSBERG), A., i, 233.
  - derivatives of (HOFFMAN and REID), A., i, 933.
  - diazonium hydroxides of (BATTEGAY and BÉHA), A., i, 861.
- **Anthraquinone**, 1:4-*di*amino-, 4-amino-1-hydroxy-, 1:5 *di*amino-8-hydroxy-, and *di*amino*di*hydroxy-, acetyl, benzoyl, and anisoyl derivatives (GRANDMOUGIN), A., i, 117.
  - chloronitro- and chloronitroso-derivatives (KOPETSCHNI), A., i, 1021.
  - hydroxy-derivatives, reduction products of (HALL and PERKIN), T., 2029; (BREARE and PERKIN), T., 2603.
    - effect of, on electrical conductivity of solutions of boric acid (BÖESEKEN, ANEMA, and BREVET), A., i, 210.
  - 1:2:6:7-*tetra*hydroxy- (BISTRZYCKI and KRAUER), A., i, 1211.
  - *di*thio- (HEILBRON and HEATON), T., 182.
- **Anthraquinone series**, reduction in (BATTEGAY and HUEBER), A., i, 1104.
- **Anthraquinoneisoamyl-5-*iso*propyldisulphone** (HOFFMAN and REID), A., i,

Anthraquinonebenzyl-1-*iso*amyldisulphones (Hoffman and Reid), A., i, 933.

Anthraquinonebenzyl-1-butyldisulphones (Hoffman and Reid), A., i, 933.

Anthraquinonebenzyl-1-ethyldisulphones (Hoffman and Reid), A., i, 933.

Anthraquinonebenzyl-1-methyldisulphones (Hoffman and Reid), A., i, 933.

Anthraquinonebenzyl-1-propyldisulphones (Hoffman and Reid), A., i, 933.

Anthraquinonebutyl-5-*iso*propyldisulphone (Hoffman and Reid), A., i, 933.

Anthraquinonediazonium amalgam (Battegay and Béha), A., i, 1141.

Anthraquinone-ethyl-5-*iso*propyldisulphone (Hoffman and Reid), A., i, 933.

Anthraquinonemethyl-5 *iso*propyldisulphone (Hoffman and Reid), A., i, 933.

Anthraquinone-*n*- and *iso*-propyl-5-*iso*-propyldisulphones (Hoffman and Reid), A., i, 933.

Anthraquinone 1-*iso*propylsulphone (Hoffman and Reid), A., i, 933.

Anthraquinonesulphonic acids, arylamine salts (Perkin and Sewell), A., i, 234.

  sodium salts, destructive distillation of (Perkin and Sewell), T., 3032.

Anthraquinyl diphenyl ether, *meso*-*di*thio- (Heilbron and Heaton), T., 180.

2-Anthrol, preparation of (Hall and Perkin), T., 2035.

Anthrone, preparation of, and its acetate and benzoate (Barnett and Matthews), T., 389.

  action of Grignard reagents on (Krollpfeiffer and Branscheid; Sieglitz and Marx), A., i, 912.

9-Anthrone, chloro-derivatives, and 4-chloro-10-bromo- (Barnett and Matthews), T., 2553.

β-*meso*-**Anthroylacrylic acid**, and its salts, and methyl ester (Oddy), A., i, 1099.

9-Anthryl dithiochloride, *di*sulphide, and thiosulphates, and their derivatives (Friedländer and Simon), A., i, 109.

9-Anthrylthiolacetic acid, and its derivatives (Friedländer and Simon), A., i, 109.

Anti-agglutinin, isolation of (Fujiwara), A., i, 1151.

Anti-enzymes (Abderhalden and Wertheimer), A., i, 504; (Slovtzov and Xenophontova), A., i, 625.

Antiketogenesis (Shaffer), A., i, 166; (Ringer), A., i, 266.

Antilaccase. See Antiphenolase.

Antimony, atomic weight of (Muzaffar), A., ii, 771.

  luminescence of solidifying (Karrer), A., ii, 811.

  electrochemical properties of (Grube and Schweigardt), A., ii, 457.

  isotopes of (Aston), A., ii, 32.

Antimony alloys with aluminium and with zinc (Sauerwald), A., ii, 172.

  with bismuth and zinc, electrochemistry of (Kremann, Langbauer, and Rauch), A., ii, 825.

  with lead (Dean), A., ii, 637.

   electric potential of (Muzaffar), A., ii, 726.

  with nickel and sulphur (Guertler and Schack), A., ii, 424.

Antimony compounds, action of, on fermentation in the organism (Smorodincev and Iliin), A., i, 1246.

Antimony *per*chlorate (Fichter and Jenny), A., ii, 245.

  *tri*chloride, absorption of light by (Macbeth and Maxwell), T., 370.

   equilibria of, with β-chloro- and α-nitro-naphthalenes (Vasiliev), A., ii, 395.

   compound of benzamide and (Belladen and Astengo), A., i, 1010.

  *tri*hydride, electrolytic formation of (Sand, Weeks, and Worrell), T., 456.

   detection of (Weeks), A., ii, 439.

  Antimonious hydroxides (Lea and Wood), T., 259.

Antimony *tri*oxide (*antimonious oxide*), crystal structure of (Bozorth), A., ii, 632.

  *pent*oxide, hydrates of (Jander and Simon), A., ii, 772.

Antimony organic compounds (Goddard), T., 2315; (Kauffmann), A., i, 874; (Weinland and Scholder), A., i, 1196.

Antimony detection, estimation, and separation:—

  detection of (Ortodocsu and Ressy), A., ii, 659.

  detection of, by Reinsch's test (Evans), A., ii, 696, 875.

  detection of small quantities of, in biological liquids (Caille and Viel), A., ii, 585.

Antimony detection, estimation, and separation:—
  estimation of (Lassieur and Lassieur), A., ii, 438.
  estimation of, electrolytically (Lassieur), A., ii, 660.
  estimation of, electrometrically (Zintl and Wattenberg), A., ii, 253.
  estimation of, oxidimetrically (Knop), A., ii, 881.
  estimation of, by sinter-oxidation (Feigl and Schorr), A., ii, 784.
  estimation of, and separation from arsenic and tin (Järvinen), A., ii, 254.
  estimation of, and its separation from tin (Wenger and Paraud), A., ii, 700.
  separation of, from tin and arsenic (Luff), A., ii, 578.
Antimony electrode. See Electrode.
Anti-oxygens (Moureu and Dufraisse), A., i, 91, 267; ii, 308.
Antipepsin (Stolz), A., i, 1253.
Antiphenolase (Bach and Engelhardt), A., i, 412.
Antipyretics, effect of, on the distribution of nitrogen in (Morinaka), A., i, 1040.
Antipyrine (1-*phenyl*-2:3-*dimethyl*-5-*pyrazolone*), polymorphism of (Gaubert), A., i, 154.
  equilibrium of caffeine, water, and (Kremann and Janetzky), A., i, 949.
  detection of (Fabre), A., ii, 99.
  estimation of, iodometrically (Kolthoff), A., ii, 270.
5-Antipyrylamino-3-ethoxyacridine (Farbwerke vorm. Meister, Lucius, & Bruning), A., ii, 1130.
Antithrombin, antihæmolytic effect of (Cosmovici), A., i, 1037.
Antitrypsin (Slovtzov and Xenophontova), A., i, 625.
  equilibrium between trypsin and (Hussey and Northop), A., i, 261.
Apis mellifera (bee), enzymes of the alimentary canal of (Pavlovski and Zarin), A., i, 626.
Apophyllenic acid (Kirpal and Reiter), A., i, 1225.
Apples, acids of (Franzen and Helwert), A., i, 637.
  odorous constituents of (Power and Chesnut), A., i, 278.
  constituents of the wax coating of (Sando), A., i, 990.
  respiration of seeds of (Harrington), A., i, 424.
Apple trees, nitrogen reserve in (Roberts), A., i, 884.
Aquopentamminecobaltic salts. See under Cobalt.
Aquopentammine magnesium chloride. See under Magnesium.
Arabinic acid, and its salts, optical rotation of (Rakuzin), A., i, 586.
Arabinose, preparation of (Harding), A., i, 898.
  fermentation of, by bacteria (Fred, Peterson, and Anderson), A., i, 1157.
Arachidic acid, structure of (Ehrenstein and Stuewer), A., i, 1057.
Arbutin (Macbeth and Mackay), T., 717.
Argentite, photoelectrical sensitivity of (Coblentz), A., ii, 51.
Argentojarosite (Schaller; Schempp), A., ii, 503.
Arginase (Clementi), A., i, 416.
  detection of, volumetrically (Clementi), A., ii, 271.
Arginine, decomposition of, in the liver (Felix and Tomita), A., i, 729.
d-**Arginine** dipicrate (Thomas, Kapfhammer, and Flaschenträger), A., i, 52.
Argol, analysis of (Chem. Fabrik vorm. Goldenburg, Geromont & Cie), A., ii, 886.
Argon, spectra of (Shaver), A., ii, 199.
  spectra of ionised potassium and of (Zeeman and Dik), A., ii, 670.
  ionisation of, on collision with electrons (Ayres), A., ii, 111.
  excitation and ionisation potentials of (Hertz), A., ii, 281.
  radiation and ionisation potentials of (Hicks), A., ii, 209.
  vapour pressure of (Born), A., ii, 376.
  hydrates (de Forcrand), A., ii, 239.
Aristolochic acid (Castille), A., i, 236.
Aromatic compounds, catalytic hydrogenation of, with platinum (Willstätter and Seitz), A., i, 771.
  reactions of (Angeli), A., i, 1003.
  reactivity of halogens in (Rheinlander), T., 3099.
  effect of ethoxy-groups on the bactericidal action of (Hirschfelder and Pankow), A., i, 986.
  polynuclear, spectrochemistry of (Krollpfeiffer; v. Auwers and Krollpfeiffer), A., ii, 101.
    molecular configurations of (Christie and Kenner), T., 779; (Burton and Kenner), T., 1043; (Christie, James, and Kenner), T., 1948.
Arsenato-metal acids, complex (Dede), A., ii, 31.

Arsenic, single potential of (Kahlenberg and Steinle), A., ii, 725.
vapour pressure of (Horiba), A., ii, 316.
in blood after salvarsan treatment (Fordyce, Rosen, and Myers), A., i, 1263.
in cerebrospinal fluid (Voegtlin, Smith, Dyer, and Thompson), A., i, 1040; (Cornwall and Myers), A., i, 1263.
content of, in the human body (Billeter and Marfurt), A., i, 1260.
action of, on protoplasm (Voegtlin, Dyer, and Leonard), A., i, 1266.
Arsenic alloys with tin (Mansuri), T., 214.
Arsenic compounds, action of, on fermentation in the organism (Smorodincev and Iliin), A., i, 1246.
Arsenic *tri*chloride, absorption of light by (Macbeth and Maxwell), T., 370.
halides, preparation of (Oddo and Giachery), A., ii, 316.
*tri*oxide (*arsenious oxide*), crystal structure of (Bozorth), A., ii, 632.
physical properties of aqueous solutions of (Anderson and Storey), A., ii, 486.
Arsenic acid, estimation of, iodometrically (Kolthoff), A., ii, 86.
Arsenious acid, oxidation of, by bromic acid (Chodkowski), A., ii, 839.
reducing action of (Kohn), A., ii, 238.
reduction of chlorates and iodates by (Kubina), A., ii, 304.
Arsenites, titration of, with permanganate (Hall and Carlson), A., ii, 658.
Arsenic *tri*sulphide sols, absorption spectrum of (Boutaric and Vuillaume), A., ii, 596.
action of light on (Murphy and Mathews), A., ii, 156.
sulphides, equilibria of sols of (Bhatnagar and Rao), A., ii, 756.
Arsenic organic compounds (Albert), A., i, 70; (Binz and Ludwig), A., i, 161; (Lewis and Cheetham), A., i, 407; (Lewis and Hamilton; Wieland and Kulenkampff), A., i, 499; (Johnson and Adams), A., i, 724; (Lieb and Wintersteiner), A., i, 873; (Margulies), A., i, 969.
distribution and elimination of, in the body (Bulmer), A., i, 1040.
Arsenic organic compounds, aliphatic, preparation of (Les Établissements Poulenc Frères and Oechslin), A., i, 664.
estimation of carbon and hydrogen in (Falkov and Raiziss), A., ii, 336.
Arsenic detection, estimation, and separation:—
Reinsch test for (Evans), A., ii, 696, 875.
detection of minute quantities of (Billeter; Rupp and Muschiol), A., ii, 335.
estimation of (Billeter and Marfurt; Poussigues), A., ii, 786; (Eschweiler and Röhrs), A., ii, 787.
estimation of, electrometrically (Zintl and Wattenberg), A., i, 253.
apparatus for estimation of, electrolytically (Monier-Williams), A., ii, 252.
estimation of, by sinter-oxidation (Feigl and Schorr), A., ii, 784.
estimation of, in arsenobenzenes (Myttenaere), A., ii, 875.
estimation of, in foods (Hann), A., ii, 787.
estimation of, in gelatin (Mehurin), A., ii, 891.
estimation of, in organic compounds (Stollé and Fechtig), A., ii, 335.
estimation of, in steel (Mazzetti and Agostini), A., ii, 506.
estimation of, in toxicology (Lewis), A., ii, 787.
estimation of, and separation from antimony and tin (Järvinen), A., ii, 254.
separation of (Tarugi), A., ii, 180.
separation of, from antimony and tin (Luff), A., ii, 578; (Moser), A., ii, 788.
separation of tin and (McCay), A., ii, 509.
p-**Arsenobenzanilide** (Lewis and Hamilton), A., i, 500.
p-**Arsenobenzanthranilide** (Lewis and Hamilton), A., i, 500.
Arsenobenzene, 3:3′-*di*amino-4:4′-*di*hydroxy-, dihydrochloride. See Salvarsan.
dinitrate and dipicrate (Gray), T., 640.
1:2-Arsenobenzene, 4-amino-, and its hydrochloride (Lieb and Winterstein), A., i, 873.
1:4-Arsenobenzene, 2-chloro- and 2-hydroxy- (Lieb and Winterstein), A., i, 874.

Arsenobenzenes, preparation of (Margulies), A., i, 969.
  estimation of arsenic in (Myttenaere), A., ii, 875.
p-**Arsenobenzo-*p*-anisidide** (Lewis and Hamilton), A., i, 500.
p-**Arsenobenzo-α-naphthylidide** (Lewis and Hamilton), A., i, 500.
p-**Arsenobenzo-*p*-phenetidide** (Lewis and Hamilton), A., i, 500.
p-**Arsenobenzo-*p*-xylidide** (Lewis and Hamilton), A., i, 500.
1-*p* **Arsenodiphenyl-di(4-amino-5-pyrazolone carbamate** (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 858.
o- and *p*-**Arsenophenylenes** (Lieb and Wintersteiner), A., i, 408.
Arsenoxides, preparation of (Margulies), A., i, 969.
Arsinebenzanisidides, *p*-*di*bromo-, *p*-*di*chloro-, and *p*-*di*iodo- (Lewis and Hamilton), A., i, 500.
Arsinebenzethylanilide, *p*-*di*chloro- and *p*-*di*iodo- (Lewis and Hamilton), A., i, 500.
Arsinebenz-*p*-phenetidide, *p*-*di*iodo- (Lewis and Hamilton), A., i, 500.
Arsinic acid, derivatives of, and their molecular weights (Lorenz and Brehmer), A., i, 265.
Arsinic acids, conductivity of (Lorenz and Brehmer), A., ii, 822.
Arsinic acids, substituted, affinity constants of (Lorenz and Brehmer), A., i, 406.
  hydroxy-, aliphatic, manufacture of (Les Établissements Poulenc Frères and Oechslin), A., i, 906.
p-**Arsinobenzanilide** (Lewis and Hamilton), A., i, 500.
p-**Arsinobenzanisidides** (Lewis and Hamilton), A., i, 500.
p-**Arsinobenzanthranilide** (Lewis and Hamilton), A., i, 500.
o-**Arsinobenzoyl** chloride, *di*chloro-, and its condensations, with aromatic hydrocarbons and ethers (Lewis and Cheetham), A., i, 407.
p-**Arsinobenzoylarsanilide**, and its hydrate (Lewis and Hamilton), A., i, 500.
Arsino-magnesium compounds (Job and Reich), A., i, 873.
Arsinoacetic acid (Huismann, Callsen, and Grüttefien), A., i, 664.
Arsphenamine. See Salvarsan.
Arsylene, physiological action of (Katzenelbogen), A., i, 421.
Artemisia, santonin from species of Viehoever and Capen), A., i, 1023.
Artemisic acid, constitution of (Bertolo), A., i, 1013.
Artemisin, constitution of (Bertolo), A., i, 1108.
  acetyl derivative, and its derivatives (Bertolo), A., i, 1108.
Aryl phosphates, preparation of (Chemische Fabrik Griesheim-Elektron), A., i, 920.
β-**Arylamino-ethanols**, synthesis of (Adams and Segur), A., i, 457.
1-**Arylamino-β-naphthols** (Wahl and Lantz), A., i, 209.
Aryldialkyl glycols, dehydration of, by heat and acids (Tiffeneau and Lévy), A., i, 788.
  hypnotic properties of (Tiffeneau and Dorlencourt), A., i, 676.
Aryldiazonium salts, condensation of alkylated malonic acids with (Walker), T., 2775.
Arylformamides, decomposition of (Mailhe), A., i, 458.
Arylhydroxylamines, β-nitro-(Borsche), A., i, 778, 1091.
1-**Arylnaphthylamines**, 2-hydroxy-, preparation of (Société Anonyme des Matières Colorantes, Wahl, and Lantz), A., i, 674.
Arylpyridinium salts, structure and fluorescence of (Izmailski), A., ii, 521, 522.
Arysulphonhalogeno-amides, salts, use of, in the estimation and iodination of phenols (Roberts), T., 2707.
Arylthiocarbimides, preparation of (Dains, Brewster, and Olander), A., i, 323.
Asbestos, filtration of (Craig), A., ii, 694.
  platinised, adsorption of carbon monoxide and hydrogen by (Pollard), A., ii, 381.
Asparagine, synthesis and degradation of, in plants (Prianischnikov), A., i, 273.
d- and *l*-**Asparagine** in lupines (Piutti), A., i, 885.
l-**Aspartic acid**, and its alkali salts, optical rotation of (Rakuzin), A., i, 545.
Aspergillus niger, formation of citric acid by (Butkewitsch), A., i, 519.
  effect of copper salts on the growth of (Molliard), A., i, 76.
  nitrogenous bases in the mycelium of (Vorbrodt), A., i, 987.
Assimilation of carbon dioxide (Thunberg; Weigert), A., i, 1271.
  plant. See Plants.

Asymmetric compounds, synthesis of (Erlenmeyer and Erlenmeyer), A., i, 215; (Bredig, Mangold, and Williams), A., i, 1012.
resolution of (Cohen), T., 2716.
Atmospheric air, spectrographic examination of (Aston), A., ii, 487.
ultra-violet spectrum of (Hopfield), A., ii, 1.
absorption of the gases of, by water (Coste), A., ii, 852.
explosion of mixtures of carbon monoxide and, at high pressures (Bone, Newitt, and Townend), T., 2008.
combustion of mixtures of carbon monoxide, hydrogen, and (Payman and Wheeler), T., 1251.
propagation of flame in mixtures of paraffins with (Mason), T., 210; (Payman and Wheeler), T., 426.
estimation of relative humidity of (Obermiller and Goertz), A., ii, 781.
estimation of carbon monoxide in (Nicloux), A., ii, 578; (Sinnatt and Slater), A., ii, 655; (Sayers, Yant, and Jones), A., ii, 789; (Andriska), A., ii, 876.
estimation of ethyl ether in (Haggard), A., ii, 343.
Atoms, structure of (Hargreaves), A., ii, 19; (Reychler; van der Berg), A., ii, 232.
Bohr's theory of (Sidgwick), T., 725; (Bohr and Coster), A., ii, 110; (Smith), A., ii, 844.
and line spectra (Bohr), A., ii, 629.
and paramagnetism (Cabrera), A., ii, 123; (Dauvillier), A., ii, 609.
and reactions (Prins), A., ii, 627.
and the quantum theory (Bohr), A., ii, 478.
Whittaker's quantum mechanism in (Lorentz), A., ii, 311.
Bohr's model of (Born and Heisenberg), A., ii, 478.
dimensions of (Herzfeld), A., ii, 554.
in relation to optical rotation (Brauns), A., ii, 598.
calculation of the diameters of, by the theory of magnetism (Young), A., ii, 213.
constancy of radii of (Wyckoff), A., ii, 311.
nuclei of, structure of (Neuberger), A., ii, 145.
dimensions of (Neuberger), A., ii, 400.
Atoms, nuclei of, rotation of (Henstock), A., ii, 400, 477, 679, 845.
stability of (Harkins), A., ii, 143, 479.
influence of, on valency and polarity (Henstock), A., ii, 233.
fundamental orbit of (Catalán), A., ii, 516.
dynamic or static nature of (Campbell), A., ii, 399.
electrical moments of (Kleeman), A., ii, 721.
photography of the disintegration of (Harkins and Ryan), A., ii, 720.
disintegration of, by collision with α-particles (Harkins and Ryan), A., ii, 601.
absorption and emission of energy by (Hamburger), A., ii, 822.
relation of the constants of, to the valency number (Hückel), A., ii, 402.
Ewing's magnetic, in relation to chemical combination (Laurie), A., ii, 311.
ideal electric (L.), A., ii, 64.
static, forces within (Langmuir), A., ii, 19.
Atomic number, relation between atomic weights and (Loewinson-Lessing), A., ii, 146.
relation between the energy of α-particles and (Myssowsky), A., ii, 817.
of radicles (Ríus y Miró), A., ii, 146.
Atomic volume. See Volume.
Atomic weight of antimony (Muzaffar), A., ii, 771.
of boron (Stock and Kuss), A., ii, 157, 856; (Hönigschmid and Birckenbach), A., ii, 559.
of bromine, carbon, chlorine, fluorine, nitrogen, and sodium (Moles and Clavera), A., ii, 149.
of chlorine (Dorenfeldt), A., ii, 629.
of gallium (Richards and Craig), A., ii, 495.
of iron (Hönigschmid, Birckenbach, and Zeiss), A., ii, 560.
of lead (Hönigschmid and Steinheil), A., ii, 764.
of mercury and of its isotopes (Hönigschmid, Birckenbach, and Steinheil; Hönigschmid and Birckenbach), A., ii, 493.
of selenium (Bruylants and Dondeyne), A., ii, 236.
of tellurium (Bruylants and Michielsen), A., ii, 153.
of titanium (Baxter and Fertig), A., ii, 498.
of uranium-lead (Hönigschmid and Birckenbach), A., ii, 764.

Atomic weights, report of the Committee on (Baxter), A., ii, 312.
  calculation of (Fehrle), A., ii, 477.
  of isotopes, calculation of (Russell), A., ii, 748.
  relation between atomic numbers and (Loewinson-Lessing), A., ii, 146.
Atophan. See 2-Phenylquinoline-4-carboxylic acid.
Atoxyl (*sodium* p-*aminophenylarsinate*), crystalline form of (Mélon), A., i, 407.
  action of, on pancreatic lipase (Rona and Pavlović), A., i, 403.
Atropine, effect of, on the heart (Heinekamp), A., i, 1265.
Auramine hydroferrocyanide (Cumming), T., 2459.
Aurin*leuco*sulphinic acid, sodium salt (Scheuing and Berliner), A., i, 859.
Autocatalysis (Quartaroli), A., ii, 550.
Autolysis, mechanism of (Steppuhn and Utkin-Ljubovzov), A., i, 1158.
Autoxidation (Moureu and Dufraisse), A., i, 267; ii, 308.
Avena sativa aristata (oat), growth and nutrition of (Dickson), A., i, 78.
Avitaminosis, alkali reserve of blood-plasma in (Collazo), A., i, 1150.
  blood of pigeons in (Marchlewski and Nowotnówna), A., i, 879.
  carbohydrate metabolism in (Collazo), A., i, 506; (Rubino and Collazo), A., i, 1153.
  fat metabolism and blood-fat in (Asada, Collazo, and Bosch), A., i, 1262.
Axe, Greek prehistoric, metallurgy of (Weiss, Dandurand, and Dureuil), A., ii, 420.
Axinite, of Prali (Grill), A., ii, 247.
Azelaic acid, *αα′*-*di*bromo-, and its ethyl ester (Challenor and Thorpe), T., 2483.
Azeotropic mixtures (Young), A., ii, 736.
Azides, formation of (Angeli and Pieroni), A., i, 1026.
Azidosuccinylglycineazide, and its derivatives (Curtius and Hechtenberg), A., i, 1072.
Azines, aliphatic, catalytic reduction of (Taipale), A., i, 547, 663.
Azobenzene, 2:4:6:2′:4′:6′-*hexa*nitro-5:5′-*di*hydroxy- (Elbs and Schliephake), A., i, 255.
Azo-colouring matters (Dominikiewicz), A., ii, 889.
  preparation of (König), A., i, 862; (Wheeler and Constable), A., i, 1027.
Azo-colouring matters, from nitronaphthylamines (Morgan and Jones), A., i, 1028.
  of the 2-pyridine series (Tschitschibabin), A., i, 613.
Azo-compounds, preparation of (Bigiavi and Carrara), A., i, 715.
Azo-compounds, *o*-amino-, oxidation of (Charrier and Crippa), A., i, 1140.
Azodicarboxy-di-3-pyridylamide (Diels and Behnen), A., i, 391.
Azodicarboxy-3-pyridylamidic acid, esters (Diels and Behnen), A., i, 391.
Azodicarboxy-3-pyridylmethyldiamide (Diels and Behnen), A., i, 391.
m- and *p*-**Azodimethylanilinomandelic acids** (Wheeler and Constable), A., i, 1027.
Azodithiocarboxylic acid, methyl ester (Arndt, Milde, and Eckert), A., i, 1079.
Azoiminomethylfurazan, and its silver salt and acetyl derivative (Ponzio and Ruggeri), A., i, 854.
Azomethylfurazan (Ponzio and Ruggeri), A., i, 854.
d- and *l*-*m*-**Azo-β-naphtholmandelic acids** (Porter and Ihrig), A., i, 1028.
p-**Azo-β-naphtholmandelic acid** (Porter and Ihrig), A., i, 1027.
m-**Azophenolmandelic acid** (Porter and Ihrig), A., i, 1027.
Azophenylcarbazole (G. and M. de Montmollin), A., i, 374.
Azophenylfurazan (Ponzio and Avogardo), A., i, 858.
Azopicric acid. See Azobenzene, 2:4 6:2′:4′:6′-*hexa*nitro-5:5′-*di*-hydroxy-.
2:2′-Azopropane (Lochte, Noyes, and Bailey), A., i, 26.
m- and *p*-**Azoresorcinolmandelic acids** (Porter and Ihrig), A., i, 1027.
Azotobacter in soils (Gainey), A., i, 1166.
  effect of reaction on the fixation of nitrogen by (Johnson and Lipman), A., i, 633.
  protein synthesis by (Hunter), A., i, 985.
Azotobacter chroococcum, effect of humus on the fixation of nitrogen by (Voicu), A., i, 735.
m-**Azotoluene**, *hexa*-*ω*-fluoro-(Swarts), A., i, 292.
Azoxybenzene, *α*-*m*-nitro-*p*-*mono*- and *p*:*p*′-*di*-hydroxy- (Bigiavi and Carrara), A., i, 716.
Azoxy-compounds, *o*-hydroxy- (Bigiavi and Poggi), A., i, 1241.

- **Azoxyphenols**, preparation of (BIGIAVI and CARRARA), A., i, 715.
- **Azulene** (KREMERS), A., i, 454.

B.

- **Bacilli**, formation and utilisation of pyruvic acid by (BERTHELOT), A., i, 881.
  - Timothy grass, metabolism of (STEPHENSON and WHETHAM), A., i, 986.
  - tubercle, fat and lipoid content of (TERROINE and LOBSTEIN), A., i, 633.
    - preparation of nucleic acid from (JOHNSON and BROWN), A., i, 160.
- *Bacillus botulinus* (SCHÜBEL), A., i, 516.
- *Bacillus cellulosæ dissolvens*, digestion of cellulose by (KHOUVINE), A., i, 1042.
- *Bacillus proteus*, butylene glycol fermentation of dextrose by (LEMOIGNE), A., i, 1041.
  - catalase from (HAGIHARA), A., i, 1157.
  - formation of α-β-furyl-lactic acid by (SASAKI and OTSUKO), A., i, 517.
  - urease produced by (TAKAHATA), A., i, 1157.
- *Bacillus pyocyaneus*, culture of, on chemical media (LIOT), A., i, 517.
- *Bacillus subtilis*, production of β-hydroxybutyric acid by (LEMOIGNE), A., i, 881.
- **Bacteria**, action of thorium-*X* on (LEMAY and JALOUSTRE), A., i, 170.
  - degradation of carbohydrates and their acids by (NAGAI), A., i, 1267.
  - fermentation of calcium lactate by (LEMOIGNE), A., i, 1269.
  - liquefaction of gelatin and formation of indole by (ARNBECK), A., i, 170.
  - activation of hydrogen in carbon dioxide assimilation by (RUHLAND), A., i, 272.
  - formation of mercaptan from *l*-cystine by (KONDO), A., i, 517.
  - nitrogen metabolism of (DE BORD), A., i, 734.
  - fission of nucleoproteins by (KOCH and OELSNER), A., i, 422.
  - fermentation of pentoses by (FRED, PETERSON, and ANDERSON), A., i, 1157.
  - pigments from (MCCOMBIE and SCARBOROUGH), T., 3279.
  - detection of phenols produced by (BELL), A., i, 1157.
  - anaërobic, production of tyrosine by (HALL and FINNERUD), A., i, 985.
- **Bacteria**, autotrophic, oxidation of selenium by (LIPMAN and WAKSMAN), A., i, 735.
  - luminous, concentration of oxygen required for luminescence in (HARVEY and MORRISON), A., i, 1267.
  - nitrifying, in relation to the reaction of media (MEEK and LIPMAN), A., i, 74.
    - effect of sugar concentration on activity of (TRUFFAUT and BEZSSONOFF), A., i, 1268.
    - in soils (GAINEY), A., i, 1166.
  - pathogenic, effect of vitamins on (ASCOLI), A., i, 1268.
  - propionic, production of carbon dioxide and volatile acids by (SHERMAN and SHAW), A., i, 1041.
  - sulphur-oxidising (WAKSMAN and STARKEY), A., i, 273; (WAKSMAN), A., i, 1042.
  - tyrosinase (STAPP), A., i, 1247.
- **Bacteriophages** (MEULI, DOERR, and BERGER), A., i, 1158.
- *Bacterium radicicola*, urease produced by (BEIJERINCK), A., i, 1157.
- **Baeyer Memorial Lecture** (PERKIN), T., 1520.
- **Baicalein**, and its tribenzoyl derivative (SHIBATA, IWATA, and NAKAMURA), A., i, 592.
- **Baicalin**, and its derivatives, from *Scutellaria baicalensis* (SHIBATA, IWATA, and NAKAMURA), A., i, 592.
- **Balance sheets** of the Chemical Society and of the Research Fund. See Annual General Meeting, T., 922.
- **Banana**, increase in saccharase activity of (MCGUIRE and FALK), A., i, 872.
- **Barbituric acid** (BOCK), A., i, 64.
  - action of carbamazide on (CURTIUS), A., i, 850.
  - preparation of halogen substituted derivatives of (STAUDINGER), A., i, 949.
- **Barbituric acid**, 5-chloro-ammonium salt, and 5:5-*di*chloro (BOCK), A., i, 712.
- **Barbituric acid series**, hypnotic action in (SHONLE and MOMENT), A., i, 248.
- **Barium alloys**, preparation of (GOLDSCHMIDT), A., ii, 688.
- **Barium salts**, crystallisation of mixtures of radium salts and (PIETENPOL), A., ii, 819.
- **Barium** amide, hydride, imide, and nitride, heats of formation of (GUNTZ and BENOIT), A., ii, 738.

Barium chloride, electrolysis of solutions of, in a magnetic field (SCHTSCHUKAREV), A., ii, 289.
solidification of the system, magnesium chloride, potassium chloride, and (VALENTIN), A., ii, 73; (MATIGNON and VALENTIN), A., ii, 417.
action of, on sulphates in fused mixtures (BATSFORD), A., ii, 860.
tantalum fluoride (HAHN and PUETTER), A., ii, 773.
halides, ammonia compounds of (HÜTTIG and MARTIN), A., ii, 72.
selenate, solubility of (MEYER and FRIEDRICH), A., ii, 5.
sulphate, ζ potential at the water interface of (GYEMANT), A., ii, 52.
precipitation of (HAHN, with OTTO), A., ii, 339.
turbidity of suspensions of (OWE), A., ii, 242.
hydrogen sulphate (DUNNICLIFF), T., 734.
sulphide, structure of (HOLGERSSON), A., ii, 321.
*di*thionate, equilibrium of sodium dithionate, water, and (DE BAAT), A., ii, 637.
Barium organic compounds:—
acetato- and formato-compounds (WEINLAND and HENRICHSEN), A., i, 291.
Barium estimation and separation:—
estimation of, as oxalate (ANGELESCU), A., ii, 657.
estimation and separation of (LEO), A., ii, 434.
Barley, maltase in (LING and NANJI), A., i, 1162
oats and wheat, effect of respiration on the amount of protein in (MCGINNIS and TAYLOR), A., i, 1164.
Base, $C_{12}H_{15}N$, and its derivatives, from 2:3-trimethylenequinoline (v. BRAUN, PETZOLD, and SCHULTHEISS), A., i, 837.
$C_{16}H_{23}N$, and its *N*-benzoyl derivative, from menthonephenylhydrazone and zinc chloride (KURODA), A., i, 603.
$C_{19}H_{16}N_2$, and its salts, from magnesium 2-methylindolyl bromide and iodoform (ODDO and TOGNACCHINI), A., i, 715.
Bases, cyclic, stability of (v. BRAUN, SEEMANN, and SCHULTHEISS), A., i, 138; (v. BRAUN and SEEMANN), A., i, 146; (v. BRAUN), A., i, 838.
electrometric titration of, with the antimony electrode (UHL and KESTRANEK), A., ii, 648.
Bases, estimation of, with the quinhydrone electrode (HARRIS), T., 3302.
estimation of, polarimetrically (GROOT), A., ii, 503, 649.
ψ-Bases (G. M. and R. ROBINSON), T., 532.
Bast fibres, action of sodium hydroxide on (NODDER and KINKEAD), A., i, 884.
Bauxite, sodium fluorophosphate and fluorovanadate from (TRAVERS), A., ii, 415.
Bavalite, from Bas-Vallon, Brittany (ORCEL), A., ii, 647.
Beans, broad, action of boric acid and borax on the growth of (WARINGTON), A., i, 1274.
Burma. See *Phaseolus lunatus.*
calabar. See Calabar bean.
carob, extract of (GUTBIER, LOCHER, and KREIDL), A., ii, 618.
haricot, hexamethylenetetramine and formaldehyde as nutrients for (E. and G. NICHOLAS), A., i, 427.
Beckmann transformation (BECKMANN and LIESCHE), A., i, 232.
Bees, digestive enzymes of (SARIN), A., i, 413.
See also *Apis mellifera.*
*iso***Behenic acid**, structure of (EHRENSTEIN and STUEWER), A., i, 1057.
Benzaldehyde, production of (CARBIDE & CARBON CHEMICALS CORPORATION), A., i, 1208.
velocity of solution of copper in (SCHAAF), A., ii, 307.
equilibrium between benzoin and (ANDERSON and JACOBSON), A., i, 467.
nitration of (BRADY and HARRIS), T., 484.
oxidation of acetic anhydride and, by oxygen (JORISSEN), A., ii, 629.
copper derivative, and its compound with pyridine (SCHAAF), A., i, 799.
*di*bromophenylhydrazones (HUMPHRIES, BLOOM, and EVANS), T., 1769.
m-nitrophenylhydrazone (RASTELLI), A., i, 1101.
estimation of chlorine in (VOIGT), A., ii, 34.
Benzaldehyde, 3:5-*di*bromo-4-hydroxy-, salts of (LINDEMANN), A., i, 687.
3-chloro-5-nitro-2-hydroxy- (DAVIES and RUBENSTEIN), T., 2850.
hydroxy-derivatives, solubility of (SIDGWICK and ALLOTT), T., 2819.
p-hydroxy-, from decomposition of tyrosine (HIRAI), A., i, 423.

Benzaldehyde, *o*-nitro-, monotropy of (Brady and Harris), T., 484.
2:4-*di*nitro-, derivatives of (Downey and Lowy), A., i, 578.
Benzaldehyde-*m*- and -*p*-carboxylic acids, chloro-derivatives (Cassella & Co.), A., i, 800.
Benzaldehydecyanohydrin, action of emulsin on (Nordefeldt), A., i, 722.
Benzaldehydehydrazones, nitro-, relation of colour and constitution in (Chattaway and Clemo), T., 3041.
Benzaldehydephenylhydrazone oxide (Bergmann, Ulpts, and Witte), A., i, 393.
Benzamide, equilibria of, with benzoic anhydride and acetic anhydride (Kremann, Mauermann, and Oswald), A., i, 336.
compounds of, with metallic salts (Belladen and Astengo), A., i, 1009.
Benzamide, 2-amino-4-chloro- (Hunn), A., i, 466.
thio-, condensation of acetonitrile with (Ishikawa), A., i, 926.
Benzanilides, arsinated (Lewis and Hamilton), A., i, 500.
Benzanilidothiocarbonic acid, thio-, esters (Rivier and Schalch), A., i, 793.
Benzaurin, and its salts (Meyer and Gerloff), A., i, 230.
Benzbisthiazoles (Edge), T., 153, 1011, 2330.
Benzene, constitution of (Fraser), T., 2712; (Lely), A., i, 313; (Olivier; van Roon; Schoutissen; Derx and Hermans), A., i, 451.
structure of (Huggins), A., i, 329.
formula of (Lely), A., i, 99; (Olivier), A., i, 195; (Prins; Schoutissen), A., i, 196; (Hermans), A., i, 767; (Orelkin), A., i, 1082.
molecular model for (Moise), A., i, 1189.
nucleus, structure of the (Challenor and Ingold), T., 2066; (Ingold), T., 2081.
substitution in the (Fraser and Humphries), A., i, 450; (Holleman), A., i, 664; (Lely; de Vliet; Hermans; Jürgens), A., i, 767; (Thomson), A., ii, 682.
effect of the mobility of chlorine in the side-chain on substitution in the (Olivier), A., i, 197, 769.
mobility of hydrogen in, compared with that of chlorine in the side-chain (Olivier), A., i, 908.
Benzene nucleus, influence of nitro-groups on the reactivity of substituents in the (Ibbotson and Kenner), T., 1260.
refractive index of (Gifford and Lowry), A., i, 705.
fluorescence spectrum of the vapour of (McVicker and Marsh), T., 820.
and its homologues, fluorescence spectra of the vapours of (Marsh), T., 3315.
Tesla-luminescence spectrum of (McVicker, Marsh, and Stewart, T., 642; (McVicker and Marsh, T., 817.
and its derivatives, ultra-red absorption spectra of (Purvis), A., ii, 513.
ultra violet absorption spectra of (Hyatt), A., ii, 810.
molecular scattering of light in (Ramanathan), A., ii, 598.
specific heat of the saturated vapour of (Bruhat and Delaygue), A., ii, 214.
mutual solubility of water and (Hill), A., ii, 467.
distribution of fatty acids between water and (Brown and Bury), T., 2430.
electrolytic oxidation of (Seyewetz and Miodon), A., i, 583.
reduction of (Dougherty and Taylor), A., ii, 549.
conversion of acetylene into (Zelinski), A., i, 1169.
influence of, on metabolism (Underhill and Harris), A., i, 733.
fate of, and of its halogen derivatives in the organism (Hele and Callow), A., i, 1156.
derivatives, formation of rings from (Wilson and Adams), A., i, 327.
substituted, Tesla-luminescence spectra of (McVicker, Marsh, and Stewart), T., 2147.
relation between structure and odour of (Bogert and Curtin), A., i, 1101.
mutual influence of substituents in (Kleucker), A., i, 27.
vicinal trisubstituted, substitution in (Davies), T., 1575; (Davies and Rubenstein), T., 2839.
detection of, in corpses (Gettler), A., ii, 440.
Benzene, bromo-, elimination of, in urine (Rhode), A., i, 74.
1-bromo- and 1-chloro-3:4:6-*tri*nitro-, action of benzylidenemethylamine on (Giua), A., i, 455.

Benzene, *p-di*bromo-, reaction between magnesium and (Pink), T., 3418.
chloro-, ultra-violet absorption spectrum of the vapour of (Henri), A., ii, 359.
freezing point of (Keyes, Townshend, and Young), A., ii, 376.
catalytic ammonolysis of (Howald and Lowy), A., i, 557.
*p-di*chloro-, syntheses by means of (Hunn), A., i, 466.
nitration of (Page and Heasman), T., 3247.
*di*hydroxy-derivatives, ethylene and trimethylene ethers of (Kohn and Wilhelm), A., i, 558; (Kohn and Safrin), A., i, 559.
nitro-, freezing point of, and its use in cryoscopy (Roberts and Bury), T., 2037.
reduction of, by sodium in liquid ammonia (White and Knight), A., i, 1004.
reduction of, by zinc in acetic acid solution (Prins), A., ii, 839.
action of, on sodium and potassium derivatives of carbazole (G. and M. de Montmollin), A., i, 373.
*tri*nitro-, equilibria of phenylenediamines and (Kremann and Mauermann), A., i, 378.
1:2:3:5-*tetra*nitro- (Borsche), A., i, 1091.
3:5-*di*nitrobromo- (Elion), A, i., 391.
1:3-*di*nitro 4-nitroso-, and 1:2:3-*tri*nitro- (Borsche), A., i, 778.
1:3-*di*nitro-4:5-*di*nitroso-, salts (Rathsburg), A., i, 316.

7-Benzeneazo-6-amino 2-*p*-tolyl-*αβ*-naphthatriazole, 7-*p*-nitro- (Holliday & Co., Ltd., and Morgan), A., i, 389.

Benzeneazo-*o*-anisidine, *p*′-nitro- (v. Braun and Seemann), A., i, 1242.

Benzeneazo-4-hydroxy-2:1-benzthiopyran (Lesser and Mehrländer), A., i, 828.

Benzeneazo*tri*hydroxynaphthalene, and its salts and methyl ether (Charrier and Tocco), A., i, 1028.

2-Benzeneazomethylene-1:2-dihydroquinoline, and 2-*p*′-nitro-, and their hydrochlorides (König), A., i, 862.

Benzeneazo-*N*-methyl-*α*-methyldihydroindole, *p*-nitro- (v. Braun and Seemann), A., i, 1242.

Benzeneazo-*N*-methylphenmorpholine, *p*-nitro- (v. Braun and Seemann), A., i, 1242.

Benzeneazo-1-methyl-1:2:3:4-tetrahydro-6-quinoline, *p*-nitro- (v. Braun and Seemann), A., i, 1242.

Benzeneazonaphthols, oxidation of (Bigiavi and Cerchiai), A., i, 159.

Benzene-1-azo-*β*-naphthol-4-sulphonic acid, *p*-nitro- (Morgan and Jones), A., i, 327.

1-Benzeneazo-*β*-naphthylamine, 1-*p*-chloro- (Charrier and Crippa), A., i, 1141.

Benzeneazo-2:4- and **-4:6 *di*nitro-*m*-toluenes** (Michele and Mario Giua), A., i, 610.

4-Benzeneazo-3(or 5)-phenyl-1-*p* nitrophenyl-5(or 3)-methylpyrazole, 4-*p*-nitro- (Macbeth), T., 1130.

5-Benzeneazo-1-phenylpyrrole-3-carboxylic acid, 4-hydroxy-, and its ethyl ester (Benary and Konrad), A., i, 241.

Benzeneazopyrogallol, and *p*-nitro- (Juillard), A., i, 1139.

Benzeneazoresorcinol, oxidation of (Bigiavi and Giannini), A., i, 158.

4-Benzeneazoxy-2:6 *di*-bromoresorcinol, and *op-di*bromo- (Bigiavi and Giannini), A., i, 158.

Benzeneazoxy-*p*-cresols, and their bromo- and nitro-derivatives (Bigiavi and Poggi), A., i, 1241.

***β*-4-Benzeneazoxyresorcinol,** and its derivatives (Bigiavi and Giannini), A., i, 158.

Benzenemelanic acid, preparation of, from benzene (Adler), A., i, 591.

Benzenemelanin (Adler), A., i, 591.

Benzenepentacarboxylic acid, preparation of (Fleischer and Retze), A., i, 221.

Benzenesulphin-amide and **-anilide** (v. Braun and Kaiser), A., i, 316.

Benzenesulphindimethylamide (v. Braun and Kaiser), A., i, 316.

Benzenesulphinic acid, salts from anils and (Knoevenagel and Römer), A., i, 197.

Benzenesulphinic acid, bromo- and chloro-derivatives (Hanke), A., i, 725.
6-chloro-3-nitro- (Krishna), T., 157.

Benzenesulphinpiperidide (v. Braun and Kaiser), A., i, 316.

Benzenesulphonbenzyl-*β*-bromoethylamide (Staub), A., i, 140.

Benzenesulphonbenzyl-*β*-hydroxyethylamide (Staub), A , i, 140.

Benzenesulphonbenzylphenacylamide (Staub), A., i, 141.

Benzenesulphoniodoamide, potassium salt (Roberts), T., 851.

Benzenesulphonyl chlorides, substituted, action of thionyl chloride on (Pollak and Rudich), A., i, 27.

Benzenesulphonylacetone, ω-bromo-*p*-chloro-, and *p*-chloro- (Tröger and v. Seelen), A., i, 1127.

Benzenesulphonylanthranilic acid, action of acetic anhydride on (Heller and Grundmann), A., i, 246.

3-Benzenesulphonyl-2-benzenesulphonylmethylquinoline, and 3-*p*-chloro- (Tröger and v. Seelen), A., i, 1127.

3-Benzenesulphonylcarbostyril, and *p*-chloro-, and its sodium salt (Tröger and Köppen-Kastrop), A., i, 369.

Benzenesulphonyl-*p*-chlorobenzenesulphonylacetone, and its semicarbazone (Tröger and v. Seelen), A., i, 1128.

3-Benzenesulphonyl-2-*p*-chlorobenzenesulphonylmethylquinoline, 3-*p*-chloro- (Tröger and v. Seelen), A., i, 1128.

α-Benzenesulphonylcinnamonitrile, β-*o*-nitro- (Tröger and Köppen-Kastrop), A., i, 369.

3-Benzenesulphonyl-diacetoxycoumarins, and *p*-chloro- (Tröger and Dunkel), A., i, 357.

3-Benzenesulphonyl-5:7-diethoxycoumarin, and *p*-chloro- (Tröger and Dunkel), A., i, 357.

3-Benzenesulphonyl-2-ethoxyquinoline (Tröger and Köppen-Kastrop), A., i, 369.

3-Benzenesulphonyl*di*hydroxycoumarins, and *p*-chloro- (Tröger and Dunkel), A., i, 357.

3-Benzenesulphonyl-2-methylquinoline, 3-*p*-chloro- (Tröger and v. Seelen), A., i, 1128.

Benzenesulphonyl-3-naphthalenesulphonylacetone, *p*-chloro- (Tröger and v. Seelen), A., i, 1128.

3-Benzenesulphonyl-2-β-naphthalenesulphonylmethylquinoline, 3-*p*-chloro- (Tröger and v. Seelen), A., i, 1128.

2-Benzenesulphonyl-β-naphthapyrone, and *p*-chloro-, hydroxy-, and hydroxychloro- (Tröger and Dunkel), A., i, 356.

α-Benzenesulphonyl-*o*-nitrocinnamonitrile, *p*-chloro- (Tröger and Köppen-Kastrop), A., i, 370.

3-Benzenesulphonyl-2-phenylquinoline, and 3-*p*-chloro-, and their salts (Tröger and v. Seelen), A., i, 1128.

3-Benzenesulphonylquinoline 2-amino-, and 2-amino-*p*-chloro-, and their salts, and 2-chloro- derivatives (Tröger and Köppen-Kastrop), A., i, 369.

3-Benzenesulphonylthiocarbostyril, and *p*-chloro-, and their methyl ethers (Tröger and Köppen-Kastrop), A., i, 369.

Benzenesulphonyl-*p*-toluenesulphonylacetone, *p*-chloro-, and its oxime (Tröger and v. Seelen), A., i, 1128.

3-Benzenesulphonyl-2-*p*-toluenesulphonylmethylquinoline, 3-*p*-chloro- (Tröger and v. Seelen), A., i, 1128.

2-Benzenesulphoxy-3-methoxybenzaldehyde, 6-nitro- (Davies), T., 1585.

2-Benzenesulphoxy-3-methoxybenzoic acid, 6-nitro- (Davies), T., 1585.

Benzenethiosulphonic acid, phenyl ester (Knoevenagel and Römer), A., i, 197.

Benzenylbenzylamidine, salts of (Pyman), T., 3373.

Benzenyldibenzylamidine, salts of (Pyman), T., 3373.

Benzenylmethylamidine, and its salts (Pyman), T., 3369.

Benzenylmethylbenzylamidine, and its picrate (Pyman), T., 3374.

Benzenylphenylmethylamidine, methylation of (Pyman), T., 369.

Benzhydryl allyl ketone (Danilov), A., i. 786.

Benzhydrylamine, tertiary amines from (Sommelet), A., i, 202.

α-Benzhydrylbutyramide (Albesco), A., i, 42.

Benzhydryl *p*-methoxystyryl ketone (Rack), A., i, 681.

Benzhydryl *iso*propyl ketone. See αα-Diphenyl-γ-methylbutan-β-one.

Benzhydryl styryl ketone, and its dibromide (Rack), A., i, 681.

Benzidine, structure of, and its compounds with *iso*phthalaldehyde and terephthalaldehyde (Adams, Bullock, and Wilson), A., i, 378.
- condensation of formaldehyde and (Kondo and Ishida), A., i, 147.
- as a reagent for aldehydes (van Eck), A., ii, 887.

Benzidines, *di*nitro-, isomerism of (Brady and McHugh), T., 2047.

Benzil (*dibenzoyl*), conversion of, into benzilic acid (Scheuing), A., i, 231; (Lachman), A., i, 784, 785; (Schönberg and Keller), A., i, 928.
- compounds of, with potassium hydroxide and sodium ethoxide (Scheuing), A., i, 231.

ψ-Benzils (Schönberg and Malchow), A., i, 115; (Schönberg and Bleyberg), A., i, 116.

Benzilic acid, formation of, from benzil (Scheuing), A., i, 231; (Lachman), A., i, 784, 785; (Schönberg and Keller), A., i, 928.

Benzil-5-nitro-2-methylaminemonoanil (Brand and Wild), A., i, 252.

Benzimide, 2-thio- (McKibben and McClelland), T., 173.
Benziminazoles, preparation of (Brand and Wild), A., i, 251.
Benziminazole-2-αβ-diphenylacrylic acid, and its derivatives (Bistrzycki and Fässler), A., i, 848.
Benziminazole-2 diphenyl-2′-carboxylic acid, and its silver salt and derivatives (Bistrzycki and Fässler), A., i, 849.
Benziminazole-2-propylsulphonic acid (Backer and de Boer), A., i, 536.
Benzoacetodinitrile, *C*-chloroacetyl derivative, and its derivatives (Benary and Lau), A., i, 366.
oxalic acid derivatives (Benary, Soenderop, and Bennewitz), A., i, 573.
Benzodiethylamide, thio- (Kindler, Burghard, Finndorf, Dehn, Giese, and Kording), A., i, 571.
Benzodimethylamide, thio- (Kindler, Burghard, Finndorf, Dehn, Giese, and Körding), A., i, 569.
Benzodi-α- and -β-naphthylmethylamides (v. Braun and Moldaenke), A., i, 1194.
Benzoic acid, production of (Carbide and Carbon Chemicals Corporation), A., i, 1208.
and hydroxy-derivatives, ultra-violet absorption spectra of (Castille and Klingstedt), A., ii, 276.
heat of combustion of (Verkade), A., ii, 217; (Schläpfer and Fioroni), A., ii, 832.
conductivity, viscosity, and density of systems formed by, with diphenylamines, naphthylamines, and quinoline (Baskov), A., i, 673.
and its salts, neutralisation of (Prideaux), T., 1626.
Benzoic acid, 6-amino-*m*-tolyl ester, and its hydrochloride (Gibson), T., 1276.
β-amyrenol ester (Rollett), A., i, 477.
benzyl ester, influence of, on nitrogen metabolism (Pack and Underhill), A., i, 413.
*di*bromoacetamidoaryl esters (Raiford and Iddles), A., i, 326.
βγ-*di*bromopropyl ester (Philippi, Seka, and Ableidinger), A., i, 1185.
α-cyanobenzyl ester (Lachman), A., i, 785.
diphenylformamidine ester (Passerini), A., i, 64.
β-naphthyl ester (*benzonaphthol*), detection of (Denigès), A., ii, 267.
2-nitro-*m*-tolyl ester (Gibson), T., 1272.
Benzoic acid, urethane derivatives of (Society of Chemical Industry in Basle), A., i, 924, 925.
Benzoic acid, amino-derivatives, decomposition of, by boiling water (McMaster and Shriner), A., i, 464.
p-amino-, allyl ester, preparation of (Society of Chemical Industry in Basle), A., i, 34.
p-*mono*- and 3:5-*di*-amino-, *n*-butyl esters (Adams and Volwiler), A., i, 676.
p-amino-, and *p*-nitro-, *n*-butyl esters (Société Chimique des Usines du Rhône), A., i, 792.
dialkylamino- and bromopropyl esters (Abbott Laboratories), A., i, 336.
4-amino-2-thiol-, silver derivative (Feldt), A., i, 573.
3:5-*di*chloro-4-amino-, and 3:5-*di*-nitro-4-nitroamino- (Elion), A., i, 391.
2-chloro-2-iodo-, and its esters, and 2-iodo-3-amino-, hydrochloride (Christie, James, and Kenner), T., 1949.
3-chloro-5-nitro-2-hydroxy- (Davies and Rubenstein), T., 2852.
o- and *m*-fluoro-, ethyl esters and nitrile of (Swarts), A., ii, 273.
4-fluoro-2-nitro- (van Hove), A., i, 318.
4-fluoro-3-nitro-, and its salts and derivatives (Rouche), A., i, 214.
p-hydroxy-, from decomposition of tyrosine (Hirai), A., i, 423.
2:4-*di*hydroxy-, methyl ester (Pacsu), A., i, 339.
di- and *tri*-hydroxyimidothio- and *di*- and *tri*-hydroxythio-derivatives, esters of, and their salts (Kaufmann and Adams), A., i, 931.
iodo-*m*-hydroxy-, and its methyl ester (Windaus and Schiele), A., i, 580.
3-iodo-4-hydroxy-, and 3:5-*di*iodo-4-hydroxy-, and their ethyl esters and acetyl derivatives (Brenans and Prost), A., i, 1203.
4-iodo-3-hydroxy- (Beijer), A., i, 215.
o-nitro-, methyl ester, velocity of hydrolysis of (Branch and McKittrick), A., ii, 230.
Benzoic anhydride, velocity of reaction of acetamide and (Kremann, Auer, Oswald, and Zoff), A., ii, 227.
velocity of reaction of acetic acid and (Kremann and Rösler), A., ii, 227.
equilibrium of benzamide and (Kremann, Mauermann, and Oswald), A., i, 336.

Benzoic-melanic acid, *p*-amino- (Adler), A., i, 1218.

Benzoic-melanin, *p*-amino- (Adler), A., i, 1218.

o-**Benzoicsulphinidoacetic acid** (Magidson and Gorbatschov), A., i, 1097.

Benzoin, equilibrium between benzaldehyde and (Anderson and Jacobson), A., i, 467.

Benzoins, substituted, preparation of (Asahina and Terasaka), A., i, 1023.

Benzoinoxime, as a reagent for copper (Feigl), A., ii, 880.

Benzomethylamide, 2:2′-*di*thio-, (McClelland and Longwell), T., 3314.

Benzonaphthalidothiocarbonic acid, α- and β-thio-, esters of (Rivier and Schalch), A., i, 793.

Benzonaphthol. See Benzoic acid, β-naphthyl ester.

Benzo-β-naphthylamide, thio- (Kindler, Burghard, Finndorf, Dehn, Giese, and Körding), A., i, 571.

Benzo-α- and **-β-naphthylmethylamides** (v. Braun and Moldaenke), A., i, 1194.

Benzonitrile, condensation of thioacetamide with (Ishikawa), A., i, 926.

Benzo-*N***-Δ^{β}-***iso***pentenylanilide** (Claisen, Kremers, Roth, and Tietze), A., i, 1051.

Benzophenone bromophenylhydrazones (Humphries, Bloom, and Evans), T., 1769.
  peroxide (Lebedev, Andreevski, and Matiuschkina), A., i, 771.

Benzophenone, 2′-bromo-4-hydroxy- (Montagne), A., i, 801.
  3′-bromo-4-hydroxy-, and 3:5-*di*bromo- (Montagne), A., i, 228.

Benzophenones, action of alcoholic potassium hydroxide on (Montagne), A., i, 227.

Benzophenone-*o***-amino-***p***-tolylhydrazone** (Busch and Schäffner), A., i, 864.

Benzophenone 2′-arsinic acid (Lewis and Cheetham), A., i, 408.

Benzophenonenitrotolylhydrazones (Busch and Schäffner), A., i, 864.

Benzophenonenitroxylhydrazone, nitrosamine of (Busch and Schäffner), A., i, 864.

Benzophenonetolylhydrazones (Busch and Schäffner), A., i, 864.

Benzophenone-*p***-tolylnitrosoamine** (Busch and Schäffner), A., i, 864.

Benzophenone-*as***-***m***-xylylhydrazone** (Busch and Schäffner), A., i, 864.

Benzopolymethylene compounds (v. Braun, Braunsdorf, and Kirschbaum), A., i, 105; (v. Braun, Gruber, and Kirschbaum), A., i, 107; (v. Braun and Wolff), A., i, 143; (v. Braun and Stuckenschmidt), A., i, 947; (v. Braun and Zobel), A., i, 1208.

Benzopropylamide, 2:2′-*di*thio- (McClelland and Longwell), T., 3314.

Benzopyrones, *tri*hydroxy-, arylsulphone derivatives of (Tröger and Dunkel), A., i., 355.

m-**Benzoquinone,** *tri*bromo-, *m*-nitrophenylhydrazone (Rastelli), A., i, 1101.

p-**Benzoquinone,** ultra-violet absorption spectrum of (Klingstedt), A., ii, 521.
  electrolytic formation and reduction of (Seyewetz and Miodon), A., i, 583.
  additive compounds of, with phenols, amines, and hydrocarbons (Kremann, Sutter, Sitte, Strzelba, and Dobotzky), A., i, 45.

p-**Benzoquinone,** *tetra*bromo-, preparation of (Datta and Chatterjee), A., i, 345.
  *tetra*hydroxy-, and its sodium salt (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 932.

Benzoquinones, reduction potentials of (Conant and Fieser), A., ii, 727.

o-**Benzoquinoneoxime,** 5-nitro-3-nitrosoamino-4-hydroxy- (Heller, Lindner, and Georgi), A., i, 1095.

p-**Benzoquinoneoxime,** Beckmann transformation of, and its derivatives (Beckmann, Liesche, and v. Philippsberg), A., i, 233.

Benzoquinone-4-oximes, 3-chloro-, stereoisomeric (Hodgson and Moore), T., 2504.

Benzothiochromanones (Krollpfeiffer and Schultze), A., i, 1114.

1:3-Benzoxazine (Mameli), A., i, 61.

Benzoxazoles, fluorescence and constitution of (Henrich, Suntheimer, and Steinmann), A., i, 145.

Benzoxy-. See Benzoyloxy-.

Benzoyl chloride, chlorination of (Hope and Riley), T., 2470.
  cyanide oxime, oxide of, and its acetyl derivative (Ponzio), A., i, 1020.
  *per*oxide, decomposition of (Fichter and Fritsch), A., i, 438.

Benzoylacetone, γ-*mono*- and γγ-*di*-chloro-, action of hydrazine on (Macbeth), T., 1128.

Benzoylacrylic acid, and its isomeric methyl and ethyl esters and their derivatives (Rice), A., i, 218.

1-Benzoylanthraquinone, 4-amino-, benzoyl derivative (Grandmougin), A., i, 117.
Benzoylbenzene-*o*-sulphonic acid, *p*-hydroxy-, and its barium salt (Orndorff and Sherwood), A., i, 341.
o-**Benzoylbenzoic acid,** *o*-amino-, salts and methyl ester (Beckmann, Liesche, and v. Philippsberg), A., i, 233.
  o-4′-hydroxy-, *p*-hydroxyanilide (Orndorff and Yang), A., i, 1016.
2-Benzoyl-5-benzylthiol-4-phenyltriazole, 3-hydroxy- (Fromm and Nehring), A., i, 858.
Benzoyl-*o*-bromo-*p*-toluidide (Ressy and Ortodocsu), A., i, 1227.
β-Benzoyl-Δ^{α}-butenoic acid (Mayer and Stamm), A., i, 803.
γ-Benzoylbutyronitrile, and its semicarbazone (Bruylants), A., i, 1003.
Benzoylcamphor, mutarotation of (Lowry and Burgess), T., 2122.
Benzoylcinchoninal, and its salts and derivatives (Seekles), A., i, 237.
Benzoylcinchonine ozonide (Seekles), A., i, 237.
Benzoyl-γ-di-*n*-butylamino-*n*-propanol, *p*-amino-, salts (Abbott Laboratories), A., i, 336.
Benzoyldihydroindigotinmalonic acid, ethyl ester (Posner and Pyl), A., i, 253.
Benzoyldimethylaminotetrahydronaphthalene hydrochlorides (González and Campoy), A., i, 209.
4-Benzoyl-2:5-dimethylbenzoic acid, and 2′:5′-*di*chloro- (de Diesbach, Perrig, Betschart, and Strebel), A., i, 805.
5-Benzoyl-2:4-dimethylbenzoic acid, and 2′:5′-*di*chloro- (de Diesbach, Perrig, Betschart, and Strebel), A., i, 805.
1-Benzoyl-3:5-dimethylpyrazole (Morgan and Ackerman), T., 1816.
Benzoyldi*iso*propylhydrazine (Taipale), A., i, 548.
Benzoylecgonine, estimation of, in coca leaf (Jong), A., ii, 798.
2′:1-*o*-Benzoylene-2-phenyl-1:3-benzdiazole (Bistrzycki and Fässler), A., i, 849.
N-**Benzoylethylurethane,** *N*-chloro- (Traube and Gockel), A., i, 189.
1-Benzoyl*cyclo*hexanol-1-carboxylanilide (Passerini), A., i, 1014.
9-Benzoyl-10-hydroxyhexahydrocarbazole, 11-nitro- (Perkin and Plant), T., 686.
Benzoylindigotinmalonic acid, ethyl ester (Posner and Pyl), A., i, 252.
Benzoylmalic acid, ethyl ester (Levene and Mikeska), A., i, 25.
β-Benzoyl-α-methylacrylic acid (Mayer and Stamm), A., i, 803.
α-Benzoyl-δ-methylarginine (Thomas, Kapfhammer, and Flaschenträger), A., i, 51.
Benzoylmethylfurazan, and its phenylhydrazones, and *mono*- and *di*-nitrophenylhydrazones (Ponzio), A., i, 470.
Benzoylmethylgranatoline, and *p*-amino- and *p*-nitro-, and their salts (Tanret), A., i, 832.
Benzoylmethyl*cyclo*hexanol-1-carboxylanilides (Passerini), A., i, 1014.
3-Benzoyl-2-methylindole (Seka), A., i, 1125.
α-Benzoyl-δ-methylornithine (Thomas, Kapfhammer, and Flaschenträger), A., i, 51.
3-Benzoyl-5-methyl-1:2:4-oxadiazole, oxime, and its derivatives (Ponzio and Avogadro), A., i, 857.
β-Benzoyl-α-methylpropionic acid (Krollpfeiffer and Schäfer), A., i, 344.
β-Benzoyl-β-methylpropionic acid (Mayer and Stamm), A., i, 802.
Benzoyl-β-naphthol sulphide, and *p*-bromo- (Lesser and Gad), A., i, 562.
Benzoyl*iso*-β-naphthol sulphides (Lesser and Gad), A., i, 562.
Benzoylnitrosodihydroindigotinmalonic acid, ethyl ester (Posner and Pyl), A., i, 253.
1-Benzoyl-9-oxanthronyl (Scholl, Dehnert, and Semp), A., i, 808.
Benzoyloxanthronyls (Scholl and Hähle) A., i, 584, 689.
Benzoyloxindole-3-aldehyde (Gränacher and Mahal), A., i, 714.
4-Benzoyloxy-2-acetoxybenzoic acid, methyl ester (Pacsu), A., i, 339.
4-Benzoyloxybenzoic acid, 2:3-*di*hydroxy- (Pacsu), A., i, 340.
α-Benzoyloxycinnamic acid, ethyl ester (Gault and Weick), A., i, 36.
4-Benzoyloxy-2:3 diacetoxybenzoic acid (Pacsu), A., i, 340.
β-Benzoyloxy-α-diethylaminoethylbutyric acid, β-*p*-amino-, and β-*p*-nitro-, ethyl esters and their hydrochlorides (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 760.
4-Benzoyloxy-2:3-dimethoxybenzoic acid, methyl ester (Pacsu), A., i, 340.
1-Benzoyloxyindole-2-carboxylic acid, ethyl ester (Gabriel, Gerhard, and Wolter), A., i, 704.
5-Benzoyloxy-1:4-naphthaquinone, 2:3-*di*chloro- (Wheeler, Dawson, and McEwen), A., i, 1020.

6-Benzoyloxy-2-phenyl-5-methylbenzoxazole (Henrich, Suntheimer, and Steinmann), A., i, 145.
α-Benzoyloxy-β-phenylpropionic acid, ethyl ester (Gault and Weick), A., i, 36.
Benzoyloxystearic acid, ethyl ester (Radcliffe and Gibson), A., i, 177.
Benzoyloxy-2:4:3′:4′-tetramethoxy-αγ-diphenylpropane, 6-*p*-nitro- (Freudenberg and Cohn), A., i, 1219.
4-Benzoyloxy-1:2:2:6-tetramethylpiperidine, and its cinnamate (Kipping), T., 3118.
***N*-Benzoyl-δ-phenylbutylamine** hydrochloride (v. Braun and Lemke), A., i, 3.
γ-Benzoyl-β-phenylbutyramide, α-cyano- (Kohler and Souther), A., i, 244.
γ-Benzoyl-β-phenylbutyric acid, α-*mono*- and αγ-*di*-bromo-α-cyano-, and α-*mono*- and αγ-*di*-bromo-α-cyano-*p*-chloro-, methyl esters (Kohler, Graustein, and Merrill), A., i, 56.
  α-cyano- and α-cyano *p*-chloro, and their methyl esters and derivatives (Kohler, Graustein, and Merrill), A., i, 55.
γ-Benzoyl-β-phenylbutyronitrile, (Kohler, Graustein, and Merrill), A., i, 55.
γ-Benzoyl-β-phenylbutyronitrile, α-bromo*di*-α-cyano-, and α-cyano- (Kohler and Souther), A., i, 244.
γ-Benzoyl-β-phenylethylmalonamic acid, αγ-*di*bromo-, methyl ester and its isomeride (Kohler, Graustein, and Merrill), A., i, 56.
γ-Benzoyl-β-phenylethylmalonic acid, methyl hydrogen ester (Kohler, Graustein, and Merrill), A., i, 55.
Benzoylphenylhydrazones, nitro-, reduction of (Lockemann), A., i, 863.
γ Benzoyl-β-phenyl-α-methylbutyric acid, α-cyano-*p*-chloro-, methyl ester (Kohler, Graustein, and Merrill), A., i, 55.
3-Benzoyl-5-phenyl-1:2:4-oxadiazole, oxime of (Ponzio and Avogadro), A., i, 857.
3-Benzoyl-2-phenyl*cyclo*propane-1-carboxylic acid, 1-cyano-, and its methyl esters (Kohler, Graustein, and Merrill), A., i, 57.
2-Benzoyl-3-phenyltetrahydrofuran, 4-bromo-4-cyano- (Kohler, Graustein, and Merrill), A., i, 56.
β-Benzoylpropionic acid, 2:4-*di*hydroxy-, silver salt (Biggs and Pope), T., 2938.
β-Benzoylpropionylpiperidide (Staudinger and Müller), A., i, 363.
Benzoylquininal, and its salts and derivatives (Seekles), A., i, 238.
Benzoylquinine ozonide (Seekles), A., i, 238.
9-Benzoyltetrahydrocarbazole, 5-nitro- (Perkin and Plant), T., 685.
δ-Benzoylvaleric acid, δ-*o*-amino-, and its benzoyl derivative (Perkin and Plant), T., 686.
  o-hydroxy-, and its derivatives and *m*-nitro-*o*-hydroxy- (v. Braun), A., i, 104.
Benzthiazole, metho-salts of (Mills, Clark, and Aeschlimann), T., 2360.
  methiodide, ψ-base from, and its derivatives (Mills, Clark, and Aeschlimann), T., 2357.
Benz-4′:5′-*iso*thiazole, 5-nitro- (Fries and Brothuhn), A., i, 842.
Benzthiazole series (Mills, Clark, and Aeschlimann), T., 2353, 2362.
Benzthiazole-2-carboxyphenylhydrazide (Zahn), A., i, 377.
2:1-Benzthiopyran, and its derivatives (Lesser and Mehrlander), A., i, 828.
1:2:3-Benztriazole, 6-nitro-1-hydroxy- (Brady and Day), T., 2266.
Benz*iso*triazole chloroplatinate (Mills and Schindler), T., 321.
  mercaptan (Mills and Schindler), T., 321.
Benzyl allyl sulphide (v. Braun and Engelbertz), A., i, 894.
  bromide, *m*-iodo- (Olivier), A., i, 769.
  chloride, *o*-iodo- (Olivier), A., i, 769.
    p-nitro-, addition of, to trimethylamine (Dexter, McCombie, and Scarborough), T., 1237.
  β-chloro- and β-diethylaminoethyl ethers (British Dyestuffs Corporation, Ltd., Perkin, and Clemo), A., i, 453.
  esters, preparation of, of acids of high boiling point (Thompson and Leuck), A., i, 210.
    pharmacology of (Nielsen and Higgins), A., i, 74.
Benzylacetoacetic acid, α-bromo-, ethyl ester, action of hydrazine on (Macbeth), T., 1127.
  o-nitro-, ethyl ester (Gabriel, Gerhard, and Wolter), A., i, 704.
Benzylacetone, semioxamazone (Wilson and Pickering), T., 396.
α-Benzylacrylic acid, and its dibromide (Mannich and Ganz), A., i, 20.
Benzyl alcohol, *o*-iodo- (Olivier), A., i, 770.

γ-Benzylallyl bromide (v. Braun and Lemke), A., i, 5.

Benzylallylaminomethylmalonic acid, and its salts (Mannich and Gray), A., i, 21.

β-Benzylaminoacrylic acid, and its salts, and α-cyano-, ethyl ester (Diels, Gärtner, and Kaack), A., i, 25.

β-Benzylaminocrotonic acid, ethyl ester, isomerism of (Benary), A., i, 201.

2-Benzylamino 1-hydroxytetrahydronaphthalene, and its salts (Braun, Braunsdorf, and Kirschbaum), A., i, 106.

Benzylaminomethylmalonic acid (Mannich and Ganz), A., i, 21.

α-Benzyl-*o*-aminophenylacetic acid (Kirchner), A., i, 913.

Benzylboric acid (Krause), A., i, 1035.

β-Benzylbutyric acid, and its acid chloride and nitrile (v. Braun and Stuckenschmidt), A., i, 948.

Benzyl*iso*coumaranone (Kirchner), A., i, 913.

Benzylcysteine, *p*-chloro- (Shiple and Sherwin), A., i, 673.

Benzylcysteinephenylhydantoin (Shiple and Sherwin), A., i, 673.

Benzyldiethylamine chloroplatinate (G. M. and R. Robinson), T., 540.

cis-**1-Benzyl-2:5-dihydroxymethylpyrrolidine,** and its salts (v. Braun and Seemann), A., i, 1118.

Benzyldimethylaminomethylmalonic acid (Mannich and Ganz), A., i, 20.

3-Benzyl-1:2-dimethylindole (Kuroda), A., i, 603.

1-Benzyl-3:5-dimethylpyrazole, and its picrate (v. Auwers and Broche), A., i, 152.

Benzylethylaminotriphenylmethane, 2″:4″-*di*nitro- (Downey and Lowy), A., i, 579.

Benzylformazyl (Walker), T., 2778.

α-Benzylglyceric acid (Mannich and Ganz), A., i, 20.

o-**Benzylguaiacol** (Claisen), A., i, 1094.

2-Benzyl*cyclo*hexane 3:6-dione-1:2-dicarboxylic acid, methyl ester, and its diphenylhydrazone (Helferich and Bodenbender), A., i, 678.

4-Benzylhydantoin-3-α-propionic acid, 4-*p*-hydroxy-, and its ethyl ester (Hahn, Kelley, and Schaeffer), A., i, 487.

Benzylidene bromide and chloride bromide, 3:5-*di*bromo-4-hydroxy-, and its acetate (Lindemann), A., i, 687.

Benzylideneacetyl-*o*-tolidine, 2:4-*di*nitro- (Downey and Lowy), A., i, 578.

Benzylidene-*p*-aminoazobenzene, 2:4-*di*nitro- (Downey and Lowy), A., i, 578.

Benzylidene-*o*-aminophenylacetic acid, *o*′-amino-, acetyl derivative, and *o*′- and *p*′-chloro- (Neber and Röcker), A., i, 946.

α-Benzylidene-*o*-aminophenylcinnamic acid, α-*o*′-nitro- (Neber and Röcker), A., i, 946.

α-Benzylideneamino*iso*propyl alcohol (Staub), A., i, 140.

6-Benzylideneamino-*m*-tolylarsinic acid, and 6-*p*′-chloro- (Johnson and Adams), A., i, 725.

Benzylideneaniline, compound of anisylideneaniline and (Pascal), A., i, 1090.

Benzylideneaniline, 3:5-*di*bromo-4-hydroxy- (Lindemann), A., i, 687.

Benzylidene-*o*- and -*p*-arsanilic acids (Johnson and Adams), A., i, 724, 725.

Benzylidenecampholic acid, brominated lactones from (Rupe and Sulger), A., i, 797.

5-Benzylidene-3-camphylrhodanine, and *m*-nitro- (Gendelman), A., i, 606.

Benzylidene-*o*- and *p*-chloroanilines, 2:4-*di*nitro- (Downey and Lowy), A., i, 578.

Benzylidene-*op*-*di*chloroaniline, 2:4-*di*nitro- (Downey and Lowy), A., i, 578.

Benzylidenediacetyl monoxime, bisnitroso-derivative, and its derivatives (Diels), A., i, 822.

2-Benzylidene-1:4-dihydroquinoxalone (Gault and Weick), A., i, 36.

as-**Benzylidenediphenylacetone.** See Benzhydryl styryl ketone.

Benzylidenediquinaldine, salts of (Hamer), T., 256.

Benzylidenedi-4-salicylic acid, *op*-*di*nitro- (Downey and Lowy), A., i, 579.

Benzylideneimines, absorption spectra and structure of acid salts of (Izmailski), A., ii, 359.

Benzylidenemalonic-acetic anhydride (Staudinger and Schneider), A., i, 466.

Benzylidenemalonic anhydride (Staudinger and Schneider), A., i, 466.

Benzylidenemethylamine, action of, on trinitrotoluenes, and on bromo- and chloro-trinitrobenzenes (Giua), A., i, 455.

Benzylidenemethyl*iso*oxazolone, and *p*-chloro-, oxidation products of (Betti and Viansino), A., i, 1024.

Benzylideneoxindole, amino-, chloro-, and nitro-derivatives (Weber and Röcker), A., i, 946.
  o-nitro-, and its hydrochloride (Kirchner), A., i, 913.
Benzylidenepinacolin, reduction of (Hill, Spear, and Lachowicz), A., i, 789.
5-Benzylidenerhodanine, *mp*-dihydroxy- (Gendelman), A., i, 606.
Benzylidenethebainone (Gulland and Robinson), T., 1004.
3-Benzylidenethioflavanone, and its phenylhydrazone (Arndt, Flemming, Scholz, and Löwensohn), A., i, 827.
5-Benzylidenethiohydantoin, *p*-chloro- (Gendelman), A., i, 605.
Benzylidene-*o*-tolidine, 2:4 *di*nitro- (Downey and Lowy), A., i, 578.
γ-Benzyliminobutyronitrile, and its salts (Bruylants), A., i, 1003.
Benzylmercuric phenylmercaptide (Sachs, Antoine, and Schlesinger), A., i, 1248.
Benzylmethylaminomethylmalonic acid, and its derivatives (Mannich and Ganz), A., i, 20.
Benzylmethylcarbamidomethylmalonic acid (Mannich and Ganz), A., i, 20.
α-Benzyl β-methylcarbamidopropionic acid (Mannich and Gray), A., i, 20.
***d*-Benzylmethylcarbinol**, preparation and rotation of the *n*-alkyl ethers of (Phillips), T., 22.
  preparation of *l*-benzylmethylcarbinyl acetate from (Phillips), T., 47.
5-Benzyl-10-methyldihydroacridine, 2:8-*di*amino-, and its dihydrochloride (Karrer), A., i, 706.
cis- and *trans*-**α-Benzyl-β-methylglutaconic acids**, derivatives of (Feist and Rauterberg). A., i, 112.
3-Benzyl-2-methylindole (Kuroda), A., i, 603.
Benzylmethylketen (Staudinger, Schneider, Schotz, and Strong), A., i, 469.
1-Benzyl-3-methylpyrazole, and its derivatives (v. Auwers and Broche), A., i, 151.
7-Benzylmethylxanthines (Traube), A., i, 1137.
1-Benzylmorphopyrrolidine, and its salts (v. Braun and Seemann), A., i, 1118.
β-Benzylnaphthindole-1:2-dione (Staudinger), A., i, 938.
***o*-Benzyl-α- and -β-naphthols** (Claisen), A., i, 1094.
Benzyl-α-naphthylmethylmethylamine, and its salts (v. Braun and Moldaenke), A., i, 1195.
Benzyloxindole (Kirchner), A., i, 913.
1-Benzyloxyindole-2-carboxylic acid, and its ethyl and methyl esters (Gabriel, Gerhard, and Wolter), A., i, 704.
***o*-Benzyloxytriphenylcarbinol**, and its derivatives (Gomberg and Nishida), A., i, 212.
***p*-Benzyloxytriphenylmethane** (Gomberg and Buchler), A., i, 211.
***p*-Benzyloxytriphenylmethyl**, and its salts and derivatives (Gomberg and Buchler), A., i, 211.
***o*-Benzylphenol** (Claisen), A., i, 1094.
Benzyl-β-phenylethylamine, and its salts and derivatives (v. Braun, Blessing, and Zobel), A., i, 1089.
Benzyl-γ-phenylpropylamine, and nitroso- (v. Braun, Blessing, and Zobel), A., i, 1089.
Benzylphosphinic acid, α-hydroxy-, esters (Conant, Wallingford, and Gandheker), A., i, 498.
ω-Benzylpinacolin, and its oxime (Hill, Spear, and Lachowicz), A., i, 789.
Benzylpiperidinomethylmalonic acid, and its salts (Mannich and Ganz), A., i, 20.
α-Benzyl-β-piperidinopropionic acid, and its ethyl ester, hydrochlorides (Mannich and Ganz), A., i, 20.
β-Benzylpropionic acid semicarbazone (Attwood, Stevenson, and Thorpe), T., 1762.
cis-**1-Benzylpyrrolidine-2:5-dicarboxylic acid**, ethyl ester, and its salts (v. Braun and Seemann), A., i, 1118.
Benzylsulphoneacetic acid, and its salts and derivatives (Lesser and Mehrländer), A., i, 828.
Benzylthiobenzanilides (Rivier and Schalch), A., i, 793.
***S*-Benzylthiolacetic acid**, and its salts and acid chloride, and *o*-cyano- (Lesser and Mehrländer), A., i, 828.
Benzylthiol-1-*iso*amylthiolanthraquinones (Hoffman and Reid), A., i, 933.
Benzylthiolanthraquinonesulphonic acids, and their sodium salts (Hoffman and Reid), A., i, 933.
Benzylthiol-1-butylthiolanthraquinones (Hoffman and Reid), A., i, 933.
Benzylthiol-1-ethylthiolanthraquinones (Hoffman and Reid), A., i, 933.
α-Benzylthiol-*p*-methylcinnamic acid (Gendelman), A., i, 606.

Benzylthiol-1-methylthiolanthraquinones (Hoffman and Reid), A., i, 933.
5-**Benzylthiol-4-phenylmethyltriazole**, 3-hydroxy- (Fromm and Nehring), A., i, 859.
5-**Benzylthiol-4-phenyltriazole**, 3-hydroxy- (Fromm and Nehring), A., i, 858.
Benzylthiol-1-propylthiolanthraquinones (Hoffman and Reid), A., i, 933.
5-**Benzylthioltriazole**, 3-hydroxy- (Fromm and Nehring), A., i, 859.
7-**Benzylxanthine** (Traube), A., i, 1137.
Beri-beri, cholesterol in (Lawaczeck), A., i, 512; (Hotta), A., i, 732.
Beryl from Ishikawa (Uyemura), A., ii, 692.
  extraction of glucina from (Britton), A., ii, 28.
Beryllia. See Glucinum oxide.
Betaine, preparation and properties of (Reychler), A., i, 758.
Betol. See Salicylic acid, β-naphthyl ester.
Betulin, and its derivatives (Vesterberg; Traubenberg), A., i, 590.
  and *mono*bromo-, and its diacetate (Dischendorfer), A., i, 123.
Betulinic acid (Traubenberg), A., i, 590.
Bettendorf's reagent, replacement of (Rupp and Muschiol), A., ii, 335.
Bile, effect of magnesium sulphate on secretion of (Frazer), A., i, 270.
  estimation of acids in (Rosenthal and v. Falkenhausen), A., ii, 667.
Bile acids (Wieland), A., i, 41; (Wieland and Schlichting), A., i, 41; (Schenck), A., i, 678; (Wieland and Fukelman), A., i, 1205; (Wieland, Honold, and Pascual Vila), A., i, 1206.
  relation of cholesterol to (Windaus), A., i, 922.
  secretion of, in cystinuria (Eppinger), A., i, 631.
  estimation of, in duodenal juice (Meyer), A., ii, 891.
Bile pigments (Fischer and Niemann; Fischer and Loy), A., i, 718.
  constitution of (Benary), A., i, 1144.
Bilirubin, action of diazomethane on (Küster and Maag), A., i, 242.
  estimation of, in plasma (Lucas, Dearing, Hoobler, Cox, Jones, and Smyth), A., i, 410.
Bilobanic acid, and its sodium salt and derivatives (Wieland and Fukelman), A., i, 1206.
Biloidanic acid, structure of (Wieland and Schlichting), A., i, 41.
Binary systems, solidification of (Giua; Bell), A., ii, 611.
  influence of substitution on equilibria in (Kremann, Sutter, Sitte, Strzelba, and Dobotzky), A., i, 45; (Kremann, Mauermann, Müller, and Rösler), A., i, 332; (Kremann, Mauermann, and Oswald), A., i, 336; (Kremann and Mauermann), A., i, 378; (Kremann, Hönigsberg, and Mauermann), A., i, 908.
Biological reactions, physico-chemical studies on (Hirsch and Kossuth), A., i, 440.
Biology, importance of sequence in (Karczag and Hajós), A., i, 1041.
Bioluminescence (Harvey), A., i, 260.
Birch tar, dokozanic acid from (Traubenberg), A., i, 298.
Bird-lime (Nishizawa), A., i, 282.
  Japanese (Yanagisawa and Takashima), A., i, 1008.
Bis-*N*-acetylindazyl 3-ether (Heller and Köhler), A., i, 851.
Bis-aminodihydrocarbostyrilspiran, and its hydrochloride (Radulescu), A., i, 1240.
Bis-β-*p*-aminophenylethylamine, and its salts and derivatives (v. Braun and Blessing), A., i, 1230.
Bis-*peri*-anthracenopenthiophen (Friedländer and Simon), A., i, 109.
4:4′-**Bisazobenzeneformamidine** (Passerini), A., i, 64.
Bisbenz*iso*pyrazolyl (Heller and Köhler), A., i, 851.
Bis-2:5-*p*-bromobenzeneazodi-iodopyrrole (Pieroni and Moggi), A., i, 613.
2:4-**Bis(5′-bromo-2′-*p*-xylylazo)-α-naphthol** (Wheeler and Constable), A., i, 1027.
2:4-**Bis(5′-bromo-2′-*p*-xylylazo)phenol** (Wheeler and Constable), A., i, 1027.
2:4-**Bis(5′-bromo-2′-*p*-xylylazo)resorcinol** (Wheeler and Constable), A., i, 1027.
Bis-5-chloroacetyl-2:4-dimethylpyrrylmethane (Fischer, Weiss, and Schubert), A., i, 703.
Bisdiethylaminotriphenylmethane, 2″:4″-*di*nitro- (Downey and Lowy), A., i, 579.
Bis-*N*:*N*′-diethylglyoxalonedioxin (Biltz and Lemberg), A., i, 958.
Bis-1:2-di-indoyl. See Bis-1:2-indil.
Bis-5-dimethylaminoacetyl-2:4-dimethylpyrrylmethane (Fischer, Weiss, and Schubert), A., i, 703.

2:6-Bis-*p*-dimethylaminostyryl-β-benzbisthiazole dimethiodide (Edge), T., 2332.

Bis-2:4-dimethyl-3-ethylpyrrylmethene *per*chlorate (Fischer and Schubert), A., i, 708.

Bis-*N*:*N*′-dimethylglyoxalonodiexin (Biltz and Lemberg), A., i, 959.

Bis-2:4-dimethylpyrrylmethene, and its salts (Fischer, Weiss, and Schubert), A., i, 703; (Fischer and Schubert), A., i, 709.

Bis-*o*-ethoxymethylbenzylamine, and its derivatives (v. Braun and Zobel), A., i, 1200.

Bis-2-ethylbenzothiazoline-1:1-spiran (Mills, Clark, and Aeschlimann), T., 2369.

Bis-(4-hydroxy-3-carbethoxy-2-methylpyrryl)diketone (Fischer and Loy), A., i, 719.

Bis-(4-hydroxy-3-carbethoxy-2-methylpyrryl)methene (Fischer and Loy), A., i, 719.

3:3′-Bis-1-hydroxyindolyl-2:2′-dicarboxylic acid, and its derivatives (Gabriel, Gerhard, and Wolter), A., i, 705.

α-Bis(4-hydroxy-2-methyl-3 *iso*propylphenyl)ethane, β-chloro- (Hinsberg), A., i, 923.

Bis-β-*p*-hydroxyphenylethylamine, and its salts and derivatives (v. Braun and Blessing), A., i, 1231.

Bis-1:2-indil (Sanna), A., i, 57.

α- and **β-Bis-3:3′-indolyl,** and their derivatives (Gabriel, Gerhard, and Wolter), A., i, 706.

Bis 3:3′ indolyl-2-carboxylic acid and its ethyl ester and its iodides (Gabriel, Gerhard, and Wolter), A., i, 706.

Bis-3:3′-indolyl-2:2′-dicarboxylic acid, and its salts and derivatives (Gabriel, Gerhard, and Wolter), A., i, 705.

Bismarck brown hydroferrocyanide (Cumming), T., 2459.

Bis-2-methylbenzothiazoline-1:1-spiran, and its derivatives (Mills, Clark, and Aeschlimann), T., 2369.

Bis-(2-methyl-3-carbethoxypyrryl)furan (Fischer and Loy), A., i, 719.

Bis-*N*-methylglyoxalonodiexin (Biltz and Lemberg), A., i, 960.

Bis-*N*-methyl-α-methyldihydroindylmethane (v. Braun and Seemann), A., i, 1242.

Bis-1-methyl-1:2:3:4-tetrahydroquinolylmethane (v. Braun and Seemann), A., i, 1242.

Bismuth, crystal structure of (McKeehan), A., ii, 173.

Bismuth, electrochemical properties of (Grube and Schweigardt), A., ii, 457.
- electrode potential of (Smith), A., ii, 210; (Swift), A., ii, 211.
- in the brain (Lemay and Jaloustre), A., i, 1038.

Bismuth alloys with antimony and zinc, electrochemistry of (Kremann, Langbauer, and Rauch), A., ii, 825.
- with cadmium and lead, electrochemistry of (Kremann and Langbauer), A., ii, 826.
- with lead and tin, crystallography of (Bux), A., ii, 419.
- with thallium, conductivity of (Guertler and Schulze), A., ii, 772.
- with tin (Bornemann and Siebe), A., ii, 169.
- with tin and zinc (Muzaffar), T., 2341.

Bismuth salts, conductivity and solubility of (Smith), A., ii, 210.
- action of dextrose on (Cousin), A., ii, 772.

Bismuth *per*chlorates (Fichter and Jenny), A., ii, 245.
- *tri*chloride, absorption of light by (Macbeth and Maxwell), T., 370.
  - hydrolysis of (Jellinek and Kühn), A., ii, 772.
  - compound of benzamide and (Belladen and Astengo), A., i, 1010.
- *sub*nitrate (Isnard), A., ii, 328.
- cobaltnitrites (Ogburn), A., ii, 328.
- *tetr*oxide, formation of, from sodium bismuthate (Corfield and Woodward), A., ii, 691.
- sodium thiosulphate, preparation of, and use in estimation of potassium (Cuisinier), A., ii, 38.

Bismuth organic compounds:—
- iodides of alkaloids (François and Blanc), A., i, 830.
- thiocyanates, complex (Paciello and Foà), A., i, 1076.

Bismuth detection, estimation, and separation:—
- Reinsch test for (Evans), A., ii, 696, 875.
- detection of, in urine (Dezani), A., ii, 342; (Ganassini), A., ii, 439.
- detection of small quantities of, in biological liquids (Caille and Viel), A., ii, 585.
- estimation of (Köster), A., ii, 93.
- estimation of small quantities of, colorimetrically (Cuny and Poirot), A., ii, 792.

Bismuth detection, estimation, and separation:—
estimation of, in urine (GANASSINI), A., ii, 93.
estimation of, and separation from lead, copper, and cadmium (LUFF), A., ii, 263.
Bismuthamines (VOURNAZOS), A., i, 759.
Bismuthobromoacetic acid, salts of (VOURNAZOS), A., i, 745, 759.
Bismuthobromobenzoic acid, *n*-propylamine salt (VOURNAZOS), A., i, 759.
Bismuthobromoformic acid, methylamine salt (VOURNAZOS), A., i, 759.
Bismuthochloroacetic acid, hydrazine salt (VOURNAZOS), A., i, 759.
Bismuthochloropropionic acid, *o*-toluidine salt (VOURNAZOS), A., i, 759.
Bismuthocitric acid (MOLES and PORTILLO), A., i, 179.
Bismuthofluoroacetic acid, aniline salt (VOURNAZOS), A. i, 759.
Bismuthoiodoacetic acid, ethylamine salt (VOURNAZOS), A., i, 759.
Bismutholactic acid (MOLES and PORTILLO), A., i, 179.
Bismuthotartaric acid (MOLES and PORTILLO), A., i, 179.
Bisnaphthaleneoxide (BAMBERGER, BAUM, and SCHLEIN), A., i, 1142.
Bis-*op-di*nitrobenzylmalonic acid, ethyl ester (RADULESCU), A., i, 1240.
Bis-β-phenoxy-*o*-ethoxyphenyl ethylene ether (KOHN and SAFRIN), A., i, 559.
Bis-γ-phenoxy-*o*-propoxyphenyl ethers (KOHN and SAFRIN), A., i, 560.
Bisphenylethylamine, derivatives of (v. BRAUN and BLESSING), A., i, 1230.
4:4′-Bis-1-phenyl-2-pentadecylpyrazol-5-one (HELFERICH and KOSTER), A., i, 1178.
Bisthioanthrone sulphides (HEILBRON and HEATON), T., 183.
Bistriazohydroxymesitylene (MORGAN and DAVIES), T., 235.
Bistriazomesidine (MORGAN and DAVIES), T., 237.
Bistriazomesitylene (MORGAN and DAVIES), T., 233.
Bistriazonitromesitylene (MORGAN and DAVIES), T., 235.
αα-Bistrimethoxyphenylethane, β-amino-, and its hydrochloride (HINSBERG), A., i, 556.
Biuret, alkyl derivatives of (BILTZ and JELTSCH), A., i, 1074.
Bixin, and its isomerides (HERZIG, FALTIS, PITTNER, KLEIN, and WATZINGER), A., i, 477.
Bleaching powder, stability of (OCHI), A., ii, 564.
Bleaching powder, estimation of, volumetrically (KOLTHOFF), A., ii, 249.
estimation of chlorine in (OCHI), A., ii, 573.
Blende, absorption spectrum and refractive index of (MELL), A., ii, 513.
estimation of fluorine in (ROCHA-SCHMIDT and KRÜGER), A., ii, 782.
Blood, hydrogen-ion concentration of, in carcinoma (CHAMBERS; CHAMBERS, and KLEINSCHMIDT), A., i, 512.
oxygen-dissociation curve of (BROWN and HILL), A., i, 398.
effect of mental work on (KNIPPING), A., i, 502.
effect of exercise on the circulation of (LUNDSGAARD and MÖLLER), A., i, 502, 623, 727; (BARR, HIMWICH, and GREEN), A., i, 623; (BARR and HIMWICH), A., i, 623, 624.
effect of deprivation of water on concentration of (UNDERHILL and KAPSINOW), A., i, 162.
coagulation of (SIBBER and SANO), A., i, 410, 411, 1151; (HIRUMA), A., i, 974.
effect of buffer salts on (JABLONS), A., i, 1252.
effect of pancreatic rennin on (EPSTEIN and ROSENTHAL), A., i, 628.
injection of peptone to prevent, and its effect on gaseous metabolism (KELEMEN), A., i, 505.
Blood, solubility of acetylene in (SCHOEN), A., i, 727.
adrenaline in (ASHER and SCHNEIDER), A., i, 410.
concentration of alcohol in (MILES), A., i, 71.
alkalinity of (GUILLAUMIN), A., i, 164.
amino-acids in (MARINO), A., i, 1036, 1251.
amino-acid nitrogen in (BLAU), A., i, 1250.
effect of coagulation on the amino-nitrogen in (PETITJEAN), A., i, 1036.
ammonia content of (HENRIQUES), A., i, 1250.
ammonia in, in nephritis (RUSSELL), A., i, 514.
arsenic in, after injection of salvarsan (FORDYCE, ROSEN, and MYERS), A., i, 1263.
bicarbonate content and buffer value of (VAN SLYKE, HASTINGS, and NEILL), A., i, 163.
buffer values of (DOISY, BRIGGS, EATON, and CHAMBERS), A., i, 164.

Blood, calcium content of, during pregnancy (Widdows), A., i, 502.
  after thyroidectomy (Parhon), A., i, 972.
 effect of carbon dioxide in, on respiration and circulation (Schneider and Truesdell), A., i, 1035.
 catalase in (Tsuchihashi), A., i, 1147; (v. Moraczevski), A., i, 1251.
 cholesterol in (Tietz), A., i, 417.
 fat in, in avitaminosis (Collazo and Bosch), A., i, 1262.
 gas and electrolyte equilibria in (Van Slyke, Hastings, Heidelberger, and Neill), A., i, 162; (Van Slyke, Hastings, and Neill), A., i, 163; (Van Slyke, Wu, and McLean), A., i, 1249.
 analysis of gases in (Straub and Gollwitzer-Meier), A., i, 503.
 origin of lipase in (Hiruma), A., i, 1037.
 lipoids in (Jung and Wolff), A., i, 504, 624; (Epstein and Lande), A., i, 624.
 mineral constituents of (Desgrez and Meunier), A., i, 409.
 changes in, under the influence of morphine (Atkinson and Ets), A., i, 1252.
 non-protein nitrogen constituents of (Plass), A., i, 875.
 formation of pentose nucleotide in, under the action of insulin (Berkeley), A., i, 1259.
 distribution of phosphates in (Zucker and Gutman). A., i, 973.
 phosphorus in (Buell), A., i, 875.
 inorganic phosphorus in serum and plasma of (Tolstoi), A., i, 504.
 pigments of (Fischer and Schneller), A., i, 964.
 proteins of, tryptophan and tyrosine content of (Kiyotaki), A., i, 399.
 production of acetaldehyde from pyruvic acid in (Stepp and Behrens), A., i, 625.
 sugar in (Rosenberg), A., i, 1154.
  distribution of (John), A., i, 973.
  concentration of (Foster), A., i, 503.
  nature of (Hewitt), A., i, 973.
 relation of sugar to fat in (Olivier and Haworth), A., i, 1251.
 lowering of sugar in, by yeast (Winter and Smith), A., i, 513.
 effect of adrenaline and insulin on the sugar in (Lyman, Nicholls, and McCann), A., i, 1035.
 effect of choline on the sugar in (Dresel and Zemmin), A., i, 1035.
Blood, effect of ergotamine on sugar in (Lesser and Zipf), A., i, 1150.
 effect of insulin on sugar concentration in (Winter and Smith), A., i, 727.
 effect of plant extracts on sugar in (Collip), A., i, 728; (Thallinner and Perry), A., i, 967.
 polysaccharides in, in diabetes (Winter and Smith), A., i, 513.
 effect of, on the action of thyroxin (Romeis), A., i, 1251.
 urea in (Marie), A., i, 74.
 concentration of urea in saliva and (Schmitz), A., i, 625.
 uric acid in (Weil and Guillaumin), A., i, 728; (Scheunert and v. Pelchrzim; Schmitt-Krahmer), A., i, 973.
 of various species, uric acid compound in (Newton and Davis), A., i, 165.
 neutrality of (Mellanby and Wood), A., i, 165.
 constituents of, of a variety of vertebrates (Scheunert and v. Pelchrzim), A., i, 973.
 arterial and venous, distribution of chlorides in (Doisy and Beckmann), A., i, 164.
 capillary, oxygen content of (Verzár and Keller), A., i, 1250.
 children's, inorganic phosphorus in (Anderson), A., i, 502.
 of marine fish, non-protein organic constituents in (Denis), A., i, 164.
 fœtal and maternal (Howe and Givens), A., i, 1036.
 horse's, influence of daily work on (Scheunert and Bartsch), A., i, 974.
 human, adenine nucleotide in (Jackson), A., i, 1255.
  absorption of carbon dioxide by (Peters), A., i, 1249.
  distribution of urea in (Cohen), A., i, 1037.
  estimation of calcium, magnesium, potassium, and sodium in (Mirkin and Druskin), A., ii, 507.
 infant's, seasonal tide of phosphates in (Hess and Lundagen), A., i, 624.
 of the new-born (Lucas, Dearing, Hoobler, Coe, Jones, and Smyth), A., i, 410.
 normal and diabetic, glycolysis in (Denis and Giles), A., i, 1262.
 ox, uric acid compound in (Davis, Newton, and Benedict; Newton and Davis), A., i, 165.
 of pigeons in avitaminosis (Marchlewski and Nowotnówna), A., i, 879.

Blood detection and estimation:—
- detection of (BECCADELLI), A., ii, 271.
- detection of urobilin in (RODILLON), A., ii, 100.
- estimation of acetone and β-hydroxybutyric acid in (LUBLIN), A , ii, 268.
- estimation of alkali of (GREENWALD and LEWMAN), A., ii, 87; (GOLLWITZER), A., ii, 248; (SUMNER, HUBBARD, and FINNER), A., ii, 790.
- estimation of calcium in (DE TONI), A., ii, 87.
- estimation of carbon monoxide in (SAYERS, YANT, and JONES), A., ii, 789.
- estimation of catalase in (OKEY), A., ii, 512.
- estimation of chlorides in (GREENWALD and GROSS), A., ii, 83.
- micro-estimation of chlorine in (IVERSEN and SCHIERBECK; IVERSEN), A., ii, 176.
- estimation of choline in (SHARPE), A., ii, 444.
- estimation of dextrose and lactose in (THALLINNER and PERRY), A., ii, 440.
- estimation of diastase in (FYFE), A., ii, 892.
- estimation of ethyl ether in (HAGGARD), A., ii, 343.
- estimation of fibrinogen in (HOWE; RUSZNYÁK and BARÁT), A., ii, 890.
- estimation of iron in (FONTÈS and THIVOLLE), A., ii, 583.
- estimation of iron and hæmoglobin in, colorimetrically (WONG), A., ii, 435.
- estimation of lactic acid in (MACLEOD and ARMOUR), A., ii, 663.
- estimation of lipoids in (LEMELAND), A., ii, 347.
- estimation of non-protein nitrogen in (CRISTOL and NIKOLITCH), A., ii, 653.
- estimation of phenols in (RAKESTRAW), A., ii, 587.
- estimation of total phosphoric acid in (GROTE), A., ii, 655.
- estimation of salvarsan in, colorimetrically (KOLLS and YOUMANS), A., ii, 800.
- estimation of sodium in (RICHTER-QUITTNER), A., ii, 256.
- estimation of sugars in (HAGEDORN and JENSEN), A., ii, 265 440; (ROSENTHAL), A., ii, 265; (CALVERT), A., ii, 345; (DENIGÈS), A., ii, 661.
- estimation of tyrosine in (HAAS; HAAS and TRAUTMANN), A., ii, 443.

Blood detection and estimation:—
- estimation of urea in (BOGGS and McELLROY), A., ii, 443; (BEHRE), A., ii, 666.
- estimation of uric acid in (SACHNOVSKA and ZALESKI; BROWN and RAIZISS; ROGERS), A., ii, 510.

Blood-corpuscles, influence of α-rays on (STRAUB and GOLLWITZER-MEIER), A., i, 503.
- adsorption of protein degradation products by (SBARSKY), A., i, 411, 1252; (SBARSKY and MICHLIN), A., i, 1252.
- white, glycogen in (HABERLANDT), A., i, 411.
- red, distribution of hæmoglobin in (GORTER), A., i, 875.
- swelling and hæmolysis of (GOLLWITZER-MEIER), A., i, 974.
- ionic exchange between phosphate buffer mixtures and (KROEIZ), A., i, 503.

Blood pigments, fission products of (FISCHER and SCHUBERT), A., i, 707.

Blood plasma, fatty acids of (BLOOR), A., i, 1250.
- alkali reserve of, in avitaminosis (COLLAZO), A., i, 1150.
- in nephritis (MARRACK), A., i, 732.
- estimation of proteins in (RUSZNYÁK), A., ii, 891.

Blood-serum, constituents of, in nephritis (DENIS and HOBSON), A., i, 514.
- viscosity of, in ratio to the albumin-globulin ratio (NEUSCHLOSZ and TRELLES), A., i, 1252.
- effect of formaldehyde on (HENLEY), A., i, 1253.
- decomposition of glycogen by (FUCHS and HETÉNYI), A., i, 625.
- effect of, on hæmolysis (PONDER), A., i, 975.
- antipeptic action of (SROLZ), A., i, 1253.
- concentration of phosphorus and calcium in (KRAMER and HOWLAND), A., i, 71.
- changes in the sugar content of (STASIAK), A., i, 1151.
- maternal and fœtal, constituents of (BOGERT and PLASS), A., i, 974; (PLASS and TOMPKINS), A., i, 975.
- estimation of calcium salts in (KRAMER, TISDALL, and HOWLAND), A., i, 412.
- estimation of uric acid in (CHANTRAINE), A., ii, 270.

Blowpipe, oxy-acetylene, use of, in spectral analysis (DE GRAMONT), A., ii, 429.

Body fluids, physico-chemical investigation of (RUSZNYÁK), A., i, 1143.

Body weight, influence of cell salts on (Asada), A., i, 1152.

Boiling point, determination of (Bergstrom), A., ii, 56.
    by distillation from test tubes (Boldyrev), A., ii, 293.
    of double salts in solution (Bourion and Rouyer), A., ii, 57.
  determination of elevation of (Jabłczyński and Kon), T., 2953.
  relation between melting point, critical temperature, and (van Aubel), A., ii, 125.

Boiling point apparatus, Beckmann's, outer jacket for (Spencer), A., ii, 215.

Boletus edulis, urease of (Goris and Costy), A., i, 405.

Boletus Satanas, constituents of (Bard and Zellner), A., i, 987.

Bone, influence of diet on the growth of (Shipley; Howe), A., i, 269.

Bone ash, analysis of, in war osteopathy (Loll), A., i, 514.

Borax. See Sodium borate.

Boric acid. See under Boron.

Borneol, action of light on acetone and (Scagliarini and Saladini), A., i, 588.

l-**Bornylacetic acid**, and its barium salt (Komatsu and Fujii), A., i, 234.

*iso***Bornylacetic acid**, esters (Komatsu and Fujii), A., i, 234.

Bornylene, action of hypochlorous acid on (Henderson and Mair), T., 1155.
  chlorohydrin, and its derivatives (Henderson and Mair), T., 1157.

Boron, atomic weight of (Stock and Kuss), A., ii, 157, 856; (Hönigschmidt and Birckenbäch), A., ii, 559.
  valency of (Böeseken), A., ii, 406.
  occurrence of, in animal organs (Moscati), A., i, 878.
  X-ray spectra of (McLennan and Clark), A., ii, 51.
  cementation with (Parravano and Mazzetti), A., ii, 248.

Boron *tri*bromide and *tri*chloride, preparation of, pure (Stock and Kuss), A., ii, 560.
  chloride, preparation of (Mazzetti and de Carli), A., ii, 67.
  *tri*fluoride, cryoscopy of solutions of (Germann and Cleaveland), A., ii, 24.
  hydrides (Huggins), A., ii, 67; (Stock and Kuss), A., ii, 408.
  *tri*oxide, effect of, on the properties of borosilicate glass (Dimbleby, Hodkin, Parkin, and Turner; English and Turner), A., ii, 410.

Boron *tri*oxide, estimation of, in glass (Dimbleby and Turner), A., ii, 482.
  Boric acid, phosphorescent (Tiede and Ragoss), A., ii, 238.
    compounds of, with organic substances containing more than one hydroxyl group (Hermans), A., i, 557.
    effect of hydroxy-derivatives of anthraquinone and naphthalene on electrical conductivity of (Böeseken, Anema, and Brevet), A., i, 210.
    and borates, effect of, on plant growth (Warington), A., i, 1274.
    estimation of, by the Hönig-Spitz method (Rath), A., ii, 697.
    estimation of, volumetrically, in presence of phosphoric acid (Kolthoff), A., ii, 38.
  Perborates (Menzel), A., ii, 756.
    constitution of (Le Blanc and Zellmann), A., ii, 415.

Boron organic compounds:—
  phenyl and *p*-tolyl difluorides (Krause), A., i, 1034.

Borosilicates, effect of boric oxide on the properties of, in glass (Dimbleby, Hodkin, Parkin, and Turner; English and Turner), A., ii, 410.

Boswellia serrata, oil from gum-oleoresin of (Simonsen), A., i, 693.

Botrytis cinerea, action of ultra-violet light on alcoholic fermentation by (de Fazi), A., i, 634.

Botulinus toxin (Schubel), A., i, 516.

Bournonite, spectrophoto-electrical sensitivity of (Coblentz and Eckford), A., ii, 206.

Brain, composition of the grey and white matter of (Lenz; Slovtzov and Georgievskaja), A., i, 627.
  autolysis of the grey matter of (Georgievskaja), A., i, 628.
  cephalin and lecithin, fatty acids of (Levene and Rolf), A., i, 11.
  retention of bismuth by the (Lemay and Jaloustre), A., i, 1038.

Bramble. See *Rubus fruticosus*.

Brandy, detection of ethyl phthalate in (Eilles), A., ii, 796.

Brass, estimation of copper in, iodometrically (Batta and Lathiers), A., ii, 41.

Brassidic acid, and its anhydride (Holde and Zadek), A., i, 1058.

Brassylic acid, derivatives of (Holde and Zadek), A., i, 1058.

Braun's law, experimental proof of (Cohen, Ishikawa, and Moesveld), A., ii, 537.

Brochantite, in Katanga (Schoep), A., ii, 869.
Bromal, fusion, viscosity, and density of the system, water and (Efremov), A., i, 537.
Bromination (Rosenmund, Kuhnhenn, and Lesch), A., i, 1095.
  of aliphatic acids (Shaw), T., 2233.
  of carbonyl compounds (Ward), T., 2207.
  of organic compounds (Krause), A., i, 891.
Bromine, atomic weight of (Moles and Clavera), A., ii, 149.
  ionisation potential of (Noyes), A., ii, 455.
  cryoscopy of solutions in (Finkelstein), A., ii, 534.
  interaction of, with acetic anhydride (Orton, Watson, and Bayliss), T., 3081.
  action of, on ammonium salts (Simpson), A., ii, 684.
  reaction of ethylene with (Norrish), T., 3006; (Stewart and Edlund), A., ii, 304.
  action of, on hydrocarbons (Merfshkowsky), A., i, 527.
  action of, on phenylhydrazones (Humphries, Bloom, and Evans), T., 1766.
  Hydrobromic acid, ionising potential of (Mackay), A., ii, 821.
    preparation of an aqueous solution of, of constant boiling point (Druce), A., ii, 65.
    boiling and condensation curves of mixtures of water and (Carrière and Cerveau), A., ii, 555.
    composition of the vapour in equilibrium with aqueous solutions of (Vrevski, Zavaricki, and Scharlov), A., ii, 739.
    catalytic decomposition of hydrogen peroxide by solutions containing (Livingston and Bray), A., ii, 747.
  Bromides, detection of, in presence of thiocyanates (Spacu), A., ii, 34.
  Bromic acid, stability of, in boiling solutions (Smith), A., ii, 504.
    oxidation of arsenious acid by (Chodkowski), A., ii, 839.
    action of, on mercuric salts (Smith), A., ii, 573.
    use of, in volumetric analysis (Smith), A., ii, 504, 573.
    detection of, in mixtures of halogenates (Dimitrov), A., ii, 650.
    estimation of, electrometrically, with titanous sulphate (Hendrixson, A., ii, 781.
Bromine:—
  Bromic acid, estimation of, in ferric iron (Smith), A., ii, 650.
Bromine detection and estimation:—
  detection of (Dimitrov), A., ii, 649.
  detection of, in silver halides (Schmalfuss), A., ii, 248.
  estimation of, in organic compounds (Heslinga), A., ii, 782.
Bromine numbers, estimation of (Becker), A., ii, 886.
Bromopentamminecobalti-salts. See under Cobalt.
Bromopicrin, preparation and reactions of (Hunter), T., 543.
Bronze, estimation of copper in, iodometrically (Batta and Lathiers), A., ii, 41.
Brucinesulphonic acids, isomeric, reactions of (Leuchs and Zander), A., i, 359.
Brucinolic acid, esters of (Leuchs and Gladkorn), A., i, 942.
Brucinonic acid, and its derivatives (Leuchs and Gladkorn), A., i, 942.
Brugnatellite, from Monte Ramazzo (Artini), A., ii, 246.
Buchu-camphor, and its derivatives (Asahina and Kwada), A., i, 474.
  oxidation products of (Cusmano), A., i, 587.
  reduction of (Cusmano and Boccucci), A., i, 1214.
Buffer solutions (Simon), A., i, 12.
    phosphate, ionic exchange between blood-corpuscles and (Kroetz), A., i, 503.
    phosphates and tartrates as (Simon and Zivy), A., ii, 175.
    estimation of the value of (Lehmann), A., i, 266.
  systems of blood (Van Slyke, Hastings, and Neill), A., i, 163; (Doisy, Briggs, Eaton, and Chambers), A., i, 164.
Butadienes, *tetra*chloro-, isomeric (Kaufler), A., i, 1170.
$\Delta^{\alpha\gamma}$-Butadiene-ααδδ-tetracarboxylic acid, ethyl ester (Benary and Schinkopf), A., i, 179.
Butane, αδ-*di*bromo-, preparation of (Marvel and Tanenbaum), A., i, 2.
  αβγ-*tri*bromo- (Delaby), A., i, 289.
  αββδ-*tetra*bromo- (Demjanov and Dojarenko), A., i, 1193.
  αδ-dihalogen derivatives, synthesis of (Marvel and Tanenbaum; v. Braun and Lemke), A., i, 2.
*iso***Butane**, ααβγ- and αβγδ-*tetra*bromo-, and its derivatives, and *hexa*bromo- (Mereshkowsky), A., i, 528.

Butane-αδ-dicarboxylic-β-acetic acid (FARMER), T., 3329.

Butane-αδ-dicarboxylic-γ-acetic acid, β-hydroxy-, lactone (FARMER), T., 3337.

Butane-αδ-dicarboxylic-β-malonic acid, ethyl ester (FARMER), T., 3329.

Butane-ααδδ-tetracarboxylic acid, αβδ-*tri*bromo-, ethyl ester (BENARY and SCHINKOPF), A., i, 179.

Butanethiol, chloro- (DELÉPINE and ESCHENBRENNER), A., i, 743.

Butane-αβγ-triol, *tri*benzoate and epibromohydrin (DELABY), A., i, 289.

Butan-γ-ol, αβ-*di*bromo- (DELABY), A., i, 289.

Δβ-Butene, αδ-*di*bromo-, action of trimethylamine on (v. BRAUN and LEMKE), A., i, 5.
  thiocyanate derivatives of (v. BRAUN and LEMKE), A., i, 6.

Δα-Butene-ααδδ-tetracarboxylic acid, ethyl ester, and its lead salt and derivatives (BENARY and SCHINKOPF), A., i, 179.

Butenonitriles (BRUYLANTS), A., i, 762.

Δβ-Butenyl thiocyanate (v. BRAUN and SCHIRMACHER), A., i, 287.

o- and *p*-**Δβ-Butenylanisoles** (v. BRAUN and SCHIRMACHER, A., i, 286.

Δβ Butenylbenzene (v. BRAUN and SCHIRMACHER), A., i, 286.

Δγ-Butenyldiethylamine, and its salts (G. M. and R. ROBINSON), T., 540.

Δβ-Butenylhomocholine (v. BRAUN and SCHIRMACHER), A., i, 287.

2-Δβ-Butenyl-α-naphthol, and the methyl ether (v. BRAUN and SCHIRMACHER), A., i, 286.

Δβ-Butenylnorcodeine, and its salts (v. BRAUN and SCHIRMACHER), A., i, 287.

o-**Δβ-Butenylphenol** (v. BRAUN and SCHIRMACHER), A., i, 286.

β-*n*-and *iso*-**Butoxybenzylacetophenones**, α-bromo- (DUFRAISSE and GÉRALD), A., i, 114.

1-*n*-Butoxymethylpiperidine (G. M. and R. ROBINSON), T., 537.

Butyl hypochlorites (CHATTAWAY and BACKEBERG), T., 3001.

n-**Butyl series**, studies in the (MORGAN and HICKINBOTTOM), T., 97.

tert.-**Butylacetylene.** See δδ-Dimethyl-Δβ-pentinene.

*iso***Butyl alcohol**, mutual solubility of water and (VERSCHAFFELT), A., ii, 617.

tert.-**Butyl alcohol**, *tri*chloro-, nitrobenzoate (ALDRICH), A., i, 924.

tert.-**Butylallene.** See δδ-Dimethyl-Δαβ-pentadiene.

n-**Butylamines**, toxicity of (HANZLIK), A., i, 419.

9-*n*-Butylanthracene, and its picrate (SIEGLITZ and MARX), A., i, 913.

n-**Butylarsine** dichloride and oxide (TIFFENEAU), A., i, 766.

n-**Butylarsinic acid** (TIFFENEAU), A., i, 766.

Butyl*iso*butylbarbituric acid (SOMMAIRE), A., i, 387.

N-*n*-**Butylcarbazole**, 3-nitro- (STEVENS and TUCKER), T., 2144.

n-**Butylcarbimide** (KAUFMANN and ADAMS), A., i, 931.

n-**Butylcatechin** tetramethyl ether (DRUMM), A., i, 1221.

9-*n*-Butyl-9:10-dihydroanthracene (SIEGLITZ and MARX), A., i, 913.

Butylene, action of selenium oxychloride on (FRICK), A., i, 890.

Δα-Butylene, αβ-*di*amino-, dibenzoyl derivative (WINDAUS and LANGENBECK), A., i, 147.

n-**Butylene-βγ-di-*p* tolyl*di*nitrosodiamines**, and their derivatives (MORGAN and HICKINBOTTOM), T., 101.

β-*iso***Butylglutaric acid**, preparation and derivatives of (CURTIS, DAY, and KIMMINS), T., 3136.

Butylene glycol, formation of, by bacterial fermentation of calcium lactate (LEMOIGNE), A., i, 1267.
  formation of, by fermentation of dextrose (LEMOIGNE), A., i, 1041.

Butylglycerol and its triacetate (DELABY), A., i, 85.

Butylheptylmalonic acid, and its ethyl ester (LEVENE and TAYLOR), A., i, 82.

n-**Butylmalonic acid**, *iso*propyl ester (SHONLE and MOMENT), A., i, 249.

sec.- and *iso*-**Butylmalonic acids**, ethyl esters (SHONLE and MOMENT), A., i, 249.

α-**Butylnonoic acid** and its ethyl ester (LEVENE and TAYLOR), A., i, 82.

β-**Butylnonyl alcohol** (LEVENE and TAYLOR), A., i, 82.

β-**Butylnonyl** iodide (LEVENE and TAYLOR), A., i, 82.

*iso***Butylphosphinic acid**, α-hydroxy-, diphenyl ester (CONANT, WALLINGFORD, and GANDHEKER), A., i, 498.

4 *iso***Butylpiperidine**, 3:5-*di*cyano-2:6-*di*hydroxy- (CURTIS, DAY, and KIMMINS), T., 3136.

1-Butylsulphoneanthraquinone-5-sulphonic acid, sodium salt (HOFFMAN and REID), A., i, 934.

Butylthiolanthraquinone-1-*iso*amylsulphones (HOFFMAN and REID), A., i, 933.

Butylthiolanthraquinone-1-butylsulphones (HOFFMAN and REID), A., i, 933.

Butylthiolanthraquinone-1-ethylsulphones (Hoffman and Reid), A., i, 933.
Butylthiolanthraquinone-1-methylsulphones (Hoffman and Reid), A., i, 933.
Butylthiolanthraquinone-1-propylsulphones (Hoffman and Reid), A., i, 933.
1-Butylthiol*iso*propylthiolanthraquinones (Hoffman and Reid), A., i, 933.
***n*-Butyl*di*thiourethane** (v. Braun and Engelbertz), A., i, 894.
Butylvinylcarbinol. See Δ^{α}-Heptene-γ-ol.
***iso*Butyraldazine**, catalytic reduction of (Taipale), A., i, 547.
Butyramide, α-chloro- (de Booseré), A., i, 311.
***iso*Butyranilide**, bromo- (Staudinger and Schneider), A., i, 465.
Butyranilide-α-sulphonic acid, aniline salt (Backer and de Boer), A., i, 536.
Butyric acid, β-amino-, hydrochloride, ethyl ester (Bruylants), A., i, 763.
  γ-amino-, synthesis of (Curtius and Hechtenberg), A., i, 1069.
  γ-amino-β-hydroxy-, and its copper salt and betaine chloroaurate (Tomita), A., i, 190.
    synthesis of, and its derivatives (Bergman), A., i, 660.
  αγ-*di*chloro-, methyl ester (Bruylants and Stassens), A., i, 213.
  γγ-*di*chloro-αβ-*di*bromo-, and its derivatives (v. Auwers and Wissebach), A., i, 296.
  γ-cyano-β-hydroxy-, ethyl ester (Lespieau), A., i, 751.
  β-hydroxy-, formation of, by *Bacillus subtilis* (Lemoigne), A., i, 881.
    p-bromophenacyl ester (v. Auwers, Meissner, Seydel, and Wissebach), A., i, 747.
    estimation of (Guillaumin), A., ii, 663.
    estimation of, in blood and urine (Lublin), A., ii, 268.
γ-Butyric acid, γγγ-*tri*chloro-β-hydroxy-, resolution of (McKenzie and Plenderleith), T., 1092.
Butyronitrile, action of magnesium ethyl bromide on (Baerts), A., i, 191.
Butyronitrile, β-*mono*- and αγ-*di*-amino- and their derivatives (Bruylants), A., i, 762.
1-Butyrophenone, 3:5-*di*bromo-2:4-*di*hydroxy-, and its phenylhydrazone, and 2:4-*di*hydroxyphenylhydrazone (Gnagy), A., i, 467.
Butyro-*p*-toluidide-α-sulphonic acid salts (Backer and de Boer), A., i, 536.
Butyryl chloride, αγ-*di*chloro- (Bruylants and Stassens), A., i, 213.
α-Butyrylbutyronitrile, and its semicarbazone (Baerts), A., i, 191.
Butyrylchloroamides (Roberts), T., 2781.
Bynin, identity of hordein and (Lüers), A., i, 398.

C.

Cabbage, carbohydrate from leaves of (Buston and Schryver), A., i, 1062.
Cacao butter, identification and purity of (Marange), A., ii, 664.
  detection of adulterants in (Pichard), A., ii, 887.
Cacodyl carbide (Wieland and Wesche), A., i, 499.
Cacodylic acid, preparation of (Guinot), A., i, 192.
  bismuth salt (Claussmann), A., i, 548.
Cacotheline, derivatives of (Leuchs and Hempel), A., i, 941.
Cactus alkaloids (Späth), A., i, 479.
Cadaverine in pancreatic glands (Semenovitsch), A., i, 628.
Cadets' oil, oxidation of (Guinot), A., i, 192.
Cadmium, spectrum of (Catalán), A., ii, 710.
  effect of metallic coatings on the spectrum of (Janicki and Lau), A., ii, 669.
  free path of electrons in the vapour of (Minkowski), A., ii, 821.
  atomic heat of (Rodebush), A., ii, 532.
  heat of vaporisation of (Fogler and Rodebush), A., ii, 738.
  vapour pressure of, and its alloys with zinc (Egerton and Raleigh), T., 3024.
  density of (Egerton and Lee), A., ii, 462.
  electrolytic, action of colloidal gelatin on the properties of (Milliau), A., ii, 378.
Cadmium alloys with bismuth and lead, electrochemistry of (Kremann and Langbauer), A., ii, 826.
  with lead and mercury, potential of (Kremann, Prammer, and Helly), A., ii, 825.
  with mercury, electromotive force of (Schulze), A., ii, 607.
  with mercury and tin, potential of (Kremann, Prammer, and Helly), A., ii, 825.

Cadmium alloys with silver, electromotive force of (Schreiner, Simonsen, and Krag), A., ii, 8.
with thallium (Di Capua), A., ii, 418.
Cadmium salts, compounds of, with benzamide (Belladen and Astengo), A., i, 1010.
reaction of hydrogen on solutions of (Ipatiev and Starynkevitsch), A., ii, 639.
Cadmium cobaltinitrite (Ogburn), A., ii, 328.
oxide, crystal structure of (Davey and Hoffman), A., ii, 27.
decomposition tensions of mixtures of sodium hydroxide and (Rolla and Salani), A., ii, 54.
phosphide (Brukl), A., ii, 75.
sulphide, and estimation of the metal (Egerton and Raleigh), T., 3019.
Cadmium organic compounds:—
tetra-aquodibenzylamine ammonium sulphate (Spacu and Ripan), A., i, 833.
Cadmium detection, estimation, and separation:—
detection of (Spacu), A., ii, 879.
estimation of (Cernatesco), A., ii, 184.
estimation of, electrometrically, in presence of zinc (Müller), A., ii, 879.
separation of, from copper (Wenger and Durst), A., ii, 581.
separation of zinc and, electrolytically (Salani), A., ii, 508.
Cæsium, absorption and fluorescence spectra of (McLennan and Ainslie), A., ii, 357.
thermionic effects of the vapour of, in a vacuum tube (Langmuir and Kingdon), A., ii, 367.
Cæsium chloride, crystal structure of (Davey and Wick), A., ii, 26.
silver gold chloride (Wells), A., ii, 32.
chlorite (Levi and Cipollone), A., ii, 492.
hydrogen sulphate (Dunnicliff), T., 733.
Caffeine, equilibrium of antipyrine, water, and (Kremann and Janetzky), A., i, 949.
aquoferritrithiocyanate (Scagliarini and Tartarini), A., i, 547.
Calabar bean, alkaloids of (Max and Michel Polonovski), A., i, 940.
Calciothomsonite, from Franklin, New Jersey (Gordon), A., ii, 647.
Calcite, formation of (Copisarow), T., 793.
Calcite, reflection of Röntgen rays from planes of (Mauguin), A., ii, 417.
Calcium, spectrum of (Catalán), A., ii, 710.
positive-ray analysis of (Dempster), A., ii, 413, 805.
effect of diet on excretion of (Sjollema), A., i, 511.
metabolism of. See Metabolism.
in blood-serum in rickets (Howland and Kramer), A., i, 418.
in human serum, after injection of calcium salts (Sieburg and Kessler), A., i, 504.
Calcium compounds in blood during pregnancy (Widdows), A., i, 502.
Calcium salts, assimilation of (Hunt, Winter, and Miller), A., i, 728; (Hunt and Winter), A., i, 1271.
action of, on milk coagulation (Rona and Gabbe), A., i, 404.
balance of (Sindler), A., i, 976.
distribution of, in plasma and cells (Cruickshank), A., i, 515.
in blood coagulation (Stuber and Sano), A., i, 411.
in blood-serum (Kramer and Howland), A., i, 71.
in cats (Heubner and Rona), A., i, 415.
metabolism of. See Metabolism.
pharmacology of (Rosenmann), A., i, 983.
Calcium amide, heat of formation of (Guntz and Benoit), A., ii, 738.
carbonate, heteromorphism of (Copisarow), T., 785.
solubility and hydrolysis of (Askew), A., ii, 763.
hexahydrate (Mackenzie), T., 2409.
use of, in nitrogen fixation (Gainey), A., i, 881.
use of, in volumetric analysis (Kordes), A., ii, 873.
carbonate and sulphate, electrometric titration of mixtures of carbon dioxide and (Shipley and McHaffie), A., ii, 649.
hydrogen carbonate, equilibrium of formation of (Shipley and McHaffie), A., ii, 655.
chloride, equilibria in the system, magnesium chloride, potassium chloride, water, and (Lee and Egerton), T., 706.
chloride and nitrate, equilibrium of potassium chloride and nitrate, water, and (Barbaudy), A., ii, 621.
hydroxide, neutralisation of phosphoric acid by (Wendt and Clarke), A., ii, 417.
iodide (Mizutani), A., ii, 417.

Calcium, oxide, crystal structure of (DAVEY and HOFFMAN), A., ii, 27.
action of water on (KOHLSCHÜTTER and FEITKNECHT), A., ii, 489.
equilibrium of carbon dioxide with (SMYTH and ADAMS), A., ii, 490.
phosphate, assimilation of, by plants (BRIOUX), A., i, 79.
analysis of (NAKASEKO), A., ii, 656.
phosphates, preparation of phosphorus trichloride from (BUDNIKOV and SHILOV), A., ii, 763.
Tricalcium phosphate (LUCE), A., ii, 320.
Calcium sulphate, heteromorphism of (COPISAROW), T., 796.
dissociation of (BUDNIKOV and SYRKIN), A., ii, 72.
sulphide, structure of (HOLGERSSON), A., ii, 321.
action of red and infra-red radiation on photoluminescence of (CURIE), A., ii, 812.
action of sulphur dioxide on (WÖHLER, MARTIN, and SCHMIDT), A., ii, 852.
thiosulphate hexahydrate, symmetry of (ASTBURY), A., ii, 636.
Calcium organic compounds :—
cyanamide, decomposition and formation of (EHRLICH), A., i, 309.
estimation of (NANUSSI), A., ii, 443.
Calcium estimation :—
estimation of (WILLSTÄTTER and WALDSCHMIDT-LEITZ), A., ii, 258.
estimation of, colorimetrically (GRÉGOIRE, CARPIAUX, LAROSE, and SOLA), A., ii, 339.
estimation of, microchemically (BLÜHDORN and GENCK), A., ii, 339.
estimation of, nephelometrically (RONA and KLEINMANN), A., ii, 433.
estimation of, oxidimetrically (GROSSFELD), A., ii, 183.
estimation of, volumetrically (VÜRTHEIM and VAN BERS), A., ii, 257.
estimation of, volumetrically, in presence of phosphoric acid (GROSSFELD), A., ii, 433.
estimation of, in blood (DE TONI), A., ii, 87.
estimation of, in blood serum (KRAMER, TISDALL, and HOWLAND), A., i, 411; (TISDALL), A., ii, 656.
estimation of, in human blood (MIRKIN and DRUSKIN), A., ii, 507.
estimation of, in plasma (HIRTH), A., ii, 698.
Calorific value of carbon compounds (KONOVALOV), T., 2184.
of fuels and other organic substances (KONOVALOV), A., ii, 217.
Calorimeter, bomb, electric fuse for (ZOLOTAREV), A., ii, 612.
water value of (MOUREU, DUFRAISSE, and LANDRIEU), A., ii, 535.
micro-bomb (PADOA and FORESTI), A., ii, 737.
Calorimetry (VERKADE), A., ii, 217; (VERKADE and COOPS), A., ii, 294.
Camellia theifera, quercitrin in the leaves of (DEUSS), A., i, 1046.
Camphane, bromonitro- (GINNINGS and NOYES), A., i, 47.
Camphene, preparation of (PARISELLE), A., i, 813.
bromination of (LIPP), A., i, 1105.
d- and *l*-**Camphene** (KOMATSU and NAKAI), A., i, 235.
Campholic acid, transformation of, to camphor (RUPE and SULGER), A., i, 473.
Camphor, formation of, from campholic acid (RUPE and SULGER), A., i, 473.
and its derivatives, absorption spectra of (PURVIS), T., 2515.
compounds of nitrogen peroxide and (PASCAL and GARNIER), A., i, 345.
mixtures of nitrophenols with (EFREMOV), A., i, 1104.
derivatives, ultra-violet absorption spectra of (HALLER and LUCAS), A., ii, 106.
hydrogenation of ethylenic derivatives of (DÉPRIE), A., i, 1213.
homologues of (NAMETKIN; NAMETKIN and SCHLESINGER), A., i, 690.
physiological action of *d*-, *l*-, and *i*-forms of (JOACHIMOGLU and MOSLER), A., i, 985.
and its derivatives, action of, on smooth muscle (DOHRN), A., i, 632.
Camphor, *dβ*- and *dπ*-*di*bromo- (BURGESS and LOWRY), T., 1867.
10-chloro-10:10-*di*nitro-derivatives (WEDEKIND, SCHENK, and STÜSSER), A., i, 347.
Camphor oil, constituents of (ROCHUSSEN), A., i, 1105.
Camphor series (KOMATSU), A., i, 234; (KOMATSU and YAMAGUCHI), A., i, 1022.
Camphoracetic acid (HALLER and PALFRAY), A., i, 578.
Camphor-β-diethylaminoethylamidic acid (WEDEKIND and STÜSSER), A., i, 809.
Camphor-β-diethylaminoethylimide, hydrochloride (v. AXTER), A., i, 809.

Camphorimide, derivatives of (v. Axter), A., i, 809.
Camphorindole (Kuroda), A., i, 603.
Camphor-β-methylaminoethylimide (v. Axter), A., i, 809.
d-**Camphoroxime**, reduction of (Komatsu and Yamaguchi), A., i, 235, 1022.
Camphorphenylhydrazone, isomeride of (Kuroda), A., i, 603.
Camphorquinone, absorption and rotation dispersion of (Wedeneewa), A., ii, 715.
Camphorsulphonic acid, Reychler's, constitution of (Wedekind, Schenk, and Stüsser), A., i, 346.
3-Camphylrhodanine (Gendelman), A., i, 606.
Camphylrhodanine-2-indoleindigo. See 2-Indoxylidene 3-camphylrhodanine.
Cancer. See Carcinoma.
Cantaloupe. See *Cucumis melo.*
Cantharidin, constitution of (Coffey), A., i, 695, 1218.
Caoutchouc (Pummerer and Burkard), A., i, 49.
  constitution of (Boswell, Hambleton, Parker, and McLaughlin), A., i, 350.
  swelling of (Le Blanc and Kroger), A., i, 1106.
  viscosity of benzene solutions of (Shimada), A., i, 818.
  hydrogenation of (Harries), A., i, 694.
  action of selenium oxychloride on (Frick), A., i, 935.
  oxide (Pummerer and Burkard), A., i, 50.
  estimation of (Pontio), A., ii, 94.
Capsaicin, constitution of (Nelson and Dawson), A., i, 1108.
Caraway oil, constituents of (Pigulevski and Nikitina), A., i, 816.
Carbamazide, action of, on ethyl malonate and on barbituric acid (Curtius), A., i, 850.
Carbamic acid, *tri*chloroethyl ester (Willstätter, Duisberg, and Callsen), A., i, 10; (Farbenfabriken vorm. F. Bayer & Co.), A., i, 86.
  γ-chloropropyl ester (Dox and Yoder), A., i, 483.
  ψ-cumyl, tolyl, and 4-xylyl esters (Avenarius), A., i, 460.
Carbamide (*urea*), Röntgen ray structure of (Mark and Weissenberg), A., i, 760.
  formation of, in fungi (Ivanov), A., i, 520.
Carbamide (*urea*), formation of, in steam supply in beet-sugar factory (v. Lippmann), A., i, 309.
  preparation of, from ammonia and carbon dioxide (Fréjacques), A., i, 902.
  synthesis and decomposition of, by urease (Mack and Villars), A., i, 405.
  substitution of, for proteins in ruminants (Honcamp and Schneller), A., i, 977.
  See also Urea.
Carbamides, constitution of (Werner), T., 2577.
  urea dearrangement of (Davis and Underwood), A., i, 22.
  substituted, preparation of (Mailhe), A., i, 458.
    Hofmann reaction applied to (Elliott), T., 804.
Carbamide rearrangement (Davies and Blanchard), A., i, 902.
o-**Carbamidobenzoic acid**, 5-bromo-, and its hydantoin (Scott and Cohen), T. 3187.
4-Carbamido-1:3-diphenylpyrazole-5-carboxyphenylhydrazide (Benary, Soenderop, and Bennewitz), A, i, 573.
5 Carbamido-2:6-*di*hydroxypyrimidine, 4-amino- (Traube), A., i, 1135.
Carbamidomalonic acid, ethyl ester (Curtius), A., i, 850.
4-Carbamido-1-phenyl-3-*p*-tolylpyrazole-5-carboxyphenylhydrazide (Benary, Soenderop, and Bennewitz), A., i, 574.
p-**Carbamidotoluene-*o*-sulphonic acid**, and its potassium salt (Scott), T., 3194.
Carbamylazide, decompositions of (Curtius and Schmidt), A., i, 1080.
5-Carbamyl-4-*iso*butyl-2-piperidone, 6-imino-3-cyano- (Curtis, Day, and Kimmins), T., 3135.
1-Carbamylguanylpiperidine, and its picrate (Pellizzari), A., i, 1003.
5 Carbamyl-4-hexyl-2-piperidone, 6-imino-3-cyano- (Curtis, Day, and Kimmins), T., 3137.
N-**Carbamyl-β-*p*-methoxyphenyl-αα′-iminodipropionic acid**, and its disodium salt (Hahn, Kelley, and Schaeffer), A., i, 487.
5-Carbamyl-4-*iso*propyl-2-piperidone, 6-imino-3-cyano- (Curtis, Day, and Kimmins), T., 3134.
Carbanilino-3-bromo-*p*-dimethylaminobenz*anti*aldoxime (Brady and Truszkowski), T., 2439.

- **1-Carbanilino-3-*iso*butylenepyrazole-5-carboxylic acid,** ethyl ester (Borsche and Thiele), A., i, 1220.
- **Carbanilino-3-nitro-*p*-dimethylaminobenz*anti*aldoxime** (Brady and Truszkowski), T., 2437.
- **Carbazole,** vapour pressure of (Senseman and Nelson), A., i, 605.
  - potassium and sodium derivatives, action of nitrobenzene on (G. and M. de Montmollin), A., i, 373.
  - alkylation of (National Aniline & Chemical Co.), A., i, 1229.
- **Carbazole series,** hydrogenation of the (v. Braun and Ritter), A., i, 141.
  - *N*-derivatives in the (Stevens and Tucker), T., 2140.
- **Carbethoxybenz*anti*aldoxime** (Brady and McHugh), T., 1193.
- **Carbethoxycamphoracetic acid** (Haller and Palfray), A., i, 577.
- **Carbethoxy-*o*-, -*m*-, and -*p*-chlorobenz*anti*aldoximes** (Brady and McHugh), T., 1193.
- **3-Carbethoxy-2:4-dimethylpyrrole-5-acetic acid,** methyl ester (Fischer and Schneller), A., i, 944.
- **5-Carbethoxy-2:4-dimethylpyrrole-3-aldehyde,** and its derivatives (Fischer, Weiss, and Schubert), A., i, 704.
- **3-Carbethoxy-2:4-dimethylpyrrole-5-azobenzene,** and its salts (Fischer and Rothweiler), A., i, 392.
- **3-Carbethoxy-2:4-dimethylpyrrole-5-carbonyl chloride** (Fischer and Schneller), A , i, 944.
- **3-Carbethoxy-2:4-dimethylpyrrylbis-*p*-dimethylaminophenylmethane** (Fischer and Schneller), A., i, 944.
- **(3-Carbethoxy-2:4-dimethylpyrryl-4-hydroxy-3-carbethoxy-2-methylpyrrolidyl)methene,** and its hydrochloride (Fischer and Loy), A., i, 719.
- **3-3′-Carbethoxy-2′:4′-dimethylpyrrylpyrazol-5-one** (Fischer and Schneller), A., i, 944.
- **Carbethoxyglutamic acid,** ethyl ester and diamide of (Cloetta and Wünsche), A., i 515.
- ***N*-Carbethoxyhydrochloro*iso*chondodendrine** (Faltis and Heczko), A., i, 358.
- **Carbethoxymaleinimide** (Küster and Maag), A., i, 243.
- **Carbethoxymethoxybenzaldoximes** (Brady and McHugh), T., 1194.
- **Carbethoxy-3:4-methylenedioxybenz*syn*aldoxime** (Brady and McHugh), T., 1195.
- **4-Carbethoxy-5-methylpyrrolenyl-2-furylmethane,** 3-hydroxy-, hydrochloride (Küster and Maag), A., i, 242.
- **4-Carbethoxy-5-methyl-2-*o*-pyrrolenylhydroxyphenylmethane,** 3-hydroxy- (Küster and Maag), A., i, 242.
- **3-Carbethoxy-2 methylpyrryl-3-carbethoxy-2:4-dimethylpyrrylmethane,** 4-hydroxy- (Fischer and Loy), A., i, 719.
- **(3-Carbethoxy 2-methylpyrryl-2:4 dimethyl-3-carbethoxypyrrolidyl)methene,** 4-hydroxy- (Fischer and Loy), A., i, 719.
- **3-Carbethoxy-2-methylpyrryl-2:4-dimethyl-3-carbethoxypyrrylmethane,** 4-hydroxy- (Fischer and Loy), A., i, 719.
- **5-(3-Carbethoxy-2-methyl-4-pyrryl)-4-hydroxy-3-carbethoxy-2-methylpyrrole** (Fischer and Loy), A., i, 719.
- **3-Carbethoxy-2-methylpyrryl-5-pyruvic acid,** 4-hydroxy- (Fischer and Loy), A., i, 719.
- **Carbethoxynitrobenz*syn*aldoximes** (Brady and McHugh), T., 1196.
- **Carbethoxy-3-nitro-4-dimethylaminobenz*anti*aldoxime** (Brady and McHugh), T., 1197.
- **Carbethoxy-6-nitro-3:4-methylenedioxybenz*anti*aldoxime** (Brady and McHugh), T., 1198.
- **Carbethoxytyramine** (Cloetta and Wünsche), A., i, 515.
- **Carbinols** as indicators (Karczag and Bodó), A., ii, 694.
- **Carbocyanines,** formation of (Mills and Braunholtz), T., 2804.
  - relation of methylenediquinaldine derivatives to (Hamer), T., 246.
- **Carbohydrate** from cabbage leaves (Buston and Schryver), A., i, 1062.
- **Carbohydrates** (Brigl and Mistele), A., i, 442.
  - constitution of (Irvine), T., 898.
  - rotation of, under the influence of strong acids (Bleyer and Schmidt), A., ii, 524.
  - heats of combustion of (Karrer and Fioroni), A., ii, 460.
  - action of, in acid, alkali, and sulphite solutions (Bleyer and Schmidt), A., i, 1180.
  - effect of addition of, to concentrated salt solutions (Herzog and Bergenthun), A., ii, 835.
  - acetaldehyde from bacterial degradation of, and their acids (Nagai), A., i, 1267.
  - preparation of carbon from (Firth), T., 324.

Carbohydrates, action of dry hydrogen bromide on (Hibbert and Hill), A., i, 184.
  oxidation of, with nitric acid (Haas and Russell-Wells), A., i, 16.
  sulphates of (Ohle), A., i, 539.
  in plant tissues, effect of desiccation on (Link and Tottingham), A., ii, 265.
  decomposition of, in muscle (Laquer and Meyer), A., i, 268.
  digestion of, in the duodenum (Böhne), A., i, 505.
  polymeric, fatty acid esters of (Karrer and Zega), A., i, 1181.
  analysis of mixtures of (Kolthoff), A., ii, 346.
4-Carbomethoxy-3:5-dimethylbenzoic acid (Feist and Eggert), A., i, 1174.
Carbomethoxyglycollonitrile, preparation of (Pratt and Robinson), T., 755.
Carbon, atomic weight of (Moles and Clavera), A., ii, 149.
  atoms, multiple linking of (Prins), A., ii, 19.
  aromatic, theory of (v. Auwers), A., ii, 101.
    graphitic nature of (v. Steiger), A., ii, 349.
  preparation of (Poch), A., ii, 632.
  spectra of (Merton and Johnson), A., ii, 446.
  X-ray spectra of (McLennan and Clark), A., ii, 51.
  ultra-violet arc spectrum of (Simeon), A., ii, 45, 709.
  Röntgen absorption coefficients of (Olson, Dershem, and Storch), A., ii, 365.
  dissociation of, in the arc (Bell and Bassett), A., ii, 122.
  specific heat of, at high temperatures (Magnus), A., ii, 374.
  evaporation of (Wertenstein and Jedrzejewski), A., ii, 632.
  adsorption by (Firth), A., ii, 464.
  from carbohydrates, sorption of iodine by (Firth), T., 323.
    catalytic decomposition of hydrogen peroxide by (Firth and Watson), A., ii, 752.
  sorption of iodine by, from chloroform solution (Firth and Watson), T., 1219.
  colloidal, ultramicroscopy of (Lachs), A., ii, 560.
  vitreous (Hofmann and Röchling), A., ii, 757.
  equilibria of, with metals and their oxides (Nischk), A., ii, 762.
Carbon, catalysis of the reaction of steam and of carbon dioxide with (Neville and Taylor), A., ii, 24.
  action of sulphur dioxide on (Rassow and Hoffmann), A., ii, 158.
Carbon alloys with iron and phosphorus (Konstantinov), A., ii, 422.
  with iron and tungsten (Ozawa), A., ii, 244.
Carbon *tetra*chloride, freezing point of (Keyes, Townshend, and Young), A., ii, 376.
    density of (Egerton and Lee), A., ii, 462.
  *sub*oxide (Staudinger and Kreis), A., i, 439.
  *mon*oxide, band spectrum of (Hulthén), A., ii, 670.
    band spectrum and molecular structure of (Nagaoka), A., ii, 594.
    motions of electrons in (Skinker and White), A., ii, 722.
    absorption of, by cuprous ammonium carbonate and formate (Larson and Teitsworth), A., ii, 157.
    absorption of, by platinised asbestos (Pollard), A., ii, 381.
    catalytic oxidation of (Benton), A., ii, 383; (Almquist and Bray), A., ii, 840.
    explosion of mixtures of air and at high pressures (Bone, Newitt, and Townend), T., 2008.
    explosion wave in mixtures of hydrogen and (Dixon and Walls), T., 1025.
    simultaneous combustion of hydrogen and (Haslam), A., ii, 624.
    combustion of mixtures of hydrogen, air, and (Payman and Wheeler), T., 1251.
    action of hydrogen with, in presence of nickel (Armstrong and Hilditch), A., ii, 307.
    catalytic action of water vapour on (Medsforth), T., 1464.
    reduction of copper oxide by (Jones and Taylor), A., ii, 765.
    reduction of, to methane, in presence of iron (Fischer and Tropsch; Fischer, Tropsch, and Mohr), A., i, 737.
    combination of hæmoglobin with (Brown), A., i, 964.
    estimation of, with iodine pentoxide (Kattwinkel), A., ii, 336.
    estimation of, in air (Nicloux), A., ii, 578; (Sinnatt and Slater), A., ii, 655; (Andriska), A., ii, 876.

Carbon *mon*oxide, estimation of, in blood and air (Sayers, Yant, and Jones), A., ii, 789.
  *di*oxide, effect of adrenaline on the production of, by animals and by plants (Hutchinson), A., i, 409.
    effect of manures on production of, in soils (Lundegardh), A, i, 284.
    action of ultra-violet light on (Spoehr), A., ii, 452.
    near ultra-red absorption spectrum of (Ôkubo), A., ii, 450.
    influence of the pitch of sound on the ratio of the specific heats of (Tornau), A., ii, 124.
    boiling point of (Keyes, Townshend, and Young), A., ii, 376.
    liquid, formation of nitric acid in the manufacture of (Hackspill and Conder), A., ii, 632.
    coefficient of viscosity of (Eglin), A., ii, 856.
    new absorption apparatus for (Morgan), A., ii, 337.
    velocity of absorption of, by ammoniacal solutions (Riou), A., ii, 228.
    absorption of, by human blood (Peters), A., i, 1249.
    equilibrium of calcium oxide with (Smyth and Adams), A., ii, 490.
    catalysis of the interaction of carbon and (Neville and Taylor), A., ii, 24.
    theory of the assimilation of (Thunberg; Weigert), A., i, 1271.
    effect of light on assimilation of (Warburg and Negelein), A., ii, 718.
    assimilation of, by bacteria (Ruhland), A., i, 272.
    assimilation of, by plants (Sabalitschka), A., i, 76.
    action of protein-chlorophyll solutions on (Eisler and Portheim), A., i, 424.
    electrometric titration of mixtures of calcium carbonate and sulphate and (Shipley and McHaffie), A., ii, 649.
    estimation of (Shikata and Saruhashi), A., ii, 86.
    dissolved, estimation of (Hall), A., ii, 507.
    estimation of, in carbonates (Tubandt and Weinz), A., ii, 87; (Järvinen and Sumelius), A., ii, 255.
    estimation of, in drinking water (Lehmann and Reuss), A., ii, 697.
Carbon oxides, action of hydrogen on (Medsforth), T., 1452.
  Carbonic acid, photolysis of (Baur and Rebmann), A., i, 91.
    thio-. See Thiocarbonic acid.
  Carbonates, analysis of (Dominikiewicz), A., ii, 876.
    estimation of, in spring and mineral waters, in presence of sulphides (Touplain and Dubief), A., ii, 337.
  Percarbonates, constitution of (Le Blanc and Zellmann), A., ii, 415.
Carbon *di*sulphide, formation of, from sulphur dioxide and carbon (Rassow and Hoffmann), A., ii, 158.
    variation of the refractive index of, with temperature (Hall and Payne), A., ii, 197.
    freezing point of (Keyes, Townshend, and Young), A., ii, 376.
    absorption of, by aqueous solutions of sodium azide (Currier and Browne), A., ii, 158.
    explosion of mixtures of oxygen and (Laffitte), A., ii, 623.
    toxic action of mixtures of hydrogen sulphide and (Fischer), A., i, 1266.
    action of mercuric acetate on (Bernardi and Rossi), A., i, 744.
Carbon estimation:—
  estimation of, by Pregl's method (Friedrich), A., ii, 788.
  estimation of, in aqueous liquids (Freund and Botstiber), A., ii, 336.
  estimation of, in organic compounds (Simon and Guillaumin), A., ii, 432.
  estimation of, in organic compounds, in presence of arsenic and mercury (Falkov and Raiziss), A., ii, 336.
  estimation of, in soils (Simon), A., ii, 506.
  estimation of, in solutions (Needham), A., ii, 655.
Carbon steel, estimation, colorimetrically, of carbonated manganese in (Forestier), A., ii, 582.
Carbonic acid. See under Carbon.
Carbonyl chloride (*phosgene*), photochemical synthesis of (Cathala), A., ii, 526.
    vapour density of (Germann and Jersey), A., ii, 25.
    cryoscopy of solutions of (Germann and Jersey), A., ii, 25.
    thermal decomposition of (Christiansen), A., ii, 62.

Carbonyl chloride, thio-, preparation of (de Fazi), A., ii, 411.
  cyanide, preparation of (Diels, Gariner, and Kaack), A., i, 24.
  cobaltocyanide (Job and Samuel), A., i, 904.
Carbonyl compounds, bromination of (Ward), T., 2207.
Carbonyl group, amphoteric nature of (Müller), A., i, 90.
  reduction of, by zinc amalgam (Steinkopf and Wolfram), A., i, 216.
γ-*p*-Carboxyanilinopropylalcohol (Pierce and Adams), A , i, 484.
***o*-Carboxybenzylthiolacetic acid** (Lesser and Mehrländer), A., i, 828.
Carboxycamphoracetic acid, esters of (Haller and Palfray), A., i, 577.
***o*-Carboxycinnamic acid**, silver salt (Beckmann, Liesche, and Dietrich), A., i, 232.
α(4-Carboxy-3:5-dimethylphenyl)-β-methylglutaconic acid, and its salts and esters (Feist and Eggert), A., i, 1173.
Carboxyhæmoglobin, velocity of formation of, from oxyhæmoglobin (Hartridge and Roughton), A., ii, 229.
***cis*- and *trans*-*o*-Carboxy*cyclo*hexaneacetic acids**, and their anhydrides (Windaus, Huckel, and Reverey), A., i, 220.
***cis*- and *trans*-*o*-Carboxy*cyclo*hexanepropionic acids**, and their derivatives (Windaus, Hückel, and Reverey), A., i, 220.
1-Carboxy-β-1-*cyclo*hexanesuccinic acid, α-hydroxy-, lactone (Ingold, Seeley, and Thorpe), T., 866.
Carboxylaminoacetic acid, barium salt, action of heat on (Blanchetière), A., i, 760.
1-Carboxylamino-β-naphthol-3-carboxylic acid, 4-cyano- (Challenor and Ingold), T., 2078.
ω Carboxymethanetriacetic acid, ethyl ester (Dreifuss and Ingold), T., 2966.
***o*-Carboxymethylbenz-*o*-aminoanilide** (Bistrzycki and Fassler), A., i, 849.
1-Carboxynaphthalenesulphonic acids, potassium and sodium salts (Royle and Schedler), T., 1644
***p*-Carboxyphenylcarbamic acid**, γ-chloropropyl ester (Pierce and Adams), A., i, 484.
Carboxyphenylethylamine, β-hydroxy-β-*tri*hydroxy- (Hinsberg), A., i, 463.
1-*o*-Carboxyphenyl-3-methyl-1:2:5-triazole (Kliegl and Schmalenbach), A., i, 835.
3-*p*-Carboxyphenyltetrahydro-1:3:2-oxazone (Pierce and Adams), A., i, 484.
β-*o*-Carboxyphenylthiolpropionic acid (Mayer and Horst), A., i, 845.
α Carboxytrihydrophenylethane, *r*-β-amino-α-hydroxy-, and its hydrochloride (Hinsberg), A., i, 556.
α- and β 3-Carboxy-α:1:1-trimethyl-*cyclo*propane-2 propionic acids, 1-α-hydroxy-, and silver salt and lactone of the former (Simonsen and Rau), T., 557.
Carbylamines (iso*nitriles*) (Passerini), A., i, 63, 764, 1013.
Carcinoma, hydrogen-ion concentration of blood in (Chambers; Chambers and Kleinschmidt), A., i, 512.
  effect of calcium and potassium salts on the growth of (Wolf), A., i, 879.
Carnaübic acid, and its derivatives (Fargher and Probert), A., i, 279.
Carnosine, and its salts and phenylcarbamido-derivative (Smorodincev), A., i, 593.
  destruction of, in muscle by a catalyst (Clifford), A., i, 168.
Carnotite from the Congo (Schoep and Richet; Schoep), A., ii, 870.
Carob bean. See Bean, carob.
Carob tree, sugar from manna of (Charaux), A., i, 427.
Carrageen (*Chondrus crispus*), mucilaginous substance from (Harwood), T., 2254.
  oxidation of carbohydrates from (Haas and Russell-Wells), A., i, 16.
Carrots, phosphatide and sterol from (v. Euler and Bernton), A., i, 498.
Carvacrol, 5-chloro- (Wheeler and Giles), A., i, 28.
Carvacrylazo-α- and -β naphthols, 5′-chloro- (Wheeler and Giles), A., i, 28.
Carvacrylazonaphtholsulphonic acids, 5′-chloro-, and their sodium salts (Wheeler and Giles), A., i, 28.
4-Carvacrylazophenol, 5′-chloro- (Wheeler and Giles), A., i, 28.
4-Carvacrylazoresorcinol, 5′-chloro- (Wheeler and Giles), A., i, 28.
4-Carvacrylazosalicylic acid, 5′-chloro-, and its sodium salt (Wheeler and Giles). A., i, 28.
Carvomenthol, resolution of (Windaus, Klänhardt, and Weinhold), A., i, 586.
Carvomenthol-digitonin (Windaus and Weinhold), A., i, 590.
Carvene, and its oxime, absorption spectra of (Purvis), T., 2518.

Carvone, conversion of, into carvacrol (Richter), A., i, 691.
  hydrosulphide, action of reagents on (Challenger, Smith, and Paton), T., 1050.
Caryophyllene (Deussen), A., i, 813.
Casein, rotation and molecular weight of (Zaykowski), A., i, 718.
  solubility of (Cohn and Hendry), A., i, 868.
  effect of moisture on the solubility of (Fouassier), A., i, 962.
  precipitation forms of (Loebenstein), A., i, 617.
  purification and precipitation of (Northrop), A., i, 1030.
  sorption of acids by (v. Euler and Bucht), A., ii, 296.
  deamination of, by nitrous acid (Lewis and Updegraff), A., i, 963.
  new sulphur-containing amino-acid from (Mueller), A., i, 963.
  digestion of, by pepsin (Smorodincev), A., i, 619.
  tryptic digestion of (Fränkel and Gallia), A., i, 398.
Caseinates, electrical conductivity of (Plattner), A., i, 963.
Cashew kernel oil (Patel, Sudborough, and Watson), A., i, 995.
Castela Nicholsoni, bitter principle from (Bosman), T., 207.
Castelamarin, constitution and properties of (Bosman), T., 207.
Castor oil, catalytic decomposition of (Mailhe), A., i, 88.
  catalytic hydrogenation of (Brochet), A., i, 750.
  and its derivatives, hydrogenation and dehydrogenation of (Brochet), A., i, 297.
Catalase from bacteria (Hagihara), A., i, 1157.
  in blood (Tsuchihashi), A., i, 1147; (v. Moraczevski), A., i, 1251.
  liver (Rona and Damboviceanu), A., i, 405.
    influence of thorium-*X* on the action of (Maubert, Jaloustre, and Lemay), A., i, 723.
  estimation of, in blood (Okey), A., ii, 512.
Catalysis (Komatsu, Nakamura, and Kurata), A., i, 769; (Komatsu and Nodzu), A., i, 782; (Dhar), A., ii, 841, 842; (Sanyal and Dhar), A., ii, 842.
  and steric hindrance (Vavon and Husson), A., i, 464; (Vavon and Ivanov), A., i, 998.
Catalysis in homogeneous gas reactions (Kiss), A., ii, 237.
  with finely-divided metals (Foresti; Sandonnini), A., ii, 747.
  at solid surfaces (Armstrong and Hilditch), A., ii, 307, 551.
  heterogeneous (Kruyt and van Duin), A., ii, 64.
  negative (Taylor), A., ii, 399.
Catalysts, influence of, on equilibria (Clarens), A., ii, 144.
  for adsorption, oxides as (Benton), A., ii, 382, 383.
  for oxidation of ammonia (Inaba), A., ii, 631.
  heat-stable, in animal tissues (Clifford), A., i, 1147.
Catalytic dehydrogenation (Zelinski and Pavlov), A., i, 767; (Zelinski; Zelinski and Delzova), A., i, 907.
  hydrogenation (Conant and Cutter), A., i, 10; (Lush), A., ii, 477.
    of olefines (Vavon and Kleiner), A., i, 891.
    of oxides (Pease and Taylor), A., ii, 30.
    with nickel (Brochet), A., i, 102; (Brochet and Cornubert), A., i, 105; (Boswell), A., ii, 231.
    with nickel salts (v. Braun and Hahn), A., i, 102; (v. Braun), A., i, 103; (v. Braun, Petzold, and Seemann), A., i, 136; (v. Braun and Ritter), A., i, 141; (v. Braun, Blessing, and Zobel), A., i, 1087; (v. Braun and Kochendörfer), A., i, 1197.
    with platinum (Willstätter and Seitz), A., i, 771.
    with colloidal platinum (Lochte and Bailey), A., i, 906.
  oxidation with charcoal (Doroschevski and Pavlov), A., ii, 398.
    with copper and uranium salts (Aloy and Valdiguié), A., ii, 552.
    with platinum black (Cusmano), A., i, 586.
  reactions, chemical dynamics of (Chodkowski), A., ii, 839.
    mechanism of (Clarens), A., ii, 397; (Sandonnini), A., ii, 759.
    promotion of (Medsforth), T., 1452.
    velocity of. See Velocity.
Cataphoresis, apparatus for (Szent-Györgyi), A., ii, 609.
Catechin (Nierenstein), A., i, 123, 1096.

Catechin, constitution of (Freudenberg and Cohn), A., i, 1219; (Drumm), A., i, 1221.
tetramethyl ether chloride (Drumm), A., i, 1221.
Catechins, stereoisomeric, and their derivatives (Freudenberg and Purrmann), A., i, 697.
Catechol. See Pyrocatechol.
Caterpillars, growth of (Abderhalden), A., i, 630.
Cathode, dropping mercury, electrolysis with (Heyrovský), A., ii, 119.
rays. See Rays.
Cats, calcium content of (Heubner and Rona), A., i, 415.
Cedrus deodara, essential oil from (Simonsen and Rau), A., i, 48.
Celery-seed oil, sesquiterpene alcohol from (Ruzicka and Stoll), A., i, 1216.
Cell or Cells, electrochemical, with a fluorescent liquid (Grumbach), A., ii, 108.
concentration, in non-aqueous solvents (Sachanov and Grinbaum), A., ii, 286.
action of gelatin on (Audubert), A., ii, 286.
conductivity, calibration of (Kraus and Parker), A., ii, 7; (Parker), A., ii, 530.
for non-aqueous solutions (Morgan and Lammert), A., ii, 604.
hydrogen-chlorine (Foerster, Nobis, and Stötzer), A., ii, 211.
Weston standard, behaviour of cadmium amalgam for (Schulze), A., ii, 607.
Weston unsaturated, temperature coefficients of (Vosburgh and Eppley), A., ii, 826.
Cell or **Cells, physiological**, effect of salts on the diffusion of acids and alkalis into (Loeb), A., i, 72.
oxidation in (Wieland), A., i, 167.
respiration of (Ellinger and Landsberger), A., i, 73; (Rona and Grassheim), A., i, 423; (Ryffel), A., i, 1035.
Cell nucleus, staining of (Steudel and Osato), A., i, 266.
action of sodium chloride on (García Banuš), A., i, 729.
Cellobiose, constitution of (Hintikka), A., i, 756.
Cello*iso*biose, nature of (Bertrand and Benoist), A., i, 757.
Cellulose, constitution of (Irvine), T., 908.
Cellulose, solubility of, in aqueous solutions of neutral salts (Williams), A., i, 305.
viscosity of (Nakano), A., i, 16; (Woolwich), A., i, 999.
chemistry of (Hibbert and Hill), A., i, 184, 439.
decomposition of, under pressure (Fischer, Schrader, and Treibs; Fischer and Schrader), A., i, 185.
action of acetyl bromide on (Zechmeister), A., i, 306.
action of hydrochloric acid on (Hirst and Morrison), T., 3226; (Sherrard and Froehlke), A., i, 900.
affinity of naphthalene azo-dyes for (Voroshcov and Gribov), A., i, 960.
hydrolysis of, by oxalic acid (Heuser and Eisenring), A., i, 657.
bacterial fermentation of (Neuberg and Cohn), A., i, 1041.
digestion of, by intestinal flora (Khouvine), A., i. 1042.
copper compounds of (Traube), A., i, 186; (Hess and Messmer), A., i, 306.
fluorohepta-acetyl derivative (Brauns), A., i, 441.
magnesyl derivative of (Costa), A., i, 186.
cotton, molecular structure of (Irvine and Hirst), T., 518.
swelling of (Collins; Collins and Williams), A., i, 1065.
white spruce, mannose from (Sherrard and Blanco), A., i, 441.
filter. See Filter.
estimation of, in flax waste (Budnikov and Solotarev), A., ii, 266.
Cellulose esters, solvents of (Mardles), A., i, 443.
of higher fatty acids (Gault and Ehrmann), A., i, 757.
acetate (Knoevenagel and König), A., i, 95.
viscosity of solutions of (Mardles), T., 1951.
swelling of (Knoevenagel), A., i, 757.
swelling and partition of, in organic solvents (Knoevenagel, Hogrefe, and Mertens), A., i, 17; (Knoevenagel and Volz), A., i, 306.
ultra-filters of (Fricke and Klempt), A., ii, 752.
nitrate (Bingham and Hyden), A., i, 94.
nitrates (Kugelmass), A., i, 186.
*hexa*stearate (Karrer and Zega), A., i, 1182.

Cellulose xanthates (WOLFFENSTEIN and OESER), A., i, 541.
α-, β-, and γ-**Celluloses**, estimation of, volumetrically (BRAY and ANDREWS), A., ii, 441.
Celtium (URBAIN; URBAIN and DAUVILLIER), A., ii, 171.
  spectrum of (DE BROGLIE and CABRERA; DAUVILLIER), A., ii, 200.
  arc spectrum of (BARDET), A., ii, 449.
  and hafnium (HANSEN and WERNER; COSTER and HEVESY), A., ii, 426; (URBAIN; KING), A., ii, 645; (ANON.; BRAUNER), A., ii, 692.
Cementation, metallic (WEISS), A., ii, 678
  with boron (PARRAVANO and MAZZETTI), A., ii, 243.
Centaurea jacea, glucoside from (BRIDEL and CHARAUX), A., i, 50.
Centaureidin (BRIDEL and CHARAUX), A., i, 51, 122, 936.
Centaurein (BRIDEL and CHARAUX), A., i, 50, 936.
Cephalin, brain, fatty acids of (LEVENE and ROLF), A, i, 11.
Ceratonia siliqua. See Carob tree.
Cereals, germination of seeds of (LOIBL), A., i, 1270.
  lævulosans in (COLIN and BELVAL), A., i, 1274.
Cerebrin, constitution of (CRUTO), A., i, 936.
Cerebrospinal fluid, arsenic in (VOEGTLIN, SMITH, DYER, and THOMPSON), A., i, 1040.
    after injection of salvarsan (CORNWALL and MYERS), A., i, 1263.
  sugar content of (MIFUJI), A., i, 73.
  in children, constituents of (BROCK), A., i, 1153.
  human, constituents of (HAUROWITZ), A., i, 978.
  detection of urobilin in (RODILLON), A., ii, 100.
  estimation of sugars in (MESTREZAT and GARREAU), A., ii, 345.
Cerium, crystal structure of (HULL), A., ii, 32.
  oxides, crystal structure of (GOLDSCHMIDT and THOMASSEN), A., ii, 644.
  Ceric *per*chlorate (FICHTER and JENNY), A., ii, 323.
    hydroxide, sols of (KRUYT and VAN DER MADE), A., ii, 421.
Cerium organic compounds:—
  acetato-compounds (WEINLAND and HENRICHSEN), A., i, 291.
Cerium earths from monazite sand (PRANDTL and LÖSCH), A., ii, 863.
Cerotic acid, ceryl ester, from sunflower seeds (BAREUTHER), A., i, 647.
Cetraria islandica, lichenin from (KARRER and JOOS), A., i, 541.
Cetyl alcohol, and its acetate, absorption of, by the animal organism (THOMAS and FLASCHENTRÄGER), A., i, 1256.
Charcoal, activity of (RUFF, MUGDAN, HOHLFELD, and FEIGL), A., ii, 411.
  adsorption of trypsin by (NORTHROP), A., ii, 1033.
  sorption by (SHELDON; FREUNDLICH and WRESCHNER), A., ii, 833.
  lecture experiment for showing the absorbent power of (v. ANTROPOFF), A., ii, 851.
  self-oxidation of, in alkalis (MEYERHOF and WEBER), A., ii, 317.
  contact catalysis of oxidation by (DOROSCHEVSKI and PAVLOV), A., ii, 398.
  animal, adsorption of the products of fermentation by (ABDERHALDEN and GLAUBACH), A., i, 518; (ABDERHALDEN; ABDERHALDEN and STIX; ABDERHALDEN and SUZUKI), A., i, 519.
    adsorption of uric acid by (HARPUDER), A., i, 389
  animal and vegetable, hydration of (RAKOVSKI), A., ii, 383.
  sugar, adsorption by (BARTELL and MILLER), A., ii, 464.
    activated, action of hydrogen peroxide with (FIRTH and WATSON), T., 1750.
Chayote. See *Sechium edule*.
Cheese, action of propionic bacteria in (SHERMAN and SHAW), A., i, 1041.
  skim milk, nitrogen compounds of (WINTERSTEIN and HUPPERT), A., i, 1260.
Chelalbines, constitution of (KARRER), A., i, 357.
Chemical combination, laws of (PUXEDDU), A., ii, 482.
Chemical constitution, determination of, from the electron theory (ENKLAAR), A., ii, 811.
    and absorption spectra (IZMAILSKI), A., i, 602; ii, 359, 521, 522.
    in relation to anæsthetic action (GRAF), A., i, 1265.
    and colour (KEHRMANN and SANDOZ), A., i, 156; (MOIR), A., ii, 48, 108, 809.
    and crystal structure (GRAHMANN), A., ii, 16.

- **Chemical** constitution and rotatory power (Pickard, Kenyon, and Hunter), T., 1; (Kenyon and McNicol), T., 14; (Phillips), T., 22, 44; (Hall), T., 32, 105; (Pickard and Hunter), T., 434; (Hunter), T., 1671; (Betti), A., ii, 674.
    - and solubility (Prins), A., ii, 131.
    - and spectrochemistry (Ley and Mannecke), A., ii, 202.
  - constants of diatomic gases (Partington), A., ii, 628.
    - of diatomic molecules (Cox), A., ii, 532
    - of the halogens (Henglein), A., ii, 124.
    - of saturation equations (Wertheimer), A., ii, 374.
  - reactions, mechanism of (Kindler, Burghard, Finndorf, Dehn, Giese, and Körding), A., i, 568.
    - effect of Röntgen rays on (Olson), A., ii, 4.
    - febrile (Quartaroli), A., ii, 550
    - unimolecular, theory of (Rodebush), A., ii, 303.
    - velocity of. See Velocity.
  - reactivity (Garrett and Lewis), A., ii, 476.
    - and conjugation (Heilbron, Barnes, and Morton), T., 2559.

  - disintegration of, in a magnetic effect (Schtschukarev), A., ii, 235.
  - active (Venkataramaiah), A., ii, 149.
  - activation of (Wendt, Landauer, and Ewing), A., ii, 22.
  - liquid, as an ionising solvent (Mennie and McIntosh), A., ii, 210.
  - solubilities of (Taylor and Hildebrand), A., ii, 315.
  - solubility of, in water (Arkadiev), A., ii, 405.
  - in synthetic hydrochloric acid (Neumann), A., ii, 851.
- **Chlorine** *mono*xide, photochemical decomposition of (Bowen), T., 2328.
    - thermal decomposition of (Hinshelwood and Prichard), T., 2730.
  - *mono*xide and *per*oxide, photochemical decomposition of solutions of (Bowen), T., 1201.
  - *tetra*oxide (Gomberg), A., ii, 235.
  - **Hydrochloric acid**, dipole length of molecules of (Frivold and Hassel), A., ii, 283.
    - preparation of, from sulphur dioxide and chlorine (Neumann and Wilczewski), A., ii, 630.
    - synthetic, chlorine in (Neumann), A., ii, 851.
    - refractive index of (Elsey and Lynn), A., ii, 349.
    - infra-red absorption spectrum of (Spence and Holley), A., ii, 275.
    - ultra-red absorption spectrum of (Colby, Meyer, and Bronk), A., ii, 356.
    - ionising potential of (Mackay), A., ii, 821.

Chlorine:—

- **Hydrochloric acid**, electrical conductivity of aqueous solutions of (PARKER), A., ii, 722.
  - physical properties of aqueous solutions of (VREVSKI and KAIGORODOV), A., ii, 738; (VREVSKI and ZAVARICKI; VREVSKI, ZAVARICKI, and SCHARLOV), A., ii, 739.
  - activity of hydrogen-ion in hydration of (LEWIS, MERRIMAN, and MORAN), A., i, 435.
  - activity coefficient of, in salt solutions (HARNED and BRUMBAUGH), A. ii, 115.
  - vapour pressure of mixtures of water and (YANNAKIS), A., ii, 611.
  - constant boiling mixture of water and (FOULK and HOLLINGSWORTH), A., ii, 482.
  - equilibrium of gelatin and (DE IZAGUIRRE), A., ii, 139.
  - compound of methyl ether and (MAASS and MORRISON), A., i, 892.
  - influence of, on the enolising action of Grignard reagents (BHAGWAT), T., 1803.
- **Chlorides**, diffusion of, into gels (STILES), A., ii, 743.
  - detection of, in presence of thiocyanates (SPACU), A., ii, 34.
  - estimation of, by Bang's method (PRIGGE), A., ii, 504.
  - estimation of, volumetrically, in presence of protective colloids (TREADWELL, JANETT, and BLUMENTHAL), A., ii, 579.
  - estimation of, in blood (GREENWALD and GROSS), A., ii, 83.
- **Chlorates**, electrolytic preparation of (PAMFILOV and FEDOROVA), A., ii, 629.
  - reduction of, by arsenious acid (KUBINA), A., ii, 304.
  - physiological action of (MAYER), A., i, 419.
  - detection of (POCH), A , ii, 177.
  - detection of, in mixtures of halogenates (DIMITROV), A., ii, 650.
  - estimation of, electrometrically, with titanous sulphate (HENDRIXSON), A., ii, 781.
- **Perchloric acid**, anhydrous (VORLANDER and KAASCHT), A., ii, 483.
  - as a micro-chemical reagent (CORDIER), A., ii, 347.
- **Perchlorates**, alkali and alkaline-earth (WILLARD and SMITH), A., ii, 239.
  - crystalline (VORLÄNDER and KAASCHT), A., ii, 487.

Chlorine:—

- **Hypochlorous acid**, action of, on bornylene (HENDERSON and MAIR), T., 1155.
  - estimation of, volumetrically (SCHLEICHER), A , ii, 504.
- **Hypochlorites**, estimation of (KOLTHOFF), A., ii, 176.
  - estimation of, in milk and cream (RUPP), A., ii, 177
- **Chlorites** (LEVI), A., ii, 421; (LEVI and CIPOLLONE), A., ii, 492.
  - stability of solutions of (LEVI and NATTA), A., ii, 760.
  - of cobaltammines (LEVI), A., ii, 767.
  - reactions of, with hydrazine and hydroxylamine salts (LEVI), A., ii, 406.

Chlorine detection and estimation:—

- detection of (DIMITROV), A., ii, 649.
- detection of, in silver halides (SCHMALFUSS), A , ii, 248.
- estimation of, in benzaldehyde (VOIGT), A., ii, 34.
- estimation of, in bleaching powder (OCHI), A., ii, 573.
- micro-estimation of, in blood (IVERSEN and SCHIERBECK; IVERSEN), A., ii, 176.
- estimation of, in organic compounds (HESLINGA), A., ii, 782.

Chlorites. See under Chlorine.

Chlorite-rock, from Derbyshire (GARNETT), A., ii, 777.

Chloroamine (MARCKWALD and WILLE), A., ii, 558.

Chloroamines, estimation of, in milk and cream (RUPP), A., ii, 177.

allo-ψ-**Chlorocodide**, and its hydrochloride (SPEYER and KRAUSS), A., i, 1116.

Chloroform, ultra-red absorption spectrum of (ELLIS), A., ii, 810.
- freezing point of (KEYES, TOWNSHEND, and YOUNG), A., ii, 376.
- and related compounds, supposed colloidal character of (BOSE), A., i, 1264.
- effect of, on the oxidation and iodine absorption of organic acids (RAY), A., i, 882.
- poisoning. See Poisoning.

α-**Chloro-ketones**, cyclic, transformations of (FAVORSKI and BOSHOVSKI), A., i, 679.

Chloropentamminecobalt salts. See under Cobalt.

Chlorophyll, effect of light and of manures on the formation of (WLODEK), A., i, 1160, 1161.
- theory of synthesis of (MAQUENNE), A., i, 1272.

- **Chlorophyll**, action of proteins and, on carbon dioxide (Eisler and Portheim), A., i, 424.
- **Chloroselenic acid**, preparation and properties of (Worsley and Baker), T., 2870.
- **Chlorosis** caused by manganese in green plants (Rippel), A., i, 1160.
- **Chloroxiphite** (Spencer and Mountain), A., ii, 774.
- **Chocolate**, milk, estimation of milk in (Grossfeld), A., ii, 98.
- **Cholanic acid**, 3-chloro-7:13-*di*hydroxy- (Wieland, Honold, and Pascual Vila), A., i, 1206.
- **Choleic acid**, stones of, in man (Mörner), A., i, 1261.
- **Cholenic acid**, 7:13-*di*hydroxy- (Wieland, Honold, and Pascual Vila), A., i, 1206.
- **Cholesteric type** (Friedel), A., ii, 224.
- **Cholesterol**, synthesis of, in the organism (Thannhauser and Schaber), A., i, 729.
    - acids formed by oxidation of (Windaus, Rosenbach, and Riemann), A., i, 1204.
    - degradation products of (Windaus and Hückel), A., i, 922.
    - physiological balance of (Thannhauser), A., i. 1037.
    - in relation to bile acids (Windaus), A., i, 922.
    - in blood in relation to basal metabolism (Epstein and Lande), A., i, 624.
    - in blood and in kidneys (Tietz), A., i, 417.
    - effect of, on consumption of oxygen by lecithin (Lange and Lawaczeck), A., i, 513.
    - content of, in muscle (Embden and Lawaczeck; Lawaczeck), A., i, 508.
    - in muscles in beri-beri (Lawaczeck), A., i, 512.
    - in the spleen (Marino), A., i, 414.
    - excretion of, in urine (Grunke), A., i, 169.
    - in pigeons with beri-beri (Hotta), A., i, 732.
    - chlorocarbonyl ester (Wieland, Honold, and Pascual Vila), A., i, 1207.
    - estimation of, (Caminade), A., ii, 264.
    - estimation of microchemically (v. Szent-Györgyi), A., ii, 344.
- **Cholic acid**, ethyl chlorocarbonyl ester, (Wieland, Honold, and Pascual Vila), A., i, 1206.
- **Cholic acid**, methyl ester, phenetidine-urethane of (Wieland, Honold, and Pascual Vila), A., i, 1207.
- **Cholic acid**, 3-chloro-7-hydroxy-, methyl ester (Wieland, Honold, and Pascual Vila), A., i, 1206.
- **Choline**, effect of, on blood-sugar (Dresel and Zemmin), A., i, 1035.
    - estimation of, in blood (Sharpe), A., ii, 444.
- **β-*iso*Choleidanic acid** (Wieland, Honold, and Pascual Vila), A., i, 1206.
- **ψ-Choloidanic acid** and its derivatives (Wieland), A., i, 41.
- ***iso*Chondodendrine**, constitution of (Faltis and Heczko), A., i, 358.
- **Chondran**, and its tetrabenzoate (Savialov), A., i, 618.
- **Chondrin**, structure and properties of (Rakuzin and Braudo), A., i, 618.
    - distinction between glutin and (Rakuzin), A., ii, 667.
- **Chondroitin** tribenzoate, and its hydrochloride (Savialov), A., i, 618.
    - hydrogen sulphate, preparation of (Rakuzin and Braudo), A., i, 618.
- **Chondroitinsulphuric acid** (Savialov), A., i, 618.
- **Chondrosine**, derivatives of (Savialov), A., i, 618
- *Chondrus crispus*. See Carrageen.
- **Chroman**, 6-amino-, and its salts and derivatives (Wilson and Adams), A., i, 329.
- ***iso*Chroman**, and thio-, and its derivatives (v Braun, Zobel, and Kühn), A., i, 1201.
- **Chromanols**, thio- (Arndt, Flemming, Scholz, and Löwensohn), A., i, 826.
- **Chromanone**, thio-, semicarbazone (Krollpfeiffer and Schultze), A., i, 1114.
- **Chromanones**, thio- (Arndt, Flemming, Scholz, and Löwensohn), A., i, 826; (Krollpfeiffer and Schultze), A., i, 1113.
- **Chrome brown P.A.** See Benzeneazopyrogallol, *p*-nitro-.
- **Chromic acid.** See under Chromium.
- **Chromium**, arc spectrum of (Catalán; de Gramont), A., ii, 104; (C. C. and H. K. Kiess), A., ii, 199; (Gieseler), A., ii, 355.
    - arc, flame, and spark spectra of (Catalán), A., ii, 519.
    - line spectrum of (Sommerfeld), A., ii, 355.
    - anodic behaviour of (Sborgi and Cappon), A., ii, 213.
    - electrochemical behaviour of (Izgaryschev and Obrutscheva), A., ii, 829.

Chromium, ionisation and resonance potentials of (Catalán), A., ii, 856.

Chromium alloys with iron electrochemistry of (Tammann and Sotter), A., ii, 825.

Chromium salts, magnetic susceptibility of (Cabrera and Piña de Rubies), A., ii, 169.

Chromium hydroxide, coefficient of magnetisation of (Veil), A., ii, 373.

*tri*oxide, solubility of, in nitric acid (Mumford and Gilbert), T., 471.

Chromic salts, electrophoresis of (Seymour-Jones), A., ii, 289.

sulphate, basic (Williamson), A., ii, 424.

Chromic acid, constitution of solutions of (Auerbach), A., ii, 327.

photochemical oxidation of quinine sulphate by, in presence of sulphuric acid (Forbes, Woodhouse, and Dean), A., ii, 675.

Chromium organic compounds (Weinland and Hachenburg), A., i, 445.

with pyrocatechol (Weinland and Walter), A., i, 674.

Chromic acid, esters (Wienhaus and Treibs), A., i, 893.

Chromithiocyanates (Scagliarini and Tartarini), A., i, 547, 1225.

Chromium estimation and separation:—

estimation of (Kano), A., ii, 699.

estimation of, in iron (Eder and Eder), A., ii, 92.

estimation of, in presence of organic matter (Grasser), A., ii, 699.

separation of, from manganese (Taverne), A., ii, 435.

Chromoisomerism of stilbene compounds (Cullinane), T., 2053.

Chromomalic acid (Barlot and Panaitopol), A., i, 534.

Chromoscope, for measurement of hydrogen-ion concentration (Guillaumin), A., ii, 82.

Chromoxalic acid, salts, dissociation of (Burrows and Turner), T., 2740.

Chrysanthemum cinerariæfolium, insecticide principles of (Yamamoto), A., i, 1010.

Chrysoidine *Y*, hydroferrocyanide (Cumming), T., 2459.

Chrysophanic acid. See 3-Methylanthraquinone, 1:8-*di*hydroxy-.

Chydenanthegenin (Duyster), A., i, 1044.

Chydenanthin (Duyster), A., i, 1044.

Chydenanthus excelsus, constituents of the seeds of (Duyster), A., i, 1044.

Chymosin. See Rennin.

Cicuta virosa, essential oil from (Schimmel & Co.), A., i, 49.

toxins of (Svagr), A., i, 936.

Cicutoxin (Svagr), A., i, 936.

Cicutoxinin (Svagr), A., i, 936.

*iso***Cilianic acid** (Wieland and Fukelman), A., i, 1206.

Ciloidanic acid (Wieland and Schlichting), A., i, 41.

Cinchomeronic acid, esters, methiodides of (Kirpal and Reiter), A., i, 1225.

Cinchonine ozonide (Seekles), A., i, 238.

Cinchoninal, and its salts and derivatives (Seekles), A., i, 237.

Cinnabar, arrangement of atoms in crystals of (Mauguin), A., ii, 493.

photoelectric conductivity of (Gudden and Pohl), A., ii, 718.

estimation of mercury in (Votoček and Kašpárek), A., ii, 184.

Cinnamaldehyde, *o*-chloro-, and its derivatives (Rosenmund, Zetzsche, and Weiler), A., i, 799.

p-hydroxy-, and its semicarbazone (Pauly and Wäscher), A., i, 342.

Cinnamaldehydesemicarbazone, and its methoxy- derivatives, phototropy of (Heilbron, Hudson, and Huish), T., 2273.

Cinnamenylacrylic acids, chlorides and piperides of (Staudinger and Schneider), A., i, 362

Cinnamic acid, velocity of, reduction of (Rideal), A., ii, 745.

catalytic hydrogenation of, derivatives of (Vavon and Husson), A., i, 464.

Cinnamic acid, *m*-amino-, acetyl derivative, and *m*-hydroxy- preparation of (Ingold and Piggott), T., 1501.

bromo-, and chloro-, and their esters, addition of bromine to (Sudborough and Williams), A., i, 337.

p-chloro-*α*-thiol- (Gendelman), A., i, 605.

Cinnamic acids, and their salts, action of sunlight on (de Jong), A., i, 574.

Cinnamoyl chloride, *o*-chloro- (Rosenmund, Zetzsche, and Weiler), A., i, 799.

α-**Cinnamoylacetone,** *β*-hydroxy- (Benary and Hosenfeld), A., i, 38.

β-**Cinnamoylaminocinnamonitrile** (Benary and Hosenfeld), A., i, 38.

β-**Cinnamoylaminocrotononitrile,** and *α*′-bromo- (Benary and Hosenfeld), A., i, 38.

Cinnamoylanilide, *o*-chloro- (Rosenmund, Zetzsche, and Weiler), A., i, 799.

α-**Cinnamoylcinnamonitrile,** *β*-amino- and *β*-hydroxy- (Benary and Hosenfeld), A., i, 38.

α-**Cinnamoylcrotononitrile,** *β*-amino- (Benary and Hosenfeld), A., i, 38.

Cinnamoyldimethylaminotetrahydronaphthalene hydrochlorides (GONZALEZ and CAMPOY), A., i, 209.
Cinnamoyl *p*-hydroxyphenylcarbamide. See Elbon.
Cinnamoylmethylgranatoline (TANRET), A., i, 832.
α-Cinnamylamino-β-3:4-methylenedioxyphenylacrylic acid, methyl ester (HARTMANN and KAGI), A., i, 605.
***o*-Cinnamyl-*p* cresol**, and its phenylcarbamate (CLAISEN), A., i, 1094.
Cinnamylideneacetic acid, allyl ester, and its hexabromide and polymerides (BLICKE), A., i, 794.
***allo*Cinnamylideneacetic acid** (v. AUWERS and MÜLLER), A., ii, 707.
Cinnamylidenecyanoacetic acid, and its amide (CURTIS, DAY, and KIMMINS), T., 3138.
β-Cinnamylidene-α-ketotetrahydronaphthalene (HERZOG and KREIDL), A., i, 61.
Cinnamylidenemalonic acid, pyridine and quinoline salts (STAUDINGER and SCHNEIDER), A., i, 362.
Cinnamylidenemalonyl chloride (STAUDINGER and SCHNEIDER), A., i, 362.
2-Cinnamylidenemethyl-3-methylchromone (HEILBRON, BARNES, and MORTON), T., 2567.
***N*-Cinnamylnorcodeine**, and its salts (v. BRAUN and LEMKE), A., i, 5.
***o*-Cinnamylphenol** (CLAISEN), A., i, 1094.
Citraconatodipentamminecobaltic citraconate nitrate and nitrate (DUFF), T., 568, 570.
Citral, derivatives of (KISHNER), A., i, 385.
Citratopentamminecobalt (DUFF), T., 569.
Citratotripentamminecobaltic dihydrogen citrate (DUFF), T., 571.
Citric acid, formation of, by moulds (BUTKEWITSCH), A., i, 519.
  equilibrium of sucrose, water, and (KREMANN and EITEL), A., ii, 622.
  in green plants (FRANZEN and HELWERT), A., i, 520.
  in sweat (LEAKE), A., i, 1153.
  salts, effect of injection of (GROSS), A., i, 733.
  calcium and strontium salts (CHATTERJEE), A., i, 896.
  detection of (JORISSEN), A., ii, 267.
  estimation of, in urine (McCLURE and SAUER), A., ii, 267.
Clamp, Mohr pinch, screw modification of (CRAIG), A., ii, 648.
Clays, colloidal, flocculation of (BRADFIELD), A., ii, 470.
Clays, Japanese acid (OKAZAWA), A., ii, 693.
  oxydase reaction of (KOBAYASHI and YAMAMOTO), A., ii, 693.
Clover, red, effect of potassium salts on the potassium–nitrogen ratio of (EMERSON and BARTON), A., i, 522.
Clupanodonic acid, methyl ester (BROWN and BEAL), A., i, 648.
Coagulation by electrolytes (IVANITZKAJA and ORLOVA), A., ii, 545.
  of colloids (MURPHY and MATHEWS), A., ii, 17.
  of colloidal suspensions (VOSNESSENSKI), A., ii, 619.
Coal, formation of (MARCUSSON), A., i, 353.
  chemical structure of (SCHRAUTH), A., ii, 502
  preparation of transparent sections of (J. LOMAX and J. R. LOMAX), A., ii, 646.
  absorption of water by (MOORE and SINNATT), T., 275.
  humic substances from (PIETTRE), A., ii, 692.
  bituminous, constituents of (PEARSON), A., ii, 246.
  upper Silesian, pyridine extract of (HOFMANN and DAMM), A., i, 429.
Coal gas, slow oxidation of (WHEELER and BLAIR), A., i, 752.
Coal tar, primary (SCHUTZ), A., i, 195.
  low temperature (FISCHER), A., i, 313; (SCHUTZ, BUSCHMANN, and WISSEBACH), A., i, 665.
Cobalt atom, magneton number of (SMITH), A., ii, 122.
  anodic behaviour of (SBORGI and CAPPON), A., ii, 213.
Cobalt bases (*cobaltammines*), solubility of (EPHRAIM), A., ii, 644.
  Aquopentamminecobaltic salts (DUFF), T., 567, 570; (EPHRAIM), A., ii, 644.
  Bromopentamminecobalti-salts (EPHRAIM), A., ii, 644.
  Chloropentamminecobalt chlorite (LEVI), A., ii, 767.
  Chloropentamminecobalti-salts (EPHRAIM), A., ii, 644.
  Diaquotetramminecobalti-salts (EPHRAIM), A., ii, 644.
  Dinitrotetramminecobalti-salts (EPHRAIM), A., ii, 644.
  Hexamminecobalt chlorite (LEVI), A., ii, 767.
  Hexamminecobaltichloride, catalytic decomposition of (SCHWARZ and KRÖNIG), A., ii, 168.
  Hexamminecobaltifluosilicate (EPHRAIM), A., ii, 644.

Cobalt bases:—
  Iodopentamminecobalti-chlorate (Ephraim), A., ii, 644.
  Nitratopentamminecobalti-salts (Ephraim), A., ii, 644.
  Nitropentamminecobalti-salts (Ephraim), A., ii, 644.
Cobalt compounds, complex (Job), A., ii, 168; (Denham and Pennycuick), A., ii, 567.
Cobalt salts, density of (Biltz and Birk), A., ii, 768.
Cobalt chloride, solubility of, in water containing hydrochloric acid (Foote), A., ii, 326.
    equilibrium of ammonium chloride, water, and (Rivett and Clendinnen), T., 1634.
  β-**Cobalt** iodide (Birk and Biltz), A., ii, 866.
Cobalt nitrites (Cuttica), A., ii, 497.
    triple (Cuttica and Paoleitti), A., ii, 76.
  higher oxide (Howell), T., 65.
  *per*oxide, decomposition of sodium hypochlorite by (Howell), A., ii, 634.
  sulphate, precipitation of solutions of, with cadmium or zinc (Kremann, Angelberger, Bakalarz, Röhrich, and Stöger), A., ii, 866.
Cobalt organic compounds (Duff), T., 560.
  acetylide (Durand), A., i, 1170.
  pyridine and tribenzylamine sulphates (Spacu and Ripan), A., i, 833.
Cobalt estimation:—
  estimation of, electrometrically (Müller and Lauterbach), A., ii, 92.
  estimation of, with dinitroso-resorcinol, in presence of nickel (Orndorff and Nichols), A., ii, 584.
  estimation of, in steel (Ferreri), A., ii, 699.
Coca leaves, Java, alkaloids from (de Jong), A., i, 1221.
  estimation of benzoylecgonine, tropacocaine, and ecgonine in (de Jong), A., ii, 798.
d- and *l*-**Cocaine**, difference in activity of (Gottlieb), A., i, 1265.
Cocoa, estimation of theobromine in (Ugarte), A., ii, 592.
Coconut oil, separation of octoic and decoic acids from (Walker), T., 2837.
Codeine, and its isomerides, and derivatives (Speyer and Krauss), A., i, 1115.
  keto-base and its derivatives from (Knoll & Co.), A., i, 940.
Codeine, effect of, on the digestion of meat (Zunz and Delcorde), A., i, 412.
  estimation of (Annett and Sanghi), A., ii, 269.
Cod-liver oil, active constituent of (Takahashi and Kawakami), A., i, 968.
  influence of, on calcium and phosphorus metabolism (Sjollema), A., i, 1254.
Coelenterates, digestion in (Bodansky and Rose), A., i, 625.
Cohesion pressure and the formation of submicrons (Traube), A., ii, 126.
Coix lacryma, constituents of the kernels of (Hattori and Komatsu), A., i, 427.
Coke, sulphur in (Powell), A., ii, 151.
Collagen, hydrolysis of, by trypsin (Thomas and Seymour-Jones), A., i, 871.
Collargol, action of salts on (Gerasimov), A., i, 492, 616.
  influence of electrolytes on the coagulation of, by acetic acid (Gerasimov), A., i, 617.
Collodion membranes. See Membranes.
Colloids, influence of, on electrolysis (Izgaryschev and Titov; Izgaryschev), A., ii, 371; (Izgaryschev and Ponomoreva), A., ii, 372.
  reversal of the charge on (Dhar and Sen), A., ii, 391.
  crystallisation theory of (v. Weimarn), A., ii, 546.
  transition of, to crystalloids (Bircumshaw), T., 91.
  kinetics of the solution of (Peskov), A., ii, 389.
  lyotropic action in the solution of (Peskov), A., ii, 225.
  separation of, from liquids (Marx and Rozières), A., ii, 470.
  coagulation of (Murphy and Mathews), A., ii, 17.
    effect of light on (Peskov), A., ii, 390.
  chemistry of (Pauli and Walter), A., ii, 325; (Kautzky and Pauli), A., ii, 329.
    history of (v. Weimarn), A., ii, 618.
  action of trypsin on (Stiasny and Ackermann), A., ii, 301.
  emulsoid, hydrogen-ion concentration and properties of (Bogue), A., ii, 59.
  hydrophilic, sensitisation and protective action of (Reitstötter), A., i, 393.
  ionisable, electrolytic dissociation of (Gyemant), A., ii, 618.

- **Colloids**, lyophile, viscosity of (DE JONG), A., ii, 132.
  - in plants (SAMEC and ISAJEVIČ), A., i, 18.
  - protective (GUTBIER and ZWEIGLE), A., ii, 60; (PESKOV; PESKOV and TRETIAKOV), A., ii, 392; (GUTBIER, HUBER, and ECKERT; GUTBIER and WÜTERICH), A., ii, 393; (GUTBIER, LOCHER, and KREIDL), A., ii, 618; (GUTBIER, SAUER, and KRÖNER), A., ii, 619; (GUTBIER and RHEIN), A., ii, 630.
    - to proteins (LOEB), A., ii, 301.
  - in soils (DAVIS), A., i, 640.
  - suspensoid, adsorption of uric acid by (HARPUDER), A., i, 389.
- **Colloidal** clays. See under Clays.

α *A*- and-*B*-**Copellidylheptoic acids**, ethyl esters (v. Braun and Schirmacher), A., i, 1050.
α-*A*- and -*B*-**Copellidylheptyl alcohols** (v. Braun and Schirmacher), A., i, 1050.
Copellidylpyrrolidinium salts (v. Braun, Lemke, and Nelken), A., i, 840.
Copper, mechanism of the roasting process for (Reinders and Goodriaan), A., ii, 321.
arc spectrum of (Mitra), A., ii, 595.
mass spectrum of (Aston), A., ii, 596.
isotopes of (Dempster), A., ii, 640.
ionisation potential of (Shenstone), A., ii, 605.
and its oxide, vapour pressures of (Mack, Osterhof, and Kraner), A., ii, 291.
adsorption of gases by (Pease), A., ii, 862.
adsorption of oxygen by (Moles and Payá), A., ii, 165.
velocity of solution of, in dilute benzaldehyde (Schaaf), A., ii, 307.
cementation of (Sirovich and Cartoceti), A., ii, 30.
films, structure and oxidation colours of (Hinshelwood), A., ii, 29.
Copper, oxidation of, and reduction of the oxide (Palmer), A., ii, 474.
action of alkali hydroxides on, and on its oxide (Creighton), A., ii, 492.
action of, on ricin (Tsuchihashi), A., i, 1152.
content of marine animals (Severy), A., i, 415.
influence of, on lactic fermentation (Fouassier), A., i, 422.
Copper alloys with aluminium, ultraviolet spark spectra of (Waché), A., ii, 518.
polymorphism of (Stockdale), A., ii, 766.
with gold and silver, specific resistance of (Fischbeck), A., ii, 10.
with tin, melting point of (Bauer and Vollenbruck), A., ii, 640.
colour and texture of (Chikashige), A., ii, 30.
with zinc, vapour tension of (Guillet and Ballay), A., ii, 74.
Copper bases (*cuprammines*) (Spacu and Ripan), A., i, 832.
Copper salts, catalytic oxidation with (Aloy and Valdiguié), A., ii, 552.
complex (Denham and Pennycuick), A., ii, 567.
complex compounds of thallium salts and (Canneri), A., ii, 74.
Copper chlorides, equilibrium of ammonium chloride, water, and (Rivett and Clendinnen), T., 1634.
equilibrium of silver chloride and (Edgar and Cannon), A., ii, 139.
chlorovanadate (Cuttica, Tarchi, and Alinari), A., ii, 499.
halides, solubility of, in sodium thiosulphate (Canneri and Luchini), A., ii, 74.
hydroxide, electrolytic (Kohlschütter and Sedelinovich), A., ii, 165.
complex salts of, with silver oxide and amines (Traube), A., i, 903.
hydroxides (Losana), A., ii, 321.
oxide, reduction of, by carbon monoxide (Jones and Taylor), A., ii, 765.
and hydroxide, equilibrium of, with sodium hydroxide (Müller, Kahlert, Wiegand, Ernst, and Keil), A., ii. 567.
oxides (Ruer and Nakamoto), A., ii, 643.
selenide, sulphide, and telluride (Garelli), A., ii, 640.
sulphate pentahydrate, dissociation pressures of (Partington and Huntingford), T., 167.

- **Copper sulphate**, nitric oxide compound, absorption spectrum of (SCHLESINGER and SALATHE), A., ii, 673.
    - sulphide, precipitation of, in presence of sodium chloride (BILTZ), A., ii, 41.
    - **Cupric compounds**, interaction of, with diazonium salts (CONTARDI), A., i, 491.
        - salts, action of thiosulphates on (BASSETT and DURRANT), T., 1279.
        - chloride, solubility of, in water containing hydrochloric acid (FOOTE), A., ii, 326.
            - compound of benzamide and (BELLADEN and ASTENGO), A., i, 1010.
            - action of sodium hyposulphite on solutions of (FIRTH and HIGSON), T., 1515.
        - chlorites (LEVI and CIPOLLONE), A., ii, 492.
        - oxide, formation of jellies of (WEISER), A., ii, 765.
            - catalytic efficiency of (ALMQUIST and BRAY), A., ii, 840.
            - hydrated (WEISER), A., ii, 566.
    - **Cuprous** compounds (ERRERA), A., ii, 165.
        - ammonium carbonate, absorption of carbon monoxide by (LARSON and TEITSWORTH), A., ii, 157.
        - nitrate and other cuprous salts, preparation and stability of, in presence of nitriles (MORGAN), T., 2901.
        - oxide electrodes. See Electrodes.
        - sulphide, preparation of (MARCHAL), A., ii, 571.
            - electrical properties of (URAZOV), A., ii, 454.
            - equilibrium of ferrous sulphide with (CARPENTER and HAYWARD), A., ii, 863.
    - **Cuprates**, existence of (CREIGHTON), A., ii 492.
- **Copper organic compounds**:—
    - with cellulose (HESS and MESSMER), A., i, 306.
    - pyridine and tribenzylamine ammonium sulphates (SPACU and RIPAN), A., i, 832.
    - with pyrocatechol (WEINLAND and WALTER), A., i, 674.
    - **Cuprous** phenyl (REICH), A., i, 972.
- **Copper detection, estimation, and separation**:—
    - detection of (SPACU), A., ii, 40; (ALOY and VALDIGUIÉ), A., ii, 91.
    - detection of, with isatin (MENKE), A., ii, 256.
    - estimation of (FEIGL), A., ii, 880.
- **Copper detection, estimation, and separation**:—
    - estimation of, microchemically (SPACU), A., ii, 41; (FONTÈS and THIVOLLE), A., ii, 581.
    - estimation of, volumetrically (LASAUSSE), A., ii, 41.
    - estimation of, in alloys (WINKLER), A., ii, 91.
    - estimation of, iodometrically, in bronze and brass (BATTA and LATHIERS), A., ii, 41.
    - estimation of, in gelatin (MEHURIN), A., ii, 891.
    - estimation of, in presence of iron (HAHN and WINDISCH), A., ii, 262.
    - estimation of, electrometrically, in presence of silver (MÜLLER and RUDOLPH), A., ii, 880.
    - estimation of, and its separation from cadmium (WENGER and DURST), A., ii, 581.
    - separation of, from selenium (ANGELETTI), A., ii, 581.
- **Coprosterol**, oxidation of, to *iso*lithobilianic acid (WINDAUS and RIEMANN), A., i, 567.
- **Coral**, constituents of (PASSERINI), A., i, 510.
- **Cork**, constituents of (KARRER, PEYER and ZEGA), A., i, 276.
- **Corpses**, detection of benzene in (GETTLER), A., ii, 440.
    - detection and behaviour of formaldehyde in (BRÜNING), A., ii, 442.
- **Corpus luteum** hormone of the, and its derivatives (FRANKEL and FONDA), A., i, 1257.
- **Corrosion** at the water-line (WATSON), A , ii, 743.
- *Corydalis cava*, alkaloids of (SPÄTH MOSETTIG, and TRÖTHANDL), A., i, 593.
- **Corypalmine**, (SPATH, MOSETTIG, and TRÖTHANDL), A., i, 594.
- **Cotton**, photochemistry of (CUNLIFFE), A., i, 1065.
    - absorption of sodium hydroxide solutions by (COWARD and SPENCER), A., i, 804.
    - action of water and steam on (FALGHER and WILLIAMS), A., i, 637.
    - action of water and of sodium hydroxide on (CLIFFORD and FARGHER), A., i, 637.
    - mercerisation of (CLIBBENS), A., i, 1065.
    - hairs, centrifuge for removal of surface liquids from (COWARD and SPENCER), A., i, 305.

Cotton, American, constituents of, extracted with benzene (Fargher and Probert), A., i, 278.
 chemical analysis of (Birtwell, Clibbens, and Ridge), A., ii, 793.
Cotton cellulose. See Cellulose.
Cotton seed, digestibility of the globulin from (Jones and Waterman), A., i, 962.
Cotton seed oil, phytosterols of (Anderson and Moore), A., i, 1008.
Coumaranones, oximino-, conversion of, into 1:3-benzoxazine derivatives (Mameli), A., i, 61.
Coumarigenin in plants (Navez), A., i, 428.
Coumarilic acid, 6-bromo-4-nitro-, and 4-nitro-, and their salts and derivatives (Dey and Row), T., 3380.
Coumarin, 6-cyano- (Dey and Dalal), T., 3387.
Coumarins, amino-, diazo-transformations of (Dey and Dalal), T., 3384.
 bromonitro-, and their reaction with alkalis (Dey and Row), T., 3375.
Coumarin-6-carboxylic acid, and its derivatives (Dey and Dalal), T., 3388.
Coumarinic acid, α-bromo-5-nitro-, and 3-α-*di*bromo-5-nitro-, and their silver salts (Dey and Row), T., 3379.
Coupling reactions, mechanism of (Konig), A., i, 862.
Cream, estimation of hypochlorites and chloroamines in (Rupp), A., ii, 177.
Creatine, origin of (Thomas, Kapfhammer, and Flaschenträger), A., i, 51.
 formation of, during muscle contraction (Uyeno and Mitsuda), A., i, 979, 980.
 in muscle (Spiegel and Löw), A., i, 414; (Hammett), A., i, 630.
  effect of cooling on (Palladin and Kudrjavzev), A., i, 268.
 conversion of, into creatinine (Hahn and Meyer), A., i, 509; (Edgar and Hinegardner), A., i, 1222; (Edgar and Wakefield), A., ii, 840.
 metabolism of. See Metabolism.
 excretion of (Palladin), A., i, 631.
  in children (Harding and Gaebler), A., i, 169.
 n-butyl, ethyl, and methyl esters, hydrochlorides (Dox and Lester), A., i, 127.
 standards for estimation of (Edgar), A., ii, 667.
 estimation of, in blood-serum (Hahn and Meyer), A., ii, 195.
 estimation of, in muscle (Hahn and Schäfer), A., ii, 444.
Creatinine, preparation of, from creatine (Edgar and Hinegardner), A., i, 1222; (Edgar and Wakefield), A., ii, 840.
 conversion of, into creatine (Hahn and Meyer), A., i, 509.
 in muscle extracts (Hammett), A., i, 630.
 excretion of, in urine (Laufberger), A., i, 732.
 standards for estimation of (Edgar), A., ii, 667.
 estimation of, in blood-serum (Hahn and Meyer), A., ii, 195.
Creatinuria, influence of the positive nitrogen balance on, during growth (Harding and Henry), A., i, 1256.
Cresalol. See Salicylic acid, *p*-tolyl ester.
m-**Cresol**, 6-chloro-, sulphide (Lesser and Gad), A., i, 564.
 nitro-derivatives (Gibson), T., 1269.
p-**Cresol**, 3-amino-, action of magnesium ethyl bromide on (Puxeddu), A., i, 555.
  acetyl derivative (Puxeddu), A., i, 555.
 3-nitro-, disinfecting power of (Glaser and Prüfer), A., i, 694.
  benzoyl derivative (Allsop and Kenner), T., 2314.
Cresols, ultra-violet absorption spectra of (Klingstedt), A., ii, 201.
Cresols, *mono*- and *di*-bromoamino-, acetyl and benzoyl derivatives (Raiford and Iddles), A., i, 327.
o- and *m*-**Cresols**, arsination of (Christiansen), A., i, 500.
m-**Cresols**, amino-, benzoyl derivatives (Gibson), T., 1276.
p-**Cresoldisulphonyl** chloride (Gibson and Smiles), T., 2390.
Critical constants of organic compounds (Herz and Neukirch), A., ii, 458.
 points, photographic registration of (Montemartini and Losana), A., ii, 373.
 solution temperature as criteria of purity (Jones), T., 1374, 1384.
  effect of addition of substances on (Drucker), A., ii, 612.
Crotin, and anti-crotin, isolation of (Fujiwara), A., i, 1152.
Crotonic acid, α-cyano-, ethyl ester (v. Auwers, Jordan, Meissner, and Seydel), A., i, 662.
*iso***Crotonic acid**, *p*-bromophenacyl ester, and α-chloro-, ethyl ester (v. Auwers, Meissner, Seydel, and Wissebach), A., i, 747.
Crotonic acids, configuration of (v. Auwers and Wissebach), A., i, 294.

Crotonic acids, *γγ-di-* and *γγγ tri-*chloro-, and their derivatives (v. Auwers and Wissebach), A., i, 295.
Crotononitrile, spectroscopy of (v. Auwers, Jordan, Meissner, and Seydel), A., i, 662.
  trimeride of (de Booseré), A., i, 311.
  melting point curve of the binary mixture, aniline, and (Lafortune), A., i, 1193.
5 Crotonylidenerhodanine (Gränacher, Gerö, Ofner, Klopfenstein, and Schlatter), A., i, 707.
Crucible, Gooch, use of (Craig), A., ii, 694.
Cryoscopy of solutions in (Finkelstein), A., ii, 534.
Cryptobranchus japonicus, hydrolysis of the muscle protein of (Suga), A., i, 1259.
Crystal hydrates, constitution of (Rhodes), A , ii, 554.
    change of water of crystallisation of, into adsorbed water (Hagiwara), A., ii, 234.
Crystals, structure of (Wyckoff), A., ii, 300.
    by means of Rontgen rays (Bragg), A., ii, 836.
    and chemical constitution (Grahmann), A., ii, 16.
    and constitution of organic compounds (Knaggs), T., 71.
  lattice structure and valencies of (Padoa), A., ii, 16.
  anomalous reflection of Rontgen rays in (Clark and Duane), A., ii, 468, 469 ; (Wyckoff), A., ii, 743.
  Röntgen ray analysis of (Shearer), A., ii, 223.
  relation between symmetry of, and molecular symmetry (Shearer), A., ii, 223 ; (Barker), A., ii, 388, 618 ; (Evans ; Shearer and Astbury), A., ii, 468.
  relation between form of, and their density and superficial energy (Hrynakowski), A., ii, 545.
  relation between the surface, mass, and volume of (Hrynakowski), A., ii, 545.
  formation of, in colloidal metals (Kohlschütter and Steck), A., ii, 133.
  liquids, molecular form of (Vorländer), A., ii. 617.
  mixed (Landrieu), A., ii, 59.
    equilibria of formation of (Rivett and Clendinnen), T., 1634.
    thermodynamics of formation of (Herzfeld), A., ii, 534.
Crystals, mixed, equilibrium of, with their solutions (Meyer), A., ii, 394.
  binary mixed, melting point curves of (Guy), A., ii, 831.
  ternary mixed, specific resistance and thermo-electromotive force of (Fischbeck), A., ii, 10.
  orthorhombic, rotatory polarisation in (Greenwood), A., ii, 715.
Crystalline liquids, classification (Friedel), A., ii, 223.
Crystallisation, rhythmic (Kägi), A., ii, 300.
  by friction of a glass rod against the wall of the vessel (Dede ; Fricke), A., ii, 132
  trajectories of, in chemical equilibrium diagrams (Kurnakov and Shemtschushni), A., ii, 620.
  of metals and salts (Tammann and Mansuri), A., ii, 300.
Crystalloids, dialysis of (Kahlenberg), A., ii, 15.
Cucumis melo (cantaloupe), proteins of the seeds of (Jones and Gersdorff), A., i, 883.
    estimation of starch in seeds of (Denny), A., ii, 95.
Cumene, synthesis of (Bert), A., i, 451.
Cumene, *p*-bromo-, action of magnesium on (Bert), A., i, 1005.
ψ Cumenol sulphide (Lesser and Gad), A., i, 564.
β-Cumidoyl chloride (de Diesbach, Perrig, Betschart, and Strebel), A., i, 805.
Cuminol, action of magnesium on a mixture of α-bromoallene and (Volkov), A , i, 564.
Cumylallylcarbinol (Volkov), A., i, 564.
γ-*p* Cumylbutyryl chloride (Ruzicka and Stoll), A , i, 120.
ψ-Cumylthiocarbimide (Dains, Brewster, and Olander), A., i, 324.
Cuprates. See under Copper.
Cupressus torulosa, oil from the leaves of (Simonsen), A., i, 1106.
Cupric salts. See under Copper.
Cuprilactic acid, salts of (Wark), T., 1815.
Cuprimalic acid, salts of (Wark), T., 1826.
Cupron (Feigl), A., ii, 880.
Currant. See *Ribes rubrum.*
Cyanamide, hydrolysis and polymerisation of (Braham), A., i, 447.
  condensation of aromatic aminosulphonic acids with (Scott and Cohen), T., 3177.
  physiological action of (Raida), A., i, 733.

Cyanamide and its derivatives, detection of (Buchanan), A., ii, 889.
Cyanates and Cyanic acid. See under Cyanogen.
Cyanic compounds, magnetic properties of (Pascal), A., i, 761.
*iso***Cyanines**, thio-, constitution of (Mills and Braunholtz), T., 2804.
Cyanine colouring matters (Mills and Braunholtz), T., 2804.
Cyanogen, spectrum of (Rayleigh), A., ii, 45.
 thio-. See Thiocyanogen.
Cyanogen bromide, action of, on mixed organic sulphides (v. Braun and Engelbertz), A., i, 893.
 Hydrocyanic acid in the Burma bean (Warth), A., i, 886.
  constitution of (Franklin), A., i, 447.
  formation of, from citric acid (Jorissen), A., ii, 267.
  synthesis of, by the electric discharge (Francesconi and Ciurlo), A., i, 764, 1067.
  isomeride of, and its toxicity (Bedel), A., i, 880.
  polymeride of (Bedel), A., i, 190.
  catalytic oxidation of (Zawadzki; Zawadzki and Wolmer), A., ii, 854.
  anticatalytic action of (Warburg), A., i, 501.
  reaction of pinene with, under the electric discharge (Francesconi and Ciurlo), A., i, 1022.
  ammonium salt, preparation of (Ellis and Gibbins), A., i, 904.
   action of, on α-diketones (Dakin and Harington), A., i, 583.
  potassium salt, reaction on, heating phosphorus with (Ellis and Gibbins), A., i, 904.
  sodium salt, vapour pressure curve for (Ingold), T., 885.
  estimation of, microchemically (Rosenthaler and Seiler), A., ii, 591.
  estimation of, in plants (Kohn-Abrest and Ricardoni), A., ii, 869.
 Cyanides, complex, dissociation of (Burrows), T., 2026.
  oxidation of, in aqueous solution (Hess), A., i, 762.
  detoxication of, in health and disease (Bodansky and Levy), A., i, 984.
  detection of (Ekeley and Macy), A., ii, 100.
  estimation of, by the aëration process (Roe), A., ii, 702.
Cyanogen:—
 Cyanides, estimation of small quantities of, iodometrically (Schulek), A., ii, 591.
 Cyanic acid, detection of (Werner), T., 2577.
 *iso***Cyanic acid**, condensation of aromatic aminosulphonic acids with (Scott and Cohen), T., 3177.
 Cyanates, formation of (Marckwald and Wille), A., i, 762.
Cyanohydrins, action of organomagnesium compounds on (Asahina and Terasaka), A., i, 1023.
Cyanuric compounds, magnetic properties of (Pascal), A., i, 761.
Cyanuryltri-triphenylphosphinimine (Kesting), A., i, 1149.
*apo***Cyclene** (Schering), A., i, 47.
Cyclic compounds, calculation of the colour of (Moir), T., 2792.
 hydrogenated (Schrauth and Görig), A., i, 1084, 1086.
 of the Ladenburg formula, synthesis of (Farmer), T., 3332.
p-**Cymene**, formation of, in hydrolysis of wood (Heuser, Zeh, and Aschan), A., i, 196.
 catalytic preparation of, and its formation in sulphite turpentine (Komatsu, Nakamura, and Kurata), A., i, 769.
 synthesis of (Bert), A., i, 451.
 variations in physical constants of, from different sources (v. Auwers and Kolligs), A., i, 99.
 from sulphite-cellulose, refractive index and density of (Karvonen), A., i, 1084.
 synthesis of thymol from (Phillips and Gibbs; Phillips), A., i, 781.
p-**Cymene**, 5-chloro-2-amino-, and its salts and derivatives (Wheeler and Giles), A., i, 28.
 2:3:5- and 2:5:6-*tri*hydroxy-, triacetates, and 2:3 5:6-*tetra*hydroxy-, tetra-acetate (Bargellini), A., i, 560.
p-**Cymylacetaldehyde**, and its semicarbazone (Bert), A., i, 1101.
Cymylhydrazine-*p*-sulphonic acid, and its barium salt (Phillips), A., i, 782.
Cypress oil (Pigulevski and Fichtenholz), A., i, 817.
Cysts, composition of liquids from (Maurin), A., i, 1039; (Mazzocco), A., i, 1040.
 ovarian mucoid, sucrase in the walls of (Lecène and Bierry), A., i, 979.
 paraovarian, liquid from (Guerbet), A., i, 1155.

Cysteine, oxidation and reduction potentials of (Dixon and Quastel), T., 2943.
metallic derivatives (Harris), A., i, 97.
Cystine, synthesis of, in the animal body (Muldoon, Shiple, and Sherwin), A., i, 1256.
estimation of, in proteins (Harris), A., i, 492.
l-**Cystine,** formation of mercaptan from, by bacteria (Kondo), A., i, 517.
Cystinuria, secretion of bile acids in (Eppinger), A., i, 631.

D.

Dacrene, and its dibromide (Goudie), A., i, 1022.
Dacrylium biforme, essential oil from the leaves of (Goudie), A., i, 1022.
Datolite, from Franklin, New Jersey (Gordon), A., ii, 647.
Decacyclene (Dziewoński and Suszko; Dziewoński, Łazowska, and Wandycz), A., i, 776; (Dziewoński and Podgórska; Dziewoński and Pochwalski), A., i, 777.
Decacyclenetrisulphonic acid (Dziewoński and Pochwalski), A., i, 777.
Decahydronaphthalene, preparation and dehydrogenation of (Zelinski), A., i, 910.
Decahydronaphthalene-1:8-dicarboxylic acid, methyl ester (Casares and Ranedo), A., i, 221.
Decahydro*iso*quinoline, and its salts (Helfer), A., i, 1228.
Decalepis Hamiltonii, 2-hydroxy-4-methoxybenzaldehyde from the roots of (Rao and Iyengar), A., i, 1018.
Decoic acid from cocoanut oil (Walker), T., 2837.
Decomposition, double, without solvents (Bergman), A., ii, 568, 761; (Bergman, Henke, and Isaikin), A., ii, 764.
*iso***Dehydracetic acid,** and bromo-, ethyl esters, preparation of (Goss, Ingold, and Thorpe), T., 318.
Dehydrobenzoylacetic acid, reactions of lactam derivatives of (Petrenko-Kritschenko), A., i, 601.
Dehydro-6-bromo-2-naphthol sulphide, and its *p*-nitrophenylhydrazone (Lesser and Gad), A., i, 563.
Dehydrocatechin tetramethyl ether, and its derivatives (Drumm), A., i, 1221.
Dehydrodeoxycholic acid, methyl ester (Shimizu), A., i, 40.
Dehydrodioxybetulin (Traubenberg), A., i, 590.
Dehydro-*dl*-nerolidol (Ruzicka), A., i, 691.
Dehydrothio-*p*-toluidine, preparation of (Hunter) A., i, 779.
De-*N*-methyldihydrocodeine. See Methyldihydromorphimethine.
Density, determination of (Egerton and Lee), A., ii, 462.
of liquids, determination of (Doemens), A., ii, 740.
below 0° (Timmermans), A., ii, 678.
of metals and their alloys at high temperatures (Bornemann and Siebe), A., ii, 169; (Sauerwald), A., ii, 172.
of mixed solutions (Doroschevski and Ekareva), A., ii, 387.
Deoxybenzoin, 4′-chloro-2:4-*di*hydroxy-, 4′-chloro-2:4:6-*tri*hydroxy-, 2:4-*di*- and 2:4:6-*tri*-hydroxy-, and their derivatives (Chapman and Stephen), T., 404.
Deoxybenzoins, disubstituted (Danilov), A., i, 680.
ψ-**Deoxybilianic acid** (Wieland, Honold, and Pascual Vila), A., i, 1206.
Deoxycholic acid, chlorocarbonyl esters (Wieland, Honold, and Pascual Vila), A., i, 1206.
β-*iso*-**Deoxycholic acid** (Wieland, Honold, and Pascual Vila), A., i, 1206.
Deoxygluconic acid, and its barium salt and lactone (Bergmann, Schotte, and Leschinsky), A., i, 654.
α- and β-**2-Deoxyglucoses,** and their derivatives (Bergmann, Schotte, and Leschinsky), A., i, 653.
2-Deoxymannitol, and its di*iso*propylidene ether (Bergmann, Schotte, and Leschinsky), A., i, 654.
Deoxymethylglucoside tribenzoate (Bergmann, Schotte, and Leschinsky), A., i, 653.
2-Deoxysorbitol. See 2-Deoxymannitol.
Deoxy-yohimbine (Barger and Field), T., 1042.
Derrid, derivatives of (Kariyone and Atsumi), A., i, 477.
Derris-root, constituents of (Kariyone and Atsumi), A., i, 477.
Dextrinosol (Kunz-Krause) A., i, 757.
Dextrose (d-*glucose*), formation of, from alanine, and from lactic and pyruvic acids (Aubel and Wurmser), A., i, 1264.
mutarotation of (v. Euler and Erikson), A., i, 1062; (Riiber), A., ii, 811.
in contact with intestinal mucosa (Stiven and Reid) A., i, 1153.
influence of salts on the muta-rotation and specific rotation of (Murschhauser), A., i, 440.

Dextrose, change of rotation of, by an enzyme (Winter and Smith), A., i, 513.
compound of ammonia with (Schmack), A., i, 1062.
action of, on bismuth salts (Cousin), A., ii, 772.
action of concentrated hydrochloric acid on derivatives of (Hirst and Morrison), T., 3226.
oxidation of, with mercuric oxide (Blanchetière), A., i, 539; (Bert), A., i, 754.
compound of sodium ethoxide and (Zemplén and Kunz), A., i, 897.
action of sodium sulphite on (Bleyer and Schmidt), A., i, 1180.
action of yeast on (Lundin), A., i, 1268.
butylene glycol fermentation of, by *Bacillus proteus* (Lemoigne), A., i, 1041.
lactic acid fermentation of, by peptone (Barthel and v. Euler), A., i, 985.
in eggs of vertebrates (Gori), A., i, 72.
ingestion of (Bodansky), A., i, 983.
excretion of, in dogs (Benedict and Osterberg), A., i, 730.
sulphate (Soda), A., i, 441.
isopropylidene compounds of (Ohle), A., i, 539.
di*iso*propylidene ether, oxidation of (Levene and Meyer), A., i, 92.
di*iso*propylidene ethers, constitution of (Freudenberg and Doser), A., i, 653.
fluorotetra-acetyl derivative (Brauns), A., i, 441.
estimation of (Lucius), A., ii, 882.
estimation of, volumetrically (Fontès and Thivolle), A., ii, 264.
detection of, in urine (Inghilleri), A., ii, 587.
estimation of, in blood and urine (Thallinner and Perry), A., ii, 440.
estimation of, in presence of soluble calcium salts (Biehler), A., ii, 345.
estimation of, by means of iodine (Cajori), A., ii, 94.
estimation of, in mixtures of sugars (Bruhns), A., ii, 440.
Diabetes (*glycosuria*), ketogenic balance in (Shaffer), A., i, 166.
in kidney disease (Rosenberg), A., i, 1154.
aldol in urine in (Fricke), A., i, 73.
glycogen in the tissues in (Ringer, Dubin, and Frankel), A., i, 417.
inorganic metabolism in (Meyer-Bisch and Thyssen), A., i, 417.
Diabetes (*glycosuria*), effect of insulin on blood-sugar in (Forrest, Smith, and Winter), A., i, 513.
polysaccharides in blood in (Winter and Smith), A., i, 513
use of yeast extracts in (Winter and Smith), A., i, 982.
Diaboleite (Spencer and Mountain), A., ii, 774.

3:5-Diacetoxymercurisalicylalaniline (Whitmore and Middleton), A., i, 726.
3:5-Diacetoxymercurisalicylaldehyde (Whitmore and Middleton), A., i, 726.
3:5-Diacetoxymercurisalicylal-*o*- and **-*p*-aminobenzoic acid** (Whitmore and Middleton), A., i, 726.
3:5-Diacetoxymercurisalicylal-*p*-toluidine (Whitmore and Middleton), A., i, 726.
2:3-Diacetoxy-4-methoxybenzoic acid, methyl ester (Pacsu), A., i, 340.
1:2- and 1:4-Diacetoxyphenylpyridinium iodides (Barnett, Cook, and Driscoll), T., 510.
Diacetoxysuccinic acid, and its methyl ester, rate of hydrolysis of (Skrabal and Mehr), A., i, 536.
Diacetyl, ultra-violet absorption spectrum of (Lardy), A., ii, 521.

Diacetyl-α- and -β-aminophenylglyoximes (Ponzio and Avogadro), A., i, 857.

5:5′-Diacetyl-2:2′-dimethoxyazobenzene, 4-amino- (Bogert and Curtin), A., i, 1102.

5:5′-Diacetyl-2:2′-dimethoxydiazoaminobenzene (Bogert and Curtin), A., i, 1102.

1:1′-Diacetyl-7:7′-dimethyldihydroindigotin, 2-hydroxy- (Posner and Heumann), A., i, 954.

Diacetylethylenediamine, *di*chloro- (Bergell), A., i, 19.

Diacetyloxindole-3-acetic acid (Gränacher and Mahal), A., i, 713.

Diacetylsuccinic acid, ethyl ester, tautomerism of (Kaufmann), A., i, 90.

Diacetyl-*d*-tartaric acid. See Diacetoxysuccinic acid.

Diacetyltartaro-*p*-bromoanil (Chattaway and Parkes), T., 664.

Diacetyltartaro-2:4-*di*bromoanil (Chattaway and Parkes), T., 665.

Diacetyltartaro-*p*-chloroanil (Chattaway and Parkes), T., 664.

Diacetyltartaro-2:4-*di*chloroanil (Chattaway and Parkes), T., 664.

Diacetyltartaro-β-naphthil (Chattaway and Parkes), T., 665.

Diacetyltartarotolils (Chattaway and Parkes), T., 665.

Diacetyltartaro 2:4-xylil (Chattaway and Parkes), T., 665.

Diacetyltartranil (Chattaway and Parkes), T., 664.

3:4-Diacetyl-2 3:4:5-tetrahydro-1:3:4-thiodiazole, 2:5-*di*imino- (Guha), A., i, 607.

Diacetyltyramine (Cloetta and Wünsche), A., i, 515.

Diacetyltyrosine, ethyl ester (Cloetta and Wünsche), A., i, 515.

Diadrenaline ether hydrochloride (Funk and Freedman), A., i, 939.

2:2′-Dialdehydodiphenyl *di*sulphide, 4:4′-*di*nitro- (Fries and Brothuhn), A., i, 842.

Dialkyl sulphides, αα′-*di*chloro- (Mann and Pope), T., 1172.

Dialkylaminoalkyl compounds (Bockmühl and Schwarz), A., i, 19.
  aliphatic, preparation of (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 18.

Dialkylbarbituric acids (Tiffeneau; Sommaire), A., i, 387.

1:1′-Dialkyldihydro-4:4′-dipyridyls, quinhydrone-like compounds of (Emmert and Dollein), A., i, 1134.

Dialkylethinylcarbinols, hydration of (Locquin and Wouseng), A., i, 302.

Diallylacetanilide (Staudinger, Schneider, Schotz, and Strong), A., i, 469.

Diallylbarbituric acid, dicarboxylic acid from ozonide of (Staudinger), A., i, 154.

***as*-Diallylhydrazine** (Diels), A., i, 1078.

Diallylhydrazinecarboxylic acid, ethyl and methyl esters (Diels), A., i, 1078.

Diallylketen (Staudinger, Schneider, Schotz, and Strong), A., i, 469.

Diallylmalonic acid, *di*chloro-, diethyl ester (Hill and Fischer), A., i, 8.

Dialyser, lily-pad (Wood), A., ii, 541.
  rapid (Gutbier, Huber, and Schieber), A., ii, 131.

Dialysis of crystalloids (Kahlenberg), A., ii, 15.

Diamines, derivatives of (Bergell), A., i, 18.

3-Di-*n*- and -*iso*-amylcarbamides (Davis and Blanchard), A., i, 902.

ββ′-Di*iso*amyloxydiethylsulphone (Cashmore), T., 1743.

Dianhydro-6-aminopiperonalthebainone dihydrobromide (Gulland and Robinson). T., 1005.

Dianhydrodiacetylanthranilic acid, constitution of (Heller and Grundmann), A , i, 245.

Dianhydrotrisdi-*p*-tolylsilicanediol (Pink and Kipping), T., 2834.

αδ-Dianilino-Δ^{β}-butene, and its bisnitrobenzoyl derivative (v. Braun and Lemke), A., i, 7.

2:5-Dianilino 3:6 di-*o*-nitrophenylthiol-*p*-benzoquinone (Fries, Ochwat, and Pense). A., i, 844.

Dianilino-2-phenylphenanthriminazoles, nitro-derivatives (A. C. and G. C. Sircar), T., 1564.

3:5-Dianilino-4:1:2-thiodiazole, dibenzoyl derivative (Fromm, Layer, and Nerz), A., i, 1240.

2:2′-Di-*p*-anisoylarsenobenzene (Lewis and Cheetham), A., i, 408.

1:4-Di-*p*-anisoylethylpiperazine and its hydrochloride (Mannich and Lammering), A., i, 44.

2:5-Di-*p*-anisoyl-*p*-xylene (de Diesbach, Perrig, Betschart, and Strebel), A., i, 805.

2:6-Dianisylidene*cyclo*hexanone (Coffey), A., i, 803.

2:3-Di-*o*-anisyl-6-methylquinoxaline (Schönberg and Malchow), A., i, 115.

2:3-Di-*o*-anisyl-αβ-naphthaquinoxaline (Schönberg and Malchow), A., i, 115.

Di-α-*p*-anisylpropylene (Skraup and Freundlich), A., i, 669.

N-**δ-Diethylaminobutylbenzamide** (v. Braun and Lemke), A., i, 4.
4:4′-Diethyl*di*amino-3:3′-dimethylbenzophenone (British Dyestuffs Corporation, Ltd., Baddiley, and Rodd), A., i, 148.
Diethylaminodiphenylaminecarboxylic acids, and their nitro-derivatives (Tuttle), A., i, 1012.
5-Diethylamino-3-ethoxyacridine, and its hydrochloride (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1130.
α-(Diethylaminoethyl)-acetoacetic acid, ethyl ester, preparation of (Bockmühl and Schwarz), A., i, 19.
p-**β-Diethylaminoethylaminobenzoic acid**, ethyl ester, and its hydrochloride (Société Chimique des Usines du Rhône), A., i, 792.
α-Diethylaminoethylbutyric acid, β-hydroxy-, ethyl ester, and its benzoyl-derivative (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 760.
Diethylaminoethylcarbamic acid, esters of, and their hydrochlorides (Society of Chemical Industry in Basle), A., i, 1091.
Diethylaminoethyliminodicarboxylic acid, phenylethyl ester (Society of Chemical Industry in Basle), A., i, 1091.
4′-Dimethylamino-2-hydroxydistyryl ketone, 5-bromo-, and 5-nitro- (Heilbron and Whitworth), T., 241.
2-Diethylamino-1-hydroxytetrahydronaphthalene, salts of (v. Braun, Braunsdorf, and Kirschbaum), A., i, 106.
Diethylaminomethyl *n*-butyl ether (G. M. and R. Robinson), T., 536.
p-**Diethylaminomethylbenzoic acid**, benzyl ester, hydrochloride (Hoffmann-La Roche & Co.), A., i, 925.
Diethylaminophenylpentanol (Delaby), A., i, 1055.
β-Diethylamino-α-2-phenyl-4-quinolylethanol, and its dihydrochloride (Society of Chemical Industry in Basle), A., i, 149.
5-γ-Diethylaminopropyl-5-*iso*amylbarbituric acid (Dox and Yoder), A., i, 950.
γ-Diethylaminopropyl*iso*amylmalonic acid, ethyl ester (Dox and Yoder), A., i, 950.
Diethylaminourethano-*m*- and -*p*-benzoic acids, salts and esters (Society of Chemical Industry in Basle), A., i, 924.
Diethylammonium dimercuribromide (Hann), A., i, 901.
Diethylaniline, 3:4-*di*nitro-, action of ammonia and amines on (van Romburgh), A., i, 917.
Diethylcarbamylnitrobenzaldoximes (Brady and Ridge), T., 2167.
1:1′-Diethylcarbocyanine iodide, preparation of (Hamer), T., 255.
1:1′-Diethylcarbocyanine iodide, 6:6′-*di*amino-, and its acetyl derivative (Hamer), T., 2333.
1:1′-Diethyl-4:4′-carbocyanine iodide (Mills and Braunholtz), T., 2811.
Diethyl-γ-chloropropylcarbinol (de Booseré), A., i, 311.
9:9-Diethyl-9:10-dihydroanthracene (Kehrmann, Monnier, and Ramm), A., i, 198.
7:9-Diethyl-4:5-dihydrouric acid, 4-hydroxy-, and its ammonium salt (Biltz and Lemberg), A., i, 956.
2:2-Diethyl-1:3-diketohydrindene-4:5:7-tricarboxylic acid (Fleischer and Retze), A., i, 221.
1:3-Diethylglyoxalone-4-carbamic acid, 5-hydroxy-, lactone (Biltz and Lemberg), A., i, 958.
1:3-Diethylglyoxalone-4-methylcarbamic acid, 5-hydroxy-, lactone (Biltz and Lemberg), A., i, 958.
1:3-Diethylhydantoylamide, and 5-hydroxy-, monohydrate (Biltz and Lemberg), A., i, 957.
Diethylidene *tri*sulphide (Mann and Pope), T., 1177.
Diethylidene-mannitol, *di*bromo- (Hibbert and Hill), A., i, 440.
α-Diethylphthalide, 4:6-*di*bromo-5-amino- (Teppema), A., i, 259.

Diethylsulphone, ββ'-*di*chloro-, hydrolysis of (Cashmore), T., 1738.
Diethylsulphonedisulphonic acid, barium salt (Rây), T., 2176.
ββ-Diethylsulphonepropane, *di*-β-chloro- (Delépine and Eschenbrenner), A., i, 743.
1:2-Diethylthio-ψ-cyanine iodide (Mills and Braunholtz), T., 2809.
Diethylthiolanthraquinones, *di*-β-hydroxy-, and their diacetates (Hoffman and Reid), A., i, 933.
ββ-Diethylthiolpropane, *di*-β-chloro- (Delépine and Eschenbrenner), A., i, 743
1'-2-Diethylthio-ψ-pyridocyanine iodide (Mills and Braunholtz), T., 2812.
Diffusion (Sommer-Batěk), A., ii, 58, 540, 541.
  coefficient, determination of (Cohen and Bruins), A., ii, 130.
  of acids in aqueous solution (Öholm; Loeb), A., ii, 15.
  in gelatin (Schleussner), A., ii, 59.
  in metals (Sirovich and Cartoceti), A., ii, 30.
  in solutions, Stokes-Einstein law for (Cohen and Bruins), A., ii, 130.
  in solid solutions (Weiss and Henry), A., ii 59.
2:2'-Diformylethylaminodiphenyl *di*sulphide Mills, Clark, and Aeschlimann), T., 2361.
2:2'-Diformylmethylaminodiphenyl *di*sulphide (Mills, Clark, and Aeschlimann), T., 2358.
Difurfuryl*cyclo*hexanone (Wolff), A, i, 1109.
2:6-Difurfurylidene-4-methyl*cyclo*hexanone (Wolff), A., i, 937.
2:6-Difurfurylidene-5-methyl*cyclo*hexanone (Wolff), A., i, 1109
2:6-Difurfuryl-4- and **-5-methyl*cyclo*hexanones** (Wolff), A., i, 1109.
Digestion (Bodansky and Rose), A., i, 625.
  effect of quinine derivatives on (Smorodincev and Adova), A., i, 412.
  of carbohydrates in the duodenum (Böhne), A., i, 505.
Digitalinum verum (Windaus and Bandte), A., i, 1107.
Digitonin, additive compounds of, with alcohols and phenols (Windaus and Weinhold), A., i, 590.
Digitoxonic acid group, synthesis of acid of (Zemplén), A., i, 437.
3:4-Di(gluconylamino)phenylarsinic acid (Lewis and Hamilton), A., i, 500.
Diglucosido*di*amino*di*hydroxyarsenobenzene (Aubry and Dormoy), A., i, 71.
ββ'-Diglycinodiethyl sulphide, and its derivatives (Cashmore and McCombie), T., 2887.
1:4-Diglycylglycine anhydride (Abderhalden and Klarmann), A., i, 1025.
Diguaiacylethane, *tri*chloro- (Pauly and Schanz), A., i, 564.
Diguaiacylsilicomethane, *di*chloro- (Pharmazeutische Industrie G. m. b. H. and Hauschka), A, i, 30.
Di-*cis-cyclo*heptane-1:2-diolboric acid, aniline salt (Hermans), A., i, 558.
Di*cyclo*hexane, stereoisomerism of (Schrauth and Görig), A., i, 1084.
Di*cyclo*hexyl (v. Braun, Gruber, and Kirschbaum), A., i, 107.
Di*cyclo*hexyl, 2-hydroxy-, isomeric forms of, and their phenylurethanes (Bedos), A, i, 1195.
1:3-Di*cyclo*hexyl*cyclo*hexanes (Schrauth, Wege, and Danner), A., i, 205.
1:3-Di*cyclo*hexyl*cyclo*hexan-2-ols, isomeric forms of, and their acetates (Schrauth, Wege, and Danner), A.. i, 205.
1-*o*-Di*cyclo*hexyl*cyclo*hexan-2-one (Schrauth and Görig), A., i, 1086.
1:3-Di*cyclo*hexyl*cyclo*hexan-2-one (Schrauth, Wege, and Danner), A., i, 205.
1:3-Di*cyclo*hexyl-Δ^1-*cyclo*hexene (Schrauth, Wege, and Danner), A., i, 205.
Dihydrazinoethylvinylketazine (Delaby), A., i, 1171.
Dihydroanthranol, nitro-, derivatives of (Barnett, Cook, and Matthews), T., 2001.
Dihydrobrucinonic acid, esters of (Leuchs and Gladkorn), A., i, 942.
Dihydrocampholytolactone, attempt to prepare (Bredt and Savelsberg), A., i, 1097.
Dihydrocapsaicin (Nelson and Dawson), A., i, 1109.
Dihydrocodeine, and its hydrochloride (Wieland and Koralek), A., i, 1222.
Dihydro-*iso*- and ψ-codeines, and their derivatives (Speyer and Krauss), A., i, 1115.
αδ-Dihydrocupreylbutane (v. Braun and Lemke), A., i, 7.
αδ-Dihydrocupreyl-Δ^β-butene (v. Braun and Lemke), A., i, 8.
Dihydrodianthranyl, *di*chloro-(Barnett and Matthews), T., 2554.

Dihydro-α-elemol (Jansch and Fantl), A., i, 815.

Dihydroeseretholemethine dimethiodide (Max and Michel Polonovski), A., i, 939.

Dihydroeserinemethine dimethiodide (Max and Michel Polonovski), A., i, 939.

Dihydrolinalyl chromate (Wienhaus and Treibs), A., i, 893.

5:6-Dihydro-11-methyl-α-naphthacridine, and its salts (v. Braun and Wolff), A., i, 144.

5:6-Dihydro-9- and -11-methyl-α-naphthacridine-7-carboxylic acids, and their salts (v. Braun and Wolff), A., i, 144.

Δ^{β}-Dihydromuconic acid, ethyl and methyl esters (Farmer), T., 2541.

Dihydronaphthacridine, and its hydrochloride (Tetralin G. m. b. H.), A., i, 1133.

5:6-Dihydro-α-naphthacridine, and its salts (v. Braun and Wolff), A., i, 143.

5:6-Dihydro-α-naphthacridine, 9-bromo-, and 9-chloro-, and their hydrochlorides (v. Braun and Wolff), A., i, 144.

5:6-Dihydro-α-naphthacridine-7-carboxylic acid, and its salts and ethyl ester (v. Braun and Wolff), A., i, 143.

5:6-Dihydro-α-naphthacridine-7-carboxylic acid, 9-bromo-, and silver salt and methyl ester, and 9-chloro- (v. Braun and Wolff), A., i, 144.

Dihydronaphthacridinecarboxylic acids, and *p*-bromo- (Tetralin G. m. b. H.), A., i, 1133.

Δ^1-Dihydronaphthalene, oxidation of (v. Braun and Zobel), A., i, 1208.

Dihydronaphthaleneozonide (Coffey), A., i, 696.

Dihydropentindole, and its derivatives (Perkin and Plant), T., 3242.

Dihydrophenanthrene derivatives, synthesis of (Kirchner), A., i, 913.

Dihydrophenanthrenecarboxylic acid (Kirchner), A., i, 913.

5:10-Dihydrophenazine, 1:3-*di*nitro-, derivatives of (Cullinane and James), A., i, 606.

Dihydropinenes (Nametkin), A., i, 811.

Dihydro*iso*quinoline, derivatives of (Society of Chemical Industry in Basle), A., i, 371; (Hartmann and Kägi), A., i, 604.

Dihydroquinoxaline, hydroxy-, and nitrosohydroxy- (Perkin and Riley), T., 2402.

Dihydroquinoxalineacetic acid, hydroxy- (Perkin and Riley), T., 2405.

Dihydrostrophanthidin, and its benzoate (Jacobs and Heidelberger), A., i, 123.

5:6-Dihydro-1:2-tetramethylene-α-naphthacridine-7-carboxylic acid (v. Braun and Wolff), A., i, 144.

Dihydrothebainonesemicarbazone (Gulland and Robinson), T., 1007.

Di-imines, cyclic (v. Braun, Lemke, and Nelken), A., i, 840.

3:5-Di-indolyl*iso*oxazole (Sanna), A., i, 58.

Di-3-indolylphenylmethane, and its oxidation product (Majima and Kotake), A., i, 150.

3:5-Di-indolylpyrazole (Sanna), A., i, 59.

Di-indolylpyrazolecarboxylamide (Sanna), A., i, 58.

2:3-Di-indolylquinoxalines (Sanna), A., i, 57.

2:2-Di-indoyl. See 2:2-Indil.

αβ-Di-3-indoylethane, and its silver derivative and dioxime (Sanna), A., i, 710.

Di-3-indoylmethane, and its derivatives (Sanna), A., i, 58.

Diketens, preparation of (Staudinger and Kreis), A., i, 438.

4:5-Diketo-2-*o*- and **-*p*-anisylpyrollidine-1-*p*-phenylarsinic acid** (Johnson and Adams), A., i, 724.

2:4-Diketo-5-benzyl-1-methylhexahydropyrimidine (Mannich and Ganz), A., i, 20.

αβ-Diketobutaldehyde, and its derivatives (Diels and Petersen), A., i, 15.

2:6-Diketo-4-*iso*butylpiperidine-5-carboxylamide, 3-cyano- (Curtis, Day, and Kimmins), T., 3135.

4:5-Diketo-2-*p*-chlorophenylpyrollidine-1-*p*-phenylarsinic acid (Johnson and Adams), A., i, 725.

α-Diketocholanic acid, dioxime, and its derivatives (Schenck), A., i, 678.

Diketocineole, and its derivatives (Cusmano), A., i, 690.

2:5-Diketo-1:4-di-*p*-anisylpiperazine and *tetra*nitro- (Reverdin), A., i, 714.

2:3-Diketodihydro-1:4-benzthiazine, and its derivatives (Zahn), A., i, 377.

2:2-Diketodihydro-α-naphthathiazine, and its 2-anil (Zahn), A., i, 377.

6:8-Diketo-5:9-dimethyl-5:6:8:9-tetrahydromalonalinium ethoxide, hydroxide, methoxide, and sulphonate (Usherwood and Whiteley), T., 1087.

2:5-Diketo-3:4-diphenyl-1-*o*-aminophenyldihydropyrrole, and its acetyl derivative (BISTRZYCKI and FÄSSLER), A., i, 848.
2:4-Diketo-5-ethyltetrahydrothiazole, and its 2-hydrazones (WILSON and BURNS), T., 802.
d- and *r*-**Diketoethylthiazolidineacetic acids** (KALLENBERG), A., i, 247.
αγ-Diketohexaldehydediethylacetal, and its copper salt (HELFERICH and RUSSE), A., i, 301.
αγ-Diketo-*n*-hexaldehydedimethylacetal, and its copper derivatives (HELFERICH and RUSSE), A., i, 302.
αγ-Diketohydrindene, crystallography of (PICHETTO), A., i, 114.
1:2-Diketohydrindene, 6-nitro- (INGOLD and PIGGOTT), T., 1488.
2:3-Diketo-5-methyldihydro-1:4-benzthiazine, 7-chloro- (ZAHN), A., i, 377.
4:5-Diketo-2-*mp*-methylenedioxyphenylpyrollidine-1-phenylarsinic acid (JOHNSON and ADAMS), A., i, 725.
2:3-Diketo-5-methyl-8-*iso*propyl-1:3-benzoxazine, and its derivatives (MAMELI), A., i, 62.
2:4-Diketo-5-methyltetrahydrothiazole, and its derivatives (WILSON and BURNS), T., 801.
d- and *r*-**Diketomethylthiazolidineacetic acids** (KALLENBERG), A., i, 248.
5:6-Diketo-α-naphthacridine (v. BRAUN and WOLFF), A., i, 143.
Diketones, action of ultra-violet light on (PORTER, RAMSPERGER, and STEEL), A., ii, 600.
  αβ unsaturated, action of benzene and aluminium chloride on (VORLÄNDER and FRIEDBERG), A., i, 683.
α-Diketones, syntheses of, by means of organo-zinc derivatives (BLAISE), A., i, 538.
  action of ammonium cyanide on (DAKIN and HARINGTON), A., i, 583.
β-Diketones, aliphatic, tellurium derivatives, bactericidal action of (MORGAN, COOPER, and BURTT), A., i, 517.
  ethoxymethylene derivatives, condensation of amidines with (MITTER and BARDHAN), T., 2179.
α- and β-Diketones (SANNA), A., i, 57, 59.
γ-Diketones of the indole group, synthesis of (SANNA), A., i, 710.
1:2-Diketones (SCHÖNBERG and MALCHOW), A., i, 115; (SCHÖNBERG and BLEYBERG), A., i, 116; (SCHÖNBERG and KELLER), A., i, 928.
αβ-Diketononoic acid, and its derivatives, A., i, 178.
4:5-Diketo-2-phenylpyrrolidine-1-*m*-anisyl-4-arsinic acid (JOHNSON and ADAMS), A., i, 725.
4:5-Diketo-2-phenylpyrrolidine-1-*p*-phenylarsinic acid (JOHNSON and ADAMS), A., i, 724.
4:5-Diketo-2-phenylpyrrolidine 1-*m*-tolyl-6 arsinic acid (JOHNSON and ADAMS), A., i, 725.
2:4-Diketo-5-phenyltetrahydrothiazole, and its derivatives (WILSON and BURNS), T., 803.
βγ-Diketo δ-phenylvaleric acid, and its copper salt and derivatives (DIELS), A., i, 822, 825.
2:5-Diketopiperazine, *di*chloroacetyl derivative (ABDERHALDEN and KLARMANN), A., i, 1025.
2:5-Diketopiperazine-3:6-dipropionic acid. See *cyclo*Glutamylpropionic acid.
Diketotetra-allyl*cyclo*butane (STAUDINGER, SCHNEIDER, SCHOTZ, and STRONG), A., i, 469.
Diketotetrapropyl*cyclo*butane (STAUDINGER, SCHNEIDER, Sc STRONG), A., i, 469.
Diketothiazolidines, stereochemistry of (KALLENBERG), A., i, 247.
Dimercury-3:3′-(or 4′-)diethyl-2:2′:5:5′-dithienylene (STEINKOPF, BIELENBERG, and AUGESTAD-JENSEN), A., i, 125.
Dimercury 2:2′:5:5′-dithienylene (STEINKOPF, BIELENBERG, and AUGESTAD-JENSEN), A., i, 125.
Dimercury-3.4 3′:4′-tetramethyl-2:2′:5:5′-dithienylene (STEINKOPF, BIELENBERG, and AUGESTAD-JENSEN), A., i, 125.
Dimethanolbenzidine (KONDO and ISHIDA), A., i, 147.
Dimethinediazidines, stability of (INGOLD and PIGGOTT), T., 2745.
Dimethoxyacetic acid, methyl ester (HELFERICH and RUSSE), A., i, 301.
w:**4-Dimethoxyacetoquinoline** (PRATT and ROBINSON), T., 750.
Dimethoxyanthracenes (HALL and PERKIN), T., 2032.

2:2′- and 3:3′-Dimethoxybenzilic acid (SCHÖNBERG and KELLER), A., i, 928.
2:3-Dimethoxybenzoic acid, 4-hydroxy- (PAOSU), A., i, 340.

3:3′-Dimethoxybenzoin (Schönberg and Malchow), A., i, 115.

Di-*p*-methoxybenzoylethylene (Conant and Lutz), A., i, 686.

4:6-Di-*p* methoxybenzoyl*iso*phthalic acid (Philippi, Seka, Figdor, and Nemeczek), A., i, 577.

2:5-Di-*p*-methoxybenzoylterephthalic acids (Philippi, Seka, Figdor, and Nemeczek), A., i, 577.

4:6-Di 5′-methoxybenzoyl-*m*-xylene, *di*-2′-hydroxy- (de Diesbach, Perrig, Betschart, and Strebel), A., i, 805.

2:3-Dimethoxycinnamic acid (Perkin and Stoyle), T., 3174.

ββ′-Dimethoxydiethylsulphone (Cashmore), T., 1743.

3 4-Dimethoxy-γ-dimethylaminopropyl benzene, and its hydrochloride (Mannich and Lammering), A., i, 45.

5:6-Dimethoxy-1:3-dimethyluracil (Biltz and Paetzold), A., i, 1233.

3:6-Dimethoxy-1:8-dimethylxanthylium ferrichloride (Pratt and Robinson), T., 743.

2:4-Dimethoxy-6-ethoxyphenyl-β-3′:4′-dimethoxyphenylethyl ketone (Freudenberg and Cohn), A., i, 1220.

2:4-Dimethoxy-6-ethoxyphenyl-3′:4′-dimethoxystyryl ketone (Freudenberg and Cohn), A., i, 1220.

Di-*o*-methoxyhexaphenylethane (Gomberg and Nishida), A., i, 213.

2:2-Dimethoxy-3-keto-2:3-dihydro-1:4-benzthiazine, and 7-chloro- (Zahn), A., i, 376.

2:2-Dimethoxy-3-keto-2:3-dihydro-α-naphthathiazine (Zahn), A., i, 376.

Di-*o*- and *p*-methoxymethylbenzylamines, and their salts and nitroso-derivatives (v. Braun, Zobel, Nelkin, and Blessing), A., i, 372.

Dimethoxymethylenedioxyphenylquinoline, and its semicarbazone (Pratt and Robinson), T., 751.

2:4-Dimethoxynicotinonitrile, 6 chloro- (Schroeter and Seidler), A., i, 1124.

βγ-Dimethoxy-βζ-oxidohexane (Bergmann and Mirkeley), A., i, 1054.

3:4′-Dimethoxy-2-phenylbenzopyrylium salts, and 7-hydroxy- (Pratt and Robinson), T., 751.

6:7-Dimethoxy-1-phenyl-3:4-dihydro*iso*quinoline-3-carboxylic acid, methyl ester, and its salts and derivatives (Society of Chemical Industry in Basle), A., i, 371; (Hartmann and Kägi), A., i, 604.

4:6-Dimethoxyphenyl-β-3′:4′-dimethoxyphenylethyl ketone, 2-hydroxy- (Freudenberg and Cohn), A., i, 1220.

3:4-Dimethoxyphenyl-β-dimethylaminoethyl ketone, and its salts (Mannich and Lammering), A., i, 44.

5′:6′-Dimethoxyphenyl-ψ-meconine (Bistrzycki and Krauer), A., i, 1211.

β-3:4-Dimethoxyphenylpropionic acid, α-amino-, benzoyl derivative, methyl ester (Society of Chemical Industry in Basle), A., i, 371.

4:5-Dimethoxyphthalon-2-anilic acid (Kuroda and Perkin), T., 2104.

4:5-Dimethoxyphthalonic acid, derivatives of (Kuroda and Perkin), T., 2094.

3:3′-Dimethoxystilbene, 4:4′-*di*hydroxy- (Pauly and Schanz), A., i, 564.

Di-*p*-methoxystyryl ketone mercuric chloride (Vorlander and Eichwald), A., i, 684.

Dimethoxy-2-styryl-3-methylchromones, and their salts (Heilbron, Barnes, and Morton), T., 2566.

4:5-Dimethoxy-*o*-tolualdehyde, and their derivatives (Kuroda and Perkin), T., 2110.

β-4:5-Dimethoxy-*o*-tolylacrylic acid (Kuroda and Perkin), T., 2110.

4:5-Dimethoxy-*o*-tolylglyoxylic acid, derivatives of (Kuroda and Perkin), T., 2094.

4:5-Dimethoxy-*o*-tolylideneaniline and its hydrochloride (Kuroda and Perkin), T., 2109.

5:6-Dimethoxy-4-vinyl-2:3:4:4a-tetrahydrophenanthrene, 2:3-*di*hydroxy- (Speyer, Selig, and Heil), A., i, 128.

Dimethyl ether. See Methyl ether.
  sulphate, action of, on salicylic acid, methyl salicylate, and *o*-methoxybenzoic acid (Simon and Frèrejacque), A., i, 1098.
  sulphide, and sulphoxide, *αα′-di*chloro- (Mann and Pope), T., 1173.
  *penta*sulphide (Riding and Thomas), T., 3277.

ββ-Dimethylacrylamide (v. Auwers, Meissner, Seydel, and Wissebach), A., i, 748.

αβ-Dimethylacrylic acid, ethyl ester preparation of (Higginbotham and Lapworth), T., 1330.

ββ-Dimethylacrylic acid, hydrogenation of (Conant and Cutter), A., i, 10.

ββ-Dimethylacrylic acid, α-cyano-, ethyl ester, preparation and condensations of (Birch and Kon), T., 2447.

Dimethylacrylic acids, γ-oxalyl derivatives of (Higginbotham and Lapworth), T., 1825.

ββ'-Dimethyladipic acids, and their derivatives (Faltis and Wagner), A., i, 1209.

Dimethylallylcarbinol, and its acetate and allyl ether (Coffey), A., i, 175.

o-(**α:γ-Dimethylallyl**)-*p*-**cresol** (Claisen), A., i, 1094.

4:4'-Dimethylallylformazyl (Walker), T., 2777.

Dimethylamine, hydrogen oxalate of (Clifford and Fargher), A., i, 637.

5-Dimethylaminoacetyl-2:4-dimethyl-3-ethylpyrrole hydrochloride (Fischer and Schubert), A., i, 708.

5-Dimethylaminoacetyl-2:4-dimethylpyrrole (Fischer, Weiss, and Schubert), A., i, 703.

4-Dimethylaminoacetyl-2:3:5-trimethylpyrrole, and its hydrochloride (Fischer and Zerweck), A., i, 365.

2-Dimethylaminoacridone (Tuttle), A., i, 1011.

p-**Dimethylaminoazobenzene**, hydrochlorides of (Vorlander and Wolferts), A., i, 716.
  hydroferrocyanide (Cumming), T., 2458.

p-**Dimethylaminobenzaldehyde**, 3-bromo- (Brady and Truszkowski), T., 2438.

p-**Dimethylaminobenzaldoximes**, 3-bromo-, and 3-nitro-, and their derivatives (Brady and Truszkowski), T., 2434.

Dimethylaminobenzenylimidine, salts of (Pyman), T., 3371.

Dimethylaminobenzenylmethylimidine, salts of (Pyman), T., 3372

p-**Dimethylaminobenzoic acid**, 3-bromo- and its nitrile (Brady and Truszkowski), T., 2439.

5-*p*-Dimethylaminobenzylidene 3-camphylrhodanine (Gendelman), A., i, 606.

p-**Dimethylaminobenzylidenecarbamide**, and its salts (Barrenscheen), A., i, 1138.

p-**Dimethylaminobenzylidenemethylcarbamide** nitrate (Barrenscheen), A, i, 1138.

p-**Dimethylaminobenzylidenepicoline** (Scheibe, Pflock, Scholl, and Friedel), A., i, 251.

γ-**Dimethylaminobutane**, α-amino-, and its derivatives (Bruylants), A, i, 763.

δ-**Dimethylamino-Δ^{α}-butene** (v. Braun and Lemke), A., i, 7.

γ-**Dimethylamino-*n*-α-butylamine.** See γ-Dimethylaminobutane, α-amino-.

β-**Dimethylaminobutyronitrile** (Bruylants), A., i, 763.

γ-**Dimethylamino-β-carboxy-*n*-butyric acid**, and its methiodide (Mannich and Ganz), A., i, 21.

β-**Dimethylaminocetyl alcohol**, and its salts (v. Braun and Schirmacher), A., i, 1186.

γ-**Dimethylamino-ββ-dicarboxy-*n*-butyric acid** (Mannich and Ganz), A., i, 21.

4'-Dimethylaminodiphenyl, 4-bromo-, and 4-bromo-2 nitro- (García Banús and Medrano), A., i, 202.

Dimethylaminodiphenylaminecarboxylic acids, and their nitro-derivatives (Tuttle), A., i, 1011.

2-Dimethylamino-1-ethoxytetrahydronaphthalene, and its salts (v. Braun, Braundsdorf, and Kirschbaum), A., i, 105.

α-**Dimethylaminoheptoic acid**, ethyl ester, and its methiodide (v. Braun and Schirmacher), A., i, 1050.

β-**Dimethylaminoheptyl alcohol**, and its derivatives (v. Braun and Schirmacher), A., i, 1050.

2-Dimethylamino-$\Delta^{1:1'}$-*dicyclo*hexenyl, and its picrate (v. Braun and Ritter), A., i, 142.

α-**Dimethylamino*cyclo*hexylacetic acid**, ethyl ester, and its salts (v. Braun and Kaiser), A., i, 1187.

β-**Dimethylamino*cyclo*hexylethyl alcohols**, and their salts and derivatives (v. Braun and Kaiser), A., i, 1187.

4'-Dimethylamino-2-hydroxydistyryl ketone, effect of substitution on the reactivity of (Heilbron and Whitworth), T. 238.

α-**Dimethylamino-β-hydroxy-*n*-heptane**, and its derivatives (v. Braun and Schirmacher), A., i, 1050.

ac-**2-Dimethylamino-1-hydroxyhydrindene**, and its salts (v. Braun, Braunsdorf, and Kirschbaum), A., i, 107.

β-**Dimethylamino-α-hydroxypropionic acid**, and its hydrochloride (Mannich and Bauroth), A., i, 22.

2-Dimethylamino-1-hydroxytetrahydronaphthalene, salts of (v Braun, Braunsdorf, and Kirschbaum), A., i, 106.

Dimethylamino-1- and 2-hydroxytetrahydronaphthalenes (González and Campoy), A., i, 209

p-**Dimethylamino-*p'*-methoxyazobenzene**, hydrochlorides of (Vorländer and Wolferts), A., i, 717.

4′-Dimethylaminomethoxy-2-hydroxydistyryl ketones (Heilbron and Whitworth), T., 243.

Dimethylaminomethyl *iso*butyl ether (G. M. and R. Robinson), T., 536.

Dimethylaminomethylallylmalonic acid, and its chloroplatinate (Mannich and Ganz), A., i, 20.

p-**Dimethylaminomethylbenzoic acid,** benzyl ester, hydrochloride (Hoffmann-La Roche & Co.), A., i, 925.

Dimethylaminomethylethylmalonic acid (Mannich and Ganz), A., i, 20.

Dimethylaminomethyltartronic acid (Mannich and Bauroth), A., i, 22.

a **Dimethylaminopalmitic acid,** ethyl ester, and its methiodide (v. Braun and Schirmacher), A., i, 1186.

β-**Dimethylamino-δ-phenoxybutyl alcohol,** and its methiodide (v. Braun and Munch), A., 1187.

a-**Dimethylamino-γ-phenoxybutyric acid,** ethyl ester (v. Braun and Munch), A., i, 1187.

Dimethylaminophenylacetonitrile, and its salts (v. Braun and Blessing), A., i, 1231.

β-**Dimethylamino-δ-phenyl-*n*-butyl alcohol,** and its salts (v. Braun and Osterroth), A., i, 1187.

a-**Dimethylamino-γ-phenyl-*n*-butyric acid,** ethyl ester, and its salts (v. Braun and Osterroth), A., i, 1186.

4 Dimethylamino-1-phenyl-2:3-dimethyl-5-pyrazolone (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 858.

β-*p*-**Dimethylaminophenylethylamine,** and its salts (v. Braun and Blessing), A., i, 1231.

β-**Dimethylamino-*a*-phenylpropionic acid** (Mannich and Ganz), A., i, 21.

β-**Dimethylamino-*a*-2-phenylquinolylethanol,** and its dihydrochloride (Society of Chemical Industry in Basle), A., i, 148.

β **Dimethylaminopropionitrile** (Mannich and Ganz), A., i, 22.

4′-Dimethylamino-2-styrylbenzopyrylium salts and metallic complexes (Buck and Heilbron) T., 1395.

2-*p*-Dimethylaminostyrylbenzothiazole methiodide (Smith), T., 2292.

2-*p*-Dimethylaminostyryl 3:3-dimethylindolenine methiodide (Smith), T., 2294.

2-*p*-Dimethylaminostyryl-4:5-diphenylthiazole methiodide (Smith), T., 2292.

2-*p*-Dimethylaminostyryl-6-methylbenzbisthiazole methiodide (Edge), T., 2332.

2-*p*-Dimethylaminostyryl-3-methylbenziminazole methiodide (Smith), T., 2294.

4′-Dimethylamino-2-styryl-3-methylchromone (Heilbron, Barnes, and Morton), T., 2567.

2-*p*-Dimethylaminostyryl 4-methylthiazole methiodide (Smith), T., 2291.

2 *p*-Dimethylaminostyrylnaphthathiazole methiodides (Smith), T., 2294.

2-*p*-Dimethylaminostyryl-4-phenyl-5-methylthiazole methiodide (Smith), T., 2292

2-*p* Dimethylaminostyrylthiazole methiodide (Smith), T. 2291.

p-**Dimethylaminothiobenzanilidothiocarbonic acid,** phenyl ester (Rivier and Schalch), A., i, 793.

4-Dimethylamino-1 *p*-tolyl-2:3-dimethyl-5-pyrazolone (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 858.

4:4′-Dimethylaminotriphenylmethane, 2″:4″-*di*nitro- (Downey and Lowy), A , i, 579.

Dimethylaminourethano-*p*-benzoic acid, ethyl ester, and its hydrochloride (Society of Chemical Industry in Basle), A., i, 925.

p-**Dimethylaminovinylbenzene,** and its salts (v. Braun and Blessing), A., i, 1231.

Dimethylammonium dimercuribromide (Hann), A., i, 901.

2:5-Dimethyl-1-*n*-amylpyrrole (Karrer and Smirnov), A., i, 122.

Dimethylaniline, 3:4-*di*nitro-, action of ammonia and amines (van Romburgh), A., i, 917.

1:2-Dimethylanthraquinone, 4-hydroxy, synthesis of (Fairbourne and Gauntlett), T., 1137.

Dimethylazodicarbothioamide (Arndt, Milde, and Eckert), A., i, 1079.

2 6 Dimethylbenzaldehyde, 3:5-*di*bromo-4-hydroxy-, and its derivatives (Lindemann), A., i, 688.

4:6 Dimethylbenzaldehyde, 2-hydroxy-, and its phenylhydrazone (Lindemann), A., i, 687.

Dimethylbenzhydrylamine, and its methiodide (Sommelet), A., i, 202.

2:5-Dimethylbenzoxazole, 6-hydroxy-, (Henrich, Suntheimer, and Steinmann), A., i, 145.

4:5-Dimethylbenzoylbenzoic acid, *o*-2-hydroxy- (Fairbourne and Gauntlett), T., 1138.

Dimethyl-1:2:3-benztriazole-1-oxides, 6-nitro- (Brady and Day), T., 2262.

2:6-Dimethylbenzylidene bromide, chloride bromide, and chloride, 3:5-*di*bromo-4-hydroxy-, and their derivatives (Lindemann), A., i, 688.

ωω′-Dimethylbiuret, ω-*mono*- and ωω′-*di*-nitroso- (Biltz and Jeltsch), A., i, 1075.

βγ-Dimethylbutadiene, reactions of derivatives of (Claisen, Kremers, Roth, and Tietze), A., i, 1050.

ββ-Dimethylbutane, α-bromo- (Favorski and Sakara), A., i, 431.

1:3-Dimethyl*cyclo*butane-2:2:4:4-tetracarboxylonitrile (Diels, Gärtner, and Kaack), A., i, 25.

βγ-Dimethyl-Δ^{β}-butenylaniline, and its benzoyl derivative (Claisen, Kremers, Roth, and Tietze), A., i, 1052.

βγ-Dimethyl-Δ^{β}-butenylbenzene, and its hydrobromide (Claisen, Kremers, Roth, and Tietze), A., i, 1052.

ββ-Dimethylbutyl alcohol, acetate and phenylurethane (Favorski and Sakara), A., i, 431.

βγ-Dimethylbutylbenzene (Claisen. Kremers, Roth, and Tietze), A., i, 1052.

βγ-Dimethyl-Δ^{β}-butylene, α-bromo-, and its derivatives (Claisen, Kremers, Roth, and Tietze), A., i, 1051.

2:6-Dimethyl-4 carbamidomethyl-1:4-dihydropyridine-3:5-dicarboxylonitrile (Benary and Löwenthal), A., i, 54.

d-**Dimethylcarbamidothiolsuccinic acid** (Kallenberg), A., i 248.

1:1′-Dimethylcarbocyanine iodide, preparation of (Hamer), T., 254.

1:3-Dimethyl-4-chloromethylbenzene (Blanc), A., i, 549.

1:3-Dimethyl-4:6-*di*chloromethylbenzene (Blanc), A., i, 549.

Dimethyl*di*chloromethylcarbinyl carbamate (Yoder), A., i, 309.

Dimethyl*tri*chloromethylcarbinyl carbamate and carbanilate (Yoder), A., i, 309.

2:6-Dimethyl-4-chloromethyl-1:4-dihydropyridine-3:5-dicarboxylonitrile (Benary and Löwenthal), A., i, 54.

1:2-Dimethylchromone, oxime of, and its sulphonic acid derivative (Beckmann and Bark), A., i, 1112.

2:3-Dimethylchromone, reactivity of the 2-methyl group in (Heilbron, Barnes, and Morton), T., 2559.

2:3-Dimethylchromone-6-sulphonic acid, and its salts (Krüger), A., i, 355.

2:3-Dimethylcinchonic acid, methyl ester (v. Braun, Gmelin, and Schultheiss), A., i, 835.

2:5-Dimethylcoumarilic acid, silver salt and 4-chloro-, and its potassium salt (Dey and Dalal), T., 3390.

2:5-Dimethylcoumarilic acid, 6-bromo-4-nitro-, and its sodium salt (Dey and Row), T., 3382.

4:7-Dimethylcoumarin, 3:8-*di*bromo-6-nitro- (Dey and Row), T., 3382.
  3- and 6-*mono*- and 3:6-*di*-chloro- (Dey and Dalal), T., 3389.

Dimethylcoumarinsulphonic acids, and their salts and derivatives (Krüger), A., i, 354.

Dimethylcoumarinthiols, and their derivatives (Krüger), A., i, 354.

2:6-Dimethyl-4-cyanomethyl-1:4-dihydropyridine-3:5-dicarboxylnitrile (Benary and Löwenthal), A., i, 54.

2:6-Dimethyl-4-cyanomethylpyridine-3:5-dicarboxylonitrile (Benary and Löwenthal), A., i, 54.

Dimethyldecahydroquinolines, and their salts and derivatives (Braun, Gmelin, and Schultheiss), A., i, 836.

1:3-Dimethyl*iso*dialuric acid, 6-chloro- and 6-iodo-methyl ethers (Biltz and Partzold), A., i, 1233.

2:2′-Dimethyl-1:1′-dianthraquinonyl (Kopetschni), A., i, 1021.

Dimethyldicarboxyglutaric dianhydride (Staudinger and Kreis), A., i, 439.

6:6′-Dimethyl-1:1′-diethylcarbocyanine iodide, preparation of (Hamer), T., 256.

1:2-Dimethyl-1:5-diethyl-Δ^4-*cyclo*hexen-3-one (Ekeley and Howe), A., i, 998.

7:7′-Dimethyldihydroindigotin, 1-nitroso-2-hydroxy-, and 1:1′-*di*nitroso-2:2′-*di*hydroxy- (Posner and Heumann), A., i, 953.

2:6-Dimethyl-1:4-dihydropyridine-4-aldoxime, 3:5-*di*cyano-, and its salts (Benary and Löwenthal), A., i, 54.

2:2 Dimethyl-2:3-dihydro-4-pyrone-6-carboxylic acid. See β-Mesityloxidoxalic acid.

7:9-Dimethyl-4:5-dihydrouric acid, 4-hydroxy-, and its ammonium salt (Biltz and Lemberg), A., i, 956.

1:1′-Dimethyl-2:2′-dinaphthyl (Mayer and Schnecko), A., i, 773.

5:5-Dimethyldi*cyclo*pentan-3-one-1:2:4-tricarboxylic acid, 2-ethyl and 1:2-diethyl ester (Toivonen), A., i, 1017.

Dimethylethylcarbinol, fusion, viscosity, and density of the system, chloral and (Efremov), A., i, 537.

Dimethylethylcarbinyl chromate (Wienhaus and Treibs), A., i, 893.

s-**Dimethylethylphenylcarbamide** (Mailhe), A., i, 458.
Dimethylethylphenyldiethylcarbamide (Mailhe), A., i, 458.
2:4-Dimethyl-6-ethylphloracetophenone (Freudenberg and Cohn), A., i, 1219.
2:4-Dimethyl-3-ethylpyrrole-5-aldehyde, and its salts (Fischer and Schubert), A., i, 708.
2:4-Dimethyl-3-ethylpyrrylmethenyldimethylpyrrylpropionic acids, hydrochlorides (Fischer and Schubert), A., i, 709.
1:3-Dimethylfluorone, 6-hydroxy- (Pratt and Robinson), T., 742.
1:4-Dimethylglyoxaline, 2-bromo-5-nitro-, and its hydrochloride (Pyman and Timmis), T., 502.
1:5-Dimethylglyoxaline, 2-bromo-4-nitro- (Pyman and Timmis), T., 503.
1:4-Dimethylglyoxaline-2-sulphonic acid, 5-nitro- (Pyman and Timmis), T., 502.
1:3-Dimethylglyoxalone-4-methylcarbamic acid, 5-hydroxy-, lactone (Biltz and Lemberg), A., i, 960.
αα-**Dimethylguanidine** sulphate (Phillips and Blanchard), A., i, 903.
γε-**Dimethylheptan-*δ*-ol**, and its allophanate (Vavon and Ivanov), A., i, 998.
1:1-Dimethyl*cyclo*heptan-2-ol, and its derivatives (Meerwein and Schafer), A., i, 325.
1:1-Dimethyl*cyclo*hexane, catalytic dehydrogenation of (Zelinski and Delzova), A., i. 907.
3:3-Dimethyl-0 1:3-*bicyclo*hexane (Uspenski), A., i, 666.
Dimethyl*cyclo*hexanes, catalytic dehydrogenation of (Zelinski), A., i, 549.
1:1-Dimethyl*cyclo*hexanes, 3:5-*di*bromo- (Uspenski), A., i, 666.
1:4-Dimethyl*cyclo*hexan-2-ol (Godchot and Bédos), A., i, 101.
1:3-Dimethyl*cyclo*hexan-4 one, oxidation of (Godchot), A., i, 582.
βε-**Dimethyl-Δ^{γ}-hexene**, *βε*-*di*hydroxy-, isomeric forms of, and their dibromides and derivatives (Zalkind), A., i, 176.
βε-**Dimethyl-Δ^{γ}-hexene-*βε*-diols**, isomeric (Zalkind), A., i, 434.
αα-**Dimethyl-Δ'-*cyclo*hexenylacetone** (Birch, Kon, and Norris), T., 1373.
Dimethylhexinenediol, catalytic hydrogenation of (Zalkind and Peschekerova), A., i, 8.
βε-**Dimethyl-Δ^{γ}-hexinene-*βε*-diol**, reduction of (Zalkind and Vilenkina), A., i, 529.
αδ-**Dimethylhexoic acid**, and its amide and chloride (Sommaire), A., i, 388.
1:3-Dimethyl-4-*cyclo*hexylamine, and its hydrochloride and phenylcarbamide (Mailhe), A., i, 199.
1:3-Dimethylhydantoylamide, and its monohydrate (Biltz and Lemberg), A., i, 957.
Dimethylhydrocellulose, preparation of (Heuser and v. Neuenstein), A., i, 95.
  molecular weight of (Heuser and Jayme), A., i, 657.
3:5-Di(2′-methyl-3′-indolyl)pyrazole (Sanna), A., i, 60.
3:5-Di(2′-methyl-3′-indolyl)*iso*oxazole (Sanna), A., i, 60.
αβ-**Di-2-methyl-3-indoylethane**, and its derivatives (Sanna), A., i, 710.
Di-2-methyl-3-indoylmethane, and its derivatives (Sanna), A., i, 59.
Dimethylisatin *O*-benzoate (Hantzsch), A., i, 1226.
Dimethylketazine, catalytic reduction of (Taipale), A., i, 547, 663.
cis- and *trans*-**1:1-Dimethyl-2-*β*-ketopropyl*cyclo*propane-2-carboxylic acids**, and their semicarbazones (Simonsen and Rau), T., 558.
6:6 Dimethyl-4-ketotetrahydropyrone-2-carboxylic acid, ethyl ester (Borsche and Thiele), A., i, 1220.
6:6′-Dimethylmethylenediquinaldine diethiodide (Hamer), T., 253.
1:2-Dimethyl-3-*n*-octylindole (Kuroda), A., i, 603.
Dimethylpentadecyl chromate (Wienhaus and Treibs), A., i, 893.
δδ-**Dimethyl-$\Delta^{\alpha\beta}$-pentadiene** (Favorski and Alexéeva), A., i, 642.
βδ-**Dimethylpentane-*βδ*-triol** (Pastureau and Bernard), A., i, 646.
  preparation of, from mesityl oxide (Pastureau and Bernard), A., i, 891.
3:4-Dimethyl*cyclo*pentan-1-one (Faltis and Wagner), A., i, 1209.
αα- and *βγ*-**Dimethyl-Δ^{β}-pentene** (Favorski and Alexéeva), A., i, 642.
δδ-**Dimethyl-Δ^{β}-pentinene**, copper and silver derivatives (Favorski and Morev), A., i, 643.
δδ-**Dimethyl-Δ^{α}-pentinene-*α*-carboxylic acid** (Favorski and Opel), A., i, 432.
Dimethylphenanthrene, and its salts and derivatives (Ruzicka and Balas), A., i, 819.
4:5-Dimethylphthalic acid, and its anhydride (Coffey), A., i, 696.
α-**Dimethylphthalide**, 5-amino-, and 4:6-*di*bromo-5-amino- (Teppema), A., i, 258.

αα-Dimethylpropaldehyde, and its derivatives (Franke and Hinterberger), A., i, 537.

ββ-Dimethylpropane, αγ-*di*bromo-, action of potassium hydrosulphide on (Franke and Dworzak), A., i, 528.

αβ-Dimethylpropionic acid, α-amino-, and its copper salt (Kurono), A., i, 308.

Dimethyl*iso*propylidene xylose (Svanberg), A., i, 1178.

1:2-Dimethyl-3-propylindole (Kuroda), A., i, 603.

Dimethylpurpurogallin, and its diacetate (Herzig), A., i, 806.

1:3-Dimethylpyrazole benzyliodide, and its picrate (v. Auwers and Broche), A., i, 153.

3:5-Dimethylpyrazole, 4-amino-, 4-bromo-, 4-chloro-, 4-iodo-, and their salts and derivatives (Morgan and Ackerman), T., 1310.

3:5-Dimethylpyrazole-4-sulphonic acid, and its acid chloride (Morgan and Ackerman), T., 1317.

1:3- and 1:5-Dimethylpyrazoline, and their picrates (v. Auwers and Broche), A., i, 153.

2:6-Dimethylpyridine benzyliodide and *per*chlorate (Emmert, Varenkamp, and Ludwig), A., i, 384.

1:3-Dimethylpyrimidine, 4:5-*di*amino-2:6-*di*hydroxy-, 5-acetyl derivative (Traube), A., i, 1136.

2:5-Dimethylpyrrole, acetyl derivatives (Fischer and Schneller), A., i, 943.

2:4-Dimethylpyrrole-3-aldehyde (Fischer, Weiss, and Schubert), A., i, 704.

2:5-Dimethylpyrrole-3-carboxylic acid, 4-amino-, ethyl ester, salts of (Fischer and Rothweiler), A., i, 392.

2:4-Dimethylpyrrole-5-carboxylic acid, ethyl ester (Fischer, Weiss, and Schubert), A., i, 703.

2:4-Dimethylpyrrole-5-carboxylic acid, 3-cyano-, ethyl ester (Fischer, Weiss, and Schubert), A., i, 704.

Dimethylpyrrole-3-carboxylic acids, cyano-, ethyl esters (Fischer and Zerweck), A., i, 365.

***N*-Dimethylpyrrolinium** bromide, and chloroplatinate (v. Braun and Lemke), A., i, 6.

Dimethylpyrryl ketones (Tronov), A., i, 602.

2:4-Dimethylquinoline (Knoll & Co.), A., i, 947.

2:6-Dimethylquinonebromomethide, 3:5-*di*bromo- (Lindemann), A., i, 688.

2:6-Dimethylquinonechloromethide, 3:5-*di*bromo- (Lindemann), A., i, 688.

Dimethylsulphine-*p*-toluenesulphonylimine, αα′-*di*chloro- (Mann and Pope), T., 1174.

Dimethylterephthalic acid, dimethyl ester (Feist and Eggert), A., i, 1174.

2:6-Dimethyl-1:5-terephthalonic acid, mono- and di-methyl esters, and their derivatives (Feist and Eggert), A., i, 1174.

1 2-Dimethyltetrahydronaphthalene (Ziegler and Tiemann), A., i, 31.

5:7-Dimethyl-1:2:3:4-tetrahydronaphthalene (Krollpfeiffer and Schafer), A., i, 344.

2:6-Dimethyltetrahydropyran-4-ol (Borsche and Thiele), A., i, 1110.

2:6-Dimethyltetrahydro-4-pyrone, derivatives of (Borsche and Thiele), A., i, 1110.

1:3-Dimethyl-1:2:3:4-tetrahydroquinoline, and its salts (v. Braun, Seemann, and Schultheiss), A., i, 138.

Dimethyltetrahydroquinolines, and their salts (v. Braun, Gmelin, and Schultheiss), A., i, 836.

***N*-Dimethyltetrahydro*iso*quinolinium** bromide and chloride (v. Braun, Zobel, and Kuhn), A., i, 1201.

***NN*′-Dimethyltetramethylenedithiocarbamide** (v. Braun and Lemke), A., i, 6.

6:8-Dimethylthianthren, 3-nitro- (Krishna), T., 2788.

6:8-Dimethylthiochromanone, and its semicarbazone (Krollpfeiffer and Schultze), A., i, 1114.

Dimethyl-β-thiocyanohæmin (Kuster), A., i, 1032.

3:8-Dimethylxanthine, sodium salt (Traube), A., i, 1135.

Di-β-naphthyl *tri*sulphide, 4:4-*di*chloro-1:1′-*di*hydroxy- (GIBSON and SMILES), T., 2393.

1:1′-**Dinaphthyl,** 4-*mono*- and 4:4′-*di*-nitro- (SCHOEPFLE), A., i, 776.

Di-α naphthylamine, thio-, acetyl derivative (KEHRMANN, GRESSLY, CHIFFÈRE, and RAMM), A., i, 378.

Dinaphthylcarbinyl ethers (SZPERL), A., i, 1192.

α-**Dinaphthylethane,** β-chloro-α-*di*-2-hydroxy- (HINSBERG), A., i, 923.

s-**Di-α-** and **-β-naphthylethanes,** and their picrates (SZPERL), A., i, 1192.

Di-2-β-naphthylethylamine, and its salts and nitroso-derivative (MAYER and SCHNECKO), A., i, 773.

ββ-**Dinaphthylethylamine,** ββ-*di*-2-hydroxy- (HINSBERG), A., i, 464.

1:1′-**Dinaphthylketone-3:3′-dicarboxylic acid,** 4:4′-*di*hydroxy- (DE MONTMOLLIN, SPIELER, and BONHOTE), A , i, 1017.

Di-α- and **-β-naphthylketoximes** (BECKMANN, LIESCHE, and CORRENS), A., i, 230.

Di-1:1′-naphthylmethane, 2-amino-2′-hydroxy-, and its derivatives (MAYER and SCHNECKO), A., i, 773.

Dinaphthylmethanes, *di*nitro*di*amino- (MORGAN and JONES), A., i, 379.

Di-α- and **-β-naphthylmethylamines** (RUPE and BECHERER), A., i, 1202.
  and their salts and nitroso-derivatives (V. BRAUN, BLESSING, and ZOBEL), A., i, 1089.

Di-α-naphthylmethyldimethylammonium iodide (V. BRAUN, BLESSING, and ZOBEL), A., i, 1089.

Di-α- and **-β-naphthylmethylmethylamines,** and their salts (V. BRAUN and MOLDAENKE), A., i, 1195.

Dinitrotetramminecobalti-salts. See under Cobalt.

αδ-**Dinorcodeyl-Δβ-butene,** and its salts (V. BRAUN and LEMKE), A., i, 7.

Dioctylamine, and its hydrochloride (V. BRAUN, BLESSING, and ZOBEL), A., i, 1088.

βγ-βζ-**Dioxidohexane,** and its phenylhydrazone (BERGMANN and MIEKELEY), A., i, 1054.

Dioximes (PONZIO), A., i, 469, 1019, 1137; (PONZIO and PICHETTO), A., i, 471; (PONZIO and AVOGADRO), A., i, 472, 855, 856, 857; (PONZIO and RUGGERI), A., i, 853.

2:4-**Dioxy-5:6-*di*aminopyrimidine,** salts (BILTZ and SCHMIDT), A., i, 491.

Diphen-*o*-aminoanilidic acid (BISTRZYCKI and FASSLER), A., i, 849.

Diphenetyl 2:2′-*di*sulphide, 4:4′-*di*-amino-, acetyl derivative (JOHNSON and SMILES), T., 2387.

αα-**Diphenetylethane,** β-amino- (HINSBERG), A., i, 556.

2.3-**Di *o*-phenetyl-αβ-naphthaquinoxaline** (SCHONBERG and MALCHOW), A., i, 115.

Diphenic acid, 5:5′-*di*chloro-, and its anhydride (HUNN), A., i, 466.
  6:6′-*di*chloro-, synthesis of, and its resolution and brucine salts (CHRISTIE, JAMES, and KENNER), T., 1948.
  4:6:4′-*tri*- and 4:6:4′:6′-*tetra*-nitro-, resolution of, and their brucine and quinidine salts (CHRISTIE and KENNER), T., 782.

Diphenic anhydride, colouring matters from (DUTT), T., 225.
  action of *o*-phenylenediamine on (BISTRZYCKI and FÄSSLER), A., i, 848.
  condensation of, with resorcinol (BISCHOFF and ADKINS), A., i, 578.

Diphenol, *tetra*bromo- (BARNETT, COOK, and DRISCOLL), T., 517.

Diphenoxyacetanilide (STAUDINGER and SCHNEIDER), A., i, 466.

5:5-Diphenoxybarbituric acid (Dox and Thomas), A., i, 952.
Di-δ-phenoxybutylamine, and its salts and derivatives (v. Braun, Blessing, and Zobel), A., i, 1088.
Diphenoxymalonic acid, and its methyl ester (Staudinger and Schneider), A., i, 465.
  ethyl ester (Dox and Thomas), A., i, 953.
Di-*o*-phenoxymethylbenzylamine, and its hydrochloride (v. Braun, Zobel, and Blessing), A., i, 372.
Di-*o*-γ-phenoxypropylbenzylamine, and its salts (v. Braun, Zobel, and Blessing), A., i, 372.
Diphenyl (García Banús and Medrano; García Banús and Guiteras), A., i, 202.
  determination of molecular weight of, in acetic acid (Berlande), A., i, 549.
  stereoisomerism of derivatives of (Turner; Kenner), A., i, 1085.
  hydrogenation of, and its carboxylic acid (Ranedo and Leon), A., i, 909.
  sulphide, chloronitrohydroxy-derivatives (Krishna), T., 2784.
Diphenyl, 3:3′:4:4′- and 3:5′:4:4′-*tetra*-amino- (Brady and McHugh), T., 2052.
  fluoroamino-, and fluoronitro-derivatives, and their salts and derivatives, and *tri*nitro-4-hydroxy- (van Hove), A., i, 318.
  2:2′-*di*hydroxy-, catalytic reduction of (v. Braun), A., i, 103.
  *hexa*hydroxy-, from pyrogallol (Eller, Saenger, Wenzel, Seiler, and Pieper), A., i, 543.
  nitro-derivatives (García Banús and Guiteras), A., i, 770.
Diphenylacetaldimine, and its derivatives (Kohler and Drake), A., i, 666.
Diphenylacetic acid, barium salt, products of dry distillation of (Vorlander and Rack), A., i, 680.
  ethyl ester, action of sodium on (Vorlander and Rack), A., i, 680.
Diphenylacetic-benzylmethylmalonic anhydride (Staudinger, Schneider, Schotz, and Strong), A., i, 469.
Diphenylacetic-bromoethylmalonic anhydride (Staudinger and Schneider), A., i, 465.
Diphenylacetic-diallylmalonic anhydride (Staudinger, Schneider, Schotz, and Strong), A., i, 469.
Diphenylacetic-dibenzylmalonic anhydride (Staudinger, Schneider, Schotz, and Strong), A., i, 469.
Diphenylacetic-diethoxymalonic anhydride (Staudinger and Schneider), A., i, 465.
Diphenylacetic-diphenoxymalonic anhydride (Staudinger and Schneider), A., i, 466.
Diphenylacetic-dipropylmalonic anhydride (Staudinger, Schneider, Schotz, and Strong), A., i, 469.
Diphenylacetic-ethoxymethylmalonic anhydride (Staudinger and Schneider), A., i, 465.
Diphenylacetic-methylallylmalonic anhydride (Staudinger, Schneider, Schotz, and Strong), A., i, 469.
Diphenylacetic-methylethylmalonic anhydride (Staudinger, Schneider, Schotz, and Strong), A., i, 469.
Diphenylacetic-phenoxyethylmalonic anhydride (Staudinger and Schneider), A., i, 465.
Diphenylacetylcystine (Shiple and Sherwin), A., i, 673.
αβ-Diphenylacrylenebenziminazole (Bistrzycki and Fassler), A., i, 848.
ββ-Diphenylacrylic acid, sodium salt (Lipp and Lüdicke), A., i, 319.
γγ-Diphenylallyl bromide (Ziegler and Tiemann), A., i, 31.
Diphenylallylacetaldehyde. See αα-Diphenyl-Δγ-pentenaldehyde.
αβ-Diphenyl-α-allylthiocarbamide (Dains, Brewster, Blair, and Thompson), A., i, 63.
Diphenylamine, conductivity, viscosity, and density of systems formed by benzoic acid and (Baskov), A., i, 672.
  oxidation of, with hydrogen peroxide (Roubcov), A., i, 321.
  action of methyl sulphate on (Gibson and Vining), T., 831.
Diphenylamine, bromo-, chloro-, and iodo-*tri*nitro-, and iodo*di*nitro- (Linke), A., i, 554.
  *poly*nitro-derivatives, reduction of (Cullinane and James), A., i, 606.
  2:4-*di*nitro-6-amino- (Cullinane and James), A., i, 606.
  2:4:6-*tri*nitro-3-amino- (Davies and James), A., i, 552.
Diphenylamine-4-azide, preparation and derivatives of (Angeli and Pieroni), A., i, 1026.
Diphenylamine-6-carboxylic acid, 2-nitro- (Tuttle), A., i, 1012.
Diphenylaminesulphonephthalein (Orndorff and Sherwood), A., i, 341.

2-Diphenylaminopyridine, and its acetate (Tschitschibabin), A., i, 598.

5:5-Diphenylbarbituric acid, *di-p*-hydroxy- (Dox and Thomas), A., i, 952.

Di-*p*-phenylbenzoylethane, and *di*bromo- (Oddy), A., i, 1099.

Diphenyl-β-benzoyl-α-phenylethylphosphine oxide (Conant, Braverman, and Hussey), A., i, 264.

Diphenyl-β-benzoyl-α-phenylvinylphosphine oxide (Conant, Braverman, and Hussey), A., i, 264.

ββ-Diphenyl-α-benzylidenepropiophenone hydrochloride (Vorländer and Friedberg), A., i, 684.

Diphenylbenzylidenetetrazancarbanilide (Busch, Müller, and Schwarz), A., i, 866.

βδ-Diphenyl-α-benzylidenetetrazan-γ-carboxylic acid, ethyl ester (Busch, Müller, and Schwarz), A., i, 865.

αα-Diphenyl-β-benzylpropane-αβ-diol (Tiffeneau and Lévy), A., i, 789.

Diphenyl-β-bromo-β-benzoyl-α-phenylethylphosphine oxide (Conant, Braverman, and Hussey), A., i, 264.

Diphenyl-β-bromo-β-*p*-chlorobenzoyl-α-phenylethylphosphine oxide, and its isomeride (Conant, Braverman, and Hussey), A., i, 264.

Diphenyl-4-bromo-α-naphthylcarbinol (Gomberg and Blicke), A., i, 915.

Diphenyl-1-bromo-α-naphthylmethyl peroxide (Gomberg and Blicke), A., i, 916.

Diphenyl-4-bromo-α-naphthylmethyl chloride (Gomberg and Blicke), A., i, 916.

Diphenylbromo*iso*oxazolone (Rupe and Grunholz), A., i, 374.

αα-Diphenyl*iso*butaldehyde, and its derivatives (Tiffeneau and Orékhov), A., i, 334.

αδ-Diphenyl-*n*-butane, β-hydroxy-, and its derivatives (v. Braun and Kochendörfer), A., i, 1198.

αδ-Diphenylbutinene-αδ-diol, hydrogenation of (Zalkind and Neischtab), A., i, 335.

Diphenyl-ψ-butylcarbinol, molecular transposition in (Ramart), A., i, 330.

Diphenyl-2-*iso*butylpyridine nitrate (Gastaldi and Peyretti), A., i, 479.

4:6-Diphenyl-2-*iso*butylpyrylium salts (Gastaldi and Peyretti), A., i, 479.

***N*-Diphenyl-*s*-butylthiocarbamide**, and its hydriodide (Dains and Thompson), A., i, 382.

Diphenylcarbamhydroxamic acid. See **αα-Diphenylcarbamide, β-hydroxy-**.

***N*-Diphenylcarbamic acid**, substituted phenyl esters (Korczynski and Grzybowski), A., i, 561.

αα-Diphenylcarbamide, β-hydroxy-, reactions of, and its derivatives (Hurd), A., i, 846.

***s*-Diphenylcarbamide**, chloroacetyl derivative (Andreasch), A., i, 546.

***s*-Diphenylcarbamide**, *di*nitroso- (Ryan and O'Toole), A., i, 381.

***s*-Diphenylcarbamide-2-sulphonic acid**, 4-bromopotassium salt (Scott and Cohen), T., 3189.

Diphenylcarbamyl-*p*-methoxybenz*syn*aldoxime (Brady and Ridge), T., 2168.

Diphenyl-β-*p*-chlorobenzoyl-α-phenylethylphosphine oxide (Conant, Braverman, and Hussey), A., i, 264.

Diphenyl-β-*p*-chlorobenzoyl-α-phenylvinyl phosphine oxide (Conant, Braverman, and Hussey), A., i, 264.

5:6-Diphenyl-2-chloromethyl-2:5-dihydro-1:4-diazine (Philippi, Seka, and Ableidinger), A., i, 1185.

2:6-Diphenyl-4-chloromethyl-1:4-dihydropyridine-3:5-dicarboxylonitrile (Benary and Löwenthal), A., i, 54.

2:6-Diphenyl-4-chloromethylpyridine-3:5-dicarboxylonitrile (Benary and Löwenthal), A., i, 54.

Diphenylchlorophosphine, additive compounds of (Conant, Braverman, and Hussey), A., i, 264.

2:6-Diphenyl-4-cyanomethyl-1:4-dihydropyridine-3:5-dicarboxylonitrile (Benary and Löwenthal), A., i 54.

Diphenyldianthranyl (Barnett and Cook), T., 2639.

9:10-Diphenyl-9:10-dihydroanthra-9:10-diol, interaction of sulphuric acid and (Kehrmann, Monnier, and Ramm), A., i, 198.

Diphenyldimethylammonium hydroxide, salts of (Gibson and Vining), T., 838.

Diphenyldimethylcarbamide (Mailhe), A., i, 458.

Diphenyldimethylethylenediamine (British Dyestuffs Corporation, Ltd., Perkin, and Clemo), A., i, 453.

αζ-Diphenyl-γδ-dimethyl-$\Delta^{\alpha\epsilon}$-hexadiinene-γδ-diols, stereoisomeric (Wilson and Hyslop), T., 2616.

αθ-Diphenyl-γζ-dimethyl-$\Delta^{\alpha\eta}$-octadiinene-γζ-diols, stereoisomeric (Wilson and Hyslop), T., 2617.

ββ-Diphenyl-αα-dimethylpropionamide (Albesco), A., i, 42.

ββ-Diphenyl-αα-dimethylpropiophenone (ALBESCO), A., i, 42.

4:4′-Diphenyl-3:3′-dimethylthiazolocarbocyanine iodide (MILLS, BRAUNHOLTZ, and SMITH), T., 2813.

Diphtheria toxin (v. Gröer), A., i, 880.

1:6-Dipiperidino-3:4-diphenylhexane-3:4-diol (Mannich and Lammering), A., i, 44.

Dipiperidylthiuram *di***sulphide** (v. Braun and Kaiser), A., i, 316.

2:6-Dipiperonylidene*cyclo*hexanone (Coffey), A., i, 808.

Dipiperonylidenemethyldihydrothebainone (Gulland and Robinson), T., 1010.

Dipiperonylidenemethylthebainol (Gulland and Robinson), T., 1010.

Dipiperonylidenethebainol (Gulland and Robinson), T., 1007.

Diplumbic hexaethyl (Midgley, Hochwalt, and Calingaert), A., i, 906.

Dipropargylmethylene ether (Guest), A., i, 892.

Dipropionyldialanylpentamethylenediamine, *di*-α-bromo- (Bergell), A., i, 19.

Dipropionylethylenediamine, *di*-α-bromo- (Bergell), A., i, 19.

Dipropionylpentamethylenediamine, *di*-α-bromo- (Bergell), A., i, 19.

Dipropyl *penta***sulphide** (Riding and Thomas), T., 3278.

Dipropylacetanilide (Staudinger, Schneider, Schotz, and Strong), A., i, 469.

Dipropylbarbituric acid, *di*-β-bromo- (Staudinger), A., i, 949.

Di*iso*propylbarbituric acid (Preiswerk), A., i, 299.

pp′-**Di*iso*propyldiphenyl** (Bert), A., i, 1005.

ββ-**Di-*n*-propylglutaric acid**, preparation and derivatives of (Bains and Thorpe), T., 1209.

ββ-**Di-*n*-propylglutaric acid**, αα′-*di*-bromo- and its ethyl ester, and α-bromo-α′-hydroxy-, and its ethyl ester, lactones (Bains and Thorpe), T., 1210.

ββ-**Di-*n*-propylglutarolactone**, αα′-*di*bromo-α′-hydroxy-, ethyl ester (Bains and Thorpe), T., 2744.

Di*iso*propylhydrazine, salts of (Taipale), A., i, 548.

s-**Di*iso*propylhydrazine**, and its derivatives (Lochte, Noyes, and Bailey), A., i, 26.

Dipropylhydrazinecarboxylic acid, *tetra*bromo-, methyl ester (Diels), A., i, 1078.

Di*iso*propylidenedextrose sulphate, salts of (Ohle), A., i, 539.

Di*iso*propylidenegalactosylhydrazinedicarboxylic acid dianilide (Freudenberg and Hixon), A., i, 1179.

Di*iso*propylidenemethylgalactose (Freudenberg and Hixon), A., i, 1180.

Di*iso*propylidenemethylmannose (Freudenberg and Hixon), A., i, 1180.

Di*iso*propylidenexylose (Svanberg and Sjöberg), A., i, 540.
Dipropylketen (Staudinger, Schneider, Scholtz, and Strong), A., i, 469.
ββ-Di-*n*-propylmalic acid, lactone (Bains and Thorpe), T., 2745.
1:4-Dipropylpiperazine, and its picrates (G. M. and R. Robinson), T., 542.
3:3-Di-*n*-propyl*cyclo*propan-1-ol-1:2-dicarboxylic acid, and its ammonium salt (Bains and Thorpe), T., 1212.
Di*iso*propylthiolanthraquinones (Hoffman and Reid), A., i, 933.
2:5-Dipropylthiophen, and 3-bromo- (Steinkopf, Augestad-Jensen, and Donat), A., i, 125.
Dipyridinoiridic acid, *tetra*chloro-, potassium salts (Delépine), A., i, 135.
4:4′-Dipyridyl, reduction of (Dimroth and Frister), A., i, 149.
  interaction of, with potassium ferrocyanide (Wibaut and Dingemanse), A., i, 382.
  alkyl halides, and their colours (Emmert and Stawitz), A., i, 249.
  1-cyanobromide, and its salts (König, Ebert, and Centner), A., i, 383.
  iodide (König, Ebert, and Centner), A., i, 383.
4:4′-Dipyridyls, fission of, by cyanogen halides (König, Ebert, and Centner), A., i, 382.
Di-2-pyridylamine, and its salts (Tschitschibabin and Vorobiev), A., i, 599.
Dipyridyl-violet chloride (Dimroth and Frister), A., i, 150.
Dipyrocatechol trimethylene ether (Kohn and Wilhelm), A., i, 558.
Dipyrrylmethenes, structure and complex salts of (Fischer and Schubert), A., i, 707.
Diquinol ethers, and their derivatives (Kohn and Wilhelm), A., i, 559.
Diquinoline, and its hydrochloride (Tschitschibabin and Zacepina), A., i, 604.
Diquinolyl (Tschitschibabin and Zacepina), A., i, 604.
Di-2-quinolylmethane, and its derivatives, colour of (Scheibe), A., i, 250.
Diresorcinol ethers, and their derivatives (Kohn and Wilhelm), A., i, 558.
p-**Di-β-resorcylic acid,** and the 4′-methyl ether of its methyl ester (Pacsu), A., i, 839.
Disaccharides, constitution of (Haworth and Linnell), T., 294; (Haworth and Mitchell), T., 301; (Haworth and Wylam), T., 3120.
Disilane, reactions of (Stock and Somieski), A., ii, 160.
Disiloxan (Stock and Somieski), A., ii, 160.
Dispersion, rotatory (Lifschitz), A., ii, 525.
  in absorbing media (Hulbert), A., ii, 812.
  magnetic rotatory, in gases (Havelock), A., ii, 205.
Dispersoids, chemistry of (v. Weimarn), A., ii, 136; (Kohlschütter and Neuenschwander), A., ii, 494.
Dissociation constants of polybasic acids (Bjerrum), A., i, 1059.
Dissociation pressure of hydrated salts (Partington and Huntingford), T., 160; (Schumb), A., ii, 219.
Distillation, equations for the relationships in (Peters), A., ii, 377.
  of liquid mixtures (Lanyar and Zechner), A., ii, 294.
Distillation apparatus, laboratory fractionating column (Clarke and Rahrs), A., ii, 294.
Distribution of substances between two phases (Swientoslawski), A., ii, 546.
Distyranic acid, and its derivatives (Stoermer and Becker), A., i, 927.
Distyrenic acid, constitution of (Stoermer and Becker), A., i, 927.
Distyrinic acid, and its salts and derivatives (Stoermer and Becker), A., i, 927.
2:6-Distyryl-β-benzbisthiazole (Edge), T., 2332.
Distyryl ketones, benzopyrylium salts of (Buck and Heilbron), T., 1395.
Disulphides, action of methyl iodide on (Steinkopf and Müller), A., i, 1055.
6′:8′-Disulphonaphthalene-2′(4)-azo-5-nitro-α-naphthylamine (Morgan and Jones), A., i, 1029.
Di-α- and -β-tetrahydronaphthylmethylamines, and their salts and derivatives (v. Braun, Blessing, and Zobel), A., i, 1089.
2-Dithiobenzoyl, preparation and reactions of (McKibben and McClelland), T., 170.
  action of primary amines with (McClelland and Longwell), T., 3310.
Di-*p*-toluoylethane, *di*bromo- (Oddy), A., i, 1099.
Ditoluoylethylenes (Conant and Lutz), A., i, 685.
2:5-Di-*p*-toluoyl-*p*-xylene (de Diesbach, Perrig, Betschart, and Strebel), A., i, 805.

Di-*m*-tolyl sulphides and sulphoxide, 4:6:4′:6′-*tetra*nitro- (Giua and Ruggeri), A., i, 790.

Di-*p*-tolylacetamide (Dox and Thomas), A., i, 952.

αβ-Di-*p*-tolyl-α-allylthiocarbamide (Dains, Brewster, Blair, and Thompson), A., i, 63.

βγ-Di-*p*-tolylamino-*n*-butanes, isomerism of, and their salts and derivatives (Morgan and Hickinbottom), T., 97.

Di-*m*-tolylarsinic acid, 2:6-′*di*hydroxy- (Christiansen), A., i, 500.

5:5 Di-*m*-tolylbarbituric acid, 5:5-*di*-6′-hydroxy- (Dox and Thomas), A., i, 952.

***N*-Di-*p*-tolyl-*S*-butylcarbamide**, and its hydriodide (Dains and Thompson), A., i, 382.

Ditolylcarbamides (Mailhe), A., i, 458.

Di-*o*-tolyldiethylcarbamide (Mailhe), A., i. 458.

Di-*p*-tolyldimethinediazidine, and its polymeride (Ingold and Piggott), T., 2750.

Di-*m*-tolylmalonic acid, *di*-6-hydroxy-, ethyl ester (Dox and Thomas), A., i, 952.

αβ-Di-*p*-tolyl-α-propanolthiocarbamide (Dains, Brewster, Blair, and Thompson), A., i, 63.

***N*-Di-*p*-tolyl-*S*-propylthiocarbamide**, and its hydriodide (Dains and Thompson), A., i, 382.

2:4-Di-*p*-tolylselenophen (Bogert and Herrera), A., i, 240.

Di-*p*-tolylsilicane, *di*chloro-, preparation of (Pink and Kipping), T., 2831.

Di-*p*-tolylsilicanediol, preparation, properties and reactions of (Pink and Kipping), T., 2830.

Di-2:4:6-trimethylbenzoylethane (Conant and Lutz), A., i, 686.

Di-(2:4:6-trimethylbenzoyl)ethylenes (Conant and Lutz), A., i, 686.

Ditriphenylphosphiniminecyanuryl azide (Kesting) A., i, 1149.

Dittany, white. See *Dictamnus albus*.

1:4-Di-β-veratroylethylpiperazine and its hydrochloride (Mannich and Lammering), A., i, 45.

Diversine, and its hydrochloride and methiodide (Kondo, Ochiai, and Nakajima), A., i, 1223.

Divinyl sulphide, action of halogen hydrides on (Bales and Nickelson), T., 2486.

1:3-Dixanthyl-5:5-diallylbarbituric acid (Fabre), A., i, 852.

1:3-Dixanthyl-5:5-diethylbarbituric acid (Fabre), A., i, 852.

1:3-Dixanthyl-5-ethyl-5-*n*- and -*iso*-butylbarbituric acids (Fabre), A., i, 853.

Dixanthylhydantoylhydrazide (Fosse, Hagène, and Dubois), A., i, 938.

1:3-Dixanthyl-5-phenyl-5-ethylbarbituric acid (Fabre), A., i, 852.

Di-*o*·*p*-xyloylethane, and *di*bromo- (Oddy), A., i, 1099.

4:6-Di-*p*-xyloyl*iso*phthalic acid (Philippi, Seka, and Hausenbichl), A., i, 576.

2:5-Di-*p*-xyloylterephthalic acid (Philippi, Seka, and Hausenbichl), A., i, 576.

Di-*p*-xylyl 6:6′-*di*sulphide, 3:3′-*di*-amino-, acetyl derivative (Johnson and Smiles), T., 2387.

Dixylylamines, and their salts and derivatives (v. Braun, Blessing, and Zobel), A., i, 1089.

Di-*o*-xylylcarbamide (Mailhe), A., i, 458.

***N*-Di-*m*-xylyl-*S*-propylphenylthiocarbamide** (Dains and Thompson), A., i, 382.

2:3-Di-*o*-4′-xylylquinoxaline (Coffey), A., i, 696.

Dodecamethylhexa-amyloses (Pringsheim and Goldstein), A., i, 899.

Dodecan-γ-ol, αβ-*di*bromo- (Delaby), A., i, 1055.

Dogs, excretion of sugar in (Benedict and Osterberg), A., i, 730.
  of different ages, glycogen in liver of (Gruzewska and Fauré-Frémiet), A., i, 267.

Dokozanic acid (Traubenberg), A., i, 298.

Dolomite, composition of (Mitchell), T., 1055.
  formation of (Mitchell), T., 1887.
  dissociation of (Garnett), A., ii, 763.

Dolphin oil, tetradecenoic acid from (Tsujimoto), A., i, 297.

Doroszewski's law (Doroszewski; Swientoslawski), A., ii, 544.

Drops, apparatus for delivering (Reimann), A., ii, 148.

Drug, Chinese, constituents of (Murayama and Itagaki), A., i, 637.

Drying, changes of properties of substances on (Baker), T., 1223.
  of organic substances, laboratory apparatus for (Bouillot), A., ii, 65.
  intensive, influence of, on internal conversion (Smits), A., ii, 547.

Dschâbir (v. Lippmann), A., ii, 314; (Darmstaedter), A., ii, 628; (van Deventer), A., ii, 683.

Dulcin. See *p*-Phenetylcarbamide.

Duodenal juice, estimation of bile acids in (Meyer), A., ii, 891.

- **Dyes.** See Colouring matters.
- **Dyeing**, physical chemistry of (Briggs and Bull), A., ii, 58.
- **Dysprosium**, arc spectrum of (Kiess), A., ii, 518.

E.

- **Earths, rare** (Kremers and Stevens), A., ii, 322.
  - absorption spectra of (Yntema), A., ii, 358.
  - spectrum analysis of (Eder), A., ii, 672.
  - *K*-absorption of (Cabrera), A., ii, 275.
  - of the cerium group, double carbonates of sodium and (Zambonini and Carobbi), A., ii, 863.
  - triple nitrites of (Cuttica and Gallo), A., ii, 689.
  - estimation and separation of, from other metals (Moser and Irányi), A., ii, 438.
  - separation of (Prandtl and Lösch), A., ii, 863.
- **Earthworm.** See *Eisenia fœtida.*
- **Ecgonine**, salts of (de Jong), A., i, 1222.
  - estimation of, in coca leaf (de Jong), A., ii, 798.
- **Echinopsine**, and its salts (Späth and Kolke), A., i, 479.
- **Edestin**, digestion of, by pepsin (Smorodincev), A., i, 619.
  - hydrolysis of, with sulphuric acid (Jaitschnikov), A., i, 398.
- **Eels**, respiratory exchange in (Gardner and King), A., i, 162.
- **Eggs**, dextrose in (Gori), A., i, 72.
  - hydrolysis of fats by secretion of (Glaser), A., i, 414.
  - hen's, enzymes of (Koga), A., i, 1257.
    - nitrogen content of (Hepburn), A., i, 729.
- **Egg-albumin.** See Albumin.
- *n*-**Eicosanic acid**, and its methyl ester (Ehrenstein and Stuewer), A., i, 1057.
- **Einstein's law** (Weigert), A., ii, 361.
- *Eisenia fœtida*, porphyrin from (Fischer and Schaumann), A., i, 964.
- **Elæomargaric acid.** See Elæostearic acid.

Ethoxydihydrobrucinolone, derivatives of (LEUCHS, GRÜSS, and HEERING), A., i, 131.

Ethoxydihydrostrychninoline (LEUCHS and NITSCHKE), A., i, 132.

4′-Ethoxydiphenylamino-2-carboxylic acid, 5-nitro- (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 1131.

α-Ethoxy-αα-diphenylethane, β-bromo- (LIPP and LUDICKE), A., i, 319.

α-Ethoxyethylmalonic acid, β-chloro-, ethyl ester (BENARY and SCHINKOPF), A., i, 180.

1-Ethoxyindole-2-carboxylic acid, and its ethyl ester (GABRIEL, GERHARD, and WOLTER), A., i, 704.

2-Ethoxy-3-keto-2:3-dihydro-1:4-benzthiazine (ZAHN), A., i, 376.

2-Ethoxy-3-keto-2:3-dihydro-α-naphthathiazine (ZAHN), A., i, 376.

2-Ethoxy-3-keto-5-methyl-2:3-dihydro-1:4-benzthiazine, 7-chloro- (ZAHN), A., i, 376.

2-Ethoxyketotetrahydroheptabenzthiazine, and 7-chloro- (MAYER and HORST), A., i, 845.

6-Ethoxylepidine ethiodide (MILLS and BRAUNHOLTZ), T., 2811.

o-Ethoxymethylbenzyl alcohol (V. BRAUN, ZOBEL, and KUHN), A., i, 1200.

o-Ethoxymethylbenzyl bromide (V. BRAUN, ZOBEL, and KUHN), A., i, 1201.

o-Ethoxymethylbenzylamine, and its salts (V. BRAUN and ZOBEL), A., i, 1200.

α-Ethoxymethyleneacetoacetic acid, γ-bromo-, and γ-chloro-, ethyl esters, and their copper derivatives (BENARY and EBERT), A., i, 1058.

Ethoxymethylenediacetyl. See α-Ethoxy-Δ^{α}-pentene-γδ-dione.

Ethoxymethylenemalononitrile (DIELS, GARTNER, and KAACK), A., i, 24.

1-Ethoxy-3-methyl-3-ethyl*cyclo*propane-1:2-dicarboxylic acid (SINGH and THORPE), T., 119.

Ethoxymethylmalonic acid (STAUDINGER and SCHNEIDER), A., i, 465.

β-o Ethoxymethylphenylethyl alcohol (V. BRAUN, ZOBEL, and KUHN), A, i, 1201.

3-Ethoxy-3-methyl*cyclo*propane-1:2-dicarboxylic acid (GOSS, INGOLD, and THORPE), T., 360.

α-Ethoxypentane-γδ-dione, and its disemicarbazone (DIELS and PETERSEN), A., i, 15.

α-Ethoxy-Δ^{α}-pentene-γδ-dione, and its derivatives (DIELS and PETERSEN), A., i, 14.

p-Ethoxyphenylcarbamic acid, β-chloroethyl ester (ADAMS and SEGUR), A., i, 457.

4-Ethoxyphenyl-4′-ethoxy*cyclo*hexylamines, isomeric, and their derivatives (V. BRAUN and HAHN), A., i, 102.

p-Ethoxyphenyl*cyclo*hexenylamine (V. BRAUN and HAHN), A., i, 103.

4-Ethoxyphenyl-4′-hydroxy*cyclo*hexylamine, and its di-p-nitrobenzoyl derivative (V. BRAUN and HAHN), A., i, 103.

4-Ethoxyphenyl-4′-hydroxy*cyclo*hexylmethylamine, and its p-nitrobenzoyl derivative (V. BRAUN and HAHN), A., i, 103.

4-Ethoxyphenylmalonamic acid, quinine salt (AKTIEN-GESELLSCHAFT FUR ANILIN-FABRIKATION, ALTSCHUL, and BACHSTEZ), A., i, 126.

N-Ethoxyphenylmethylaminomethyl sulphite, sodium derivative (BOCKMUHL and WINDISCH), A., i, 29.

3-p-Ethoxyphenyltetrahydro-1:3:2-oxazone (PIERCE and ADAMS), A., i, 484.

2-Ethoxypyridine, 5-amino-, acetyl derivative (TSCHITSCHIBABIN), A., i, 596.
  s-nitro-, and its amine (TSCHITSCHIBABIN and BYLINKIN), A., i, 596.

Ethoxyquinaldines (BRAUNHOLTZ), A., i, 245.

6-Ethoxy-2-styryl-3-methylchromone (HEILBRON, BARNES, and MORTON), T., 2568.

ω-Ethoxy-o-tolylacetic acid, and its ethyl ester and nitrile (V. BRAUN, ZOBEL, and KUHN), A., i, 1201.

Ethyl alcohol, production of, from calcium lactate (KAYSER), A., i, 986.
  optical constants of (TEAR), A., ii, 593.
  refractive index of (ELSEY and LYNN), A., ii, 349.
    variation of, with temperature (HALL and PAYNE), A., ii, 197.
  ionisation of (DANNER and HILDEBRAND), A., ii, 116; (DANNER), A., ii, 117.
  photo-oxidation of (COHEN), A., i, 1053.
  density and refractive index of mixtures of acetaldehyde and (VAN AUBEL), A., i, 181.
  compressibility of mixtures of water and (MOESVELD), A., ii, 174.
  solubility of substances in mixtures of water and (WRIGHT), T., 2493.

Ethyl alcohol, action of, on ammonium sulphates (Dunnicliff), T., 476.
as a stabiliser for hydrogen peroxide (Lisievici-Draganescu), A., ii, 235.
dehydration of, with phosphoric oxide (Balareff), A., i, 287.
concentration of, in blood and urine (Miles), A., i, 71.
absolute, preparation of (Noyes), A., i, 433.
specific gravity of (Riiber), A., i, 891.
estimation of, in mixtures with acetone (Bushill), A., ii, 665.
estimation of water in (Kolthoff), A., ii, 248.
separation of, from nitric acid (E. and R. Urbain), A., ii, 125.
Ethyl alcohol, bromonitro-, chloronitro-, and *β*-hydroxylamino-derivatives; and their derivatives (Wilkendorf and Trénel), A., i, 288.
Ethyl bromide, action of silver sulphate in sulphuric acid solution on (Schilov), A., i, 2.
Ethyl ether, preparation of (Senderens), A., i, 742.
densities and vapour pressures of (Taylor and Smith), A., i, 9.
freezing point of (Keyes, Townshend, and Young), A., ii, 376.
mutual solubility of water and (Hill), A., ii, 467.
dehydration of, with phosphoric oxide (Balareff), A., i, 287.
molecular compounds of orthophosphoric acid and (Rabinowitsch and Jakubsohn), A., i, 1172.
influence of, on the Grignard reaction (Majima and Kotake), A., i, 482.
mercuri-salts of (Hofmann and Leschewski), A., i, 194.
detection of ethylenic compounds in (Richard), A., ii, 587.
estimation of, in air, blood, and other fluids (Haggard), A., ii, 343.
Ethyl ether, *αβ*-*di*chloro-, interaction of ethyl sodiomalonate and (Benary and Schinkopf), A, i, 179.
Ethyl groups, introduction of (Gilman and Hoyle), A., i, 26.
mercaptan, formation of, from *l*-cystine by bacteria (Kondo), A., i, 517.
β-bromo-, and *β*-chloro- (Delépine and Eschenbrenner), A., i, 743.
*per*oxide, *di*hydroxy- (Wieland and Wingler), A., i, 651.
phenyl ether, *β*-chloro- (British Dyestuffs Corporation, Ltd., Perkin, and Clemo), A., i, 453.
sulphate, ethylation with (Cade), A., i, 993.
Ethyl sulphate, action of magnesium organic haloids with (Gilman and Hoyle), A., i, 26.
vinyl sulphide, *α*-bromo- and *α*-chloro- (Bales and Nickelson), T., 2488.
5-Ethyl-5-*γ*-acetanilidopropylbarbituric acid (Dox and Yoder), A., i, 950.
Ethyl-*γ*-acetanilidopropylmalonic acid, ethyl ester (Dox and Yoder), A., i, 950.
Ethylacetoacetic acid, bromo- and chloro-, ethyl esters, action of hydrazine on (Macbeth), T., 1125.
5-Ethyl-5-*γ*-acetophenetidinopropylbarbituric acid (Dox and Yoder), A., i, 950.
Ethyl-*γ*-acetophenetidinopropylmalonic acid, ethyl ester (Dox and Yoder), A., i, 950.
Ethyl-acetylbenzhydrazide, 5-nitro-2-*α*-hydroxy- (Teppema), A., i, 258.
***β*-Ethylacraldehyde**, and its semicarbazone (Delaby), A., i, 753, 1171.
*N*ms-**Ethylallophanic acid**, ammonium salt and esters of (Biltz and Jeltsch), A., i, 1074.
***β*-Ethylallyl alcohol**. See Δ^{β}-Penten-*α*-ol.
Ethylallylbarbituric acid, monocarboxylic acid from ozonide of (Staudinger), A., i, 155.
5-Ethylaminoacridine (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1130.
***γ*-Ethylaminobutane**, *α*-amino-, and its chloroplatinate (Bruylants), A., i, 763.
***γ*-Ethylamino-*n*-*α*-butylamine**. See *γ*-Ethylaminobutane, *α*-amino-.
***β*-Ethylaminobutyronitrile**, and nitroso- (Bruylants), A., i, 763.
5-Ethylamino-3-ethoxyacridine (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 1130.
2-Ethylamino-1-hydroxytetrahydronaphthalene, *β*-hydroxy-, and its hydrochloride (v. Braun, Braunsdorf, and Kirschbaum), A., i, 106.
3-Ethylaminoindole hydrochloride, preparation of, from rutaecarpine (Asahina and Daiichi Seiyaku Kabushiki Kaisha), A., i, 953.
Ethyl*iso*amylbarbituric acid (Shonle and Moment), A., i, 249; (Tiffeneau), A., i, 387.
Ethyl*iso*amylmalonic acid, and its ethyl ester (Tiffeneau), A., i, 387.
2-Ethyl-5-*iso*amylthiophen, and 3-(or 4-)bromo- (Steinkopf, Augestad-Jensen, and Donat), A., i, 124.
5-*γ*-Ethylanilinopropyl-5-*iso*amylbarbituric acid (Dox and Yoder), A., i, 950.

γ-**Ethylanilinopropyl*iso*amylmalonic acid**, ethyl ester (Dox and Yoder), A., i, 950.

N-**Ethyl-*o*-anisidine**, β-hydroxy-, salts of (v. Braun and Seemann), A., i, 146.

9-**Ethylanthracene**, 10-chloro- (Krollpfeiffer and Branscheid), A., i, 912.

Ethylation with ethyl sulphate (Cade), A., i, 993.

Ethylbenzene, variations in physical constants of, from different sources (v. Auwers and Kolligs), A., i, 99.

Ethylbenzene series, basic derivatives of (v. Braun and Blessing), A., i, 1230.

Ethylbenzhydrazide, 5-bromo-2-α-hydroxy-, 5-chloro-2-α-hydroxy-, and 5-nitro-2-α-hydroxy-, and their derivatives (Teppema), A., i, 258.

Ethylbenzoylacetic acid, α-bromo-, and α-chloro-, ethyl esters, action of hydrazine on (Macbeth), T., 1128.

ms-**Ethylbiuret** (Biltz and Jeltsch), A., i, 1075.

ω-**Ethylbiuret**, ω-nitroso- (Biltz and Jeltsch), A., i, 1075.

Ethyl-β-bromopropylbarbituric acid (Staudinger), A., i, 949.

Ethyl-γ-bromopropylmalonic acid, ethyl ester (Dox and Yoder), A., i, 950.

Ethylbutylbarbituric acids (Shonle and Moment), A., i, 249; (Tiffeneau), A., i, 387

Ethylbutylmalonic acid (Levene and Taylor), A., i, 81.

Ethyl-*n*- and -*iso*-butylmalonic acids, and their ethyl esters (Tiffeneau), A., i, 387.

Ethylcarbamide, chloroacetyl-derivative (Andreasch), A., i, 546.

d- and *r*-**Ethylcarbamidothiolsuccinic acids** (Kallenberg), A., i, 247.

N-**Ethylcarbazole**, 3-bromo- (Stevens and Tucker), T., 2146.
  3-iodo- (Stevens and Tucker), T., 2147.

Ethylcatechin tetramethyl ether (Drumm), A., i, 1221.

Ethylchloroallylmalonic acid, diethyl ester (Hill and Fischer), A., i, 8.

Ethyl γ-chloropropyl ketone, and its semicarbazone (de Booseré), A., i, 811.

2-**Ethylcinchonic acid**, methyl ester (v. Braun, Gmelin, and Schultheiss), A., i, 836.

9-**Ethyldecahydrocarbazole** and its salts (v. Braun and Ritter), A., i, 142.

Ethyldeoxybenzoin (Danilov), A., i, 680.

5-**Ethyl-5-γ-diethylaminopropylbarbituric acid** (Dox and Yoder), A., i, 950.

Ethyl-γ-diethylaminopropylmalonic acid, ethyl ester (Dox and Yoder), A., i, 950.

9-**Ethyl-9:10-dihydroanthracene**, 9-hydroxy- (Krollpfeiffer and Branscheid), A., i, 912.

Ethyldiphenylamine chloroplatinate (Gibson and Vining), T., 841.

Ethylene, absorption of, by chlorosulphonic acid (Traube and Justh), A., i, 641.
  reaction of bromine on (Norrish), T., 3006; (Stewart and Edlund), A., ii, 304.
  catalytic combination of hydrogen and, in presence of copper (Pease), A., ii, 472, 842.
  hydration of (Wibaut and Diekmann), A., i, 1049.
  oxidation of (Blair and Wheeler), A., i, 1175.
  action of ozone on (Blair and Wheeler), A., i, 997.
  action of selenium oxychloride on (Frick), A., i, 890.
  derivatives, absorption curves of (Ley and Rinke), A., ii, 201.
  *di*bromide, density of (Egerton and Lee), A., ii, 462.
  sulphides, and their derivatives (Delepine and Eschenbrenner), A., i, 743.
  estimation of, and its homologues (Tropsch and Philippovich), A., ii, 509.

Ethylene, α-chloro-αββ-*tri*iodo-, and αβ-*di*chloro-αβ-*di*iodo- (Howell), A., i, 175.

Ethylenediamine, formation of complex ions by solutions of silver salts and (Job), A., i, 307.

Ethylenedicarbimide (Curtius and Hechtenberg), A., i, 1073.

6:7-**Ethylenedioxy-1-methyl-1:2:3:4-tetrahydroquinoline**, and its salts (v. Braun, Seemann, and Schultheiss), A., i, 140.

γ-3:4-**Ethylenedioxyphenylpropyldimethylamine**, and its salts (v. Braun, Seemann, and Schultheiss), A., i, 140.

6:7-**Ethylenedioxyquinoline** methiodide (v. Braun, Seemann, and Schultheiss), A., i, 140.

6:7-**Ethylenedioxy-1:2:3:4-tetrahydroquinoline**, and its picrate (v. Braun, Petzold, Seemann, and Schultheiss), A., i, 137.

Ethylenediphenylcarbamide (Curtius and Hechtenberg), A., i, 1074.

Ethylene glycol, *mono*thallium derivative (de Forcrand), A., i, 84.

Ethylene glycol, *di*thio-, interaction of platinic chloride with (Rây), T., 138.

Ethylene-oxide-*dispiro*-9:10:9′:10-dihydroanthracene. See α-Anthrapinacolin.

Ethylenetricarboxylic acid (Staudinger and Kreis), A., i, 439.

Ethylformazyl (Walker), T., 2778.

β-Ethylgalactoside, extraction of (Charpentier), A., i, 540.

Ethylglycerol, catalytic dehydration of (Delaby), A., i, 1171.
  epibromohydrin, action of magnesium halides on (Delaby), A., i, 531, 646.
  tribenzoate (Delaby), A., i, 289.
  triformin (Delaby), A., i, 1171.

1-Ethylglyoxaline, 5 chloro-, and its picrate (Sarasin), A., i, 711.

8-Ethylguanine, and its hydrochloride (Traube), A., i, 1136.

Ethylheptylmalonic acid, ethyl ester (Sommaire), A., i, 388.

9-Ethylhexahydrocarbazole, and its methiodide, and 7-amino- (v. Braun and Ritter), A., i, 143.

Ethylhexahydrodiphenylene oxide, amino-, and its salts (v. Braun), A., i, 104.

γ-Ethylhexane, γζ-*di*chloro-, (de Booseré), A., i, 311.

α-Ethyl-*n*-hexanol, β-hydroxy-, and its semicarbazone (Grignard and Dubien), A., i, 896.

γ-Ethyl-Δ^{γ}-hexene, ζ-chloro- (de Booseré), A., i, 311.

α-Ethyl-Δ^{1}-*cyclo*hexenylacetone, and its semicarbazone (Birch, Kon, and Norris), T., 1372.

α-Ethylhexoic acid, and its carbamide and chloride (Tiffeneau), A., i, 387.
  ethyl ester (Levene and Taylor), A., i, 81.

β-Ethylhexyl alcohol (Levene and Taylor), A., i, 81.

β-Ethylhexyl iodide (Levene and Taylor), A., i, 81.

β-Ethylhexylene βζ-oxide (de Booseré), A., i, 311.

α-Ethyl-γ-hydroxypimelolactone (Leuchs and Nagel), A., i, 90.

Ethylidene bromohydrin, and bromo-, and trimethylene ether, bromo- (Hibbert and Hill), A., i, 439.

Ethylidenebismalononitrile (Diels, Gärtner, and Kaack), A., i, 25.

Ethylidenebisnitroanilines, *di*chlorohydroxy-, constitution of (Wheeler and Smith), A., i, 948.

Ethylidene glycerol, bromo- (Hibbert and Hill), A., i, 439.

Ethylidene glycol, preparation of esters and ethers of (Consortium für Elektrochemische Industrie), A., i, 893.

Ethylidene glycol, bromo- (Hibbert and Hill), A., i, 439.

Ethylidenemalonic acid, ethyl ester, reduction of (Higginbotham and Lapworth), T., 1618.

5-Ethylidenerhodanine (Gränacher, Gerö, Ofner, Klopfenstein, and Schlatter), A., i, 707.

Ethylketen, bromo- (Staudinger and Schneider), A., i, 465.

Ethylmercuric mercaptides (Sachs, Antoine, and Schlesinger), A., i, 1248.

Ethylmorphine, chloro-, and its hydrochloride (v. Kereszty and Wolf), A., i, 941.

β-Ethylnaphthindole-1:2-dione (Staudinger), A., i, 938.

9-Ethyloctahydrocarbazole (v. Braun and Ritter), A., i, 142.

γ-Ethylpentan-γ-ol-β-one, and its derivatives (Locquin and Wouseng), A., i, 302.

γ-*p*-Ethylphenyl-*n*-butyric acid (Krollpfeiffer and Schäfer), A., i, 343.

α-Ethylphthalide, 5-amino-, 5-bromo-, and 5-chloro- (Teppema), A., i, 258.

5-Ethyl-2-propiothienone, and its semicarbazone (Steinkopf, Augestad-Jensen, and Donat), A., i, 124.

2-Ethyl-5-propylthiophen (Steinkopf, Augestad-Jensen, and Donat), A., i, 124.

4-Ethylpyridine, and its salts (Tschitschibabin and Oparina), A., i, 1123.

4-Ethylpyridine-3:5-dicarboxylic acid (Tschitschibabin and Oparina), A., i, 1123.

3-Ethylquinoline, and its salts (v. Braun, Petzold, Seemann, and Schultheiss), A., i, 137.

α-Ethylsemicarbazide, and its salts and derivatives (Taipale and Smirnov), A., i, 905.

1-Ethyltetrahydronaphthalene, β amino-, and its derivatives (v. Braun, Gruber, and Kirschbaum), A., i, 108.

3-Ethyl-1:2:3:4- and 5:6:7:8-tetrahydroquinolines, and their salts and derivatives (v. Braun, Petzold, Seemann, and Schultheiss), A., i, 137.

1-Ethylthiolanthraquinone, β-hydroxy- (Hoffman and Reid), A., i, 988.

- **5-Ethylthiolanthraquinone-1-butylsulphone** (Hoffman and Reid), A., i, 934.
- **1-Ethylthiol*iso*propylthiolanthraquinones** (Hoffman and Reid), A., i, 933.
- **Ethyl-*o*-toluidine**, formyl derivative (Mailhe), A., i, 458.
- **Ethyl-*o*-tolylurethane**, nitration of (Ryan and Cullinane), A., i, 322.
- **Ethylurethane**, *N*-chloro-, and its salts (Traube and Gockel), A., i, 189.
- *Eucalyptus globulus*, sesquiterpenes of oil of (Ruzicka, Pontalti, and Balas), A., i, 1217.
- **Eucupine** solutions, gel formation in (Rona and Takata), A., i, 357.
- **Eudalene**, constitution of (Ruzicka and Stoll), A., i, 119.
- *Eugenia pitanga*, constituents of the leaves of (Coppetti and González), A., i, 280.
- **Eugenol**, estimation of, in volatile oils (van Eck), A., ii, 702.
- *n*- and *iso*-**Eugenols**, ultra-violet absorption spectra of (Thompson), T., 1594.
- **Euhygroscopic point** (Schoorl), A., i, 899.
- **Eutectic mixtures** of volatile substances (Vasiliev), A., ii, 395.
- **Evaporation**, improved methods of (Becker), A., ii, 737.
- *Evodia rutæcarpa*, constituents of the fruit of (Asahina, Ishio, Kashiwagi, Mayeda, and Fujita), A., i, 638.
- **Exercise**, effect of, on circulation and respiration (Lundsgaard and Moller), A., i, 502.
- **Explosion**, propagation of, in mixed gases (Dixon and Walls), T., 1025.
  - gaseous, pre-pressure interval in (Morgan), T., 1304.
  - waves, formation of (Laffitte), A., ii, 472, 623.
- **Explosives**, high, calorimetry of (Robertson and Garner), A., ii, 536.
- **Extraction apparatus** for large amounts of liquids (Franzen), A., ii, 683.
  - for continuous extraction of solutions in the cold (Javillier and de Saint-Rat), A., ii, 628.
  - for use with boiling solvents (Schaap), A., ii, 403.
  - with device for solvent recovery (Twisselmann), A., ii, 850.

F.

- **Fæces**, porphyrin in (Papendieck), A., i, 782.
  - estimation of total phosphoric acid in (Grote), A., ii, 655.
- **Faraday's law** (de Hemptinne), A., ii, 121.
- **Farnesol**, synthesis of (Ruzicka), A., i, 691.
- **Fatigue**, chemistry of (Rakestraw, Barley, and Hahn), A., i, 875.
- **Fats**, formation of (Terroine and Lobstein), A., i, 633.
    - in plant cells (Haehn and Kinttof), A., i, 426.
  - synthetic, preparation and constitution of (Gilchrist), A., i, 297.
  - enzyme action in synthesis of (Spiegel), A., i, 723.
  - in milk. See Milk.
  - nutritive value of (Takahashi), A., i, 977, 978.
  - as precursors of acetone substances (Hubbard), A., i, 631.
  - saponification of (Treub), A., ii, 626.
  - estimation of the acetyl value of (Powell), A., ii, 887.
  - estimation of the bromine number of (Becker), A., ii, 886.
  - estimation of the iodine number of (Margosches, Baru, and Wolf), A., ii, 266; (Rosenmund and Kuhnhenn), A., ii, 886.
- **Feathers**, colour of (Mason), A., i, 509.
- **Feeding-stuffs**, replacement of proteins by urea in (Honcamp), A., i, 266.
  - amino-acids of (Hamilton, Uyei, Baker and Grindley), A., i, 522.
- *d-cyclo***Fenchene** (Schering), A., i, 47.
- *cis*- and *trans-apo***Fenchocamphoric acids**, and their derivatives (Nametkin and Chuchrikova), A., i, 677.
- **Fenchone**, absorption spectra of solutions and vapour of (Purvis), T., 2516.
  - action of nitric acid on, and bromonitro- (Nametkin, Lubovcova, and Chochriakova), A., i, 810.
- **Fenchone**, nitro-, reduction products of (Nametkin, Lubovcova, and Chochriakova; Nametkin and Chochriakova), A., i, 810.
- **Fenchyl alcohol**, melting point of (Nametkin and Selivanova), A., i, 586.
- **Fenchyl** sulphite (Ruzicka and Liebl), A., i, 475.
- **Fenchylene** (Nametkin and Rushenceva), A., i, 692.
- **Fenchylxanthic acid**, ethyl ester, decomposition of (Nametkin and Selivanova), A., i, 586.
- **Fermentation**, chemistry of (Neuberg), A., i, 171.
  - influence of amines on (Orient), A., i, 171

Fermentation, alcoholic, action of ultra-violet light on (Söhngen and Coolhaas), A., i, 1042.

  action of metallic salts on (v. May), A., i, 1269.

  stimulation of (Soda), A., i, 517.

  by *Botrytis cinerea* (de Fazi), A., i, 634.

  with yeast-cells (Abderhalden and Glaubach), A., i, 518; (Abderhalden), A., i, 518, 519; (Abderhalden and Stix), A., i, 519.

 lactic, influence of copper on (Fonassier), A., i, 422.

 of sugars (Willstatter and Sobotka), A., i, 75.

  equivalence of acetaldehyde and glycerol in (Gehle, Neuberg, Hirsch, and Reinfurth), A., i, 171.

Ferricyanides, estimation of, electrometrically, with titanous sulphate (Hendrixson), A., ii, 781.

Ferrioxalic acid, salts, dissociation of (Burrows and Walker), T., 2741.

Ferrithiocyanates (Scagliarini and Tartarini), A., i, 547.

Ferrocyanides, electrometric titration of metals with (Treadwell and Chervet), A., i, 764.

Ferromanganese as a catalytic fertiliser (Picado and Vicente), A., i, 1276.

Ferrous salts. See under Iron.

Fertilisers. See Manures, artificial.

Fibres, textile, use of, in qualitative analysis (Cole), A., ii, 94.

Fibrin, reversibility of coagulation of (Barkan and Gaspar), A., i, 1036.

 hydrolysis of, in presence of ketones (Gortner and Norris), A., i, 399.

Fibrinogen, estimation of (Starlinger; Howe; Rusznyak and Barat), A., ii, 890.

Fichtelite (Ruzicka, Balas, and Schinz), A., i, 819.

Films, spreading of (Harkins and Feldman), A., ii, 127.

 thin, structure of (Adam), A., ii, 539.

Filters, carbon, electroendosmosis through (Umetsu), A., ii, 299.

 cellulose, for viscous liquids (Gutbier and Sauer), A., ii, 850.

 quantitative, Buchner (Cross), A., ii, 779.

Filter-pump, improved (Hickman), T., 3414.

Filtration, velocity of. See Velocity.

Fish, glycogen content of (Kilborn and Macleod), A., i, 270.

Fish, fresh-water, respiration of (Gardner and King), A., i, 162, 727.

 marine, non-protein organic constituents of the blood of (Denis), A., i, 164.

Fish oils, unsaturated fatty acids of (Brown and Beal), A., i, 647.

Flames, electrical properties of (Wilson), A., ii, 677.

 as disperse systems (v. Weimarn), A., ii, 394.

Flame, propagation of, in mixed gases (Payman), T., 412; (Payman and Wheeler), T., 1251; (Ellis), T., 1435.

 propagation of, in mixtures of paraffins and air (Mason), T., 210.

 bunsen, roaring of (Glaser), A., ii, 141.

 coloured, production of (Manley), A., ii, 148.

Flavanol-*p*-dimethylaminoanil, thio- (Arndt, Flemming, Scholz, and Löwensohn), A., i, 827.

Flavanone, thio- (Arndt, Flemming, Scholz, and Löwensohn), A., i, 826.

Flavanones, thio- (Arndt, Flemming, Scholz, and Lowensohn), A., i, 826.

Flavone colouring matters, absorption spectra of (Shibata and Kimotsuki), A., ii, 360.

Flavonols, formation of anthocyanins from (Noack), A., i, 937.

Flax waste, estimation of cellulose in (Budnikov and Solotarev), A., ii, 266.

Flores cinae. See Tansy.

Florida earth, oxydase reaction (Kobayashi and Yamamoto), A., ii, 693.

Florideæ, starch in (Mangenot), A., i, 276.

Fluorene, spectrochemistry of (v. Auwers and Krollpfeiffer), A., ii, 101.

 picryl chloride (Efremov), A., i, 552.

Fluorenequinone (Gomberg and Blicke), A., i, 915.

Fluorene-9-sulphonic acid, sodium salt (Wedekind and Stüsser), A., i, 809.

Fluorescein, colour of (Moir), A., ii, 48.

Fluorescence, effect of ultra-violet light on (Cale), A., ii, 204.

 and photochemistry (Levaillant), A., ii, 597.

 and radiochemistry (Perrin), A., ii, 714, 810.

 and photochemical transformation of dye solutions (Pringsheim), A., ii, 528.

Fluorescent substances, apparatus for detection of (Moreau), A., ii, 208.

Fluorindinum salts (Kehrmann and Leuzinger), A., i, 488.

Fluorine, atomic weight of (Moles and Clavera), A., ii, 149.

spectrum of (Gale), A., ii, 803.

oxidation with (Fichter and Humpert), A., ii, 562.

Hydrofluoric acid, estimation of, in presence of hydrofluosilicic acid (Brinton, Sarver, and Stoppel), A., ii, 783.

Fluorides, influence of, in electrolytic oxidation (Ríus y Miró), A., ii, 119.

estimation of (Smitt), A., ii, 35.

Hydrofluosilicic acid, concentration of (Jacobson), A., ii, 561.

estimation of, in presence of hydrofluoric acid (Brinton, Sarver, and Stoppel), A., ii, 783.

Fluorine organic compounds, refractivity of (Swarts), A., ii, 273.

Fluorine detection and estimation:—

detection of, in inorganic fluorides (Meulen), A., ii, 249.

estimation of, in blende (Rocha-Schmidt and Krüger), A., ii, 782.

Fluorone, 1:6:8-*tri*hydroxy- (Pratt and Robinson), T., 741.

Fluorspar, quantitative decomposition of (Palit), A., ii, 861.

Foods, physical chemistry of (Paul), A., i, 167.

estimation of arsenic in (Hann), A., ii, 787.

estimation of metals in, colorimetrically (Järvinen), A., ii, 655.

Formaldehyde, photochemical formation of (Baly, Heilbron, and Barker), A., i, 996.

formation of, from carbonates (Thunberg), A., i, 1271.

from hydrocarbons (Schonfelder; Blair and Wheeler), A., i, 1175.

from methane (Wheeler and Blair), A., i, 285.

from ozone and hydrocarbons (Blair and Wheeler), A., i, 997.

preparation of (Bobrov), A., i, 300; (Wheeler and Blair; Consortium für Elektrochemische Industrie), A., i, 752.

equilibrium between amino-acids and (Svehla), A., i, 181.

condensation of benzidine and (Kondo and Ishida), A., i, 147.

action of Grignard reagents on (Ziegler and Tiemann), A., i, 30.

action of hydrogen peroxide on (Bach and Generosow), A., i, 13.

Formaldehyde, condensation of nitronaphthylamines and (Morgan and Jones), A., i, 379.

action of, on potassium sulphite and hydrogen sulphite (Estalella), A., i, 181.

fixation and polymerisation of, by green plants (Sabalitschka), A., i, 76.

effect of, on blood-serum (Henley), A., i, 1253.

action of, on serum proteins (Kürten), A., i, 504.

detection and behaviour of, in corpses (Bruning), A., ii, 442.

estimation of (Blair and Wheeler), A., ii, 268; (Borgstrom), A., ii, 797.

estimation of, by oxidation (Gros), A., ii, 98.

estimation of, in presence of copper sulphate (Jakeš), A., ii, 442.

estimation of, in formalin (Mach and Herrmann), A., ii, 99.

estimation of, in paraformaldehyde (Borgstrom and Horsch), A., ii, 590.

Formaldehyde, β-*tri*thio- (Hinsberg), A., i, 1056.

Formaldehyde-protein (Reiner and Marton), A., i, 615.

Formaldehydesulphoxylic acid, sodium salt, estimation of, volumetrically, (Salkin), A., ii, 664.

Formalin, estimation of formaldehyde in (Mach and Herrmann), A., ii, 99.

Formanilide, decomposition of (Mailhe), A., i, 458.

Formhydroximinic acid, ester of (Houben, Pfankuch, and Kühling), A., i, 1077.

Formic acid, and its esters, preparation and rotation of (Pickard, Kenyon, and Hunter), T., 9.

electrolytic dissociation of (Auerbach and Zeglin), A., ii, 55.

thermal decomposition of the vapour of (Hinshelwood and Topley), T., 1014.

partition of, between ether and water (Auerbach and Zeglin), A., ii, 61.

decomposition of (Hinshelwood and Hartley), T., 1333.

in presence of alumina (Adkins and Nissen), A., ii, 309.

catalytic decomposition of, in acetic anhydride (Schierz), A., ii, 231.

velocity of decomposition of, by sulphuric acid (Schierz), A., ii, 230.

electrolytic oxidation of (Müller), A., i, 743.

Formic acid, catalytic dehydroxidation of (Müller and Keil), A., ii, 748.
action of, on ethylglycerol (Delaby), A., i, 753.
hydrolysis of proteins by (Zelinski and Sadikov), A., i, 721.
distribution of, in tissues, after injection of sodium formylglycine and after sodium formate (Steppuhn), A., i, 1155.
in urine of children (McNeal and Eldridge), A., i, 631.
cuprous ammonium salt (Larson and Teitsworth), A., ii, 157.
sodium salt, oxidation of, under pressure (Schrader), A., i, 87.
ethyl ester, preparation of (Bishop), A., i, 1056.
reaction of, with organomagnesium derivatives (Stadnikov), A., i, 462.
β-ethylallyl ester (Delaby), A., i, 1171.
derivatives, preparation of (Badische Anilin- & Soda-Fabrik), A., i, 1172.
estimation of (Whittier), A., ii, 346.
estimation of, gravimetrically (Auerbach and Zeglin), A., ii, 95.
estimation of, volumetrically (Utkin-Ljubovzov), A., ii, 588; (Holmberg and Lindberg), A., ii, 794.
estimation of, in urine (Benedict and Harrop), A., ii, 96.
Formic acid, chloro-, *tri*chloroethyl ester (Farbenfabriken vorm. F. Bayer & Co.), A., i, 86.
γ-chloropropyl ester (Dox and Yoder), A., i, 483.
chloro*mono*- and chloro*di*-thio-, methyl esters (Arndt, Milde, and Eckert), A., i, 1080.
*di*thio-, salts and derivatives of (Levi), A., i, 996.
Formo-βγ-dimethyl-Δβ-butenylanilide (Claisen, Kremers, Roth, and Tietze), A., i, 1052.
Formo-*N*-Δβ-*iso*pentenylanilide (Claisen, Kremers, Roth, and Tietze), A., i, 1051.
Formoxyhæmin (Küster and Willig), A., ii, 1031.
α-Formoxypropylbenzene, β-bromo- (Schmidt, Schumacher, and Asmus), A., i, 645.
Formulæ and symbols (Walker), T., 939.
electronic, method of writing (Williams), A., ii, 481.
***O*-Formylcamphenebromohydrin** (Schmidt, Schumacher, and Asmus), A., i, 645.
Formylformamidoxime (Houben, Pfankuch, and Kühling), A., i, 1078.
***p*-Formylphenylarsinic acid**, diethylhydrazone and phenylmethylhydrazone (Albert), A., i, 70.
Fowls, chemical defence mechanism of (Crowdle and Sherwin), A., i, 420.
synthesis of ornithine in (Crowdle and Sherwin), A., i, 632.
fasting, synthesis of glycine and ornithine by (Bullowa and Sherwin), A., i, 733.
Freezing point, measurements of (Keyes, Townshend, and Young), A., ii, 376.
of organic liquids (Timmermans), A., ii, 215.
Frogs, behaviour of glycogen in (Lesser), A., i, 1154.
Fuconamide (Clark), A., i, 16.
Fucose, structure of (Clark), A., i, 16.
Fuel, calorific value of various kinds of (Konovalov), A., ii, 217.
absorption of water by (Moore and Sinnatt), T., 275.
motor, estimation of free sulphur in (Ormandy and Craven), A., ii, 504.
micro-analysis of (Gault, Nicloux, Pfersch, and Guillemet), A., ii, 788.
Fulgides, halochromism of (Stobbe and Dietzel), A., i, 39.
Fuller's earth, oxydase reaction of (Kobayashi and Yamamoto), A., ii, 693.
action of, on terpenes (Venable), A., i, 474.
Fulminic acid, mercury salt, decomposition of (Langhans), A., i, 97.
Fumarase, purification of (Tsuchihashi), A., i, 1148.
Fumaric acid, physical properties of (Weiss and Downs), A., i, 534.
use of, in volumetric analysis (Lange and Kline), A., ii, 180.
detection of, micro-chemically (van Itallie), A., ii, 97.
Fumaric acid, *di*hydroxy-. See Maleic acid, *di*hydroxy-.
Fumaroles, of Alaska (Allen and Zies), A., ii, 646.
Fumaroyl *per*oxide, decomposition of (Fichter and Fritsch), A., i, 438.
Fundulus, eggs of, effect of salts on the diffusion of acids and alkali into (Loeb), A., i, 72.
Fungi, constituents of (Ivanov), A., i, 735.
formation of carbamide in (Ivanov), A., i, 520.
in soils (Abbott), A., i, 1167.
urea and urease in (Goris and Costy), A., i, 171.

Fungi, higher, chemistry of (Bard and Zellner), A., i, 987.
Furfuraldehyde, formation and distillation of (Pervier and Gortner), A., ii, 884.
  blue colouring matter from (Paschke) A., i, 699.
Furfuraldehydediallylhydrazone (Diels), A., i, 1079.
Furfuraldehydephenylhydrazone oxide (Bergmann, Ulpts, and Witte), A., i, 393.
Furfuryl alcohol, decomposition of (Pummerer and Gump), A., i, 698.
Furfurylcamphor (Wolff), A., i, 1109.
Furfuryl*cyclo*hexanone (Wolff), A., i, 1109.
Furfurylideneanthranilic acid, and 2-bromo-, action of acetic anhydride on (Ekeley and Rogers), A., i, 66.
2-Furfurylidene-4-methyl*cyclo*hexanone (Wolff), A., i, 937.
2-Furfurylidene-5-methyl*cyclo*hexanone (Wolff), A., i, 1109.
2-Furfurylidenemethyl-3-methylchromone (Heilbron, Barnes, and Morton), T., 2567.
2-Furfuryl-4- and -5-methyl*cyclo*hexanones (Wolff), A., i, 1109.
Furnace, electric. See Electric furnace.
  gas combustion (Hedley), A, ii, 876.
Furylacetaldoxime (Asahina and Fujita), A., i, 239.
Furylethylamine, and its derivatives (Asahina and Fujita), A., i, 239.
d-**β-Furyl-lactic acid**, formation of, by *Bacillus proteus* (Sasaki and Otsuko), A., i, 517.
α- and **β-Fusanols** (Rao and Sudborough), A., i, 588.

G.

Gadolinium, arc spectrum of (Kiess), A., ii, 518.
  ethyl sulphate, magnetic properties of (Jackson and Onnes), A., ii, 609.
Galactose, structure of (Pryde), T., 1808.
  ingestion of (Bodansky), A., i, 983.
  di*iso*propylidene ether, and its toluene-*p*-sulphonyl derivative (Freudenberg and Hixon), A., i, 1179.
  phenylhydrazone and phenylmethylhydrazone, dimorphism of (Svanberg), A., i, 442.
  detection of, biochemically, in presence of arabinose (Bridel and Charpentier), A., ii, 882.
  detection and identification of (Castellani and Taylor), A., ii, 265.
d-**Galactose-*o*-hydroxymethylbenzhydrazide** (Teppema), A., i, 257.
l-**Galacturonolactone**, semicarbazone of (Kiliani), A., i, 1060.
Gallaldehyde (Rosenmund), A., i, 226.
  acidity of (Nierenstein), A., i, 41.
Gallium, atomic weight of (Richards and Craig), A., ii, 495.
  spark spectrum of (Klein), A., ii, 354.
  separation of, from aluminium (Llord y Gamboa), A., ii, 642.
Gallomolybdic acid, salts of (Fernandes), A., i, 1100.
Gallotungstic acid, potassium salts of (Fernandes), A., i, 1100.
Gallouranic acid, potassium salts of (Fernandes), A., i, 1100.
Gallstones, solubility of (Rosin), A., i, 270.
Gardenia florida, colouring matter from the fruit of (Munesada), A., i, 77.
Gas, electrolytic, ignition temperature of (v. Wartenberg and Kannenberg), A., ii, 623.
  illuminating, combustible power and percentage of nitrogen in (Nicloux), A., ii, 578.
Gases, magnetic rotatory dispersion in (Havelock), A., ii, 205.
  β-rays produced in (Auger), A., ii, 601.
  positive rays in (McHenry), A., ii, 208.
  electrochemistry of (Lind), A., ii, 676.
  active cross-section of molecules of, for slow electrons (Ramsauer), A., ii, 749.
  electrical discharge in (de Hemptinne), A., ii, 121.
  electric discharge in, using Tesla currents (Fischer), A., ii, 283.
  disappearance of, under the electric discharge (Newman), A., ii, 684.
  passage of resonance radiation through (Compton), A., ii, 280.
  thermal properties of (Cardoso and Coppola), A., ii, 832; (Cardoso and Bruno), A., ii, 833.
  thermal ionisation of (Becker), A., ii, 820.
  heat capacity and entropy of (Urey), A., ii, 533.
  vapour density and heats of solution of (Vrevski), A., ii, 740.
  solubilities of (Taylor and Hildebrand), A., ii, 315.
  apparatus for measurement of the flow of (Arkadiev), A., ii, 402.
  adsorption of, by copper (Pease), A., ii, 862.

Gases, adsorption of, by nickel (Gauger and Taylor), A., ii, 398.
  by oxide catalysts (Benton), A., ii, 382, 383.
  by solids (Evans and George), A., ii, 296.
 velocity of reaction between liquids and (Becker), A., ii, 228.
 explosion of, pre-pressure interval in (Morgan), T., 1304.
 temperatures of combustion of (Pollitzer), A., ii, 11.
 combustible, analysis of (Hauser), A., ii, 788.
 diatomic, chemical constants of (Partington), A., ii, 628.
  entropy and rotational specific heat of (Tolman and Badger), A., ii, 830.
  low voltage arcs in (Duffendack), A., ii, 373.
 dissociated, arc spectra and ionisation potentials of (Compton), A., ii, 350.
 ideal, properties of (Pavlov), A., ii, 378.
 inert, radii of atoms of (Davey), A., ii, 847.
 mixed, volume and pressure of (Masson and Dolley), A., ii, 462.
  separation of, by diffusion (Hertz), A., ii, 297; (Fischer, Schrader, and Jaeger), A., ii, 742.
  effect of pressure on ignition of (Payman and Wheeler), T., 426.
  propagation of flame in (Mason), T., 210; (Payman), T., 412; (Payman and Wheeler), T., 1251; (Ellis), T., 1435.
  propagation of explosion in (Payman and Walls), T., 420; (Dixon and Walls), T., 1025.
 natural (Henrich and Prell), A., ii, 572.
 polyatomic, specific heat of, at low temperatures (Millar), A., ii, 374.
 rare (Moureu), T., 1905.
  free paths of electrons in (Spooner; Minkowski), A., ii, 821.
  collision area of molecules of (Ramsauer), A., ii, 529.
  radiation and ionisation potentials of (Hicks), A., ii, 209.
Gas-absorption apparatus (Morgan), A., ii, 337.
Gas absorption and washing apparatus (Keller), A., ii, 850.
Gas analysis, use of phosphorus in (Holmes), A., ii, 332.
 in blood (Straub and Gollwitzer-Meier), A., i, 503.
Gas analysis apparatus (Tiddy), A., ii, 694.
 absorption pipette (Saunders), T., 2826.
 burette (Creighton), A., ii, 780.
 van Slyke (Shohl), A., ii, 573.
Gas electrode. See Electrode.
Gas generator, simple attachment for (Spiegel), A., ii, 752.
Gas mantles, incandescent, catalysts in the making of (Medsforth), T., 1467.
Gas reactions, heterogeneous (Hinshelwood and Prichard), T., 2725; (Hinshelwood and Topley), T., 1014.
 homogeneous (Hinshelwood and Prichard), T., 2730.
Gauze dressings, detection and estimation of mercury in (Barral), A., ii, 657.
Geber, identity of (Holmyard; Partington), A., ii, 148; (v. Lippmann), A., ii, 314; (Darmstaedter), A., ii, 628.
 works ascribed to (Ruska; Partington; van Deventer), A., ii, 683.
Gedanite, succinite and (Tschirch, Aweng, de Jong, and Hermann), A., i, 351.
Gels, constitution of (Duclaux), A., ii, 134.
 theory of (Bradford), A., ii, 470.
 diffusion of colouring matters into (Traube and Shikata), A., ii, 385.
 diffusion of electrolytes into (Stiles), A., ii, 743.
 influence of a dissolved crystalloid on the rigidity of (Michaud), A., ii, 134.
Gelatin, isoelectric point of (Price), T., 410; (Wilson and Kern), A., i, 68.
 liquefaction of, by bacteria (Arnbeck), A., i, 170.
 effect of time on the properties of solutions of (de Izaguirre), A., i, 1145.
 adsorption of acids and salts by (Rakuzin and Henke), A., i, 870.
 interfacial tension between solutions of, and toluene (Sheppard and Sweet), A., ii, 136.
 formation of Liesegang's rings in (Schleussner), A., ii, 59.
 gels, structure of (Gortner and Hoffman), A., i, 965.
 as a protective colloid (Gutbier and Zweigle), A., ii, 60.
 products of decomposition of (Gulevitch) A., i, 1244.

Gelatin, action of solutions of acids, alcohols, and salts on (Rakuzin and Gönke; Rakuzin), A., ii, 465.

equilibrium of hydrochloric acid and (de Izaguirre), A., ii, 139.

deaminised, combination of hydrochloric acid with (Hitchcock), A., i, 1244.

addition of, to silver concentration cells (Audubert), A., ii, 286.

precipitation of tannic acid by (Thomas and Frieden), A., ii, 664.

purification of (Knaggs, Manning, and Schryver), A., i, 1144.

estimation of ash, arsenic, copper, and zinc in (Mehurin), A., ii, 891.

estimation of nitrogen in (Gerngross and Schaefer) A., ii, 653.

Gentiobiose, constitution of (Haworth and Wylam), T., 3120.

Geraniol in apples (Power and Chesnut), A., i, 278.

action of light on acetone and (Scagliarini and Saladini), A., i, 587.

Germanium (Dennis, Tressler, and Hance), A., ii, 769.

crystal structure of (Hull), A., ii, 869.

isotopes of (Aston), A., ii, 499.

extraction of, and detection of arsenic in the oxide (Dennis and Johnson), A., ii, 570.

Germanium *tetra*iodide (Dennis and Hance), A., ii, 172.

oxide (Nichols), A., ii, 571.

Germanium estimation:—

estimation of, gravimetrically (Muller), A., ii, 43.

Glands, physiology of (Asher and Schneider), A., i, 410.

lacteal, formation of lactose in (Hesse), A., i, 981.

lymph. See Lymph glands.

pancreatic, cadaverine content of (Semenovitsch), A., i, 628.

See also Pituitary and Suprarenal glands.

Glass, fluorescence and coloration of, produced by β-rays (Clarke), A., ii, 277.

potential difference between, and electrolytes (Hughes), A., ii, 114.

adsorption of toluene vapour by (Carver), A., ii, 129.

wetting of, by mercury (Schumacher), A., ii, 833.

contamination of water by solution of (Collins and Riffenburg), A., ii, 83.

Glass, borosilicate, effect of boric oxide on the properties of (Dimbleby, Hodkin, Parkin, and Turner; English and Turner), A., ii, 410.

lead, action of potassium carbonate on (Richmond), A., ii, 687.

soda-lime, conduction process in (Kraus and Darby), A., ii, 113.

soda-lime-silicate, action of water and steam on (Hodkin and Turner), A., ii, 242.

analysis of bubbles in (General Electric Co., Ltd., Ryde, and Huddart), A., ii, 565.

estimation of boron trioxide in (Dimbleby and Turner), A., ii, 432.

Gleditschia triacanthos, constituents of the fruits of (Aszkenazy), A., i, 1044.

Gliadin, from wheat, acid hydrolysis of (Vickery), A., i, 968.

Globin, isoelectric point of (Osato), A., i, 160.

Globulin, antagonism of albumin to (Brossa), A., i, 397.

change of albumin into (Rusznyák), A., i, 1143.

coagulation of gold sols by solutions of (Fischer and Fodov), A., i, 616.

artificial (Fanconi), A., i, 1030.

Globulins, physical chemistry of (Adolf), A., i, 396.

estimation of amino-acids in (Oparin), A., ii, 511.

Glucina. See Glucinum oxide.

Glucinum (*beryllium*), *X*-ray spectra of (McLennan and Clark), A., ii, 51.

excitation of *K*-rays in (Holtsmark), A., ii, 528.

heat of oxidation of (Copaux and Philips), A., ii, 216.

Glucinum oxide (*glucina*) from beryl (Britton), A., ii, 28.

Glucinum organic compounds:—

salts of organic acids (Meyer and Mantel), A., i, 11.

Glucinum separation:—

separation of uranium and (Brinton and Ellestad), A., ii, 257.

Glucodesose. See 2-Deoxyglucose.

Glucokinin (Collip), A., i, 967, 1247.

Gluconic acid, preparation of (Blanchetière), A., i, 539.

mercurous salt, preparation of (Bert), A., i, 754.

Gluconyl-*p*-arsanilic acid (Lewis and Hamilton), A., i, 500.

*iso***Glucosamine**, constitution and derivatives of (Schmuck), A., i, 1062.

Glucosan, constitution of (Cramer and Cox), A., i, 94.
Glucosans, action of chloral on (Pictet and Reichel), A., i, 755.
Glucosazones, isomeric (Svanberg), A., i, 441.
d-**Glucose**. See Dextrose.
α- and **β-Glucoses**, rate of fermentation of (Willstätter and Sobotka), A., i, 75.
β-Glucosidase, action of, on various glucosides (Willstätter, Kuhn, and Sobotka), A., i, 1034.
Glucosides (Macbeth and Mackay), T., 717; (Karrer and Hurwitz), A., i, 93; (Hérissey), A., i, 589.
  constitution of (Irvine), T., 902.
  optical rotation of (Maltby), T., 1404.
  cyanogenetic (Wattiez), A., i, 1275.
  hydrocyanic acid, detection of, in plant tissues (Rosenthaler and Seiler), A., i, 278.
Glucosides. See also:—
  Amygdalin.
  Arbutin.
  Betulin.
  Centaurein.
  Chydenanthin.
  Coumarigenin.
  Digitonin.
  Loroglossin.
  Monotropein.
  Monotropin.
  Rutin.
  Sinigrin.
  Sophorin.
  Verbenalin.
1-**β-*d*-Glucosidoglycerol** (Karrer and Hurwitz), A., i, 93.
d-**Glucosido-α-trimethylammonium** hydroxide and salts (Karrer and ter Kuile), A., i, 93.
Glucosimine, true nature of (Schmuck), A., i, 1062.
α **1-Glucosyl-2-glucose**, and its derivatives (A. and J. Pictet), A., i, 755.
Glutaconic acids, chemistry of (Thorpe and Wood), T., 62; (Goss, Ingold, and Thorpe), T., 327, 3342.
Glutaconodinitrile (Lespieau), A., i, 751.
Glutamic acid, condensation of glycerol with (Blanchetière), A., i, 12.
Glutamylglutamic acid, formation of (Blanchetière), A., i, 12.
*cyclo***Glutamylglutamic acid**, formation of (Blanchetière), A., i, 12.
Glutaratodipentamminecobaltic glutarate nitrate and nitrate (Duff), T., 568, 570.
Glutaric acid, β-hydroxy-, ethyl ester (Lespieau), A., i, 751.
Glutarodinitrile, β-bromo-, and its hydrobromide, and β-hydroxy- (Lespieau), A., i, 447.
Glutathione (Hopkins and Dixon), A., i, 167; (Quastel, Stewart, and Tunnicliffe), A., i, 1072.
  oxidation and reduction potentials of (Dixon and Quastel), T., 2943.
  reduced, oxidation of (Dixon and Tunnicliffe), A., i, 416.
Glutin, distinction between chondrin and (Rakuzin), A., ii, 667.
Glycæmia, action of insulin in (Chabanier, Lobo-Onell, and Lebert; Desgrez, Bierry, and Rathery), A., i, 982.
  in kidney disease (Rosenberg), A., i, 1154.
Glyceric acid, fermentation of (Lebedev and Polonski), A., i, 633, 634.
Glycerol, formation of, in alcoholic fermentation (Abderhalden and Glaubach), A., i, 518; (Abderhalden and Stix), A., i, 519.
  optical constants of (Tear), A., ii, 593.
  specific heats and entropy of (Gibson and Giauque), A., ii, 124.
  mutual solubility of alcohols, aldehydes, and phenols with (McEwen), T., 2284.
  mutual solubility of ketones and (McEwen), T., 2279.
  condensation of glutamic acid with (Blanchetière), A., i, 12.
  equivalence of acetaldehyde and, in fermentation products (Gehle; Neuberg, Hirsch, and Reinfurth), A., i, 171.
  alkyl derivatives, reactions of (Delaby), A., ii, 264.
  αα′-bistriphenylmethyl ether (Speidel and Toeldte), A., i, 331.
  glucosides of (Karrer and Hurwitz), A., i, 93.
  thallium derivative (de Forcrand), A., i, 84.
Glycerophosphatase in plant seeds (Němec), A., i, 736, 882.
Glycine, synthesis of, by fasting fowls (Bullowa and Sherwin), A., i, 733.
  crystalline forms of (Brautlecht and Eberman), A., i, 1001.
  hydrolysis of (Baur), A., i, 97.
  peptisation of (Zelinski and Sadikov), A., i, 1185.
  influence of, on the fermentative action of soja-bean urease (Katô), A., i, 622.
  ethyl ester, interaction of **ββ′-dichloro**diethyl sulphide, sulphone, and sulphoxide with (Cashmore and McCombie), T., 2884.

- **Glycineanilide** carbonate (Usherwood and Whiteley), T., 1086.
- **Glycogen**, formation and exchange of, in avitaminosis (Rubino and Collazo), A., i, 1153.
  - constitution of (Irvine), T., 912.
  - composition of (Samec and Isajevič), A., i, 656.
  - decomposition of, by blood-serum (Fuchs and Hetényi), A., i, 625.
  - synthesis of, in the liver (C. F. and G. T. Cori and Pucher), A., i, 1039.
  - in liver of dogs of various ages (Gruzewska and Fauré-Frémiet), A., i, 267.
  - behaviour of, in frogs (Lesser), A., i, 1154.
  - in invertebrates and fish (Kilborn and Macleod), A., i, 270.
  - metabolism. See Metabolism.
  - in tissues in diabetes (Ringer, Dubin, and Frankel), A., i, 417.
  - effect of insulin on, in animal tissues (Dudley and Marrian), A., i, 978.
  - estimation of, in yeast (Mayer), A., ii, 441.
- **Glycols**, diacetylenic (Wilson and Hyslop), T., 2612.
  - higher diprimary, action of sulphuric acid on (Franke and Liebermann), A., i, 530.
- **α-Glycols**, action of dehydrating agents on (Danilov), A., i, 786, 787.
- **αγ-Glycols**, formation of acetone compounds by (Böeseken and Hermans), A., i, 86.
- **αδ-** and **αε-Glycols**, oxidation of anhydrides of (Franke and Lieben), A., i, 10.
- **Glycol anhydrides**, $C_{10}H_{18}O_3$, isomeric, and their derivatives, from oxidation of sabinene (Henderson and Robertson), T., 1853.
- **Glycollic acid**, preparation of, from paraformaldehyde (Hammick and Boeree), T., 2881.
- **Glycolysis** in normal and diabetic blood (Denis and Giles), A., i, 1262.
- **Glycosuria.** See Diabetes.
- **Glycuronic acid**, synthesis of, from dextrose (Bergmann and Wolff), A., i, 649.
  - phenylhydrazone, and its derivatives (Bergmann and Wolff), A., i, 650.
- **Glycylalanine anhydride** (Abderhalden), A., i, 717.
- **Glycyl-*dl*-leucylglycine** (Abderhalden and Alker), A., i, 1071.
- **Glyoxal**, and its sulphate (Chemische Fabrik vorm. Weiler ter Meer), A., i, 896.
  - ultra-violet absorption spectrum of (Luthy), A., ii, 520.
- **Glyoxalbisphenylhydrazone** (Chemische Fabrik vorm. Weiler ter Meer), A., i, 1060.
- **1-Glyoxalid-2-one-5-carboxylic acid**, and its methyl ester (Karrer and Schlosser), A., i, 660.
- **Glyoxaline**, 2-*mono*-, and 2:5-*di*bromo-, and their salts (King and Murch), T., 626.
  - 2:5-*di*chloro- (King and Murch), T., 625.
- **Glyoxalines**, formation of, from dibenzamidoethylene derivatives (Windaus and Langenbeck), A., i, 147.
  - quaternary salts of (Sarasin), A., i, 710.
- **Glyoxaline group**, syntheses in the (Sarasin), A., i, 711.
- **Glyoxalineamino-acetic acid**, synthesis of, and its derivatives (Stewart), A., i, 486.
- **Glyoxaline-4-carboxyanilide**, bromination of (King and Murch), T., 621.
- **Glyoxaline-4-carboxy-*p*-bromoanilide**, and 5-*mono*- and 2:5-*di*-bromo- (King and Murch), T., 624.
- **Glyoxaline-4-carboxylic acid**, 5-bromo-, and its nitrate and ethyl ester (King and Murch), T., 628.
- **Glyoxaline-5(4)-carboxylic acid**, 4(5)-amino-, and 4(5)-nitro-, methyl esters and amides of (Windaus and Langenbeck), A., i, 386.
- **Glyoxylic acid**, phenylhydrazones of (Bergmann and Wolff), A., i, 650.
- **Gold**, dispersoid synthesis of (v. Weimarn), A., ii, 869.
  - colloidal, preparation of solutions of (Naumov), A., ii, 245.
    - formation of, in silicic acid gels (Davies), A., ii, 140, 836.
    - action of proteins on (Reznikoff), A., i, 615.
    - analysis and constitution of (Kautzky and Pauli), A., ii, 329.
  - sols, preparation of (v. Weimarn), A., ii, 645.
    - precipitation of, by alkaline globulin solutions (Fischer and Fodor), A., i, 616.
    - protective action of potassium oleate on, in alcohol–water mixtures (Rideal and Bircumshaw), T., 1565.
  - catalytic action of (Hinshelwood and Topley), T., 1020.

Gold, anodic oxidation of (Jirsa and Buryánek), A., ii, 80, 173.
  fusion of particles of, with borax (Ehringhaus and Wintgen), A., ii, 390.
  diffusion of silver into (Weiss and Henry), A., ii, 59.
Gold alloys with copper and silver, specific resistance of (Fischbeck), A., ii, 10.
  with iron, electrical conductivity of (Guertler and Schulze), A., ii, 284.
  with silver, crystal structure of (McKeehan), A., ii, 428.
Gold silver chlorides (Wells), A., ii, 32.
Gold organic compounds:—
  ammonium halogen salts, complex (Gutbier), A., i, 1184.
Gold detection and estimation:—
  detection of, with stannous chloride (Cole), A., ii, 94.
  estimation of, volumetrically (Pollard), A., ii, 660.
Gold-fish, respiratory exchange in (Gardner and King), A., i, 162.
Gossypic acid, and its derivatives (Fargher and Probert), A., i, 279.
Gossypol, effect of, on protein digestion (Jones and Waterman), A., i, 962.
Gossypyl alcohol, and its derivatives (Fargher and Probert), A., i, 279.
Gout, origin and treatment of (Steudel and Ellinghaus), A., i, 732.
Granite, Dartmoor (Brammall and Harwood), A., ii, 777.
Grapes, methyl anthranilate in the juice of (Power and Chesnut), A., i, 280.
Grape seed oil, hydroxy-acids from (André), A., i, 437.
Graphite, preparation and properties of (Pirani and Fehse), A., ii, 317.
  properties of (Burns and Hulett), A., ii, 317.
  structure of (Simon), A., i, 908.
  crystal structure of (Hull), A., ii, 869.
  molecular complexity of, at high temperature (Jouniaux), A., ii, 411.
  oxidation of (Simon), A., ii, 560.
Grasses, precipitation of proteins in (O'Dwyer), A., i, 636.
Grignard reaction, influence of solvents on (Majima and Kotake), A., i, 150, 482.
  application of, to acetylenic compounds (Wilson and Hyslop), T., 2612.
Grignard reagents, permanence of (Gilman and Meyers), A., i, 193.
Grignard reagents, reducing action of (Buylla and Olay), A., i, 193.
  influence of hydrochloric acid on the enolising action of (Bhagwat), T., 1803.
  action of, on ethylenic hydrocarbons, A., i, 285.
  action of, on α-hydroxymethyl ketones (Locquin and Wouseng), A., i, 433.
  action of, on nitriles (Bruylants), A., i, 1003.
  estimation of (Gilman, Wilkinson, Fishel, and Meyers), A., ii, 272.
Growth of rats, effect of air exposed to ultra-violet light on (Hume and Smith), A., i, 728.
Guaiacol (Ruzicka, Pontalti, and Balas), A., i, 1217.
Guanidinoacetylphenylarsinic acid, *p*-amino- (Albert), A., i, 70.
Guanidinopiperidine, 1-cyano- (Pellizzari), A., i, 1002.
p **Guanidinotoluene-*m*-sulphonic acid**, (Scott and Cohen), T., 3189.
Guanine-8-propionic acid, and its methyester hydrochloride (Traube), A., i, 1137.
1-Guanylcarbamylpiperidine, and its picrate (Pellizzari), A., i, 1002.
Guanylic acid, preparation and estimation of (Feulgen and Rossenbeck), A., i, 494.
Guanylnucleic acid (Feulgen), A., i, 68.
Guanylphenylcarbamide, and its salts (Pellizzari), A., i, 1003.
Guanylphenylmethylcarbamide, and its nitrate (Pellizzari), A., i, 1002.
Gum tragacanth as protective colloid (Gutbier and Wüterich), A., ii, 393.
Gurjun balsam, sesquiterpenes of (Ruzicka, Pontalti, and Balas), A., i, 1217.
Gypsum, dehydration of (Jolibois and Lefebvre), A., ii, 417.

H.

Hæmatoidin (Fischer and Reindel), A., i, 718.
Hæmatoporphyrin, absorption spectrum of (Goio; Hári), A., ii, 277.
Hæmins, thiocyano- (Kuster), A., i, 1031.
Hæmocyanin (Quagliariello), A., i, 68.
Hæmoglobin, influence of α-rays on (Straub and Gollwitzer-Meier), A., i, 503.
  adsorption of gases by (Hill), A., i, 869; (Adam), A., i, 870.

- **Hæmoglobin**, effect of carbon dioxide and acetic acid on osmotic pressure of (Wilson), A., i, 494.
  - impermeability of collodion membranes for (Brinkman and v. Szent-Györgyi), A., i, 974.
  - kinetics of (Hartridge and Roughton), A., ii, 746.
  - combination of, with carbon monoxide and oxygen (Brown), A., i, 964.
  - combination between oxygen and (Adam), A., i, 617; (Bayliss), A., i, 618.
  - digestion of, by pepsin (Dmochowski), A., i, 871.
  - tryptophan and tyrosine content of (Kiyotaki), A., i, 399.
  - distribution of, in red blood cells (Gorter), A., i, 875.
  - crystals of, from rodents (Krummacher), A., i, 494.
  - relation of the function of, to respiration (Gesell), A., i, 1249.
  - reduced, alkali-binding and buffer values of (Van Slyke, Hastings, Heidelberger, and Neill), A., i, 162.
  - estimation of, colorimetrically, (Wong), A., ii, 435; (Osgood and Haskins), A., ii, 891.
  - Duboscq colorimeter for estimation of (Newcomer), A., ii, 592.
- **Hæmoglobinometer**, Sahli's new standard for (Harkins), A., ii, 891.
- **Hæmolysis**, chemical causes of (Brinkman and v. Szent-Györgyi), A., i, 1152.
  - with alkali and alkaline earth salts (Beckmann), A., i, 505.
  - effect of blood serum on (Ponder), A., i, 975.
- **Hæmotetracarboxylic acids.** See Pentanetetracarboxylic acids.
- **Hæmotricarboxylic acids.** See Pentane-αγδ-tricarboxylic acids.
- **Hafnium** (Coster and Hevesy), A., ii, 80, 171; (Hevesy), A., ii, 570.
  - discovery of, and its properties (Hevesy), A., ii, 645.
  - chemistry of (Hevesy), A., ii, 769.
  - presence of, in malacon and alvite (Goldschmidt and Thomassen), A., ii, 174.
  - in zirconium ores (Hevesy and Jantzen), T., 3218.
  - and celtium (Hansen and Werner; Coster and Hevesy), A., ii, 426; (Urbain; King), A., ii, 645; (Anon.; Brauner), A., ii, 692.
  - spectra of (Hansen and Werner), A., ii, 200, 807.
- **Hafnium**, *L*-series spectrum of (Žáček), A., ii, 449.
  - Röntgen ray spectrum of (Coster), A., ii, 807.
- **Hair**, manganese in (McCrae), A., i, 415.
- **Halides**, structure of, in relation to compressibility of (Woodward), A., ii, 414.
  - anhydrous, preparation of (Oddo and Giachery), A., ii, 316.
  - inorganic, reduction of (Ruff and Neumann; Ruff and Wallstein), A., ii, 868.
- **Halochromism** (Skraup and Freundlich), A., i, 667; (Moir), A., ii, 809.
- **Halogens**, absorption and emission spectra of (Narayan and Gunnaya), A., ii, 351.
  - chemical constants of (Henglein), A., ii, 124.
  - and their hydrides, molecular structure and viscosity of (Schmidt), A., ii, 147.
  - reactivity of, in aromatic compounds (Rheinlander), T., 3099.
  - action of ultra-violet light on the reactivity of, attached to the nucleus (Rosenmund, Luxat, and Tiedemann), A., ii, 717.
  - reactions of ketones with (Rice), A., ii, 18.
  - action of, on the surface of metals (Tammann), A., ii, 624.
  - action of, on phenylhydrazones (Humphries, Bloom, and Evans), T., 1766.
  - inactivation of saccharase by (v. Euler and Josephson), A., i, 620.
  - estimation of, electrometrically (Willard and Fenwick), A., ii, 331.
  - estimation of, in organic compounds (Macbeth), A., ii, 34.
  - estimation of, in organic compounds in presence of sulphur (Leonard), A., ii, 177.
  - apparatus for estimation of, in organic compounds (Rübke), A., ii, 249.
  - separation and estimation of, electrolytically (Schaz), A., ii, 331.
- **Halogen** atoms, lability of, in organic compounds (Macbeth), T., 1122; (Henderson, Hirst, and Macbeth), T., 1130.
  - hydrides, vapour pressure and crystal structure of (Henglein, Roth, and Andres), A., ii, 753.
    - relation between the dipole moment and heat of sublimation of (Born and Kornfeld), A., ii, 291.
  - ions, radii of (Davey), A., ii, 847.

Halogenation (Datta and Chatterjee), A., i, 345.
o-**Halogeno ketones**, condensation of, with aldehydes (Bodforss), A., i, 41.
Hamster, crystals of hæmoglobin from (Krummacher), A., i, 494.
Haricot beans. See Beans.
Heart, effect of atropine and hyoscine on the (Heinekamp), A., i, 1265.
residual nitrogen in diseases of (Pribram and Klein), A., i, 1262.
surviving mammalian, perfusion experiments with (Klewitz), A., i, 978.
Heat, atomic (van Aubel), A., ii, 124.
specific (Padoa), A., ii, 10.
of liquids (Herz), A., ii, 56.
of polyatomic gases at low temperatures (Millar), A., ii, 374.
specific rotational, of diatomic gases (Tolman and Badger), A., ii, 830.
Heat capacity, determination of (Moureu, Dufraisse, and Landrieu), A., ii, 535.
of gases (Urey), A., ii, 533.
Heat of activation of heterogeneous gas reactions (Hinshelwood and Topley), T., 1014.
Heat of combustion (v. Weinberg), A., ii, 217.
of carbohydrates (Karrer and Fioroni), A., ii, 460.
of nitro-compounds (Rubcov and Severjanov), A., ii, 218.
Heat of formation of hydrates (Bouzat), A., ii, 149.
of isomorphous mixtures of organic compounds (Nagornov), A., ii, 461.
of nitro-compounds (Rubcov and Severjanov), A., ii, 218.
of quinonoid compounds (Blaszkowska), A., ii, 535.
of solid solutions (Bruni; Landrieu), A., ii, 535; (Bruni), A., ii, 612.
Heat of oxidation of the alkaline earth metals (Guntz and Benoit), A., ii, 126.
Heat of solution, variation of, with temperature (Mondain-Monval), A., ii, 295.
Heat of vaporisation, internal (Mills and Smith), A., ii, 377.
Helium, formation of, in hydrogen discharge tubes (Piutti), A., ii, 20; (Piutti and Boggio-Lera), A., ii, 69.
model of the ortho-form of (Halpern), A., ii, 845.
atom, models of (Kramers), A., ii, 479; (Sommerfeld), A., ii, 627.
and ionisation potential (Silberstein), A., ii, 400.
Helium atom, Langmuir model of, and its spectrum (Newboult), A., ii, 399.
atoms, abnormal, ionisation of (Horton and Davies), A., ii, 4.
spectrum of (Silberstein), A., ii, 46, 595, 805; (Hicks), A., ii, 108; (Hughes and Lowe), A., ii, 804; (Raman and Ganesan; Offerhaus), A., ii, 805.
band spectrum of (Takahashi), A., ii, 198; (Curtis), A., ii, 351; (Kratzer), A., ii, 595.
effect of metallic coatings on the spectrum of (Janicki and Lau), A., ii, 669.
Stark effect in spectrum of (Foster), A., ii, 198.
effect of an electric field on the series spectrum of (Tschulanowsky), A., ii, 517.
spectra and ionisation of (Déjardin), A., ii, 517.
ionising potential of (Mackay), A., ii, 821.
radiation and ionisation potentials of (Hicks), A., ii, 209.
ionisation by collision in (Townsend), A., ii, 366.
course of α-particles in (Bose and Ghosh), A., ii, 363.
motion of electrons in (Townsend and Bailey), A., ii, 721.
radiation voltages of electrons in (Davies), A., ii, 281.
isothermals of, at low temperatures (Martinez and Onnes), A., ii, 734.
equilibrium of liquid and gaseous phases of (Onnes), A., ii, 633.
coefficients of slip and of viscosity of (States), A., ii, 613.
light, use of, in refractometry (Schoorl), A., ii, 445.
lecture experiment for obtaining, from air (v. Antropoff), A., ii, 851.
*iso*Helium, atomic structure of (Neuberger), A., ii, 145.
Hemicellulose (Pringsheim and Seifert), A., i, 998.
Hemicelluloses (Clayson and Schryver; Schryver and Thomas; O'Dwyer), A., i, 1066.
m-**Hemipinanilic acid** (Kuroda and Perkin), T., 2105.
Hemipinic anhydride, condensation of, with phenol ethers (Bistrzycki and Krauer), A., i, 1209.
Hen's eggs. See Eggs.
Heparene (Chapman), T., 778.
Heptacyclene, *di*thio- (Heilbron and Heaton), T., 182.

Heptadecoic acid, and its salts (HEIDUSCHKA and RIPPER), A., i, 894.

Heptanaphthenecarboxylic acid, and its amide (SKITA, HAUBER, and SCHÖNFELDER), A., i, 461.

n-**Heptane**, α-bromo- and α-chloro-β-hydroxy- (v. BRAUN and SCHIRMACHER), A., i, 1050.
  αβγ-*tri*bromo- (DELABY), A., i, 289.

*cyclo***Heptaneacetic acid**, αβ-*di*bromo- (BAKER and INGOLD), T., 132.

*cyclo***Heptane-1:1-diacetic acid**, preparation of, and its *mono*- and *di*-bromo- and hydroxy-derivatives (BAKER and INGOLD), T., 128.

*cyclo***Heptanehexacarboxylic acid**, and its methyl ester (MEERWEIN, KIEL, KLOSGEN, and SCHOCH), A., i, 223.

trans-*cyclo***Heptane***spirocyclo***propane-2:3-dicarboxylic acid** (BAKER and INGOLD), T., 130.

*cyclo***Heptane***spirocyclo***propan-2-ol-2:3-dicarboxylic acid** (BAKER and INGOLD), T., 133.

Heptane-αβγ-triol epibromohydrin (DELABY), A., i, 289.

Heptan-γ-ol, αβ-*di*bromo- (DELABY), A., i, 289.

$\Delta^{\alpha\gamma\epsilon}$-**Heptatriene**, structure of (ENKLAAR), A., i, 738.

Heptene αβ-glycol (v. BRAUN and SCHIRMACHER), A., i, 1050.

Δ^{α}-**Heptene oxide** (v. BRAUN and SCHIRMACHER), A., i, 1049.

Δ^{α}-*iso***Heptenoic acid**, α-cyano-, ethyl ester (v. AUWERS, JORDAN, MEISSNER, and SEYDEL), A., i, 663.

Δ^{α}-**Hepten-γ-ol** (DELABY), A., i, 84.

Heptylbarbituric acid, ethyl ester (SOMMAIRE), A., i, 388.

*cyclo***Heptylideneacetic acid**, and its silver salt (BAKER and INGOLD), T., 132.

Heptylmalonic acid, ethyl ester (SOMMAIRE), A., i, 388.

Herrings, composition of the ova of (STEUDEL and TAKAHASHI), A., i, 729.
  weight of ova and spermatozoa of (STEUDEL), A., i, 1257.

Heteroalbumose (ZUNZ and GYORGY), A., i, 259.

Heusler alloys, crystal structure of (YOUNG), A., ii, 640.

Hexa-acetatodihydroxo-acetamidetrichromi-salts (WEINLAND and HACHENBURG), A., i, 447.

Hexa-acetatodihydroxodiacetamidetrichromichloride (WEINLAND and HACHENBURG), A., i, 447.

Hexa-acetatodihydroxodicarbamidetrichromi-salts (WEINLAND and HACHENBURG), A., i, 446.

Hexa-acetatodihydroxosesquicarbamidetrichromichloride (WEINLAND and HACHENBURG), A., i, 446.

Hexa-acetatodihydroxotricarbamidetriferri-salts (WEINLAND and HACHENBURG), A., i, 446.

Hexa-acetatodihydroxotrithiocarbamidetrichromi-salts (WEINLAND and HACHENBURG), A., i, 446.

Hexa-acetatohydroxoaquotricarbamidetrichromidiacetate (WEINLAND and HACHENBURG), A., i, 446.

$\Delta^{9:14}$-**Hexadecahydro-9:10-benzophenanthrene** (SCHRAUTH and GÖRIG), A., i, 1086.

Hexadecylene-αβ-oxide (v. BRAUN and SCHIRMACHER), A., i, 1186.

Hexahydroanisylcamphor (DÉTRIE), A., i, 1214.

Hexahydrocarbazole-9-carboxylic acid, 10:11-*di*hydroxy- (PERKIN and PLANT), T., 692.

Hexahydro*iso***coumaranone** (COFFEY), A., i, 696.

Hexahydrodigitaligenin, and its acetyl derivative (WINDAUS and BANDTE) A., i, 1107.

Hexahydrodigitaligenone, and its derivatives (WINDAUS and BANDTE), A., i, 1107.

Hexahydrodiphenylene oxide, and amino- and nitro- and their salts and derivatives (v. BRAUN), A., i, 103.

Hexahydrohomocoralyne. See Homocoralydine.

Hexahydro-α-hydrindone, and its derivatives (WINDAUS, HUCKEL, and REVEREY), A., i, 220.

5:6:6*a*:7:12:12*a*-Hexahydro-α-naphthacridine-7-carboxylic acid, and its derivatives (v. BRAUN and WOLFF), A., i, 144.

Hexahydro-*o*-phthalic acid (WINDAUS and EHRENSTEIN), A., i, 895.

Hexahydrophthalide (WINDAUS, KLÄNHARDT, and REVEREY), A., i, 111.

Hexahydrotoluic acids, configurations of (SKITA), A., i, 460.

Hexahydrotoluidines. See Methyl*cyclo*hexylamines.

Hexahydrotyrosine, and its salts and derivatives (WASER and BRAUCHLI), A., i, 337.

n-**Hexaldehyde**, αγ-*di*hydroxy-, and its derivatives (HELFERICH and RUSSE), A., i, 301.

Hexamethylenetetramine (PUMMERER and HOFMANN), A., i, 759.

Hexamethylenetetramine, crystal structure of (Dickinson and Raymond), A., i, 308.
  complex ions formed by silver salts and (Job), A., i, 902.
  compound of, with trichloroacetic acid (Debucquet), A., i, 1185.
  as a fertiliser (Blanch, Geilmann, and Giesecke), A., i, 171.
  action of, on plants (E. and G. Nicolas), A., i, 77.
  chromi-, ferri-, and vanadi-thiocyanates (Scagliarini and Tartarini), A., i, 547.
  hydroferrocyanide (Cumming), T., 2458.
  mercuric compounds of (Douris and Beytout), A., i, 188.
  as a reagent in analysis (Cole), A., ii, 660.
Hexamethylenetetramine, *tetra*chloro- (Buratti), A., i, 97.
Hexamethylenetetramine-betaine, and its salts (Boedecker and Sepp), A., i, 188.
Hexamethylguanidinium iodide (Lecher and Graf), A., i, 761.
Hexamethyltriamylose (Pringsheim and Goldstein) A., i, 899.
Hexamminecobaltic salts. See under Cobalt.
Hexamminemagnesium bromide. See under Magnesium.
*cyclo***Hexan-1:2-diol**, and its acetate (Godchot), A., i, 327.
*cyclo***Hexandioneketazine-2:2′-diphenylhydrazone** (Coffey), A., i, 804.
Hexane, *αβγ-tri*bromo- (Delaby), A., i, 289.
*cyclo***Hexane**, refractive index of (Gifford and Lowry), A., ii, 705.
  catalytic dehydrogenation of (Zelinski and Pavlov), A., i, 767.
  solubility of, in liquid sulphur dioxide (Seyer and Dunbar), A., i, 313.
*cyclo***Hexanes**, 1:4-*di*bromo-, stereoisomeric (Uspenski and Turin), A., i, 666.
*cyclo***Hexane-1-acetic-2-propionic acid**, and its derivatives (Helfer) A., i, 1229.
*cyclo***Hexane-1:1-diacetic acid**, α-cyano-, ω-imide (Birch and Kon), T., 2445.
*cyclo***Hexane-3:6-dione-1:2-dicarboxylic acid**, methyl ester and dinitrile, and their salts and derivatives (Helferich and Bodenbender), A., i, 678.
isc- and *trans-cyclo***Hexane***spiro***-1-hydroxy***cyclo***propane-1:2-dicarboxylic acids**, preparation and derivatives of (Lanfear and Thorpe), T., 2868.
5-*cyclo***Hexane***spiro*di*cyclo***pentan-3-one-1-carboxylic acid.** See 5-*cyclo*Hexane*spiro*di*cyclo*-Δ^2-penten-3-ol-1-carboxylic acid.
5-*cyclo***Hexane***spiro*di*cyclo***pentan-3-one-1:2-dicarboxylic acid.** See 5-*cyclo*Hexane*spiro*di*cyclo*-Δ^2-penten-3-ol-1:2-dicarboxylic acid.
5-*cyclo***Hexane***spiro*di*cyclo*-Δ^2-**pentene**, 1:3-*di*hydroxy-, and its bromo-derivatives (Ingold, Seeley, and Thorpe), T., 870.
5-*cyclo***Hexane***spiro*di*cyclo*-Δ^2-**penten-3-ol-1-carboxylic acid**, ethyl ester, and its semicarbazone (Ingold, Seeley, and Thorpe), T., 872.
5-*cyclo***Hexane***spiro*di*cyclo*-Δ^2-**penten-3-ol-1-carboxylic acid**, 4-*mono*-, 2:4-*di*- and 2:2:4-*tri*-bromo- (Ingold, Seeley, and Thorpe), T., 868.
5-*cyclo*-**Hexane***spiro*di*cyclo*Δ^2-**penten-3-ol-1:2-dicarboxylic acid**, diethyl ester, and its semicarbazone (Ingold, Seeley, and Thorpe), T., 873.
5-*cyclo***Hexane***spiro*di*cyclo*-Δ^2-**penten-3-ol-1:2-dicarboxylic acid**, 4-*mono*-, and 2:4-*di*-bromo- (Ingold, Seeley, and Thorpe), T., 868.
5-*cyclo***Hexane***spiro**cyclo*-Δ^2-**penten-3-ol-1:4-dione**, and its derivatives (Ingold, Seeley, and Thorpe), T., 864.
*cyclo***Hexanesulphonic acid**, potassium salt, preparation of (Clutterbuck and Cohen), T., 2511.
Hexan-γ-ol, *αβ-di*bromo- (Delaby), A., i, 289.
*cyclo***Hexanol**, oxidation of (v. Braun and Lemke), A., i, 3.
  ester from phosphoric acid, and its salts (Komatsu and Kumamoto), A., i, 205.
*cyclo***Hexanol**, amino-, and its hydrochloride (Senderens and Aboulenc), A., i, 919.
  2-bromo-, and its phenylurethane (Bedos), A., i, 780.
  2-bromo-, and its formate (Schmidt, Schumacher, and Asmus), A., i, 645.
  2-chloro-, and its phenylurethane (Godchot), A., i, 327.
*cyclo***Hexan-2-ol-1-acetic acid**, and its salts and amide (Coffey), A., i, 696.
*cyclo***Hexanolacetobenzohydrazide** (Coffey), A., i, 696.
*cyclo***Hexanolacetohydrazide** (Coffey), A., i, 696.
*cyclo***Hexanolacetolactone.** See Hexahydro*iso*coumaranone.
*cyclo***Hexanolacetophenylhydrazide** (Coffey), A., i, 696.

*cyclo***Hexanol-1-carboxylanilide** (Passerini), A., i, 1014.

*cyclo***Hexanol-2-malonhydrazidic acid**, ethyl ester (Coffey), A., i, 696.

2-*cyclo***Hexanol-2-malonic acid**, derivatives of (Coffey), A., i, 696.

Hexasulphamide (Macbeth and Graham), A., ii, 855.

Hexatriose, preparation of (Ling and Nanji), T., 2678.

Δ^{α}-Hexene, β-bromo- (Bourguel), A., i, 1170.

Δ^{β}-Hexene-α-carboxylic acid, derivatives of (v. Auwers, Meissner, Seydel, and Wissebach), A., i, 748.

Δ^{γ}-Hexenoic acid, β-hydroxy-, ethyl ester (Zemplén), A., i, 437.

Δ^{α}-Hexen-γ-ol (Delaby), A., i, 84.

Δ^{γ}-Hexen-β-one, and its *p*-nitrophenylhydrazone (Pringsheim and Leibowitz), A., i, 1053.

*cyclo***Hexenylacetone**, synthesis of (Birch, Kon, and Norris), T., 1370.

Δ^{1}-*cyclo*Hexenylacetonitrile, condensation products of (Birch and Kon), T., 2444.

2-Δ^{1}-*cyclo*Hexenyl*cyclo*hexanone, and its semicarbazone (v. Braun and Ritter), A., i, 142.

*iso***Hexoamide**, αβ-*di*bromo- (v. Auwers, Meissner, Seydel, and Wissebach), A., i, 749.

Hexoic acid, and its derivatives (Dakin), A., i, 746.

***n*-Hexoic acid.** βγδ-*tri*hydroxy-, barium salt and hydrazide (Zemplén), A., i, 437.

Hexone bases, separation of, from protein hydrolysates (Foster and Schmidt), A., i, 963.

Hexosephosphoric acid, new ester of (Robison), A., i, 86.
  esters, in ossification (Robison), A., i, 730.

*dl-iso***Hexoylglycyl-*dl*-leucylglycine**, α-bromo-, and its ethyl ester (Abderhalden and Alker), A., i, 1072.

*cyclo***Hexylacetic acid**, α-bromo-, ethyl ester (v. Braun and Kaiser), A., i, 1187.

β-Hexylacrylic acid, α-cyano-, and its amide (Curtis, Day, and Kimmins), T., 3137.

***n*-Hexylamine** picrolonate (Karrer and Smirnov), A., i, 122

*cyclo***Hexyl-β-*p*-aminophenylethylamine, and its salts and derivatives** (v. Braun and Blessing), A., i, 1231.

*cyclo***Hexylbenzylamine**, and its hydrochloride and derivatives (v. Braun, Blessing, and Zobel), A., i, 1088.

*cyclo***Hexylene**, *di*- and *tri*-thiocarbonates, and the pyridylhydrazone of the former (Mills and Schindler), T., 320.

*cyclo***Hexylethylene oxide** (v. Braun and Kaiser), A., i, 1187.

β-Hexylglutaramide, αα′-*di*cyano- (Curtis, Day, and Kimmins), T., 3136.

β-Hexylglutarimide (Curtis, Day, and Kimmins), T., 3137.

*cyclo***Hexylglycollic acids**, and their derivatives (Freudenberg, Brauns, and Siegel), A., i, 216.

Hexylheptylcarbinol, and its derivatives (v. Braun and Kochendorfer), A., i, 1199.

*o-cyclo***Hexyl*cyclo*hexanol.** See Di*cyclo*hexyl, 2-hydroxy-.

2-*cyclo*Hexyl*cyclo*hexanone, and its derivatives (v. Braun, Gruber, and Kirschbaum), A., i, 107.
  and its semicarbazone (Bedos), A., i, 1195.

*cyclo***Hexyl-β-*p*-hydroxyphenylethylamine**, and its salts and dibenzoyl derivatives (v. Braun and Blessing), A., i, 1231.

*α-cyclo***Hexylidene*iso*heptonitrile** (Birch and Kon), T., 2446.

*cyclo***Hexylidenesuccinic acid** (Ingold, Seeley, and Thorpe), T., 866.

*o-cyclo***Hexylmethylethylaniline**, and its picrate (v. Braun), A., i, 839.

*cyclo***Hexyl-γ-phenoxybutylamine**, and its salts and nitroso-derivative (v. Braun, Blessing, and Zobel), A., i, 1088.

γ-*cyclo*Hexyl-Δ^{α}-propinene, preparation of, and its compounds with metallic salts (Bourguel), A., i, 1170.

Hide powder, effect of amino-acids on the equilibrium of tannin with (Moeller), A., i, 1154.

Hippuric acid, synthesis of, from benzoic acid in the organism (Morgulis, Pratt, and Jahr), A., i, 629.
  synthesis of, in the kidneys (Snapper, Grunbaum, and Neuberg), A., i, 730.
  synthesis and elimination of, in the organism (Griffith and Lewis), A., i, 1261.
  enzymic hydrolysis of (Clementi), A., i, 1246.
  and its homologues, hydrolysis of, by histozyme (Smorodincev), A., i, 269.
  ammonium, lithium, potassium, and sodium salts (Corfield and Melhuish), A., i, 1010.

Hippuricase (Clementi), A., i, 1246.

Histidine, detection of, in proteins (Brunswick), A., ii, 592.

Histozyme (Smorodincev), A., i, 269, 722, 723.

Hodgkinsonite, from Franklin, New Jersey (Gordon), A., ii, 647.

Hofmann reaction, application of, to substituted carbamides (Elliott), T., 804.

Homocamphenilone, and its semicarbazone (Lipp), A., i, 1105.

cis-**Homocaronic acid**, and its silver salt (Simonsen and Rau), T., 556.

Homocoralydine, and its hydriodide (Schneider and Nitze), A., i, 702.

Homocoralynesulphopropionic acid, and its salts (Schneider and Nitze), A., i, 701.

Homogeranyl-ethinylmethylcarbinol. See Dehydro-*dl*-nerolidol.

α-Homonaphthyldiethylamine, and its picrate (G. M. and R. Robinson), T., 543.

Homophorone (Ekeley and Howe), A., i, 997.

Homophthalic acid, preparation of, and 4-nitro, and its methyl ester (Ingold and Piggott), T., 1497.

Homophthalic anhydride, action of *o*-phenylenediamine on (Bistrzycki and Fassler), A., i, 848.

α-Homopiperonal, and its derivatives (Nagai), A., i, 225.

Homopiperonylmethylamide (Kindler, Burghard, Finndorf, Dehn, Giese, and Kording), A., i, 572.

Homopiperonylthiomethylamide (Kindler, Burghard, Finndorf, Dehn, Giese, and Kording), A, i, 572.

Homoranthus flavescens and *virgatus*, oils from (Penfold), A., i, 693.

Homo-1:2:3:4-tetrahydroquinoline, and 1-cyano-, and their derivatives (v. Braun and Seemann), A., i, 147.

as-**Homotetrahydro*iso*quinoline**, synthesis of, and its salts (v. Braun, Zobel, and Blessing), A., i, 371.

Homotetrophan (v. Braun and Stuckenschmidt), A., i, 947.

Homothionaphthen, 4-hydroxy-. See 2:1-Benzthiopyran, 4-hydroxy-.

Homo-*o*-xylylene bromide, synthesis of (v. Braun and Zobel), A., i, 1199; (v. Braun, Zobel, and Kühn), A., i, 1201.

Hongay oil (Desai, Sudborough, and Watson), A., i, 995.

Hops, preservative principles of (Pyman, Rogerson, and Walker), A., i, 78; (Walker), A., ii, 668.

Hordein, identity of bynin and (Lüers), A., i, 398.

Hordenine, influence of, on gaseous exchange (Abelin), A., i, 874.

Horn, hydrolysis of, by strong sulphuric acid (Salkowski), A., i, 259.

Horse, calcium and phosphoric acid metabolism in the (Scheunert, Schattke, and Weise), A., i, 975, 976.

  blood of. See Blood.

Horsehair, pigment in (Tutschku), A., i, 509.

"**Hsiung ch'uang**," constituents of (Murayama and Itagaki), A., i, 637.

Humic acid, constitution of (Fuchs), A., i, 1006.

Humic acid, chloro- (Eller, Herdieckerhoff, and Saenger), A., i, 544.

  *semi*nitro-, and nitrohydroxy- (Eller, Meyer, and Saenger), A., i, 541.

Humic acids (Eller, Saenger, Wenzel, Seiler, and Pieper), A., i, 542; (Eller, Meyer, and Saenger), A., i, 543; (Eller, Herdieckerhoff, and Saenger), A., i, 544.

  structure and formation of (Marcusson), A., i, 353.

  synthetic, and their derivatives (Stamberger), A., i, 1006.

Humic substances from coal (Piettre), A., ii, 692.

Humus, extraction of, from soils (Piettre), A., i, 736.

  estimation of, in soils (Agafonoff), A., ii, 668.

Hyacinthus orientalis, dextrin reserve in (Colin and Belval), A., i, 885.

Hydantoylhydrazide (Fosse, Hagène, and Dubois), A., i, 938.

ω-Hydantylscatole (Majima and Kotake), A., i, 156, 495.

Hydnum versipelle, constituents of (Bard and Zellner), A., i, 987.

Hydrangea hortensis, hydrogen-ion concentration in the soil in relation to the flower colour of (Atkins), A., i, 1162.

Hydrastine, ultra-violet absorption spectrum of (Steiner), A., ii, 107.

Hydrates (Willstatter and Kraut), A., ii, 167, 493.

  constitution of (Lembert), A., ii, 313.

  heat of formation of (Bouzat), A., ii, 149.

Hydration, discontinuity of the process of (Davis and Eyre), A., ii, 838.

  of ions (Baborovský), A., ii, 288, 532.

  of salts, determination of, by a radioactive method (Terrey and Jolly), T., 1979.

Hydratropic acid. See α-Phenylpropionic acid.

- **Hydrazidoglutarylaminoacethydrazide,** ethyl ester, and its derivatives (Curtius and Hechtenberg), A., i, 1069.
- **Hydrazidosuccinylglycinehydrazine,** and its derivatives (Curtius and Hechtenberg), A., i, 1072.
- **Hydrazine,** preparation of (Joyner), T., 1114.
  - equilibrium of ammonia and (Friedrichs), A., ii, 856.
  - chlorite (Levi), A., ii, 406.
  - *di*hydrochloride, crystal structure of (Wyckoff), A., ii, 155.
  - complex iridium salts with (Tschugaev), A., ii, 774.
  - sulphate, preparation of (Orelkin, Chlopin, and Tscherniaev), A., ii, 406.
- **Hydrazines,** halogenated aromatic (Votoček and Jirů), A., i, 961.
- **Hydrazinedicarbonamides** containing sulphur, ring closure with (Arndt and Bielich), A., i, 611.
- **Hydrazinedicarbonthioamide,** action of hydrazine on (Arndt and Bielich), A., i, 611.
- **Hydrazinedicarbothionamides,** action of acetic anhydride on (Guha), A., i, 607.
- **5-Hydrazinoacridine** (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1131.
- **Hydrazinoacrylic acid,** cyano-, ethyl ester, and its acetone derivative (Diels, Gartner, and Kaack), A., i, 25.
- **Hydrazino-5:5-bisacridine** (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 1131.
- **Hydrazobenzene** hydroferrocyanide (Cumming), T., 2462.
- **Hydrazo-compounds,** *o*-nitro- (Michele and Mario Giua), A., i, 608.
- **Hydrazomethylfurazan** (Ponzio and Ruggeri), A., i, 854.
- **αα′-Hydrazonaphthalene** (Cumming and Steel), T., 2467.
- **Hydrazones,** oxidative fission of (Bergmann, Ulpts, and Witte), A., i, 393.
- **Hydrazones,** nitroso- (Busch and Schaffner), A., i, 864.
- **Hydrazophenylfurazan** (Ponzio and Avogadro), A., i, 858.
- **Hydrazo*di*thiocarboxylic acid,** methyl ester (Arndt, Milde, and Eckert), A., i, 1079.
- **Hydrazothiourazole,** 4:4′-*di*amino-, and its salts and derivatives (Arndt and Bielich), A., i, 612.
- ***o*-Hydrazotoluene** hydroferrocyanide (Cumming), T., 2462.
- *om*- and *m*-**Hydrazotoluenes,** 4:6-*di*nitro- (Michele and Mario Giua), A., i, 610.
- **1-Hydrindamine,** 6-amino-, and 6-nitro-, and their acetyl derivatives (Ingold and Piggott), T., 1484.
- **1-Hydrindene,** 2-oximino-6-nitro- (Ingold and Piggott), T., 1487.
- **1-Hydrindone,** preparation of (Ingold and Piggott), T., 1483
- **1-Hydrindone,** 4- and 6-amino-, 2:2-*di*bromo-4-, and -6-nitro-, 6-hydroxy-, and 6-nitro-, and their derivatives (Ingold and Piggott), T., 1486.
- **1-Hydrindyltrimethylammonium** iodide, 6-amino-, acetyl derivative (Ingold and Piggott), T., 1491.
- **Hydrobixin** (Herzig, Faltis, Pittner, Klein, and Watzinger), A., i, 477.
- **Hydrobromic acid.** See under Bromine.
- **Hydrocalcite** (Copisarow), T., 785.
- **Hydrocaoutchouc** (Pummerer and Burkard), A., i, 49.
- **Hydrocarbon,** C_6H_8, from dibromodimethyl*cyclo*propane, oxidation of (Ingold), T., 1711.
  - $(C_6H_5)_n$, from distillation of lignin (Karrer and Bodding-Wiger), A., i, 1183.
  - $C_{10}H_{18}$, and its bromide, from the action of heat on spinacene (Chapman), T, 775.
  - $C_{12}H_{14}$, from bromination of 1-phenyl*cyclo*hexane-3:5-diol (Uspenski), A., i, 669.
  - $C_{28}H_{58}$, from *Alchemilla alpina* (Vogl), A., i, 990.
- **Hydrocarbons,** genesis of (D'Andrimont), A., i, 993.
  - formation of, from action of potassium on ethyl acetate (Scheibler, Ziegner, and Peffer), A., i, 82.
  - equilibrium of dinitrotoluenes with (Kremann, Honigsberg, and Mauermann), A., i, 908.
  - hydration of (Wood), A., i, 890.
  - liquid, solubility of, in superheated water (Jaeger), A., i, 1004.
  - action of bromine on (Mereshkowsky), A., i, 527.
  - oxidation of (Wheeler and Blair), A., i, 285, 752.
    - to formaldehyde (Schönfelder; Blair and Wheeler), A., i, 1175.
  - action of ozone on (Blair and Wheeler), A., i, 997.
  - compounds of aluminium chloride with (Schleicher and Büttgenbach), A., i, 1083.
  - compounds of, with picric acid and its amide and acid chloride (Efremov), A., i, 551, 552.

Hydrocarbons, stypnates of (Efremov), A., i, 670.
acetylenic, preparation of (Bourguel), A., i, 429, 1170, 1176; (Bouis), A., i, 1052.
isomerisation of (Favorski), A., i, 642.
aromatic, molecular refraction of (v. Auwers and Kollig), A., i, 99.
specific heats of (Padoa), A., ii, 10.
sulpho-chromic oxidation of (Simon), A., i, 908.
preparation of chloromethyl derivatives of (Blanc), A., i, 549.
estimation of nitrogen in, by Kjeldahl's method (Margosches and Kristen), A., ii, 653.
benzenoid, fluorescence spectra of the vapours of (Marsh), T., 3315.
ethylenic, halochromism of (Skraup and Freundlich), A., i, 667.
action of Grignard reagents on (Gilman and Crawford), A., i, 285.
paraffin, propagation of flame in mixtures of air and (Mason), T., 210.
analysis of, with hydrogen (King), A., ii, 43.
polycyclic, of terpene series, preparation of (Schering), A., i, 47.
tertiary, oxidation of (Levene and Taylor), A., i, 81.
Hydrocarbons, halogen derivatives, elimination of hydrogen halides from (Favorski and Favorskaia), A., i, 738.
isomeric transformations of (Favorski), A., i, 430.
chloronitro-, velocity of reaction between substituted anilines and (Linke), A., i, 553.
Hydrocellulose (Heuser and v. Neuenstein), A., i, 17, 95; (Clifford), A., i, 541; (Heuser and Jayme; Heuser and Eisenring) A., i, 657.
Hydrocotarnine, ultra-violet absorption spectrum of (Steiner), A., ii, 107.
Hydrocyanic acid. See under Cyanogen.
Hydroetheseroline, and its methiodide (Max and Michel Polonovski), A., i, 940.
Hydroferricyanic acid, potassium salt, electrolytic precipitation with (Kolthoff), A., ii, 256, 260.
Hydroferricyanides of organic bases (Cumming), T., 2457.
Hydroferrocyanic acid, potassium salt, photoelectric activity of (Poole), A., ii, 363.
interaction of, with 4:4′-dipyridyl (Wibaut and Dingemanse), A., i, 382.
Hydroferrocyanides of organic bases, (Cumming), T., 2457.
Hydrofluoric acid. See under Fluorine.
Hydrofluosilicic acid. See under Fluorine.
Hydrogels (Willstätter and Kraut), A., ii, 167, 493.
Hydrogen, apparatus for electrolytic preparation of (Niese), A., ii, 314.
pure, electrolytic generator for (Elveden and Sinkinson), T., 2715.
spectra of (Brackett), A., ii, 103; (Geddes), A., ii, 350; (Gehrcke and Lau), A., ii, 802.
Balmer lines in (Hulbert), A., ii, 803.
Zeeman effect in (Försterling and Hansen), A., ii, 708.
effect of electric and magnetic fields on (Halpern), A., ii, 803.
in low voltage arcs (Duffendack), A., ii, 802.
atomic and molecular spectra of (v. Keussler), A., ii, 446.
secondary spectrum of (Menzies), A., ii, 45; (Gehrcke and Lau), A., ii, 197; (Kiutti), A., ii, 273; (Kimura and Nakamura), A., ii, 594; (Basu), A., ii, 669; (Barratt), A., ii, 708.
ultra-violet spectrum of (Hopfield), A., ii, 1, 351.
Rontgen absorption coefficients of (Olson, Dershem, and Storch), A., ii, 365.
collision of electrons with (Horton and Davies), A., ii, 820.
low voltage arc in (Duffendack), A., ii, 373.
ionisation of, on collision with electrons (Ayres), A., ii, 111.
ionisation potential of (Smyth; Olson, and Glockler), A., ii, 455; (Mackay), A., ii, 821.
critical potentials in (Olmstead), A., ii, 367, 820.
specific heat of (Kemble and van Vleck), A., ii, 610.
heat of adsorption of, by finely-divided metals (Foresti), A., ii, 747.
active (Grubb), A., ii, 403.
preparation of (Venkataramaiàh), A., ii, 235, 482.
activation of, at low temperature (Mitchell and Marshall), T., 2448.
gaseous, radiating atoms within (Lasarev), A., ii, 233.
molecular, dissociation of (Edgar), A., ii, 296.

Hydrogen, quantum theory of the molecule of (Niessen), A., ii, 845; (Nordheim), A., ii, 846.
- model of the molecule of (Allen), A., ii, 679.
- tautomeric, theory of, in relation to the theory of induced alternate polarities (Allsop and Kenner), T., 2296.
- co-ordination of (Lowry and Burgess), T., 2111.
- isothermals of, at low temperatures (Martinez and Onnes), A., ii, 734.
- liquid and solid, thermal properties of (Simon and Lange), A., ii, 458.
- solubility of, in metals (Schmidt), A., ii, 732.
- chemical constant of (Simon), A., ii, 438.
- adsorption of, by platinised asbestos (Pollard), A., ii, 381.
- adsorption of, by nickel (Gauger and Taylor), A., ii, 398.
- diffusion of, through nickel (Lombard), A., ii, 570.
- occlusion of, by palladium (Yamada), A., ii, 81.
- action of, on carbon oxides (Medsforth), T., 1452.
- simultaneous combustion of carbon monoxide and (Haslam), A., ii, 624.
- explosion of mixtures of carbon monoxide and (Dixon and Walls), T., 1025.
- combustion of mixtures of carbon monoxide, air, and (Payman and Wheeler), T., 1251.
- action of carbon monoxide with, in presence of nickel (Armstrong and Hilditch), A., ii, 307.
- photochemical interaction of chlorine and (Chapman), T., 3062; (Weigert), A., ii, 3; (Coehn and Tramm), A., ii, 205; (Coehn and Jung), A., ii, 206.
- catalytic combination of ethylene and, in presence of copper (Pease), A., ii, 472, 842.
- formation of helium and neon from (Piutti), A., ii, 20.
- reduction of metallic oxides by (v. Wartenberg, Broy, and Reinicke), A., ii, 424
- action of light on mixtures of oxygen and (Coehn and Tramm), A., ii, 205.
- combination of oxygen and (Pease and Taylor), A., ii, 30.
- catalytic combination of oxygen and, in presence of the platinum metals (Hofmann), A., ii, 477.

Hydrogen, combustion of, in oxygen (Hauser), A., ii, 404.
- interaction of sulphur and (Norrish and Rideal), T., 696, 1689, 3202.
- replacement of mercury, zinc, cadmium, and magnesium by, from their salt solutions (Ipatiev and Starynkevitsch), A., ii, 639.

Hydrogen *tri*bromide and *tri*iodide, electrolytic dissociation of (Hl̂asko), A., ii, 556.
- halides. See Halogen hydrides.
- *per*oxide, preparation of, by combustion of hydrogen in oxygen (Hauser), A., ii, 404.
  - pure, properties of (Maass and Hatcher), A., ii, 21.
  - stabilisation of, with ethyl alcohol (Lisievich-Draganescu), A., ii, 235.
  - photochemical decomposition of (Winther), A., ii, 50; (Anderson and Taylor), A., ii, 278, 451.
  - thermal decomposition of (Hinshelwood and Prichard), T., 2726.
  - action of activated sugar charcoal with (Firth and Watson), T., 1750.
  - catalytic decomposition of, by carbon (Firth and Watson), A., ii, 752.
  - catalytic decomposition of, in bromine–bromide solution (Bray and Livingston), A., ii, 473, 747.
  - catalytic decomposition of, by ferric salts (Duclaux), A., ii, 18, 308.
  - action of, on formaldehyde (Bach and Generosow), A., i, 13.
  - decomposition of, by metallic oxides (Clarens), A., ii, 397.
  - activation of, by palladium hydride (Zelinski and Borissow), A., ii, 149.
  - estimation of, volumetrically, in presence of bromides (Bray and Livingston), A., ii, 473.
- selenide, electrolytic dissociation of (de Hlasko), A., ii, 454.
  - acidity and electrolytic dissociation of (de Hlasko), A., ii, 152.
  - viscosity and molecular dimensions of (Smith), A., ii, 483.
- sulphide, dissociation of, in aqueous solution (Jellinek and Czerwinski), A., ii, 14.
  - precipitation of metals by (Smith), A., ii, 639.
  - action of, on unsaturated compounds (Challenger, Smith and Paton), T., 1046.

Hydrogen sulphide, toxic action of mixtures of carbon disulphide and (FISCHER), A., i, 1266.
estimation of (HEATH and LEE), A., ii, 652.
*hexa*sulphide (WALTON and WHITFORD), A., ii, 315.
telluride, properties of (BRUYLANTS; DE HLASKO), A., ii, 154.
electrolytic dissociation of (DE HLASKO), A., ii, 454.

Hydrogen estimation:—
analysis of (DODGE), A., ii, 653.
analysis of, with paraffin hydrocarbons (KING), A., ii, 43.
estimation of, by Pregl's method (FRIEDRICH), A., ii, 788.
estimation of, in organic compounds (SIMON and GUILLAUMIN), A., ii, 432.
estimation of, in organic compounds, in presence of arsenic and mercury (FALKOV and RAIZISS), A., ii, 336.

Hydrogen-chlorine cell. See Cells, electrochemical.

Hydrogen electrode. See Electrode.

Hydrogen ions, determination of concentration of (HATFIELD), A., ii, 429; (BOVIE and HUGHES), A., ii, 677; (KOLTHOFF), A., ii, 694.
chromoscope for estimation of the concentration of (GUILLAUMIN), A., ii, 82.
concentration of, in solutions containing carbon dioxide, calcium carbonate, and sulphate (SHIPLEY and MCHAFFIC), A., ii, 649.
equivalent conductivity of (KRAUS and PARKER), A., ii, 6.
hydration of (BABOROVSKÝ), A., ii, 629.

Hydrogenation, selective (HILDITCH and MOORE), A., i, 180.

Hydrolysis of esters (OLIVIER and BERGER), A., ii, 144.

Hydromethylbixin, and its derivatives (HERZIG, FALTIS, PITTNER, KLEIN, and WATZINGER), A., i, 477.

Hydromuconic acid, *aa'β-tri*chloro-, methyl ester (FARMER), T., 2545.

Hydromuconic acids (FARMER), T., 2531.

Hydronickelocyanic acid, potassium salt (JOB and SAMUEL), A., i, 905.

Hydronorbixin, and its calcium salt (HERZIG, FALTIS, PITTNER, KLEIN, and WATZINGER), A., i, 477.

Hydroplatinocyanic acid, equilibrium of mixtures of lithium and potassium salts of, and their hydrates (TERREY and JOLLY), T., 2217.

Hydroxamic acids (GASTALDI), A., i, 1236, 1237.

Hydroxamic acids, formation of, from keten (HURD and COCHRAN), A., i, 312.

Hydroxy-acids, nomenclature of (WOHL and FREUDENBERG), A., i, 182.
photolysis of (VOLMAR), A., ii, 279.
metallic complexes of (WARK), T., 1815, 1826.

α-Hydroxy-acids, configuration of (FREUDENBERG, BRAUNS, and SIEGEL), A., i, 215.
acetone compounds of (WILLSTÄTTER and KÖNIGSBERGER), A., i, 1172.

Hydroxy-aldehydes, spectrochemistry of (V. AUWERS and WISSEBACH), A., ii, 593.
aromatic, action of iodine and potassium hydroxide on (WINDAUS and SCHIELE), A., i, 580.

γ-Hydroxyaldehydes (HELFERICH and KOSTER), A., i, 1171.

Hydroxy-ketones, spectrochemistry of (V. AUWERS and WISSEBACH), A., ii, 593.

Hydroxylamine, transport experiments with ionisable derivatives of (NOYES and HIBBEN), A., i, 444.
reaction of nitroprussides with (GIRAL PEREIRA), A., i, 905.
action of, on γ-trinitrotoluene (GIUA), A., i, 1189.
hydrochloride (SEMON), A., ii, 155.
detection and estimation of ammonia in (GROS), A , ii, 84.
detection of (FISCHER), A., ii, 431; (HIRSCHEL and VERHOEFF), A., ii, 577.

Hydroxylamine*iso*disulphonic acid, potassium salt (RASCHIG), A., ii, 161.

Hydurilic acid, 5:5'-*di*chloro-, ammonium salt (BOCK), A., i, 713.

α-Hyocholic acid, true constitution of (WINDAUS), A., i, 923.

Hyoscine, effect of, on the heart (HEINEKAMP), A., i, 1265.

Hypnotics, aryldialkylglycols as (TIFFENEAU and DORLENCOURT), A., i. 676.

Hypochlorites and **Hypochlorous acid.** See under Chlorine.

Hypoglycæmia, production of, by insulin (MCCORMICK, MACLEOD, NOBLE, and O'BRIEN), A., i, 514.
adrenaline, effect of acids in production of (KORNFELD and ELIAS), A., i, 271.

Hypophosphorous acid. See under Phosphorus.

Hypothiocyanic acid, and its amides (LECHER, WITTWER, and SPEER), A., i, 660.

Hyssop oil (Pigulevski and Fichtenholz), A., i, 817.
  sesquiterpenes of (Ruzicka, Pontalti, and Balas), A., i, 1217.

I.

Ice, melting point of (Smith and Taylor), A., ii, 735.
Ices, edible, theory of (Kremann and Eitel), A., ii, 622.
Ichthulin, constituents of (Steudel and Takahashi), A., i, 729.
Ignition of gases by a spark in a closed tube (Ellis), T., 1435.
  of mixed gases, effect of pressure on (Payman and Wheeler), T., 426.
β-Imidazolyl*iso*piperidine. See Tetrahydro-1:3:6-benztriazole.
Imidocarbonic acid, chloro-, ethyl ester, Sandmeyer synthesis of (Houben, Pfankuch, and Kühling), A., i, 1077.
Imidophenylperacetic acid, ethyl ester (van Peski), A., i, 214.
Iminazolylglycine. See Glyoxalineaminoacetic acid.
Imino-aryl ethers (Chapman), T., 1150.
Iminobismethylbenzylmalonic acid (Mannich and Gray), A., i, 21.
β-Iminobis-α-phenylpropionic acid, and its hydrochloride (Mannich and Ganz), A., i, 21.
Iminodi-β-butyronitrile, and its chloroplatinate (Bruylants), A., i, 763.
2:5-Iminodihydro-1:2:3-triazole (Dutt), T., 265.
γδ-Imino-γ-ethylhexane, and its salts and *N*-bromo-derivative (de Booseré), A., i, 312.
2:5-Imino-1-phenyldihydro-1:2:3-triazole, and its derivatives (Dutt), T., 271.
2:5-Imino-1-phenyldihydro-1:2:3-triazole-4-carboxylic acid, ethyl ester, and its methyl derivative (Dutt), T., 269.
Iminosulphides, constitution of (Rivier and Schalch), A., i, 793.
Iminothio-esters, preparation of (Kaufmann and Adams), A., i, 930.
Indane, 1-amino-, acetyl derivative. See Acetylhydrindamine.
Indanthrene colouring matters, reduction of, by sodium hyposulphite (Yoe and Edgar), A., i, 236.
Indazole, nitroso-2-hydroxy- (Bamberger), A., i, 65.
Indene series, syntheses in (Orékhov; Orékhov and Schapir), A., i, 454.
Indene-2-aldehyde, and its derivatives (v. Braun and Zobel), A., i, 1209.
Indian yellow, mangin from (Wiechowski), A., i, 591.
Indicators, lecture experiment to show the action of (Thatcher), A., ii, 555.
  effect of alcohol on the sensitivity of (Kolthoff), A., ii, 380.
  carbinols as (Karczag and Bodó), A., ii, 694.
  radioactive, use of, in location of substances in plants (Hevesy), A., i, 1160.
Indigo, micro-sublimation of (Pirschle), A., i, 607.
Indigo group (Posner and Heumann), A., i, 953.
Indigoid compounds (Fries and Ehlers), A., i, 829.
Indigotin, crystallisation of (Pirschle), A., i, 607.
  catalytic reduction of (Brochet), A., i, 65.
  metallic derivatives of (Kunz), A., i, 155; (Kunz and Günther), A., i, 1134.
*iso*Indigotin (Dornier and Martinet), A., i, 852.
  identity of, with indine (Wahl and Hansen), A., i, 607.
Indigotinmalonic acid, and nitroso-, ethyl esters (Posner and Pyl), A., i, 252.
2:2-Indil, and its phenylosazone (Sanna), A., i, 57.
3:3-Indil, silver derivative and phenylosazone (Sanna), A., i, 57.
Indine (Dornier and Martinet), A., i, 852.
  identity of, with *iso*indigotin (Wahl and Hansen), A., i, 607.
Indirubin, crystallisation of (Pirschle), A., i, 607.
Indium, absorption spectrum of (Grotrian), A., ii, 106.
  detection and separation of (Wada and Ato), A., ii, 657.
Indole, production of, by bacteria (Arnbeck), A., i, 170.
  effect of, on nitrogenous metabolism (Underhill and Kapinow), A., i, 165.
  derivatives of (Kuroda), A., i, 603; (Seka), A., i, 1125.
Indole group, syntheses in (Majima and Kotake), A., i, 150, 156; (Oddo and Tognacchini), A., i, 715.
  α- and β-diketones of (Sanna), A., i, 57, 59.
1-Indole-2-carboxylic acid, and 3-bromo-, and 3-chloro-, and their ethyl esters (Gabriel, Gerhard, and Wolter), A., i, 705.

1-Indole-2-carboxylic acid, 1-hydroxy-, and its salts (GABRIEL, GERHARD, and WOLTER), A., i, 704.
β-Indolehydantoin (MAJIMA and KOTAKE), A., i, 495.
3-Indolylchloromethyl ketone (MAJIMA and KOTAKE), A., i, 151, 482.
3-Indolylidenehydantoin (MAJIMA and KOTAKE), A., i, 156.
Indo*iso*oxazole-γ-carboxylic acid (GRÄNACHER and MAHAL), A., i, 714.
Indophenine, constitution of (SCHLENK and BLUM), A., i, 1235.
4-Indophenol-1-naphthol-2-sulphonic acid (CLARK and COHEN), A., ii, 726.
3′-Indoxyl-(2:2′-*peri*-anthracenopenthiophen (FRIEDLÄNDER and SIMON), A., i, 110.
2-Indoxylidene-3-camphylrhodanine (GENDELMAN), A., i, 606.
ψ-Indoxylidene-α-thiolacetic acid (GRÄNACHER and MAHAL), A., i, 713.
ψ-Indoxyl*spirocyclo*pentane, and its acetyl derivative and 9-nitro-(PERKIN and PLANT), T., 619.
Indyl colouring matters (ODDO and TOGNACCHINI), A., i, 715.
Infants, acid-base metabolism of (GAMBLE, ROSS, and TISDALL; GAMBLE and ROSS), A., i, 1038.
Inoloma alboviolaceum, constituents of (BARD and ZELLNER), A., i, 987.
Inorganic compounds, lattice energy and ionisation of (GRIMM), A., ii, 16.
  colour and constitution of (BILTZ), A., ii, 809.
  adsorption of organic dyes by (RHEINBOLDT and WEDEKIND), A., ii, 129.
  formation of organic from, by light (BAUDISCH), A., ii, 816.
Inositol polyphosphate, and its calcium sodium salt (POSTERNAK), A., i, 85.
  estimation of (NEEDHAM), A., ii, 662.
Insulin, purification and properties of (DUDLEY), A., i, 967.
  solubility of (WIDMARK), A., i, 1148.
  effect of, on blood-sugar concentration (WINTER and SMITH), A., i, 727.
  effect of, on blood-sugar in diabetes (FORREST, SMITH, and WINTER), A., i, 513.
  action of, in glycæmia (CHABANIER, LOBO-ONELL, and LEBERT; DESGREZ, BIERRY, and RATHERY), A., i, 982.
  production of hypoglycæmia by (McCORMICK, MACLEOD, NOBLE, and O'BRIEN), A., i, 514.
  influence of, on the formation of pentose nucleotide (BERKELEY), A., i, 1259.
Insulin, effect of, on the respiratory exchange (DUDLEY, LAIDLAW, TREVAN, and BOOCK), A., i, 972.
  effect of, on the respiratory exchange and blood-sugar curves (LYMAN, NICHOLLS, and McCANN), A., i, 1035.
  effect of, on rabbits (BANTING, BEST, COLLIP, MACLEOD, and NOBLE), A., i, 420.
Interfacial tension (POUND), T., 578.
Interferometer, measurement of adsorption by (WOLFF), A., ii, 128.
Intestines, bacillus from the flora of (KHOUVINE), A., i, 1042.
  small, of the ox, proteolytic enzyme in (HEDIN), A., i, 1258.
Inulin, constitution of (IRVINE), T., 914.
  palmitate and stearate (KARRER and ZEGA), A., i, 1182.
  detection and identification of (CASTELLANI and TAYLOR), A., ii, 265.
Invertase (WILLSTÄTTER and WASSERMANN), A., i, 69; (FODOR), A., i 261.
  of bees (SARIN), A., i, 413.
  saccharase and raffinase activity of (WILLSTÄTTER and KUHN), A., i, 401.
  inactivation of, by silver nitrate (V. EULER and MYRBÄCK), A., i, 1245.
Invertebrates, glycogen content of (KILBORN and MACLEOD), A., i, 270.
  marine, inorganic constituents of (CLARKE and WHEELER), A., i, 415.
Invertin, active preparation of, and its sulphur content (V. EULER and JOSEPHSON), A., i, 401.
Invert-sugar, estimation of, in mixtures of sucrose and lactose (JESSEN-HANSEN), A., ii, 882.
Iodic acid and **Iodates**. See under Iodine.
Iodimetry, standardisation of solutions used in (POPOFF and CHAMBERS), A., ii, 575.
Iodine, absorption spectra of (VOGT and KOENIGSBERGER), A., ii, 449.
  band spectrum of (MECKE), A., ii, 669.
  electron-affinity spectrum of (GERLACH and GROMANN), A., ii, 803.
  ultra-violet resonance spectra of the vapour of (OLDENBERG), A., ii, 708.
  luminous discharge in, and the ionisation potential (NOYES), A., ii, 209.
  low voltage arc in (DUFFENDACK), A., ii, 373.

Iodine, monatomic, chemical constant of (Braune and Ramstetter), A., ii, 13.
vapour, dissociation of (Braune and Ramstetter), A., ii, 13.
sorption of, by carbon (Firth), T., 323; (Firth and Watson), T., 1219.
binary eutectic mixtures of naphthalene, iodoform, and (Vasiliev), A., i, 455.
catalytic action of, and its compounds (Moureu and Dufraisse), A., ii, 308.
action of, on diastase (Berczeller and Freud), A., i, 404.
action of, on alkaline solutions of phenol (Vortmann), A., i, 206.
reaction between phosphorous acid and (Mitchell), T., 2241.
reaction of silver perchlorate and (Gomberg), A., ii, 235.
compound of starch with (Berczeller), A., i, 304.
replacement of, by ferric chloride, in volumetric analysis (Jellinek and Winogradoff), A., ii, 871.
Iodine hydrate (Villard), A., ii, 556.
*pent*oxide, solubility of, in sulphuric acid (Lamb and Phillips), A., ii, 149.
Hydriodic acid, ionising potential of (Mackay), A., ii, 821.
reduction of *m*-methoxybenzyl bromide by (Shoesmith), T., 2828.
Iodides, pharmacology and therapeutics of (Osborne), A., i, 73.
estimation of, by Winkler's method (Kolthoff), A., ii, 651.
Iodic acid, conductivity of aqueous solutions of (Kraus and Parker), A., ii, 6.
Iodates, reduction of, by arsenious acid (Kubina), A., ii, 304.
detection of, in presence of chlorates, bromates, dichromates, and nitrates (Dimitrov), A., ii, 651.
estimation of, electrometrically, with titanous sulphate (Hendrixson), A., ii, 781.
Iodine detection and estimation:—
detection of, in chloroform solution with starch (Firth and Watson), A., ii, 574.
detection of, in silver halides (Schmalfuss), A., ii, 248.
estimation of, by sodium thiosulphate (Rice, Kilpatrick, and Lemkin), A., ii, 574.
estimation of, in soluble iodides (Riegler), A., ii, 651.
Iodine detection and estimation:—
estimation of, in organic compounds (Heslinga), A., ii, 782.
estimation of, in thyroid glands (Fabre and Pénau), A., ii, 575.
estimation of, in spring and mineral waters (Dubief), A., ii, 332.
Iodine numbers, estimation of (Rosenmund and Kuhnhenn), A., ii, 886.
Iodochlorides, unsaturated aliphatic, spontaneous decomposition of (Howell), A., i, 174.
Iodoform, binary eutectic mixtures of naphthalene, iodine, and (Vasiliev), A., i, 455.
Iodopentamminecobalti-salts. See under Cobalt.
Ions, refractivity and radii of (Wasastjerna), A., ii, 593.
migration of (Gillet), A., ii, 609.
size of (Davey), A., ii, 17; (Herzfeld), A., ii, 554.
and their activity (Debye), A., ii, 827.
electrometric measurements of the activity of (Michaelis and Kakinuma), A., ii, 824.
effect of sucrose on the activities of (Corran), A., ii, 607.
valency of, effect of, on permeability (Raber), A., i, 1272, 1273.
adsorption of, by manganese dioxide (Ganguli and Dhar), A., ii, 58.
determination of hydration of (Baborovský), A., ii, 288, 532.
antagonism of (Wastl), A., ii, 229.
distribution of, in serum (Rona and Petow), A., i, 728.
dual (Bluh), A., ii, 823.
inorganic, absorption of, by plants (Hoagland and Davis), A., i, 1272.
isomeric, velocity of migration of (Ley and Diekmann), A., ii, 731.
Ionic micelle (McBain and Bowden), T., 2417.
Ionisation, theory of (Hantzsch), A., ii, 475.
of alcohols (Williams and Truesdail), A., ii, 532.
of strong electrolytes (Sand), A., ii, 55.
and lattice energy of inorganic compounds (Grimm), A., ii, 16.
intramolecular (Lowry), A., ii, 480, 848.
thermal. See Thermal ionisation.
Ionisation potentials (Bazzoni), A., ii, 89.
in dissociated gases (Compton), A., ii, 350.
in hydrogen (Olmstead), A., ii, 820.
Iridium bases:—
pentammine salts, equilibrium of decomposition of (Lamb and Fairhall), A., ii, 226.

Iridium hydrazine salts, complex (Tschugaev), A., ii, 774.

Iridium organic compounds:—

with pyridine (Délépine), A., i, 243, 480, 944.

Iridium, estimation of, with thiocyanates (Ivanov), A., ii, 263.

Iridodichlorodioxalic acids, potassium salts (Délépine), A., i, 89, 944.

Iridodipyridinodioxalic acid, potassium salts (Délépine), A., i, 367.

Iron, atomic weight of (Honigschmid, Birckenbach, and Zeiss), A., ii, 560.

spectrum of (Nagaoka and Suguira), A., ii, 672; (Hagenbach and Schumacher), A., ii, 673.

classification of lines in the spectrum of (Merrill), A., ii, 355.

arc spectrum of (Walters), A., ii, 519.

electric furnace spectra of (King), A., ii, 354.

Rontgen ray spectra of (Dauvillier), A., ii, 596.

anodic behaviour of (Sborgi and Cappon), A., ii, 213.

corrosion of (Friend), T., 2996.

in presence of iron sulphide (Stumper), A., ii, 422.

striated structure of (Daeves), A., ii, 31.

and its oxides, equilibrium of steam with (Wöhler and Günther), A., ii, 471.

meteoric. See Meteoric iron.

Iron alloys, with aluminium (Kurnakov, Urasov, and Grigoriev), A., ii, 75, 423.

with aluminium, with chromium, and with molybdenum, electrochemistry of (Tammann and Sotter), A., ii, 825.

with carbon and manganese, acid decomposition of (Schenck, Giesen, and Walter), A., ii, 767.

with carbon and phosphorus (Konstantinov), A., ii, 422.

with carbon and tungsten (Ozawa), A., ii, 244.

with gold, electrical conductivity of (Guertler and Schulze), A., ii, 284.

Iron compounds, reduction of methylene blue by (Morgan and Quastel), A., i, 982.

function of, in cell respiration (Ellinger and Landsberger), A., i, 73.

in seeds (McHargue), A., i, 635.

Iron carbide (Wever), A., ii, 767.

*penta*carbonyl, oxidation of (Freundlich and Vosnessenski), A., ii, 865.

Iron chlorides, equilibrium of ammonium chloride, water, and (Rivett and Clendinnen), T., 1634.

hydroxide, easily filtrable, preparation of (Hahn and Hertrich), A., ii, 643.

colloidal, adsorption and replacement of nutritive salts in (Lichtenwalner, Flenner, and Gordon), A., i, 888.

oxides (Ferguson), A., ii, 642; (Ruer and Nakamoto), A., ii, 643.

phosphate, assimilation of, by plants (Brioux), A., i, 79.

sulphides, action of sulphur dioxide on (Wöhler, Martin, and Schmidt), A., ii, 852.

Ferric salts, reaction of, with thiocyanates (Clarens), A., i, 903; (Durand and Bailey), A., ii, 582.

catalytic decomposition of hydrogen peroxide by (Duclaux), A., ii, 18, 308.

chloride, equilibrium in the system, ammonium chloride, water, and (Clendinnen), T., 1338.

hydrolysis of aqueous solutions of (Puxeddu), A., ii, 496.

hydroxide, molecular coefficient of magnetisation (Veil), A., ii, 122.

adsorption of radium-*B* and -*C* and thorium-*B* and -*C* by (Cranston and Hutton), T., 1318.

osmosis of sols of (Lindemann), A., ii, 543.

oxide, equilibrium of phosphoric acid, water, and (Carter and Hartshorne), T., 2223.

jellies (Schalek and Szegvary), A., ii, 423.

sols, preparation of, from iron carbonyl (Freundlich and Vosnessenski), A., ii, 865.

constitution of (Browne), A., ii, 244; (Pauli and Walter), A., ii, 325.

heat of coagulation of, with sodium sulphate (Browne), A., ii, 218.

Ferrous chloride, action of, on the hydrochlorides of aromatic amines (Cumming), A., i, 553.

hydroxide, reducing action of (Miyamoto), A., ii, 76.

phosphate, kinetics of the reaction between sulphur dioxide and (Carter and Butler), T., 2370, 2380.

Iron:—
Ferrous ferric phosphate, blue basic, formation of, in an arable soil (KUNZ-KRAUSE), A., ii, 325.
sulphate, oxidation of solutions of, in air (BANERJEE), A., ii, 866.
nitric oxide compound, absorption spectrum of (SCHLESINGER and SALATHE), A., ii, 673.
reduction of potassium chlorate by (HERSCHKOWITSCH), A., ii, 25.
sulphide, equilibrium of cuprous sulphide with (CARPENTER and HAYWARD), A., ii, 863.
Iron, cast, estimation of sulphur in (KITAJIMA), A., ii, 873.
Steel, cementation of, with boron (PARRAVANO and MAZZETTI), A., ii, 243.
estimation of arsenic in (MAZZETTI and AGOSTINI), A., ii, 506.
estimation of cobalt in (FERRERI), A., ii, 699.
estimation of manganese in (HALL and CARLSON), A., ii, 658.
estimation of oxygen in (CHAUDRON and BLANC), A., ii, 35.
estimation of sulphur in (NIKOLAI), A., ii, 35.
Iron organic compounds (WEINLAND and HACHENBURG), A., i, 445.
acetylide (DURAND), A., i, 1170.
Iron estimation and separation:—
estimation of, electrometrically (GUSTAVSON and KNUDSON), A., ii, 185.
estimation of, electrometrically, in the presence of vanadium (MÜLLER and JUST), A., ii, 42.
estimation of, gravimetrically (SOLAJA), A., ii, 583.
estimation of, microchemically (FONTÈS and THIVOLLE), A., ii, 583.
estimation of, volumetrically (THOMPSON), A., ii, 791.
effect of silicic acid on the estimation of, volumetrically (BRANDT), A., ii, 659.
ferric, estimation of, volumetrically (HAHN and WINDISCH), A., ii, 262.
estimation of, in blood, colorimetrically (WONG), A., ii, 435.
estimation of, in presence of chromium (KANO), A., ii, 699.
estimation of, in colloidal solutions (KUGELMASS), A., ii, 92.
estimation of, in ores (ENNOS and SUTCLIFFE), A., ii, 185.
estimation of, in presence of titanium (KANO), A., ii, 700.
estimation of sulphur in (NIKOLAI), A., ii, 35; (ASHIDA), A., ii, 575.
Iron estimation and separation:—
separation of (SCHERINGA), A., ii, 185.
separation of, from manganese (LUNDELL and KNOWLES), A., ii, 341.
Isatin, reactions of metallic salts with (MENKE), A., ii, 256.
preparation of homologues of (RESSY and ORTODOCSU), A , i, 1227.
Isatins, *N*-substituted (STOLLÉ, BERGDOLL, LUTHER, AUERHAHN, and WACKER), A., i, 1125.
Isatin series, isomerism in the (HANTZSCH), A., i, 1226.
Isatinoxime, sulphonic acid from (BECKMANN and BARK), A., i, 1113.
Isatogens, additive compounds of (RUGGLI, BOLLIGER, and LEONHARDT), A., i, 833.
Isatoids (HELLER and LAUTH), A., i, 851.
Isoelectric points, calculation of (LEVENE and SIMMS), A., ii, 456.
Isomerides, specific heat of (PADOA), A., ii, 10.
Isomerism (HELLER and KÖHLER), A., i, 850.
Isomorphism, effect of, on neutralisation and viscosity (SIMON), A., ii, 219.
of organo-metallic compounds (PASCAL), A., i, 406.
Isoprene derivatives, reactions of (CLAISEN, KREMERS, ROTH, and TIETZE), A., i, 1050.
Isotopes (HARKINS), A., ii, 553; (ASTON), A., ii, 748.
calculation of the atomic weights of (RUSSELL), A., ii, 748.
spectra of (NARAYAN), A., ii, 807.
quantum theory with reference to (NICHOLSON), A., ii, 401.
separation of (MULLIKEN), A., ii, 31, 637; (HARKINS), A., ii, 145, 479; (KENDALL and CRITTENDEN), A., ii, 282; (PILLEY), A., ii, 554.
separation of, by diffusion (MURMANN), A., ii, 401.
Itaconatodipentamminecobaltic itaconate nitrate and nitrate (DUFF), T., 568, 570.
Ivory, vegetable, mannan in (PATTERSON), T., 1139; (PRINGSHEIM and SEIFERT), A., i, 78.

J.

Jellies, photochemical reactions in (BENRATH and SCHAFFGANZ), A., ii, 50.
effect of heat on rhythmic precipitation in (LIESEGANG), A., ii, 395.
velocity of diffusion in (WATANABE), A., ii, 385.

Joints, glass-to-metal (Dundon), A., ii, 314; (Meyers), A., ii, 752.
  ground, substitute for (v. Antropoff), A., ii, 850.
Juglone, chlorination of (Wheeler, Dawson, and McEwen), A., i, 1020.
Juniper oil (Pigulevski), A., i, 815.
Justite (Hofmann-Degen), A., ii, 163.

K.

Kakigoma (Komatsu and Matsunami), A., i, 1197.
Kakishibu (Komatsu and Matsunami), A., i, 1197.
Kaolin, properties and reactions of (Tammann and Pope), A., ii, 758.
Keratin (Heiduschka and Komm), A., i, 69, 494, 619.
  amino-acids of (Sammartino), A., i, 399.
Keten, formation of hydroxamic acids from (Hurd and Cochran), A., i, 312.
Ketens (Staudinger and Kreis), A., i, 438; (Staudinger and Schneider), A., i, 465, 466; (Staudinger, Schlubach, and Schneider), A, i, 467; (Staudinger, Schneider, Schotz, and Strong), A., i, 468.
1-Keto-4-acetyl-3(4′-keto-1′-acetyldihydro-2-quinolylacetyl)-dihydro-2:4-benzoxazine (Ekeley and Rogers), A., i, 66.
Keto-acid, $C_{10}H_{16}O_3$, and its semicarbazone, from reduction of nitrofenchone (Nametkin, Lubovcova, and Chochriakova), A., i, 810.
Keto-alcohols, synthesis of, from cyclic ketones and formaldehyde (Mannich and Brose), A., i, 565.
3-Keto-*peri*-anthracenopenthiophen (Friedländer and Simon), A., i, 109.
β-Keto-bases, synthesis of (Mannich and Lammering), A., i, 43.
4-Keto-1-(5′-bromo-αβ-benzcoumaronylidene)dihydronaphthalene, 3-hydroxy- (Fries and Ehlers), A., i, 830.
2-Keto-3-carbamyl-4:6-diphenylpiperidine (Kohler and Souther), A., i, 244.
2-Keto-3-carbamyl-4:6-diphenytetrahydropyridine (Kohler and Souther), A., i, 244.
Ketocineole, and oximino- (Cusmano), A., i, 689.
2-Keto-3-cyano-4:6-diphenylpiperidine (Kohler and Souther), A., i, 244.
2-Keto-3-cyano-4:6-diphenyltetrahydropyridine, and 5-*mono*- and 3:5-*di*-bromo-, and 5-chloro- (Kohler and Souther), A., i, 244.
3-Keto-5:10-diacetoxy-2:3-dihydro-1:4-naphthathiazine (Fries and Oohwat), A., i, 843.
3-Keto-2:3-dihydro-1:4-benzthiazine, 2-bromo-, and 2-*mono*- and 2:2-*di*-chloro- (Zahn), A., i, 375.
3-Ketodihydroindazole, 1:2-*di*nitroso- (Heller and Köhler), A., i, 851.
3-Keto-2:3-dihydro-α-naphthathiazine, 2-*mono*-, and 2:2 *di*-chloro- (Zahn), A., i, 376.
1-Keto-6:7-dimethoxy-2-phenyl-1:2-dihydrophthalazine-4-carboxylic acid (Kuroda and Perkin), T., 2103.
1-Ketodimethyl-1:2:3:4-tetrahydronaphthalenes, and their semicarbazones (Mayer and Stamm), A., i, 803.
1-Keto-5:7-dimethyl-1:2:3:4-tetrahydronaphthalene, and its semicarbazone (Krollpfeiffer and Schäfer), A., i, 343.
1:1′-Ketodinaphthalene-3:3′-dicarboxylic acid, 4:4′-*di*hydroxy-, preparation of (Society of Chemical Industry in Basle), A., i, 678.
2-Keto-4:6-diphenylpiperidine-3-carboxylic acid, methyl ester (Kohler and Souther), A., i, 244.
6-Keto-2:4-diphenyltetrahydropyridine (Kohler, Graustein, and Merrill), A., i, 55.
6-Keto-2:4-diphenyltetrahydropyridine-5-carboxylic acid, and 3-*mono*- and 3:5-*di*-bromo-, methyl esters (Kohler, Graustein, and Merrill), A., i, 55.
Ketodiphenyltetrahydrotetrazinecarboxylic acid, ethyl ester (Busch, Muller, and Schwarz), A., i, 866.
α-Keto-ββ-di-*n*-propylglutaric acid, and its semicarbazone (Bains and Thorpe), T., 1211.
1-Keto-7-ethyl-1:2:3:4-tetrahydronaphthalene, and its semicarbazone (Krollpfeiffer and Schäfer), A., i, 343.
Ketoheptabenzthiazine-2-thiolacetic acid (Mayer and Horst), A., i, 845.
Keto-*n*-hexaldehydediethylacetal, hydroxy- (Helferich and Russe), A., i, 301.
α-Keto*cyclo*hexane-1:1-diacetic acid (Lanfear and Thorpe), T., 2869.
  and its quinoxaline derivative (Ingold, Seeley, and Thorpe), T., 867.
α-Keto-*n*-hexoic acid, fermentation of (Sen), A., i, 1159.
2-Keto-3-hydroxy-1-methyl-1:2-dihydroquinoxaline (Usherwood and Whiteley), T., 1082.

Keto-*o*-hydroxyphenyl-*o*-tolyltetrahydrotetrazinecarboxylic acid, ethyl ester (Busch, Müller, and Schwarz), A., i, 867.

1-Keto-2:(2′)-indoxyltetrahydronaphthalene, and its sulphonic acid (Herzog and Kreidl), A., i, 61.

Ketoketens, substituted (Staudinger, Schneider, Schotz, and Strong), A., i, 468.

3-Keto-5-methyl-2:3-dihydro-1:4-benzthiazine-, 2:7-*di*chloro- (Zahn), A., i, 376.

3-Keto-5-methyldihydro-1:4-*iso*benzthiazine, 7-chloro- (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 794.

2-Keto-1-methyl-1:2-dihydroquinoxaline (Usherwood and Whiteley), T., 1084.

2-Keto-1-methyl-1:2-dihydroquinoxaline-3-carboxylic acid (Usherwood and Whiteley), T., 1084.

α-Keto-ββ-methylethylglutaric acid, and its quinoxaline derivative (Singh and Thorpe), T., 121.

γ-Keto-ε-methyl-Δ^{α}-heptenoic acid, α-hydroxy-, ethyl ester and its derivatives (Borsche and Thiele), A., i, 1220.

1-Keto-2-methyl-1:2:3:4-tetrahydronaphthalene semicarbazone (Kroffpfeiffer and Schäfer), A., i, 344; (Mayer and Stamm), A., i, 802.

1-Keto-4-methyl-1:2:3:4-tetrahydronaphthalene, and its semicarbazone (Mayer and Stamm), A., i, 803.

1-Keto-7-methyl-1:2:3:4-tetrahydronaphthalene, and its semicarbazone, and 2-bromo- (Krollpfeiffer and Schafer), A., i, 343.

1-Keto-3- and -4-methyl-1:2:3:4-tetrahydronaphthalenes, and their semicarbazone (v. Braun and Stuckenschmidt), A., i, 947.

2-Keto-1-methyl-1:2:3:4-tetrahydroquinoxaline-3-carboxylmethylanilide (Usherwood and Whiteley), T., 1084.

2-Keto-4-methylthiazoline-3-acetic anhydride, and its derivatives (Groth and Holmberg), A., i, 247.

Ketones, absorption spectra of vapours and solutions of (Purvis), T., 2515.

mutual solubility of glycerol and (McEwen), T., 2279.

catalytic decomposition of (Maihle), A., i, 293.

hydrogenation of, by means of platinum black (Faillebin), A., i, 92.

Ketones, action of alcoholic potassium hydroxide on (Montagne), A., i, 227, 801.

reaction between aniline and (Oddo and Tognacchini), A., i., 225.

reaction of halogens with (Rice), A., ii, 18.

reaction of, with keto-enol substances (Kohler and Corson), A., i, 1014.

aromatic, decomposition of (Mailhe), A., i, 800.

fatty aromatic, behaviour of, in the animal body (Thierfelder and Daiber), A., i, 1264.

cyclic, reactions of, with carbylamines (Passerini), A., i, 1013.

synthesis of keto-alcohols and polyhydroxy-alcohols from formaldehyde and (Mannich and Brose), A., i, 565.

unsaturated, reactivity of (Heilbron and Whitworth), T., 238.

α-unsaturated, velocity of addition of hydrogen chloride to (Vorländer and Eichwald), A., i, 685.

additive compounds of mercury halides and (Vorländer and Eichwald), A., i, 684.

αβ-unsaturated, condensation products of, with phenols (Chemische Fabrik vorm. Weiler ter Meer), A., i, 114.

detection of (Gillet), A., ii, 442.

estimation of, in vegetable oils (Bennett and Bateman), A., ii, 665.

Ketone acetals, preparation of (Evlampiev), A., i, 1061.

hydrolysis of (Parfentiev), A., i, 1060.

β-Ketonic esters, ethoxymethylene derivatives, condensation of amidines with (Mitter and Bardhan), T., 2179.

γ-Ketonic esters, formation of cyclic compounds from (de Rosanbo), A., i, 1019.

δ-Ketolic nitriles (Kohler and Souther), A., i, 243.

γ-Keto-*n*-nonadecaldehyde (Helferich and Köster), A., i, 1178.

1-Keto-octahydroanthracene, and its semicarbazone, and 2-bromo- (Krollpfeiffer and Schäfer), A., i, 344.

1-Keto-2:3′-oxy-2′-thionaphthentetrahydronaphthalene (Herzog and Kreidl), A., i, 61.

α-Keto*cyclo*pentane-1:1-diacetic acid, and its silver salt and quinoxaline derivative (Lanfear and Thorpe), T., 1688.

α-Keto-β-phenyl-γ-benzylbutyrolactone-γ-carboxylamide (Gault and Weick), A., i, 36.

α-Keto-γ-phenylbutyric acid, γ-imino-β-cyano-, and its salts and derivatives (Benary, Soenderop, and Bennewitz), A., i, 573.

β-Keto-γ-phenylbutyric acid, and its ethyl ester (Attwood, Stevenson, and Thorpe), T., 1762.

6-Keto-4-phenyl-2-*p*-chlorophenyltetrahydropyridine-3-carboxylic acid, 3:4:5-*tri*chloro-, methyl ester (Kohler, Graustein, and Merrill), A., i, 56.

6-Keto-4-phenyl-2-*p*-chlorophenyltetrahydropyridine-5-carboxylic acid, and 3-*mono*-, and 3:5-*di*bromo-, and 5-chloro-, methyl esters (Kohler, Graustein, and Merrill), A., i, 55.

4-Keto-2-phenyl-1:4-dihydropyrimidine-5-carboxylic acid, ethyl ester (Mitter and Bardhan), T., 2183.

2-Keto-1-phenyl-3:5-di-*p*-tolylhexahydro-1:3:5-triazine (Ingold and Thorpe), T., 2751.

Ketophenyl-*o*-hydroxyphenyltetrahydrotetrazinecarboxylic acid, ethyl ester (Busch, Müller, and Schwarz), A., i, 866.

4-Keto-1-phenyl-2-methylpyrroline-3-carboxylic acid, 5-nitroimino-, methyl ester, and 5-oximino-, and its methyl ester (Benary and Konrad), A., i, 242.

4-Keto-1-phenyl-2-methylpyrroline-3-nitrile, 5-nitroimino-, and its derivatives, and 5-oximino- (Benary and Lau), A., i, 366.

Ketophenylmethyltetrahydrotetrazinecarboxylic acid, ethyl ester (Busch, Muller, and Schwarz), A., i, 867.

Ketophenyl-*m*-nitrophenyltetrahydrotetrazinecarboxylic acid, ethyl ester (Busch, Müller, and Schwarz), A., i, 866.

4-Keto-1-phenylpyrroline-3-carboxylic acid, 5-oximino-, ethyl ester, and its isomeride (Benary and Konrad), A., i, 241.

4-Keto-3-phenyltetrahydroglyoxaline, 2-hydroxy-, and its acetyl derivative (Usherwood and Whiteley), T., 1086.

2-Keto-3-phenyltetrahydro-1:3-oxazine (Dox and Yoder), A., i, 484.

Ketophenyl-*o*-tolyltetrahydrotetrazinecarboxylic acid, ethyl ester (Busch, Müller, and Schwarz), A., i, 867.

β-Keto-δ-phenylvaleronitrile, γ-hydroxy- (Diels), A., i, 823.

***iso*Ketopinic acid**, and its phenylhydrazone (Wedekind and Stüsser), A., i, 808.

Ketopinic acids, constitution of, and their phenylhydrazones and nitriles (Wedekind, Schenk, and Stüsser), A., i, 346.

8-Keto-2-*iso*propyl-5:6:7:8-tetrahydronaphthalene, and its semicarbazone (Ruzicka and Stoll), A., i, 120.

Ketotetracarboxylic acid, $C_{22}H_{32}O_9$, from ciloidanic acid (Wieland and Schlichtung), A., i, 41.

1-Ketotetrahydrocarbazole, and its derivatives (Coffey), A., i, 804.

Ketotetrahydroheptabenzsulphazone, and 7-chloro- (Mayer and Horst), A., i, 845.

4-Ketotetrahydro-1:5-heptabenzthiazine and its chloro-derivatives (Mayer and Horst), A., i, 844.

1-Ketotetrahydronaphthalene, formation of derivatives of, from γ-aryl-*n*-butyric acid (Krollpfeiffer and Schafer), A., i, 343.

2-Ketotetrahydronaphthalene semicarbazone (v. Braun, Braunsdorf, and Kirschbaum), A., i, 107.

α-Ketotetrahydronaphthalene. See α-Tetralone.

1-Ketotetrahydronaphthalene-3-carboxylic acid, and its semicarbazone (Attwood, Stevenson, and Thorpe), T., 1764.

1-Ketotetrahydronaphthalene-3:3-dicarboxylic acid, and its semicarbazone (Attwood, Stevenson, and Thorpe), T., 1763.

2-Keto-2:3:4:5-tetrahydro-1:3:4-thiodiazole, 5-imino-, and its hydrochloride and diacetyl derivative (Guha), A., i, 608.

4-Keto*iso*thiochroman. See 2:1-Benzthiopyran, 4-hydroxy-.

α-Keto-γ-*p*-tolylbutyric acid, γ-imino-β-cyano-, and its salts and derivatives (Benary, Soenderop, and Bennewitz), A., i, 574.

4-Keto-2-*p*-tolyl-1:4-dihydropyrimidine (Mitter and Bardhan), T., 2183.

4-Keto-2-*p*-tolyl-1:4-dihydropyrimidine-5-carboxylic acid, ethyl ester (Mitter and Bardhan), T., 2183.

2-Keto-3-*o*-tolyltetrahydro-1:3-oxazine (Dox and Yoder), A., i, 484.

Ketoximes, transformations of (Beckmann, Liesche, and Correns), A., i, 228.

Kidneys, cholesterol in (Tietz), A., i, 417.
  glycæmia and glycosuria in diseases of (Rosenberg), A., i, 1154.
  synthesis of hippuric acid in (Snapper, Grünbaum, and Neuberg), A., i, 730.

Kidneys, selective action of, on excretion of inorganic salts (Denis), A., i, 511.
  action of quinine and atoxyl on lipase of (Rona and Haas), A., i, 1258.
  nerve control of, in relation to diuresis and secretion of urine (Marshall and Crane), A., i, 628.
  residual nitrogen in diseases of (Pribram and Klein), A., i, 1262.
  human, chemical regularities of (Adolph), A., i, 1258.
  microchemical detection of uric acid in (Walter), A., i, 1154.
Kinetics of heterogeneous systems (Yamazaki), A., ii, 63.
Kinetic reactions (v. Euler and Rudberg), A., ii, 547.
Kolbe reaction, intermediate stages in (Schall), A., ii, 120.
Kryptocyanine, constitution of (Mills and Braunholtz), T., 2804.
Krypton, spectra of, and velocity of electrons in the gas (Déjardin), A., ii, 282.
  Röntgen-ray spectrum of (de Broglie and Lepape), A., ii, 518.
  hydrate (de Forcrand), A., ii, 239.
Kynurenic acid, formation of, in the liver (Matsuoka and Takemura), A., i, 72.

L.

Lactalbumin, hydrolysis of (Waterman), A., i, 868.
Lactic acid, formation of, by fermentation of dextrose (Barthel and v. Euler), A., i, 985.
  production of, by microbes (Aubel), A., i, 272.
  effect of, on muscular exercise on (Hill and Lupton), A., i, 977.
  formation of pyruvic acid from (Smull and Subkow), A., i, 298.
  excretion of, in urine (Knoop and Jost), A., i, 1261.
  calcium salt, fermentation of, by bacteria (Lemoigne), A., i, 1267.
    action of yeast on (Kayser), A., i, 986.
  complex compounds of cupric hydroxide with (Wark), T., 1815.
  esters, rotatory dispersion of (Wood, Such, and Scarf), T., 600.
  4:4′-bisazobenzeneformamidine ester (Passerini), A., i, 64.
  diphenylformamidine and esters (Passerini), A., i, 64.
  estimation of, in blood (Macleod and Armour), A., ii, 663.
  estimation of, in the stomach (Ege), A., ii, 266.
d(−)**Lactic acid**, methyl ester and amide (Freudenberg, Brauns, and Siegel), A., i, 216.
Lactide, hydrolysis of (Ringer and Skrabal), A., ii, 305.
Lactone, $C_8H_{14}O_5$, from oxidation of tetramethyl γ-fructose (Haworth and Linnell), T., 299.
  $C_8H_{14}O_2$, from silver *cyclo*hexanediacetate and iodine (Windaus, Klänhardt, and Reverey), A., i, 111.
  $C_{12}H_{13}O_3N$, from lævulic acid and phenylcarbylamine (Passerini), A., i, 764.
β-Lactones, formation of (Bains and Thorpe), T., 2742.
γ-Lactones, spectrochemistry of (v. Auwers and Wissebach), A., ii, 593.
Lactose (*milk-sugar*), formation of, in the lacteal gland (Hesse), A., i, 981.
  inversion of, by acids (Bleyer and Schmidt), A., ii, 306.
  fission of methyl derivatives of (Schlubach and Moog), A., i, 1063.
  propionic acid formation in fermentation of (Sherman and Shaw), A., i, 985.
  estimation of (Edwards), A., ii, 346.
  estimation of, volumetrically (Fontès and Thivolle), A., ii, 264.
  estimation of, in blood and urine (Thallinner and Perry), A., ii, 440.
  estimation of, in mixtures of invert-sugar and sucrose (Jessen-Hansen), A., ii, 882.
Lævulic acid, production of, from hexoses (Pummerer and Gump), A., i, 698.
  action of, with carbylamines (Passerini), A., i, 764.
  action of Grignard reagents on (Porter), A., i, 437.
  methyl ester, semicarbazone (Pummerer and Gump), A., i, 698.
Lævulosans in cereals (Colin and Belval), A., i, 1274.
Lævulose, preparation of (Harding), A., i, 1062.
  change of rotation of, by an enzyme (Winter and Smith), A., i, 518.
  ingestion of (Bodansky), A., i, 983.
  di*iso*propylidene ethers (Freudenberg and Doser), A., i, 658.
  estimation of (Lucius), A., ii, 882.
  estimation of, in presence of dextrose (Colin), A., ii, 701.
  estimation of, by means of iodine (Cajori), A., ii, 94.

Laminaria, biochemistry of species of (Freundler, Laurent, and Ménager), A., i, 276.
Laminarin, physico-chemical properties of (Gruzewska), A., i, 656.
Lanthanum, preparation and properties of (Kremers and Stevens), A., ii, 322.
  Lanthanates (Zambonini and Carobbi), A., ii, 765.
Lanthanum earths (Prandtl and Lösch), A., ii, 863.
Lappaconine, and its hydrochloride (Weidemann), A., i, 126.
Lappaconitine, and its salts (Weidemann), A., i, 126.
Lauric acid, potassium salt, migration data for (McBain and Bowden), T., 2417.
  starch ester (Gault), A., i, 1064.
Lavender oil (Autran and Fondand), A., i, 1163.
Lead, atomic weight of (Honigschmid and Steinheil), A., ii, 764.
  arc spectrum of (Grotrian), A., ii, 672.
  isotopes of (Russell), A., ii, 861.
    separation of (Honigschmid and Steinheil), A., ii, 764.
  electrical resistance of (Onnes and Tuyn), A., ii, 724.
  density of (Egerton and Lee), A., ii, 462.
  vapour pressure of (Egerton), A., ii, 491.
  fractional crystallisation of (Atkinson), A., ii, 689.
  action of natural waters on (Thresh), A., ii, 73.
  assimilation of, by plants (Hevesy), A., i, 1160.
Lead alloys, hardness and density of (Goebel), A., ii, 164.
  with antimony (Dean), A., ii, 687; (Muzaffar), A., ii, 726.
  with bismuth and cadmium, electrochemistry of (Kremann and Langbauer), A., ii, 826.
  with bismuth and tin, crystallography of (Bux), A., ii, 419.
  with cadmium and mercury, potential of (Kremann, Prammer, and Helly), A., ii, 825.
  with sodium, freezing points of (Calingaert and Boesch), A., ii, 687.
  with thallium, electrical conductivity of (Guertler and Schulze), A., ii, 418.
  with tin, potentials of (Muzaffar), A., ii, 285.
    dilatation and thermal curves of (Losana), A., ii, 689.
Lead salts, action of alkali hydroxides on (Ogata and Kai'un), A., ii, 420.
Lead halides, spectrophotoelectrical sensitivity of (Coblentz and Eckford), A., ii, 279.
  iodide, equilibrium of, with ammonium and potassium iodides (Demassieux), A., ii, 565.
  nitrate, solubility of, in water and in mixtures with sodium and potassium nitrates (Glasstone and Saunders), T., 2134.
  oxide, modifications of (Kohlschütter and Roesti), A., ii, 164.
  chlorovanadate (Cuttica, Tarchi, and Alinari), A., ii, 499.
Lead organic compounds:—
  acetylide (Durand), A., i, 1170.
  tri-*m*-xylyl, preparation of, and its action on thallic chloride (Goddard), T., 1171.
Lead estimation:—
  estimation of (Winkler), A., ii, 40, 90.
  estimation of, electrolytically (Minot), A., ii, 261.
  estimation of, in presence of carbon (Kahlbaum), A., ii, 879.
  estimation of, as cyanide (Herz and Neukirch), A., ii, 879.
  estimation of, in presence of zinc (Muller and Gabler), A., ii, 90.
Lead electrode. See Electrodes.
Lead–copper minerals, new, from the Mendips (Spencer and Mountain), A., ii, 774.
Lead ores, fusion of, with sodium peroxide (Sternberg), A., ii, 40.
Leather, estimation of nitrogen in (Gerngross and Schaefer), A., ii, 653.
Leaves, diurnal variation in the nitrogen content of (Chibnall), A., i, 1045.
  separate extraction of vacuole and protoplasm from the cells of (Chibnall), A., i, 635.
Lecithin, effect of cholesterol on the consumption of oxygen by (Lange and Lawaczeck), A., i, 513.
  brain, fatty acids of (Levene and Rolf), A., i, 11.
Lectures delivered before the Chemical Society (Desch), T., 280; (Irvine), T., 898; (Perkin), T., 1520; (Moureu), T., 1905; (Jeans), T., 3398.
Lecture experiment illustrating adsorption (Tanner), A., ii, 234.
  to show solubility and indicator action (Thatcher), A., ii, 555.
Leguminates, alkali, optical properties of (Rakuzin and Pekarskaja), A., i, 494.

Leguminosæ, nutritive value of (BERZZELLER and BILLIG), A., i, 977.

3-Leucauraminylphthalyl-leucauramine (BOGERT and RUDERMAN), A., i, 32.

Leucine, and its alkali salts, optical rotation of (RAKUZIN), A., i, 545.

Leucomalachitegreen, derivatives of (JACOBS and HEIDELBERGER), A., i, 67.

Leucosin (LÜERS and LANDAUER), A., i, 306.

dl-**Leucylglycine**, chloroacetyl derivative, and its ethyl ester (ABDERHALDEN and ALKER), A., i, 1072.

dl-**Leucyl**-*dl*-**leucylglycine** (ABDERHALDEN and ALKER), A., i, 1072.

l-**Leucyl**-*d*-**valine anhydride** (ABDERHALDEN), A., i, 717.

Librocedrus Bidwillii, essential oil in the leaves of (GOUDIE), A., i, 1023.

Lichens, orcinol from (BARGELLINI), A., i, 783.

Lichenase (KARRER, JOOS, and STAUB), A., i, 1182.

Lichenin (KARRER, JOOS, and STAUB), A., i, 1182.
  from *Cetraria islandica* (KARRER and JOOS), A., i, 541.
  decomposition of, by enzymes (PRINGSHEIM and SEIFERT), A., i, 998.

Liesegang's rings (DAVIES), A., ii, 140, 141, 836.
  formation of (SCHLEUSSNER), A., ii, 59; (NOTBOOM), A., ii, 395; (HEPBURN), A., ii, 744.

Light, scattering of, in benzene (RAMANATHAN), A., ii, 598.
  absorption of (WEIGERT), A., ii, 3.
    by inorganic salts (MACBETH and MAXWELL), T., 370.
    by mixtures of substances (PESKOV), A., ii, 277.
  chemical actions of (SCAGLIARINI and SALADINI), A., i, 587.
  action of, on metallic electrodes (AUDUBERT), A., ii, 827.
  action of, of various colours on photosynthesis (LUBIMENKO), A., ii, 716.
  polarised, biochemical effects of (SEMMENS), A., ii, 718.
  ultra-violet, effect of, on fluorescence of solutions (CALE), A., ii, 204.
    action of, on the reactivity of halogens (ROSENMUND, LUXAT, and TIEDEMANN), A., ii, 717.
    action of, on diketones (PORTER, RAMSPERGER, and STEEL), A., ii, 600.
    action of, on alcoholic fermentation (SÖHNGEN and COOLHAAS), A., i, 1042.

Lignic acid, and its copper salts (GRÜSS), A., i, 534.

Lignin (HEUSER and WINSVOLD), A., i, 900; (ANDERZEN and HOLMBERG), A., i, 1067; (KARRER and BODDING-WIGER), A., i, 1183.
  constitution of (SCHRAUTH), A., i, 443.
  structure of (HEUSER and WINSVOLD), A., i, 541.
  relation of, to coal (PICTET and GAULIS), A., i, 758.
  decomposition of, under pressure (FISCHER, SCHRADER, and TREIBS), A., i, 185, 187; (FISCHER and SCHRADER), A., i, 185.
  compound of hydrochloric acid and (HÄGGLUND), A., i, 1066.
  pine (KLASON), A., i, 187; (HÄGGLUND), A., i, 1000.
  from straw, derivatives of (PASCHKE), A., i, 658.
  from straw and wood, differences between (BECKMANN, LIESCHE, LEHMANN, and LINDNER), A., i, 999.
  pentosans in (HEUSER), A., i, 1183.

Lignin acids, bacterial degradation of (PRINGSHEIM and FUCHS), A., i, 1183.

Lignin alcohol, and its vanadium salt (GRÜSS), A., i, 541.
  oxidation of (GRÜSS), A., i, 534.

Lignite, low temperature tar from (FROMM and ECKARD), A., i, 526.

Lignite tar, chemical composition of (PFAFF and KREUTZER), A., i, 1004.
  constituents of oils of (AVENARIUS), A., i, 459.

β-**Lignosulphonic acid**, β-naphthylamine salt (KLASON), A., i, 187.

Limestone, formation of (COPISAROW), T., 794.

d- and *l*-**Limonenes**, preparation of (v. BRAUN and LEMKE), A., i, 813.

Limulus, composition of the cartilage of (MATHEWS), A., i, 1260.

Linalyl chromate (WIENHAUS and TREIBS), A., i, 893.

Lindera obtusiloba, fatty acid from (IWAMOTO), A., i, 995.

Linderic acid, and its methyl ester, and *di*hydroxy- (IWAMOTO), A., i, 995.

Linkings, double, polarisation of (LAPWORTH and ROBINSON), A., ii, 849.

Linoleic acid, and its anhydride (HOLDE and WEILL), A., i, 995.
  methyl ester, separation of methyl oleate and (ANDRÉ), A., i, 436.

Linseed oil, phytosterols of (ANDERSON and MOORE), A., i, 1008.

- **Lipase**, origin of, in blood (Hiruma), A., i, 1037.
  - resolution of polypeptide esters by (Abderhalden and Alker), A., i, 1071.
  - of kidneys, action of quinine and atoxyl on (Rona and Haas), A., i, 1258.
  - liver, hydrolysis of alkyl esters by (Knaffl-Lenz), A., i, 621.
    - hydrolysis of dicarboxylic esters by (Hyde and Lewis), A., i, 873.
  - pancreatic (Willstätter, Waldschmidt-Leitz, and Memmen), A., i, 403; (Willstätter and Waldschmidt-Leitz), A., i, 403.
    - action of quinine and of atoxyl on (Rona and Pavlović), A., i, 403.
  - stomach, action of quinine and its derivatives on (Rona and Takata), A., i, 402.
  - estimation of hydrolysis of tributyrin by (Willstätter and Memmen), A., ii, 704.
- **Lipofuscin** (Lubarsch), A., i, 981.
- **Lipoids**, formation of (Terroine and Lobstein), A., i, 633.
  - nutritive value of (Takahashi), A., i, 977, 978.
  - in blood (Epstein and Lande; Jung and Wolff), A., i, 624.
  - in plasma and serum (Jung and Wolff), A., i, 504.
  - in relation to suprarenal glands (Baumann and Holly), A., i, 629.
  - estimation of, in blood and tissues (Lemeland), A., ii, 347.
- **Liquids**, molecular weight of, by the camphor method (Houben), A., ii, 735.
  - calculation of molecular weights of, from critical data (Herz), A., ii, 742.
  - relation between properties of (Herz), A., ii, 293.
  - dielectric constants of, at the critical temperature (Herz), A., ii, 52.
  - potential differences at the contact of (Baur and Buechi), A., ii, 605.
  - specific heat of (Herz), A., ii, 56.
  - irregular expansion of (Montemartini and Losana), A., ii, 373.
  - thermodynamics of vaporisation of (Sano), A., ii, 611.
  - purity of, from critical solution temperatures (Jones), T., 1374, 1384.
  - determination of density of (Doemens), A., ii, 740.
  - density of, below 0° (Timmermans), A., ii, 678.
- **Liquids**, formula for internal pressure of (Karpen), A., ii, 11.
  - adsorption at interfaces of (King), A., ii, 381.
  - mutual solubility of (Hill), A., ii, 467; (Verschaffelt), A., ii, 617.
  - influence of a third substance on the miscibility of two (Bailey), T., 2579.
  - azeotropic mixtures of (Young), A., ii, 736.
  - equations of the distillation of (Peters), A., ii, 377.
  - distillation of small quantities of (Lanyar and Zechner), A., ii, 294.
  - theory of the capillary layer of (Bakker), A., ii, 297.
  - dialysis of small volumes of (Wood), A., ii, 541.
  - spreading of (Harkins and Feldman), A., ii, 127.
  - rhythmic precipitation on the surface of (Janek), A., ii, 395, 620.
  - velocity of reaction between gases and (Becker), A., ii, 228.
  - abnormal, electrostatic theory of (Bikerman), A., ii, 313.
  - mixed, refractive index and volume contraction of (Counson), A., ii, 801.
    - separation of (E. and R. Urbain), A., ii, 125.
  - binary mixed, stability of, on addition of water (Perrakis), A., ii, 836.
  - organic, freezing points of (Timmermans), A., ii, 215.
    - interfacial tension of, and water (Pound), T., 583.
  - pure, molecular state of (Kolosovski), A., ii, 378; (Pavlov), A., ii, 378, 380.
  - saturated, properties of, at the critical point (Verschaffelt), A., ii, 533.
  - viscous, viscosity and surface tension of (Washburn), A., ii, 613.
    - filter for (Gutbier and Sauer), A., ii, 850.
  - volatile hygroscopic, apparatus for combustion analysis of (Shoesmith), A., ii, 254.
  - separation of suspended colloids from (Marx and Rozières), A., ii, 470.
- **Liquid phases**, forces at the boundary between (Bauer), A., ii, 53.
- **Lithium**, atomic structure of (Neuberger), A., ii, 145.
  - and its hydride, structure of (Bijvoet), A., ii, 857.
  - *X*-ray spectra of (McLennan and Clark), A., ii, 51.
  - spark spectrum of (von Angerer), A., ii, 709.

Lithium, excitation of *K*-rays in (Holtsmark), A., ii, 528.
positive ray analysis of (Dempster), A., ii, 805.
ions, hydration of (Baborovský), A., ii, 288, 582; (Baborovský and Velíšek), A., ii, 635.
Lithium amide and imide, heats of formation of (Guntz and Benoit), A., ii, 738.
ammonium (Benoit), A., ii, 635.
chloride, free energy of dilution of alcoholic solutions of (Pearce and Hart), A., ii, 7.
halides, space lattices of (Ott), A., ii, 564.
hydride, molten, ionising power of (Guntz), A., ii, 289.
hydroxide, dissociation constant of (Kolthoff), A., ii, 834.
iodide, crystal structure of (Wyckoff and Posnjak), A., ii, 858.
platinocyanide, equilibrium of, with water and with potassium platinocyanide (Terrey and Jolly), T., 2217.
sulphate, electrolytic precipitation with (Kolthoff), A., ii, 88.
  equilibrium in the system, sulphuric acid, ammonium sulphate, water, and (van Dorp), A., ii, 621.
hydrogen sulphate (Dunnicliff), T., 732.
hydrosulphide (Jones and Thomas), T., 3285.
Lithium, estimation and separation of (Willard and Smith), A., ii, 182.
*iso***Lithobilianic acid**, formation of, from coprosterol (Windaus and Riemann), A., i, 567.
Lithopone (Maas and Kempf), A., ii, 491.
Liver, chemistry of (Sammartino), A., i, 168.
rôle of, in production of urea and in metabolism of amino-acids (Gottschalk and Nonnenbruch), A., i, 1255.
decomposition of arginine in (Felix and Tomita), A., i, 729.
glycogen synthesis in (C. F. and G. T. Cori, and Pucher), A., i, 1039.
of dogs, glycogen in (Gruzewska and Fauré-Frémiet), A., i, 267.
Liver oils, detection of, with sulphuric acid (Harden and Robison), A., ii, 347.
α-Longif-1:2-dione, and its derivatives (Simonsen), T., 2659.
*iso***Longifolaldehyde**, and its semicarbazone (Simonsen), T., 2655.
Longifolamide, and its urethane (Simonsen), T., 2656.
*iso***Longifolanilide** (Simonsen), T., 2657.
Longifolene, oxidation of (Simonsen), T., 2652.
n- and *iso*-**Longifolic acids**, and their salts and esters (Simonsen), T., 2653.
*iso***Longifolol**, and its derivatives (Simonsen), T., 2655.
d-**Longif-1-ol-2-one**, and its acetyl derivative (Simonsen), T., 2661.
l-α- and -β-**Longiforic acids**, and their derivatives (Simonsen), T., 2661.
Longifquinone. See *d*-Longif-1:2-dione.
Loroglossigenin (Bridel and Delauney), A., i, 1218.
Loroglossin (Bridel and Delauney), A., i, 1218.
from orchids (Delauney), A., i, 1046.
Lubricating oils. See under Oils.
Luciferin, concentration of, for luminescence (Harvey), A., ii, 598.
Luminescence, relation between structure and (Schleede and Gantzckow), A., ii, 714.
production of, by Röntgen rays (de Beaujèu), A., ii, 818.
in chemical reactions (Lifschitz and Kalberer), A., ii, 3.
inorganic (Tiede and Reinicke), A., ii, 240.
of bacteria, concentration of oxygen for (Harvey and Morrison), A., i, 1267.
Lungs, nucleic acid of (Sammartino), A., i, 414.
Lupines, germinating, asparagine in (Piutti), A., i, 885.
Lycoperdon gemmatum (puff-ball), ripening of the fruit of (Ivanov), A., i, 428.
Lycoperdon piriforme, constituents of fruits of (Ivanov), A., i, 785.
Lymph glands, proteolytic enzymes of (Hedin), A., i, 507.
Lyotropic action in the solution of colloids (Peskov), A., ii, 225.
Lysin, bacteriophage reaction of (Meuli, Doerr, and Berger), A., i, 1158.
influence of, on the hydrolysis of starch (Sherman and Caldwell), A., i, 262.
Lysocephalins (Levene and Rolf), A., i, 650.
Lysolecithins (Levene and Rolf), A., i, 650.

M.

Magenta-sulphurous acid, bromine reaction of (Schening and Schaaff), A., i, 860.

Magnesium, spark spectrum of, and the arc spectrum of sodium (Fues), A., ii, 353.
specific volume of (Sauerwald), A., ii, 172.
equilibrium in the system, aluminium, silicon, zinc, and (Sander and Meissner), A., ii, 641.
rate of solution of, in acids (Centnerszwer), A., ii, 627.
reaction between *p*-dibromobenzene and (Pink), T., 3418.
Magnesium alloys with aluminium (Portevin and Chevenard), A., ii, 166.
with mercury, electromotive behaviour of (Smits), A., ii, 728.
Magnesium bases (*magnesium ammines*), salts of (Spacu and Ripan), A., ii, 72.
Magnesium compounds, effect of, in soils (MacIntyre, Shaw, and Young; MacIntyre and Young), A., i, 1168.
Magnesium salts, reaction of hydrogen on solutions of (Ipatiev and Starynkevitsch), A., ii, 639.
metabolism of. See Metabolism.
Magnesium carbonate and chloride, double salt of (Nishimura), A., ii, 689.
trihydrate. See Nesquehonite.
chloride, solidification of the system, barium chloride, potassium chloride, and (Matignon and Valentin), A., ii, 417.
equilibria in the system, calcium chloride, potassium chloride, water, and (Lee and Egerton), T., 706.
solidification of potassium chloride, barium chloride, and (Valentin), A., ii, 73.
oxide, crystal structure of (Davey and Hoffman), A., ii, 27.
sulphate, solubility of potassium sulphate and (Levi), A., ii, 758.
sulphide, structure of (Holgersson), A., ii, 321.
Aquopentamminemagnesium chloride (Spacu and Ripan), A., ii, 72.
Diaquodiamminemagnesium sulphate (Spacu and Ripan), A., ii, 72.
Hexamminemagnesium bromide (Spacu and Ripan), A., ii, 72.
Tetra-aquodiamminemagnesium sulphate (Spacu and Ripan), A., ii, 72.
Triaquotriamminemagnesium sulphate (Spacu and Ripan), A., ii, 72.
Magnesium organic compounds, thermochemistry of (Lifschitz and Kalberer), A., ii, 3.
Magnesium organic compounds, action of, on cyanohydrins (Asahina and Terasaka), A., i, 1023.
reactions of, with esters (Stadnikov), A., i, 462, 463.
action of, on ethylglycerol epibromohydrin (Delaby), A., i, 531.
action of ethyl sulphate with (Gilman and Hoyle), A., i, 26.
interaction of halogen alkyl sulphonates and (Gilman and Beaber), A., i, 453.
action of, on nitriles (Baerts), A., i, 191; (Bruylants), A., i, 310; (de Booseré), A., i, 311; (Bruylants and Gevaert), A., i, 1188.
action of, on sulphuryl chloride (Cherbuliez and Schnauder), A., i, 435.
alkyl and aryl halides, luminescence of (Dufford, Calvert, and Nightingale), A., ii, 714.
alkyloxides, mixed, condensations of (Grignard and Dubien), A., i, 896.
p-bromophenyl bromide, fluorescence of solutions of (Evans and Dufford), A., ii, 204.
cellulosyl bromide (Costa), A., i, 186.
cumyl chloride (Bert), A., i, 969.
diaquodiethylenediamine iodide (Spacu), A., i, 96.
ethyl bromide, action of, on aminophenols (Puxeddu), A., i, 555.
ethyl iodide, preparation of (Gilman and Meyers), A., i, 193.
hexammine thiocyanate (Spacu), A., i, 96.
hexapyridine thiocyanate (Spacu), A., i, 96.
2-methyl indolyl bromide, action of iodoform on (Oddo and Tognacchini), A., i, 715.
phenyl bromide, action of, on nitriles (Bary), A., i, 226.
pyrryl halides, syntheses by means of (Oddo and Tognacchini), A., i, 709.
tetrapyridine salts (Spacu), A., i, 96.
triethylenediamine salts (Spacu), A., i, 96.
Magnesium estimation and separation:—
estimation of (Willstätter and Waldschmidt-Leitz), A., ii, 258.
estimation of, colorimetrically (Hammett and Adams), A., ii, 88; (Grégoire and Sola), A., ii, 340.
estimation of, electrometrically (Kolthoff), A., ii, 183.

Magnesium estimation and separation:—
estimation of, microchemically (Gadient), A., ii, 790.
estimation of, volumetrically (Bulli and Fernandes), A., ii, 508.
estimation of, in aluminium alloys (Withey), A., ii, 88.
estimation of, in carbonate rocks, volumetrically (Brandenberg and Avakian), A., ii, 258.
estimation of, in human blood (Mirkin and Druskin), A., ii, 507.
estimation of, in plasma (Hirth), A., ii, 698.
estimation of, in sea-water (Denigès), A., ii, 183.
separation of, from the alkali metals (Hemming), A., ii, 878.
Magnesium electrodes. See Electrodes.
Magnesylamine, and its compounds with pyridine and nitrobenzene and pyridine (Oddo and Calderaro), A., i, 448.
Magnetic valency. See Valency.
Magnetic double refraction, dispersion accompanying (Szivessy), A., ii, 707.
Magneto-chemical effect (Schtschukarev), A., ii, 235.
Magnetons, behaviour of, in a magnetic field (Laurie), A., ii, 400.
Magneton number, calculation of (Smith), A., ii, 122.
spectroscopic (Sommerfeld), A., ii, 734.
Maize, distribution of pentosans in (Verhulst, Peterson, and Fred), A., i, 638.
constituents of pollen of (Anderson), A., i, 885.
brown-husked, *iso*quercitrin from (Sando and Bartlett), A., i, 172.
Maize cobs, preparation of xylose from (Ling and Nanji), T., 620.
Maize oil, phytosterols of (Anderson and Moore), A., i, 1008.
Maize spores, adsorption of metallic salts by (Pichler and Wöber), A., i, 172.
Malachite-green, derivatives and salts of (Jacobs and Heidelberger), A., i, 67.
Malacon, hafnium in (Goldschmidt and Thomassen), A., ii, 174.
Malaria, iron in the pigment of (Mayer), A., i, 981.
Malatodipentamminecobaltic malate nitrate and nitrate (Duff), T., 567, 570.
Maleatodipentamminecobaltic nitrate (Duff), T., 567.
Maleatopentamminecobaltic nitrate (Duff), T., 567.
Maleic acid, physical properties of (Weiss and Downs), A., i, 534.
hydrogenation of (Conant and Cutter), A., i, 11.
use of, in volumetric analysis (Lange and Kline), A., ii, 180.
Maleic acid, *di*hydroxy- (Böeseken and de Voogd), A., i, 896.
Maleinaldehydic acid, *p*-nitrophenylhydrazone (v. Auwers and Wissebach), A., i, 297.
Malic acid, physical properties of (Weiss and Downs), A., i, 534.
effect of molybdates on the rotatory power of (Darmois), A., i, 299.
action of uranyl acetate on (Kopatschek), A., i, 745.
in plants (Franzen and Keyssner), A., i, 427.
chromium salt (Barlot and Panaitopol), A., i, 534.
complex compounds of cupric hydroxide with (Wark), T., 1826.
uranyl salt, rotation of (Darmois), A., i, 751.
esters, action of molybdic acid on the rotatory power of (Darmois), A., i, 535.
use of, in volumetric analysis (Lange and Kline), A., ii, 180.
estimation of, polarimetrically (Auerbach and Kruger), A., ii, 884.
d-**Malic acid,** preparation of, from malonic acid (McKenzie and Plenderleith), T., 1090.
r-**Malic acid,** resolution of (McKenzie, Plenderleith, and Walker), T., 2879.
decomposition of (Darmois and Périn), A., i, 300.
Malol, and its sodium salt, and acetyl derivatives (Sando), A., i, 991.
Malonamide, *iso*nitroso- (Usherwood and Whiteley), T., 1069.
Malonatodinitro-*cis*-diamminecobaltic hydroxide, barium salt (Thomas), T., 619.
Malonatodipentamminecobaltic nitrate (Duff), T., 566.
Malonatopentamminecobaltic malonate nitrate (Duff), T., 570.
Malondimethylanilide, chloro-, chloronitro-, and nitro- (Usherwood and Whiteley), T., 1078.
Malonic acid, conversion of, into *d*-malic acid (McKenzie and Plenderleith), T., 1090.
glucinum salts, structure of (Meyer and Mantel), A., i, 11.

Malonic acid, sodium derivative, ethyl ester, interaction of αβ-dichloroethyl ether and (BENARY and SCHINKOPF), A., i, 179.
  ethyl ester, action of carbamazide on (CURTIUS), A., i, 850.
Malonic acids, alkylated, condensation of aryldiazonium salts with (WALKER), T., 2775.
Malonic anhydrides, preparation of ketens from (STAUDINGER, SCHLUBACH, and SCHNEIDER), A., i, 467.
Malono-*p*-ethoxyanilic acid, and its ethyl ester (AKTIEN GESELLSCHAFT FUR ANILIN-FABRIKATION), A., i, 995.
Malt extract, hydrolysis of maltose by (MAQUENNE), A., i, 442.
Maltase in germinated and ungerminated barley (LING and NANJI), A., i, 1162.
Maltosan, and its hexa-acetyl derivative (PICTET and MARFORT), A., i, 303.
Maltose, preparation of (HARDING), A., i, 899.
  influence of dextrins on crystallisation of (DE HOOP and VAN TUSSENBROEK), A., i, 303.
  hydrolysis of, by malt extract (MAQUENNE), A., i, 442.
  octa-acetyl derivative, action of phosphorus pentachloride on (BRIGL and MISTELE), A., i, 442.
  detection and identification of (CASTELLANI and TAYLOR), A., ii, 265.
  estimation of (JOSEPHSON), A., ii, 662.
  estimation of, by means of iodine (CAJORI), A., ii, 94.
*iso***Maltose**, preparation of (LING and NANJI), T., 2681.
Maltosyl chloride (PICTET and MARFORT), A., i, 303.
Mandelic acid, configuration of (FREUDENBERG, BRAUNS, and SIEGEL), A., i, 215.
  benzyl ester, pharmacology and toxicology of (MACHT), A., i, 1012.
  diphenylformamidine acid ester (PASSERINI), A., i, 64.
Mandelic acid, *m*-amino-, cinchonine salt (PORTER and IHRIG), A., i, 1027.
Manganese, spectrum of (CATALÁN), A., ii, 709; (MONK), A., ii, 806.
  arc spectrum of (CATALÁN), A., ii, 104.
  line spectrum of (SOMMERFELD), A., ii, 355.
  Zeeman effect in the spectra of (BACK), A., ii, 518.
  electrolytic, properties of (CAMPBELL), T., 2323.
Manganese, anodic behaviour of, in solutions of alkali hydroxides (GRUBE and METZGER), A., ii, 118.
  in hair (MCCRAE), A., i, 415.
Manganese alloys with iron and carbon acid, decomposition of (SCHENCK, GIESEN, and WALTER), A., ii, 767.
Manganese compounds in seeds (MCHARGUE), A., i, 635.
  in soils (WESTER), A., i, 640.
Manganese salts, effect of, on plant growth (MCHARGUE; RIPPEL), A., i, 1160.
Manganese chloride, equilibrium of ammonium chloride, water, and (RIVETT and CLENDINNEN), T., 1634.
  *per*chloride, anodic formation of (CAMPBELL), T., 892.
  *di*oxide, properties of (WYCKOFF), A., ii, 243.
    adsorption of ions by (CHATTERJI and DHAR), A., ii, 615.
    adsorption of salts by (GELOSO), A., ii, 541.
    catalytic efficiency of (ALMQUIST and BRAY), A., ii, 840.
    precipitation of, by bromine, in presence of ammonium salts (SIMPSON), A., ii, 684.
    spontaneous decomposition of mixtures of potassium chlorate and (BROWN, BURROWS, and MCLAUGHLIN), A., ii, 561.
  sulphates, equilibria of (GRUBE and HABERICH), A., ii, 138.
  Manganous chloride dihydrate, equilibrium of ammonium chloride and (CLENDINNEN and RIVETT), T., 1344.
  Manganates, mechanism of the reduction of (HOLLUTA), A., ii, 774.
  Permanganates (CRESPI and MOLES), A., i, 161, 565; (MOLES and CRESPI), A., ii, 642.
    mechanism of reduction of (HOLLUTA), A., ii, 744, 864.
    titration of, with sodium arsenite (HALL and CARLSON), A., ii, 658.
Manganese organic compounds, tervalent (MEYER and SCHRAMM), A., i, 12.
  acetylide (DURAND), A., i, 1170.
  diaquodibenzylamine ammonium sulphate (SPACU and RIPAN), A., i, 833.
Manganese detection, estimation, and separation:—
  detection of (DYRMONT; VALIASCHKO), A., ii, 341.
  estimation of, electrometically (MÜLLER and WAHLE), A., ii, 881.

- **Manganese detection, estimation, and separation:—**
  - estimation of, volumetrically (Mathevet), A., ii, 435.
  - estimation of, in iron (Eder and Eder), A., ii, 92.
  - estimation of, in steel (Hall and Carlson), A., i, 658.
  - estimation of, colorimetrically, in carbon steel (Forestier),, A., ii, 582.
  - estimation of, as sulphate (Hillebrand), A., ii, 791.
  - separation of, from chromium (Taverne), A., ii, 435.
  - separation of, from iron (Solaja), A., ii, 583.
- **Mangin**, from Indian yellow, and its lead salt and derivatives (Wiechowski), A., i, 591.
- **Mannan**, from vegetable ivory, and its derivatives (Patterson), T., 1139.
  - triacetate (Pringsheim and Seifert), A., i, 78.
- **Mannitan** dioleate (Gilchrist), A., i, 297.
- **Mannitol**, solubility of, in mixtures of alcohol and water (Creighton and Klauder), A., i, 646.
  - cyclic derivatives of (van Romburgh and van der Burg), A., i, 85.
  - *tetra*chlorohydrin sulphate (Helferich, Löwa, Nippe, and Riedel), A., i, 654.
- **Mannose**, from white spruce cellulose (Sherrard and Blanco), A., i, 441.
  - di*iso*propylidene ether (Freudenberg and Hixon), A., i, 1179.
- *d*-**Mannose**-*o*-**hydroxymethylbenzhydrazide** (Teppema), A., i, 257.
- α-*d*-**Mannosidase**, reversibility of action of (Hérissey), A., i, 497.
- α-*d*-**Mannoside**, biochemical synthesis of (Hérissey), A., i, 183.
- *l*-**Mannuronolactone**, semicarbazone of (Kiliani), A., i, 1060.
- **Manometer**, optical lever (Carver), A., ii, 148.
  - quartz fibre (Coolidge), A., ii, 612.
- **Manures**, effect of, on carbon dioxide in soils (Lundegårdh), A., i, 284.
  - artificial, effect of, on chlorophyll formation (Wlodek), A., i, 1160, 1161.
    - estimation of phosphates in (Robertson and Dickinson), A., ii, 252.
- **Marble**, synthetic and metamorphic (Copisarow), T., 785.
- **Margosopicrin**, and its acetyl derivative (Watson, Chatterjee, and Mukerjee), A., i, 1163.
- **Mass action**, law of, and ionic equilibria (Brönsted and Pedersen), A., ii, 61.
  - in relation to statistical equilibrium (Rodebush), A., ii, 620.
- **Meat**, effect of codeine on digestion of (Zunz and Delcorde), A., i, 412.
- **Meconic acid**, in Indian opium (Annett and Bose), A., i, 358.
- *Melaleuca acuminata*, essential oil from (Smith), A., i, 350.
- *Melaleuca Deanei* and *ericifolia*, essential oils from (Baker and Smith), A., i, 350.
- *Melampyrum*, aucubin and dulcitol in species of (Braecke), A., i, 280.
- **Melamine**, formation of (Davis and Underwood), A., i, 23.
- **Melanin**, formation of (Hirai), A., i, 423.
  - preparation of, from benzene (Adler), A., i, 591.
  - pathological, phosphorus content of (Salkowski), A., i, 980.
- **Melanins**, preparation of, containing nitrogen (Adler), A., i, 1218.
  - from adrenaline (Saccardi), A., i, 126.
  - from pyrrole derivatives (Saccardi), A., i, 135.
- **Melezitose**, preparation of (Harding), A., i, 898.
- **Melibiose**, preparation of (Harding), A., i, 1181.
- **Melting point**, relation between boiling point, critical temperature, and (Aubel), A., ii, 125.
  - influence of surface tension on (Rie), A., ii, 459.
  - of difficultly fusible metals (Pirani and Alterthum), A., ii, 125.
- **Melting point determination**, heating curve and quenching methods of (Morey), A., ii, 677.
  - apparatus for (Bell), A., ii, 376.
- **Membrane potential.** See Potential.
- **Membranes**, Donnan equilibrium at (Hill), A., ii, 221.
  - collodion, osmosis through (Preuer and Roder), A., ii, 220; (Bartell and Carpenter), A., ii, 221, 298, 384.
    - diffusion of acids through (Loeb), A., ii, 15.
    - for liquid junctions (Fales and Stammelman), A., ii, 455.
  - thin, passage of the electric current through (Lillie and Pond), A., ii, 829.
- **Memorial Lecture**, van der Waals (Jeans), T., 3398.
- **Mendeléevite** (Vernadski), A., ii, 330.

Menhaden oil, unsaturated fatty acids of (Brown and Beal), A., i, 647.
Mental work, effect of, on blood and respiratory exchange (Knipping), A., i, 502.
p-**Menthadienone**, *tri*bromo- (Jost and Richter), A., i, 209.
Menthol, action of light on acetone and (Scagliarini and Saladini), A., i, 587.
i-**Menthol**, preparation of (Rheinische Kampfer-Fabrik), A., i, 808.
l-**Menthone** in pine oil (Gill), A., i, 1104.
dicarboxylic esters, preparation and rotation of (Hall), T., 105.
*iso***Menthene**, semicarbazones (Hughesdon, Smith, and Read), T., 2920.
Menthones, stereoisomeric (Hughesdon, Smith, and Read), A., i, 345.
Menthonehydrazone (Maihle), A., i, 199.
Menthoneindole (Kuroda), A., i, 603.
l-**Menthylamine** hydroferrocyanide (Cumming), T., 2457.
α-**Menthylglycuronic acid**, and its salts (Bergmann and Wolff), A., i, 649.
Mercaptans, action of sulphur monochloride on (Chakravarti), T., 964.
2-Mercapto-4(5)-methyl-5(4)-allylglyoxaline (Sarasin), A., i, 712.
Mercapturic acid, synthesis of, in the body (Hele), A., i, 1156.
Mercurialis perennis, maltose in (Gillot), A., i, 1163.
Mercury, atomic weight of, and of its isotopes (Honigschmid, Birckenbach, and Steinheil; Honigschmid and Birckenbach), A., ii, 493.
atomic refraction of (Tiffeneau and Sommaire), A., ii, 349.
spectrum of (Déjardin), A., ii, 47.
band spectra of (Nagoaka), A., ii, 274.
effect of metallic coatings on the spectrum of (Janicki and Lau), A., ii, 669.
isotopes of (Mulliken), A., ii, 31, 637; (Harkins and Madorsky), A., ii, 166, 322.
luminescence and ionisation of the vapour of (Pavlov), A., ii, 603.
ionisation of the vapour of, in presence of argon (Déjardin), A., ii, 112.
low voltage arc in the vapour of (Yao), A., ii, 361.
free path of electrons in the vapour of (Minkowski), A., ii, 821.
heat of vaporisation of (Fogler and Rodebush) A. ii, 738.
Mercury, freezing point of (Keyes, Townshend, and Young), A., ii, 376.
surface tension of, in contact with oxygen (Palacios and Lasala), A., ii, 166; (Batuecas), A., ii, 639.
crystal structure of (McKeehan and Cioffi), A., ii, 864.
colloidal, preparation of (v. Weimarn), A., ii, 636.
wetting of glass by (Schumacher), A., ii, 833.
apparatus for purification of (Dixon and McKee), T., 895.
catalytic, in sulphonation of anthraquinone (Clough), A., i, 46.
Mercury alloys (*amalgams*), use of, in volumetric analysis (Kano), A., ii, 699, 700.
with alkali metals, preparation of (Giesy and Withrow), A., ii, 70.
relative intensity of spectra of (Newman), A., ii, 46.
with cadmium and lead, potential of (Kremann, Prammer, and Helly), A., ii, 825.
with cadmium and tin, potential of (Kremann, Prammer, and Helly), A., ii, 825.
Mercury compounds, phototropic (Dey), A., ii, 639.
Mercury salts. reaction of hydrogen on solutions of (Ipatiev and Starynkevitsch), A., ii, 639.
Mercury chlorites (Levi), A., ii, 421.
halides, additive compounds of α-unsaturated ketones and (Vorländer and Eichwald), A., i, 684.
Mercuric salts, action of, on bromates (Smith), A., ii, 573.
bromide and chloride, equilibria of thallium nitrate with (Bergman, Henke, and Isaikin), A., ii, 764.
chloride, association of (Bourion and Rouyer)) A., ii, 568.
influence of hydrogen ion concentration on the antiseptic action of (Joachimoglu), A., i, 424.
titration of, iodometrically (Kolthoff), A., ii, 91.
iodide, dynamic allotropy of (Damiens), A., ii, 864.
miscibility of, with alkali and thallium nitrates (Bergman), A., ii, 568.
fusion of silver nitrate and (Bergman), A., ii, 636.

Mercury:—
- **Mercuric** oxide, action of sulphur monochloride with (Oddo and Giachery), A., ii, 322.
  - phosphide (Brukl), A., ii, 75.
- **Mercurous** bromide, reaction of ammonium hydroxide with (Druce), A., ii, 421.
  - phosphide (Brukl), A., ii, 75.

Mercury organic compounds (Sneed and Maynard; Hofmann and Leschewski), A., i, 194; (Whitmore and Middleton; Mills and Adams), A., i, 970.
- estimation of carbon and hydrogen in (Falkov and Raiziss), A., ii, 336.
- dialkyls, preparation of, and their halides (Marvel and Calvary), A., i, 449.
- dibenzyl (García Banús), A., i, 265.
- diethyl-5:5-dithienylene-2:2′-dimercurichloride (Steinkopf, Bielenberg, and Augestad-Jensen), A., i, 125.
- dimethyl, preparation of (Maynard and Howard), T., 960.
- dipropyl, preparation of, and its action on thallic chloride (Goddard), T., 1168.
- di-*n*- and -*iso*-propyls (Goret), A., i, 312.
- 5:5′-dithienylene-2:2′-dimercurichloride (Steinkopf, Bielenberg, and Augestad-Jensen), A., i, 125.
- di-*p*-tolyl, reaction of, with sulphonyl halides (Whitmore and Thurman), A., i, 501.
- mercaptides (Sachs, Antoine, and Schlesinger), A., i, 1248.
- with phenyl halides (Hanke), A., i, 725.
- *n*- and *iso*-propyls, and their salts, and the hydroxide of the latter (Goret), A., i, 312.
- with salicylaldehydes (Whitmore and Middleton), A., i, 726.
- with thiophen (Steinkopf, Bielenberg, and Augestad-Jensen), A., i, 125.
- *p*-tolyl chloride (Whitmore, Hamilton, and Thurman), A., i, 501.
- **Mercuric** chloride, double salts of amine chloroplatinites and (Strömholm), A., i, 658.
  - hexamethylenetetramine salts (Douris and Beytout), A., i, 188.
- **1:1-Mercuridimethylenebis-4-methyl-1:2-dihydrobenzfuran** (Mills and Adams), A., i, 971.
- **Mercurimethyl-4-carboxyvinylene-1:2-dihydrobenzfuran**, 1-chloro- (Mills and Adams), A., i, 971.

Mercury organic compounds:—
- **Mercurimethyl-1:2-dihydrobenzfuran**, salts of, and 4:1-*di*bromo-, 4-bromo-1-chloro-, 4-bromo-1-iodo, 1-cyano-, and 1-hydroxy- (Mills and Adams), A., i, 971.
- **Mercurimethyl-1:2-dihydrobenzfurancarboxylic acids**, 1-chloro- (Mills and Adams), A., i, 971.
- **Mercurimethylmethyl-1:2-dihydrobenzfurans**, salts of, and bromo-, chloro-, cyano-, hydroxy-, and iodo- (Mills and Adams), A., i, 971.
- **Mercuri-5-nitrosalicylalaniline**, 3-hydroxy-, anhydride (Whitmore and Middleton), A., i, 726.
- **Mercurisalicylalaniline**, 3-chloro-, and 5-nitro-3-chloro- (Whitmore and Middleton), A., i, 726.
- **Mercurisalicylaldehyde**, *mono*- and *di*-chloro-, and 5-nitro-3-chloro- (Whitmore and Middleton), A., i, 726.

Mercury detection, estimation, and separation:—
- detection and estimation of, in gauze dressings (Barral), A., ii, 657.
- estimation of (Votoček and Kaspárek), A., ii, 184.
- estimation of, electrolytically (de Meeüs), A., ii, 42.
- separation of, from zinc (Artmann and Hartmann), A., ii, 89.

Mercury electrode. See Electrode.

Merotropy (Lowry), T., 828.

Mesitol, oxidation of (Goldschmidt and Bernard), A., i, 1096.

Mesityl oxide, preparation of (Locquin), A., i, 440.
- conversion of, into βδ-dimethylpentane-βγδ-triol (Pastureau and Bernard), A., i, 891.
- semioxamazone, and its sodium derivative (Wilson and Pickering), T., 396.
- preparation of homologues of (Gheorgiu), A., i, 538.

Mesityleneazoacetoacetanilide, nitro- (Morgan and Davies), T., 232.

Mesityleneazo-β-naphthol, amino-, nitro-, and nitroamino- (Morgan and Davies), T., 232.

Mesitylenebisazoresorcinol, 6-nitro- (Morgan and Davies), T., 234.

Mesitylenebisdiazonium salts, and amino- (Morgan and Davies), T., 233.

Mesitylenediazonium salts, nitroamino-, and nitro- (Morgan and Davies), T., 231.

β-Mesityloxidoxalic acid, ethyl ester, derivatives of (Borsche and Thiele), A., i, 1220.

- **β-Mesityloxidoxalic acid**, methyl ester, spectrochemistry and constitution of (v. Auwers and Dieckmann), A., i, 895.
- **Mesobilirubin**, hydrochloride and dimethyl ester of (Fischer and Niemann), A., i, 718.
- **Mesomorphic state** (Friedel), A., ii, 223.
- **Mesotartratodipentamminecobaltic** nitrate (Duff), T., 566.
- **Mesotartratopentamminecobaltic** nitrate (Duff), T., 569.
- **Mesoxamide**, oxime of. See Malonamide, *iso*nitroso-.
- **Mesoxdimethylanilide** (Usherwood and Whiteley), T., 1080.
- **Mesoxophenine** (Schlenk and Blum), A., i, 1235.
- **Metabolism**, influence of benzene on (Underhill and Harris), A., i, 733.
  - and protein content (Terroine, Feuerbach, and Brenckmann), A., i, 413.
  - influence of purine bases on (Underhill and Farrell), A., i, 413.
  - influence of pyramidone on (Gessler), A., i, 975.
  - action of thyroxin and of potassium iodide on (Hildebrandt), A., i, 506.
  - acid-base, of infants (Gamble, Ross, and Tisdall; Gamble and Ross), A., i, 1038.
  - of alkaline earth metals in relation to acidosis (Floris), A., i, 876.
  - of amino-acids, rôle of the liver in (Gottschalk and Nonnenbruch), A., i, 1255.
  - calcium, effect of diet on (Bogert and Kirkpatrick; Bogert and Trail), A., i, 166.
    - regulation of, by the thyroid (Parhon), A., i, 973.
  - calcium and magnesium, relation between (Bogert and McKittrick), A., i, 165.
  - calcium and phosphoric acid, of the horse (Scheunert, Schattke, and Weise), A., i, 975, 976.
  - calcium and phosphorus (Telfer), A., i, 418; (Sjollema), A., i, 1254.
  - carbohydrate (Foster), A., i, 503.
    - effect of phosphates on (Elias and Löw; Elias, Popescu-Inotesti, and Radoslav), A., i, 976.
    - in avitaminosis (Collazo), A., i, 506; (Rubino and Collazo), A., i, 1153.
    - rôle of the pancreas in (Koga), A., i, 1254.
    - influence of pancreatic extracts on (Murlin, Clough, Gibbs, and Stokes), A., i, 878.
- **Metabolism**, intermediary carbohydrate (Shaffer), A., i, 1254.
  - creatine (Benedict and Osterberg), A., i, 877.
  - fat, in avitaminosis (Asada), A., i, 1262.
  - gaseous, effect of proteins on (Leimdörfer), A., i, 420.
  - glycogen, in avitaminosis (Collazo), A., i, 506.
  - inorganic (Bogert and McKittrick), A., i, 165; (Bogert and Kirkpatrick; Bogert and Trail), A., i, 166; (Gross), A., i, 738; (Sjollema), A., i, 1254.
    - in diabetes (Meyer-Bisch and Thyssen), A., i, 417.
  - nitrogen, influence of benzyl benzoate on (Pack and Underhill), A., i, 413.
    - effect of indole and scatole on (Underhill and Kapsinow), A., i, 165.
    - in heart and kidney diseases (Pribram and Klein), A., i, 1262.
    - of bacteria (de Bord), A., i, 734.
    - in plants (Prianischnikov), A., i, 425.
  - nuclein (Jackson), A., i, 1255.
  - phosphorus (Sjollema), A., i, 1254.
    - of the nervous system (Hecker and Winterstein), A., i, 978; (Hecker), A., i, 1039.
  - protein and gaseous, influence of cell salts on (Asada), A., i, 1152.
  - intermediary protein (Gottschalk and Nonnenbruch), A., i, 1255.
  - pyrimidine (Wilson), A., i, 878.
  - uric acid (Lewis and Corley), A., i, 626.
- **Metals**, absorption spectra of the vapours of (Grotrian), A., ii, 710.
  - arc spectra of (Procopiu), A., ii, 199; (Perrette), A.. ii, 801.
  - excitation of Röntgen rays from (Horton, Andrewes, and Davies), A., ii, 817.
  - and their alloys and compounds, Röntgen-ray analysis of (Becker and Ebert), A., ii, 519.
  - cathodic polarisation of (Tammann and Wiederholt), A., ii, 8.
  - passivity of (Schmidt), A., ii, 732.
  - oligodynamy of (Schumacher), A., i, 424.
  - electro-deposited, crystalline form of (Blum and Rawdon), A. ii, 732.
  - anodic behaviour of, in non-aqueous solutions (Sborgi and Cappon), A., ii, 213.

Metals, thermal conductivity of (Brown), A., ii, 830.
  difficultly fusible, melting point of (Pirani and Alterthum), A., ii, 125.
  density of, and their alloys, at high temperatures (Bornemann and Siebe), A., ii, 169; (Sauerwald), A., ii, 172.
  cementation of (Weiss), A., ii, 678, 862.
  adsorption on surfaces of (v. Euler and Rudberg), A., ii, 13.
  diffusion in, in the solid state (Sirovich and Cartoceti), A., ii, 30.
  valency and crystal structure of (Padoa), A., ii, 16.
  crystalline, structure of (Owen and Preston), A., ii, 223.
  recrystallisation of (Tammann and Mansuri), A., ii, 300.
  colloidal. See Colloidal metals.
  effect of various poisons on the rate of solution of, in acids (Sieverts and Lueg), A., ii, 306.
  catalysis with (Foresti; Sandonnini), A., ii, 747.
  and their oxides, equilibria of carbon with (Nischk), A., ii, 762.
  velocity of reaction of oxygen, nitric oxide, and nitrous oxide on (Schroder and Tammann), A., ii, 838.
  action of gases on, with production of coloured films (Tammann), A., ii, 624.
  action of, on milk enzymes (Weichinger), A., i, 1155.
  reactions of, with organic compounds in liquid ammonia (Kraus and White), A., i, 456; (White), A., i, 457; (White and Knight), A., i, 1004.
  and their oxides, action of selenium oxychloride on (Ray), A., ii, 754.
  desulphuration of, by lime (Bogitch), A., ii, 151.
  of the ammonium sulphide group, separation of (Luff), A., ii, 791.
  heavy, optically active complexes of (Lifschitz), A., i, 348.
  of the hydrogen sulphide group, detection of (Feigl and Neuber), A., ii, 508.
    the iron group, analysis of Hufferd), A., ii, 262.
  noble, solution of, in potassium cyanide (Yamazaki), A., ii, 63.
  non-ferrous, cementation of (Sirovich and Cartoceti), A., ii, 30.
  of the platinum groups as catalysts (Hofmann) A., ii, 477.

Metals, rare, reduction of chlorides of, by sodium (Hunter and Jones), A., ii, 688.
  precipitation of, with hydrogen sulphide (Smith), A., ii, 639.
  electrometric titration of, with ferrocyanides (Treadwell and Chervet), A., i, 764.
  estimation of, electro-analytically, in hydrochloric acid solution (Engelenburg), A., ii, 260.
  estimation of, in foodstuffs, colorimetrically (Järvinen), A., ii, 655.

Metallic chlorides, solubility of, in selenium oxychloride (Wise), A., ii, 484.
  hydrides, studies on (Sand, Weeks, and Worrell), T., 456.
  hydroxides, dehydration of (Pascal), A., ii, 861.
    peptisation of (Sen and Dhar), A., ii, 835.
  oxides, action of the electrical discharge on (de Hemptinne), A., ii, 121.
    reduction of, with hydrogen (v. Wartenberg, Broy, and Reinicke), A., ii, 424.
    action of nitrosyl chloride and of vanadyl trichloride on (Cuttica, Tarchi, and Alinari), A., ii, 499.
  phosphides, preparation of (Brukl), A., ii, 75.
  salts, electrical conductivity of aqueous solutions of (Walden and Ulich), A., ii, 723.
    recrystallisation of (Tammann and Mansuri), A., ii, 300; (Vogel), A., ii, 301.
    vapour pressures of aqueous solutions of (Dieterici), A., ii, 377.
    hydrated, dissociation pressures of (Partington and Huntingford), T., 160.
    double decomposition of binary mixtures of (Bergman), A., ii, 761.
    effect of addition of carbohydrates to solutions of (Herzog and Bergenthun), A., ii, 835.
    taste of (Kionka and Strätz), A., i, 416.
    complex (Thomas and Fraser), T., 2973.
    action of, on alcoholic fermentation (v. May), A., i, 1269.
    biological adsorption of solutions of (Pichler and Wöber), A., i, 172.
    action of kidneys on excretion of (Denis), A., i, 511.

- **Metallic** sulphates, hydrated, vapour pressure of (CARPENTER and JETTE), A., ii, 292.
  - sulphides, preparation of (MARCHAL), A., ii, 571.
    - unipolar conductivity of (URAZOV), A., ii, 454.
    - estimation of, by ignition in hydrogen sulphide (MOSER and NEUSSER), A., ii, 580.
- **Metallurgy,** applications of physical chemistry to (DESCH), T., 280.
- **Metaphosphoric acid.** See under Phosphorus.
- **Metapilocarpine** (MAX and MICHEL POLONOVSKI), A., i, 130.
- **Meteoric iron** from Glasgow, Kentucky (MERRILL), A., ii, 174.
  - from Pennsylvania (MERRILL), A., ii, 175.
- **Meteorite** of St. Sauveur, France (LACROISE), A., ii, 778.
- **Methæmoglobin,** formation of, by the action of narcotics (ELLINGER and ROST), A., i, 410.
  - reduction of, by ammonium sulphide (QUAGLIARIELLO), A., i, 68.
  - oxygen content of (ROAF and SMART), A., i, 1144.
- **Methane,** catalytic preparation of (MEDSFORTH), T., 1452.
  - synthesis of (ARMSTRONG and HILDITCH), A., ii, 307.
  - thermodynamic properties of (KEYES, TAYLOR, and SMITH), A., ii, 376
  - solubility of, under pressure (FISCHER and TERBE), A., i, 173.
  - equation of state for (KEYES, SMITH, and JOUBERT), A., ii, 375.
  - partial combustion of (BERL and FISCHER), A., i, 641.
  - oxidation of (WHEELER and BLAIR), A., i, 285; (SCHÖNFELDER), A., i, 1175.
  - reduction of carbon monoxide to, in presence of iron (FISCHER and TROPSCH; FISCHER, TROPSCH, and MOHR), A., i, 737.
  - chlorination of (SCHLEEDE and LUCKOW), A., i, 83.
  - reaction of zirconium tetrachloride with (VENABLE and DEITZ), A., ii, 170.
  - synthesis of the polyacetic acids of (DREIFUSS and INGOLD), T., 2964.
  - estimation of, in mine gases (WHITAKER), A., ii, 586.
- **Methane,** bromo*tri*nitro- (SCHMIDT, SCHUMACHER, and ASMUS), A., i, 645.
- **Methanesulphonic acid,** chloro- (DEMARS), A., i, 789.
- **Methanesulphonyl** bromide (CHERBULIEZ and SCHNAUDER), A., i, 435.
- **Methanetetra-acetic acid,** crystal structure of (KNAGGS), T., 78.
- **Methanetriacetic** acid, synthesis of (DREIFUSS and INGOLD), T., 2964.
- **Methanolbenzidine** hydrochloride (KONDO and ISHIDA), A., i, 147.
- **Methionatodipentamminecobaltic nitrate** methionate (DUFF), T., 566.
- ω-**Methoxyacetophenone** (PRATT and ROBINSON), T., 748.
- *p*-**Methoxyacetophenone,** *m*-amino-, *m*-cyano-, *m*-iodo-, and *m*-iodoso-, and their derivatives (BOGERT and CURTIN), A., i, 1101.
- *p*-**Methoxyacetophenonesulphonic acid,** sodium salt and methyl ester (BOGERT and CURTIN), A., i, 1101.
- ω-**Methoxyacetoveratrone** (PRATT and ROBINSON), T., 755.
- 8-**Methoxyacridine,** 2:5-*di*amino-, 5-chloro-2-nitro-, and 2-nitro-5-amino- (FARBWERKE VORM. MEISTER, LUCIUS, & BRUNING), A., 1131.
- β **Methoxyadipic acid,** and its methyl ester (FARMER), T., 3330.
- **Methoxy-5-aldehydobenzoic acids.** hydroxy- (PERKIN and STOYLE), T., 2175.
- **Methoxyanthranylpyridinium** bromide and picrate (BARNETT, COOK, and MATTHEWS), T., 2004.
- 1-**Methoxyanthraquinone,** 4-amino-, acetyl and benzoyl derivatives (GRANDMOUGIN), A., i, 117.
- 2-**Methoxybenzaldehyde,** 3-chloro-, and 3-chloro-5-nitro- (DAVIES and RUBENSTEIN), T., 2850.
- 3-**Methoxybenzaldehyde,** 5-nitro-2-hydroxy-, preparation of (DAVIES), T., 1583.
- 4-**Methoxybenzaldehyde,** 3:5-*di*bromo- (LINDEMANN), A., i, 687.
  - 2-hydroxy-, from the roots of *Decalepsis Hamiltonii* (RAO and IYENGAR), A., i, 1018.
- *m*-**Methoxybenzamide** (BRADY and DUNN), T., 1802.
- *p*-**Methoxybenzodimethylamide,** thio- (KINDLER, BURGHARD, FINNDORF DEHN, GIESE, and KÖRDING), A., i, 571.
- *o*-**Methoxybenzoic acid,** action of dimethyl sulphate on (SIMON and FRÈREJACQUE), A., i, 1098.
- 2-**Methoxybenzoic acid,** 5-bromo- (MELDRUM and SHAH), T., 1985.
  - 3-chloro-, and 3-chloro-5-nitro- (DAVIES and RUBENSTEIN), T., 2850.
- 4-**Methoxybenzophenone-2′-arsenious acid** (LEWIS and CHEETHAM), A., i, 408.

4-Methoxybenzophenone-2′-arsinic acid (Lewis and Cheetham), A., i, 408.

4-Methoxybenzophenone-4′-arsinoacetic acid (Lewis and Cheetham), A., i, 408.

4-Methoxybenzophenone-2′-4′-*di*bromoarsines (Lewis and Cheetham), A., i, 408.

4-Methoxybenzophenone-2′- and -4′-*di*-chloroarsines (Lewis and Cheetham), A., i, 408.

4-Methoxybenzophenone-2′- and -4′-*di*-iodoarsines (Lewis and Cheetham), A., i, 408.

1-Methoxy-1:2:3-benzotriazole, 6-nitro- (Brady and Day), T., 2266.

δ-*o*-Methoxybenzoylvaleric acid, and its derivatives (v. Braun), A., i, 104.

Methoxybenzyl bromides, isomeric (Shoesmith), T., 2698.

***m*-Methoxybenzyl** bromide, reduction of, by hydrogen iodide (Shoesmith), T., 2828.

β-Methoxybenzylacetophenone, α-bromo- (Dufraisse and Gérald), A., i, 114.

4-*p*-Methoxybenzylhydantoin-3-α-propionic acid, and its sodium salt and ethyl ester (Hahn, Kelley, and Schaeffer), A., i, 487.

4-Methoxybenzylidene bromide, 3:5-*di*-bromo- (Lindemann), A., i, 687.

5- (or 6)-Methoxy-1-benzylidene-3-α-hydroxybenzylindene (Ingold and Piggott), T., 1508.

***p*-Methoxybenzylidene-*o*-hydroxymethylbenzhydrazide** (Teppema), A., i, 256.

***p*-Methoxybenzylidenemethylamine** (Kindler, Burghard, Finndorf, Dehn, Giese, and Körding), A., i, 571.

Methoxybromostyrene (Billmann and Lund), A., i, 219.

Methoxy*penta*chlorobenzene, chloro- (Pollak and Rudich), A., i, 28.

5-Methoxy-6-chloromethoxy-1:3-dimethyluracil hydrate (Biltz and Paetzold), A., i, 1234.

Methoxycinnamaldehydes, semicarbazones of, and their phototropy (Heilbron, Hudson, and Huish), T., 2276.

3-Methoxycinnamaldehydes, 2- and 4-hydroxy-, and their derivatives (Pauly and Wascher), A., i, 342.

***o*-Methoxycinnamic acid**, ethyl ester, velocity of reaction of, with ethyl alcohol and sodium hydroxide (Moesveld), A., ii, 746.

***p*-Methoxycinnamic acid**, α-thiol- (Granacher, Gerö, Ofner, Klopfenstein, and Schlatter), A., i, 707.

2-Methoxy-3-cyano-4:6-diphenylpyridine (Kohler and Souther), A., i, 244.

4-Methoxy-7:9-diethyl-4:5-dihydrouric acid (Biltz and Lemberg), A., i, 956.

5-Methoxy-7:9-diethyl-4:5-dihydrouric acid, 4-hydroxy- (Biltz and Lemberg), A., i, 955.

Methoxydihydrobrucinolone (Leuchs, Grüss, and Heering), A., i, 131.

Methoxydihydrostrychninolone, and its acetate (Leuchs and Nitschke), A., i, 132.

6-Methoxy-2:3-dimethylchromone (Heilbron, Barnes, and Morton), T., 2567.

Methoxy-2:3-dimethylchromones (Heilbron, Barnes, and Morton), T., 2568.

4-Methoxydimethyl-4:5-dihydrouric acids (Biltz and Lemberg), A., i, 956.

5-Methoxy-1:3-dimethyluracil (Biltz and Paetzold), A., i, 1234.

4′-Methoxydiphenylamine-6-carboxylic acid, 3-nitro- (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 1131.

α-Methoxy-αα-diphenylethane, β-bromo- (Lipp and Lüdicke), A., i, 319.

2-Methoxy-3-ethoxybenzaldehyde, 5-bromo-, and 5-bromonitro- (Davies), T., 1593.

5-nitro- (Davies), T., 1588.

Methoxyethoxybenzaldehydes, derivatives of, and bromo- and nitro- (Davies and Rubenstein), T., 2844.

2-Methoxy-3-ethoxybenzoic acid, and 5- and 6-nitro- (Davies), T., 1588, 1591.

Methoxyethoxybenzoic acids, nitro- (Davies and Rubenstein), T., 2847.

4-Methoxy-3-ethoxyphthal-1-aldehydic acid, 6-nitro-, and its esters (Wegscheider and Müller), A., i, 1204.

2-Methoxy-3-ethoxysalicylaldehyde (Davies), T., 1589.

4′-Methoxy-6-ethoxy-2-styryl-3-methylchromone (Heilbron, Barnes, and Morton), T., 2568.

***o*-Methoxyhexahydrobenzylcamphor** (Détrie), A., i, 1214.

5-Methoxyhomophthalic acid (Ingold and Piggott), T., 1507.

5-Methoxy-1-hydrindamine, and its derivatives (Ingold and Piggott), T., 1504.

6-Methoxy-1-hydrindamine, and its derivatives (Ingold and Piggott), T., 1493.

Methoxyhydrindene, bromo- (Schmidt, Schumacher, and Asmus), A., i, 645.

5-**Methoxy-1-hydrindone**, and its semicarbazone and oxime (Ingold and Piggott), T., 1503.

6-**Methoxy-1-hydrindone**, and its oxime (Ingold and Piggott), T., 1492.

β-3-**Methoxy-2-hydroxyphenylethyl-methyl ketone**, *β*-hydroxy-, and its benzoyl derivative (Heilbron and Whitworth), T., 242.

Methoxy-2-hydroxystyryl methyl ketones (Heilbron and Whitworth), T., 244.

5(or 6)-**Methoxyindene**, and its derivatives (Ingold and Piggott), T., 1506.

2-**Methoxy-3-keto-2:3-dihydro-1:4-benzthiazine** (Zahn), A., i, 376.

2-**Methoxy-3-keto-2:3-dihydro-*a*-naphthathiazine** (Zahn), A., i, 376.

2-**Methoxy-3-keto-2-methyl-2:3-dihydro-1:4-benzthiazine** (Zahn), A, i, 376.

2-**Methoxy-3-keto-5-methyl-2:3-dihydro-1:4-benzthiazine**, 7-chloro- (Zahn), A., i, 376.

2-**Methoxy-4-ketotetrahydroheptabenzthiazine** (Mayer and Horst), A., i, 845.

7-**Methoxy-1-keto-1:2:3:4-tetrahydronaphthalene**, and its semicarbazone (Krollpfeiffer and Schafer), A., i, 344.

δ-**Methoxylævulaldehyde** dimethyl acetal, and its derivatives (Pummerer and Gump), A., i, 698.

o- and *p*-**Methoxymethoxycinnamaldehydes** (Pauly and Wäscher), A., i, 342.

3-**Methoxy-2-** and **-4-methoxymethoxybenzaldehydes** (Pauly and Wascher), A., i, 342.

3-**Methoxy-2-** and **-4-methoxymethoxycinnamaldehydes** (Pauly and Wascher), A., i, 342.

1-**Methoxymethyl-1:2:3-benzotriazoles**, 4- and 6-nitro- (Brady and Day), T., 2262.

o- and *p*-**Methoxymethylbenzylamines**, and their salts and derivatives (v. Braun, Zobel, Nelken, and Blessing), A., i, 372.

7-**Methoxy-4-methylcoumarin-6-sulphonic acid**, and its salts and derivatives (Krüger), A., i, 355.

7-**Methoxy-4-methylcoumarin-6-thiol**, and its derivatives (Krüger), A., i, 355.

Methoxymethylenedioxyphenylquinoline, and its semicarbazone (Pratt and Robinson), T., 748.

cis- and *trans*-1-**Methoxy-3-methyl-3-ethyl*cyclo*propane-1:2-dicarboxylic acids**, and their anhydride (Singh and Thorpe), T., 120.

3-**Methoxy-3-methyl*cyclo*propane-1:2-dicarboxylic acid** (Goss, Ingold, and Thorpe), T., 3358.
 methyl esters (Goss, Ingold, and Thorpe), T., 360.

4-**Methoxy-2-methylpyrrole-3-carboxylic acid**, 5-nitro-, ethyl ester (Küster and Maag), A., i, 242.

8-**Methoxy-5-methylthianthren**, 3-amino-, hydrochloride and 3-nitro- (Krishna), T., 2789.

2-**Methoxy-1-naphthylmethanesulphonic acid**, sodium salt, preparation of (Clutterbuck and Cohen), T., 2510.

β-**Methoxy-*βζ*-oxidohexane**, *γ*-bromo-, and *γ*-hydroxy- (Bergmann and Miekeley), A., i, 1054.

β-4-**Methoxyphenylacrylamide**, *a*-cyano- (Curtis, Day, and Kimmins), T., 3139.

o-**Methoxyphenylarsinic acid**, and *p*-amino- and *p* nitro- (Johnson and Adams), A., i, 724.

3-**Methoxy-2-phenylbenzopyrylium** salts, and 7-hydroxy- (Pratt and Robinson), T., 749.

3′-**Methoxy-2-phenylbenzopyrylium** ferrichloride, 3·4′-*di*hydroxy- (Pratt and Robinson), T., 754.

γ-*p*-**Methoxyphenyl-*n*-butyric acid** (Krollpfeiffer and Schäfer), A., i, 344.

3-**Methoxyphenyl*tri*chloromethylcarbinol**, 4-hydroxy-, and the corresponding monoocetate (Pauly and Schanz), A., i, 564.

p-**Methoxyphenyl *β*-dimethylaminoethyl ketone** hydrochloride and picrate (Mannich and Lammering), A., i, 44.

3-**Methoxyphenylglyoxaldiphenylhydrazone**, 4-hydroxy- (Pratt and Robinson), T., 754.

4-**Methoxyphenyl 2-hydroxy-*β*-methoxystyryl ketone** (Pratt and Robinson), T., 751.

β-**Methoxyphenylpropionic acid**, bromohydroxy- and hydroxy-derivatives (Biilmann and Lund), A., i, 219.

m-**Methoxy-*β*-phenylpropionyl chloride** (Ingold and Piggott), T., 1503.

3-**Methoxy-1-phenylpyrrole** (Benary and Konrad), A., i, 241.

4-**Methoxy-1-phenylpyrrole-3-carboxylic acid**, and its potassium salt and methyl ester (Benary and Konrad), A., i, 241.

4′-**Methoxy-2-phenyl-4-styrylbenzopyrylium hydroxide**, 7-hydroxy-, and its salts and derivatives (Buck and Heilbron), T., 2527.

p-**Methoxyphenylthioacetodimethylamide** (Kindler, Burghard, Finndorf, Dehn, Giese, and Kording), A., i, 571.

α-*p*-**Methoxyphenyl-αβ-*di*thiocyanopropane** (Kaufmann and Liepe), A., i, 766.

5(or 6)-**Methoxy-1-piperonylidene-3-α-hydroxypiperonylindene** (Ingold and Piggott), T., 1508.

5(or 6)-**Methoxy-1-piperonylideneindene** (Ingold and Piggott), T., 1508.

4-**Methoxypyrrole-3-carboxylic acid**, 5-nitro-2-hydroxy-, and its salts and esters (Kuster and Maag), A., i, 243.

4-**Methoxyresorcylaldehyde.** See 4-Methoxybenzaldehyde, 2-hydroxy-.

Methoxy-2-styryl-3-methylchromones, and their salts (Heilbron, Barnes, and Morton), T., 2566.

6′-**Methoxy-2-sulphino-3′-methyldiphenyl** sulphide, 4-nitro- (Krishna), T., 2788.

p-**Methoxysulphonic acids**, action of bromine on (Meldrum and Shah), T., 1982.

p-**Methoxystyrene**, ω-bromo-ω-nitro-, and ω-nitro-, dibromide (Rosenmund and Kuhnhenn), A., i, 783.

p-**Methoxythiobenzomethylamide** (Kindler, Burghard, Finndorf, Dehn, Giese, and Kording), A., i, 571.

2-**Methoxytoluene**, 5-bromo- (Meldrum and Shah), T., 1984.

3-**Methoxytoluene-4:6-disulphonic acid**, derivatives of (Haworth and Lapworth), T., 2992.

Methoxytoluenesulphinic acids (Haworth and Lapworth), T., 2987.

4-**Methoxytoluene-3-sulphonacetic acid** (Gibson and Smiles), T., 2391.

4-**Methoxytoluene-3-sulphonacetone** (Gibson and Smiles), T., 2390.

4-**Methoxytoluene-3-sulphonacetophenone** (Gibson and Smiles), T., 2391.

Methoxytoluenesulphonic acids, salts and derivatives of (Haworth and Lapworth), T., 2987.

3-**Methoxy-*o*-toluic acid**, and its amide and nitrile (Gibson), T., 1274.

3-**Methoxy-*o*-toluidine**, and its benzoyl derivative (Gibson), T., 1273.

1-*o*-**Methoxy-*m*-toluidino-β-naphthol** (Wahl and Lantz), A., i, 210.

ω-**Methoxy-*o*- and -*p*-toluonitriles** (v. Braun, Zobel, Nelken, and Blessing), A., i, 372.

4-**Methoxy-*m*-tolyl** mercaptan (Krishna), T., 2788.

6′-**Methoxytolyl-ψ-meconines** (Bistrzycki and Krauer), A., i, 1210.

4-**Methoxytolyl-3-thiolacetic acid** (Gibson and Smiles), T., 2390.

o-**Methoxytriphenylmethyl**, and its salts and peroxide (Gomberg and Nishida), A., i, 213.

p-**Methoxytriphenylmethyl**, and its salts and peroxide (Gomberg and Buchler), A., i, 211.

Methyl alcohol, optical constants of (Tear), A., ii, 593.
freezing point of (Keyes, Townshend and Young), A., ii, 376.
dehydration of, with magnesium (Bjerrum and Zechmeister), A., i, 529, 645.
purification of (Bates, Mullaly, and Hartley), T., 401.
poisoning by. See Poisoning.
detection of, in alcoholic liquids (van Rijn), A., ii, 701.
detection of, in ethyl alcohol (Kolthoff), A., ii, 43; (van Urk), A., ii, 264; (Meurice), A., ii, 700.
detection of impurities in (Richard), A., ii, 586.
estimation of acetone in (Bates, Mullaly, and Hartley), T., 401.

Methyl bromide, preparation of (Bygdén), A., i, 174.
esters, preparation of (Simon), A., i, 290.
velocity of saponification of (Jones, McCombie, and Scarborough), T., 2688.
ether, preparation of (Senderens), A., i, 742.
physical properties of (Cardoso and Coppola), A., ii, 832; (Cardoso and Bruno), A., ii, 833.
melting point curve of mixtures of boron trifluoride and (Germann and Cleaveland), A., ii, 24.
compound of hydrogen chloride and (Maas and Morrison), A., i, 892.
chloride, freezing point of (Keyes, Townshend, and Young), A., ii, 376.
melting point curve of mixtures of boron trifluoride and (Germann and Cleaveland), A., ii, 24.
estimation of, in mixed gases (McKee and Burke), A., ii, 586.
iodide, action of, on disulphides (Steinkopf and Müller), A., i, 1055.
estimation of, in presence of ethyl iodide (Küster and Maag), A., ii, 440.
*per*oxide, *di*hydroxy- (Wieland and Wingler), A., i, 650.

Methyl sulphate, action of, on monocarboxylic acids (Simon), A., i, 290.
  action of, on diphenylamine and on methyldiphenylamine (Gibson and Vining), T., 831.
  action of, on phenols (Simon and Fréjacques), A., i, 462.
 sulphide, sodium derivative (Phillips and Clarke), A., i, 903.
Methylacetoacetic acid, bromo- and chloro-, ethyl esters, action of hydrazine on (Macbeth), T., 1125.
p-**Methylacetophenoneanil** (Bogert and Herrera), A., i, 240.
Methylacetylbenzhydrazide, 5-amino-2-hydroxy-, acetyl derivative (Teppema), A., i, 257.
5-Methylacridine, 3-chloro- (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1132.
Methylallophanic acids, methyl esters (Biltz and Jeltsch), A., i, 1074.
4(5)-Methyl-5(4)-allylglyoxaline (Sarasin), A., i, 712.
Methylallylketen (Staudinger, Schneider, Schotz, and Strong), A., i, 469.
Methylallylmalonic acid, and its ethyl ester (Staudinger, Schneider, Schotz, and Strong), A., i, 469.
Methylamine, photosynthesis of (Baly, Heilbron, and Stern), T., 186.
  bismuthonitrate (Vournazos), A., i, 759.
Methylamines, graphic representation of the thermal decomposition of (Michel), A., i, 307.
Methylaminobenzenylmethylimidine and its salts (Pyman), T., 3371.
β-**Methylamino-αα-bis-*o*-dimethoxyphenylethane**, and its hydrochloride (Hinsberg), A., i, 556.
β-**Methylaminobutane**, α-amino-, and its chloroplatinate (Bruylants), A., i, 763.
γ-**Methylamino-*n*-α-butylamine**. See β-Methylaminobutane, α-amino-.
β-**Methylaminobutyronitrile** (Bruylants), A., i, 763.
β-**Methylamino-αα-di-*o*-*di*hydroxyphenylethane**, and its hydrochloride (Hinsberg), A., i, 556.
Methyl-2-β-aminoethylbenzene, 1-amino-, and its salts (Helfer), A., i, 1229.
Methyl-2-β-aminoethyl*cyclo*hexane, 1-amino-, and its salts (Helfer), A., i, 1229.
r-β-**Methylamino-α-hydroxy-α-*o*-*di*hydroxyphenylethane**, and its hydrochloride (Hinsberg), A., i, 556.
β-**Methylamino-α-hydroxypropionic acid** hydrochloride (Mannich and Bauroth), A., i, 22.
2-Methylamino-1-hydroxytetrahydronaphthalene picrate (v. Braun, Braunsdorf, and Kirschbaum), A., i, 106.
α-**Methylaminomethyleneacetoacetic acid**, γ-chloro-, ethyl ester (Benary and Ebert), A., i, 1059.
α-**Methylaminomethylenethiotetronic acid** (Benary and Ebert), A., i, 1059.
Methylaminomethylethylmalonic acid, and its benzoyl derivative (Mannich and Ganz), A., i, 20.
Methylaminomethyltartronic acid (Mannich and Bauroth), A., i, 22.
Methyl-*p* aminophenol hydroferrocyanide (Cumming), T., 2458.
p-**Methylaminophenol**, *o*-chloro-, sulphate (Christiansen), A., i, 1093.
β-**Methylaminopropene-α-carboxylic acid**, methyl ester (Korschun and Roll), A., i, 1070.
4(5)-Methyl-5(4)-β-aminopropylglyoxaline, and its salts (Sarasin), A., i, 712.
Methyl*iso*amylbarbituric acid (Sommaire), A., i, 388.
1-Methyl-3-*tert*-amylbenzene, and its derivatives (Charrier, Gallotti, and Zappelli), A., i, 196.
δ-**Methyl-*n*-amyldiethylamine**, and its salts (G. M. and R. Robinson), T., 541.
Methyl*iso*amylmalonic acid, and its ethyl ester (Sommaire), A., i, 388.
Methylaniline, 5-bromo-2:4-*di*nitro- (Giua), A., i, 456.
α-*N*-**Methyl-*p*-anisylcarbamide** (Boehringer and Söhne), A., i, 949.
9-Methylanthracene (Krollpfeiffer and Branscheid), A., i, 912.
  picrate (Sieglitz and Marx), A., i. 912.
Methylanthraquinones, 3:7:8-*tri*hydroxy- (Bistrzycki and Krauer), A., i, 1210.
β-**Methylanthraquinone**, derivatives of (Eder and Widmer), A., i, 688.
3-Methylanthraquinone, 5- and 8-amino-1-hydroxy- (Eder and Widmer), A., i, 688.
  *di*hydroxy- (*chrysophanic acid*), synthesis of (Eder and Widmer), A., i, 688.
Methylarginine (Thomas, Kapfhammer, and Flaschenträger), A., i, 51.
dl-**Methylarginine**, and its salts (Thomas, Kapfhammer, and Flaschenträger), A., i, 51.

Methylation (Freudenberg), A., ii, 884.

Methylbenzhydrazide, 5-amino-, 5-bromo-, 5-chloro-, and 5-nitro-2-hydroxy-, and their derivatives (Teppema), A., i, 357.

1-Methylbenziminazole-2-carboxylic acid (Usherwood and Whiteley), T., 1085.

Methylbenziminazole-2-propylsulphonic acid (Backer and de Boer), A., i, 537.

Methylbenzoic acid, *p*-bromo-, and its acid chloride and benzyl ester (Hoffmann-La Roche & Co.), A., i, 925.

4-Methylbenzophenone-2′-arsinic acid (Lewis and Cheetham), A., i, 408.

7-Methyl-1:2:4-benzosulphonediazine, 3-chloro-, and its salts, 3-chloronitro-, and 3-hydroxy- (Scott), T., 3196.

4-Methylbenzthiazole-2-carboxylic acid, 6-chloro-, anilide and ethyl ester, and derivatives (Zahn), A., i, 376.

2-Methylbenzthiazoline, and its derivatives (Mills, Clark, and Aeschlimann), T., 2361.

2-Methylbenzthiazolone, thio-, and its oxidation products (Mills, Clark, and Aeschlimann), T., 2362.

4-Methyl-1:2:3:benztriazole, 6-nitro-1-hydroxy- (Borsche), A., i, 780.

6-Methyl-1:2:3-benztriazole, 4-nitro- (Borsche), A., i, 780.

Methyl-1:2:3-benztriazoles, nitrohydroxy-derivatives (Brady and Day). T., 2261.

Methylbenzylaminobenzenylimidine, salts of (Pyman), T., 3374.

Methylbenzylaminobenzenylmethylimidine, picrate of (Pyman), T., 3375.

a-**Methylbenzylphosphinic acid**, *a*-hydroxy-, diphenyl ester (Conant, Wallingford, and Gandheker), A., i, 498.

ms-**Methylbiuret** (Biltz and Jeltsch), A., i, 1075.

ω-**Methylbiuret**, *ω*-nitroso- (Biltz and Jeltsch), A., i, 1074.

β-**Methylbixin** (Herzig, Faltis, Pittner, Klein, and Watzinger), A., i, 477.

Methyl-*n*- and *iso*-borneol, and their derivatives (Nametkin and Chuchrikova), A., i, 586.

Methylbornyl alcohol, dehydration of (Nametkin and Schlesinger), A., i, 690.

2-Methyl-1-bromomethylnaphthalene (Ziegler and Tiemann), A., i, 31.

Methylbromonitrocamphane anhydride, and its benzoyl derivative (Ginnings and Noyes), A., i, 47.

4(5)-Methyl-5(4)-*β*-bromopropylglyoxaline (Sarasin), A., i, 712.

4(5)-Methyl-5(4)-*βγ*-*di*bromopropylglyoxaline (Sarasin), A., i, 712.

γ-**Methyl-Δ^{α}-butene-*a*-carboxylic acid**, derivatives of (v. Auwers, Meissner, Seydel, and Wissebach), A., i, 748.

Methyl-Δ^{β}-butenylaniline, and its salts (v. Braun and Schirmacher), A., i, 287.

Methyl-*n*- and *iso*-butylbarbituric acids (Sommaire), A., i, 387.

Methyl *iso*butylketone, semioxamazone (Wilson and Pickering), T., 396.

Methyl-*n* and *iso*-butylmalonic acids, and their ethyl esters (Sommaire), A., i, 387.

a-**Methylbutyric acid**, *a*-hydroxy-, ethyl ester, preparation of (Higginbotham and Lapworth), T., 1330.

Methylcacotheline, reactions of (Leuchs, Winkler, and Leuchs), A., i, 133.

β-**Methylcamphene** (Nametkin), A., i, 690.

β-**Methylcamphenilane** (Nametkin, Chuchrikoff, Schlesinger, and Brüssoff), A., i, 934.

β-**Methylcamphenilol**, and its derivatives (Nametkin, Chuchrikoff, Schlesinger, and Brüssoff), A., i, 934.

β-**Methylcamphenilone**, and its semicarbazone (Nametkin), A., i, 690.
  derivatives of (Nametkin, Chuchrikoff, Schlesinger, and Brüssoff), A., i, 934.

β-**Methylcamphenylamide** (Nametkin), A., i, 690.

N-**Methylcamphidine**, and its picrate (v. Auwers), A., ii, 706.

6-Methylcamphor, synthesis of, and its derivatives (Nametkin and Chuchrikova), A., i, 586.

Methyl*cis*camphoric acid, and its anhydride (Nametkin and Chuchrikova), A., i, 586.

d- and *r*-**Methylcarbamidothiolsuccinic acids** (Kallenberg), A., i, 247.

N-**Methylcarbazole**, 3-bromo- and 3-iodo- (Stevens and Tucker), T., 2146.

Methylcelloside, and its barium phosphate and sulphate (Helferich, Löwa, Nippe, and Riedel), A., i, 898.

Methylchelalbine, formula of (Karrer), A., i, 857.

Methyl-*β*-chloroethylaniline (British Dyestuffs Corporation, Ltd., Perkin, and Clemo), A., i, 453.

4(5)-Methyl-5(4)-*βγ*-chloroiodopropylglyoxaline (Sarasin), A., i, 712.

1-Methyl-3- and -4-*tri*chloromethylbenzenes, 1-*di*chloro-, chloro-derivatives (CASSELLA & Co.), A., i, 800.

Methyl*tri*chloromethylcarbinyl carbamate (YODER), A., i, 309.

2-Methyl-1-chloromethylnaphthalene (ZIEGLER and TIEMANN), A., i, 31.

1-Methyl-2-chloromethyl-4-*iso*propylbenzene (BLANC), A., i, 549.

3-Methyl-2-γ-chloropropylbenzanilide (v. BRAUN and KÜHLEIN), A., i, 837.

p-**Methylcinnamic acid**, α-thiol-, and its disulphide (GENDELMAN), A., i, 606.

Methylcinnamylideneacetic acids, and their ethyl esters (v. AUWERS and MÜLLER), A., i, 707.

A- and *B*-*N*-**Methylcopellidines** (v. BRAUN and SCHIRMACHER), A., i, 1050.

Methylcoumaric acid, action of bromine on (BIILMANN and LUND), A., i, 218.

Methylcoumarinic acid, action of bromine on (BIILMANN and LUND), A., i, 218.

4-Methylcoumarin-6-sulphonic acid, derivatives of (KRÜGER), A., i, 354.

4-Methylcoumarin-6-thiol (KRÜGER), A., i, 354.

9-Methyldecahydrocarbazole, and its salts (v. BRAUN and RITTER), A., i, 142.

Methyldecahydroquinolines, and their salts and derivatives (v. BRAUN, GMELIN, and SCHULTHEISS), A., i, 835.

Methyldeoxybenzoin semicarbazone (MCKENZIE and RICHARDSON), T., 88.

4′-Methyldeoxybenzoin, 2:4-*di*- and 2:4:6-*tri*-hydroxy-, and their derivatives (CHAPMAN and STEPHEN), T., 408.

Methyldiethylamine, and its chloroplatinate (G. M. and R. ROBINSON), T., 539.

4(5)-Methyl-5(4)diethylaminopropylglyoxaline, and its salts (SARASIN), A., i, 712.

Methyldiethyl-*n*-butoxymethylammonium salts (G. M. and R. ROBINSON), T., 538.

9-Methyl-9:10-dihydroanthracene (SIEGLITZ and MARX), A., i, 912.

As-**Methyldihydroarsindole**, and its derivatives (TURNER and BURY), T., 2489.

des-*N*-**Methyldihydro*iso*codeine**, and its derivatives (SPEYER and KRAUSS), A., i, 1116.

Methyldihydromorphimethine, and its salts (WIELAND and KORALEK), A., i, 1222.

4-Methyldihydronaphthacridine, and its picrate (v. BRAUN and STUCKENSCHMIDT), A., i, 948.

8-Methyldihydropentindole, and its picrate (PERKIN and PLANT), T., 3245.

2-Methyl-5:10-dihydrophenazine, 6:8-*di*nitro- (CULLINANE and JAMES), A., i, 607.

Methyldihydrothebainone methiodide (GULLAND and ROBINSON), T., 1009.

8-Methyl-8:9-dihydroxanthene, and its hydriodide (BILTZ and SCHMIDT), A., i, 490.

cis-**1-Methyl-2:5-dihydroxymethylpyrrolidine, and its salts** (v. BRAUN and SEEMANN), A., i, 1118.

5-Methyldiketodihydro-1:4-benzthiazine-2-anil, 7-chloro- (ZAHN), A., i, 377.

2-Methyl-1:3-dioxolane-4-carbinol, *tri*chloro-, and its urethane (YODER), A., i, 309.

3′-Methyldiphenyl sulphide, 6-chloro-3-nitro-6′-hydroxy- (KRISHNA), T., 2785.

Methyldiphenylamine, action of methyl sulphate on (GIBSON and VINING), T., 831.
  hydroferrocyanide (CUMMING), T., 2458.

Methyldiphenylaminesulphonic acid, salts of (GIBSON and VINING), T., 836.

Methyldiphenylpyrylium salts, constitution of (DILTHEY and FISCHER), A., i, 699.

ε-**Methyldodecane** (LEVENE and TAYLOR), A., i, 82.

Methyleneacetoacetic acid, γ-bromo-α-amino- and -α-hydroxy-, and γ-chloro-α-amino- and -α-hydroxy-, ethyl esters (BENARY and EBERT), A., i, 1058.

Methylenebismalononitrile (DIELS, GARTNER, and KAACK), A., i, 25.
  action of hot water on (DIELS and CONN), A., i, 1076.

Methylenebisnitro-β-naphthylamines (MORGAN and JONES), A., i, 380.

Methylene-blue, absorption of, by cotton (BIRTWELL, CLIBBENS, and RIDGE), A., ii, 793.
  reduction of, by iron compounds (MORGAN and QUASTEL), A., i, 982.
  analogies between oxydases and (ASCHMARIN), A., i, 622.
  estimation of (MORAW), A., ii, 800.

Methylenecamphor (RUPE and KUSSMAUL), A., i, 809.

Methylenecamphor, hydroxy-, optically active compounds of heavy metals and (LIFSCHITZ), A., i, 348.

Methylenecamphorphenylchloroamine (RUPE and DICHL), A., i, 117.

Methylenecamphorphenylhydroxylamine, and its salts and derivatives (Rupe and Diehl), A., i, 117.

3:4-Methylenedioxybenzaldoximes, hydrochlorides of (Brady and Dunn), T., 1797.

3:4-Methylenedioxycinnamic acid, α-amino-, cinnamoyl, and piperonyl derivatives, methyl esters (Society of Chemical Industry in Basle), A., i, 371.

3′:4′-Methylenedioxy-6-ethoxy-2-styryl-3-methylchromone (Heilbron, Barnes, and Morton), T., 2568.

6:7-Methylenedioxy-1-*mp*-methylenedioxyphenyl-3:4-dihydro*iso*quinoline-3-carboxylic acid, methyl ester, and its hydrochloride (Hartmann and Kägi), A., i, 605.

6:7-Methylenedioxy-2-methylquinoline, 3-amino-, and its derivatives, and 3-hydroxy- (Berlingozzi and Napolitano), A., i, 847.

9:10-Methylenedioxyphenanthrene (Biltz and Paetzold), A., i, 1235.

6:7-Methylenedioxy-1-phenetyl-3:4-dihydro*iso*quinoline-3-carboxylic acid, methyl ester (Hartmann and Kagi), A., i, 605.

Methylenedioxyphenylalanine (Granacher, Gerö, Ofner, Klopfenstein, and Schlatter), A., i, 707.

β-*mp*-**Methylenedioxyphenylbutyrophenone**, γ-amino-, and γ-nitro- (Kohler and Drake), A., i, 1119.

β-Methylenedioxyphenyl-αβ-diethyl propiophenone (Albesco), A., i, 42.

6-7-Methylenedioxy-1-phenyl-3:4-dihydro*iso*quinoline-3-carboxylic acid, methyl ester (Hartmann and Kägi), A., i, 605.

  and its salts (Society of Chemical Industry in Basle), A., i, 371.

β-Methylenedioxyphenyl-αα-dimethyl-β-ethylpropiophenone (Albesco), A., i, 42.

β-Methylenedioxyphenyl-αβ-dimethylpropiophenone (Albesco), A., i, 42.

6:7-Methylenedioxy-1-phenylethyl-3:4-dihydro*iso*quinoline-3-carboxylic acid, methyl ester, and its salts (Society of Chemical Industry in Basle), A., i, 371.

β-Methylenedioxyphenyl-β-ethylpropiophenone (Albesco), A., i, 42.

β-Methylenedioxyphenyl-α-methyl-β-ethylpropiophenone (Albesco), A., i, 42.

β-Methylenedioxyphenyl-β-methylpropiophenone (Albesco), A., i, 42.

α-**3:3-Methylenedioxyphenylpropane**, βγ-*di*bromo- (Rosenmund and Kuhnhenn), A., i, 783.

Methylenedioxyphenylpropionic acid, α-oximino- (Granacher, Gerö, Ofner, Klopfenstein, and Schlatter), A., i, 707.

3:4-Methylenedioxyphenylpropionic acid, α-amino-, phenylpropionyl and piperonyl derivatives, methyl esters (Society of Chemical Industry in Basle), A., i, 371.

6:7-Methylenedioxy-2-phenylquinoline, 3-amino-, and its derivatives and 3-hydroxy- (Berlingozzi and Napolitano), A., i, 848.

β-Methylenedioxyphenyl-ααβ-trimethylpropiophenone (Albesco), A., i, 42.

3:4-Methylenedioxystyrene, ω-bromo-ω-nitro-, and ω-nitro-, dibromide (Rosenmund and Kuhnhenn), A., i, 783.

3′:4′-Methylenedioxy-2-styryl-3-methylchromone, and its hydrochloride (Heilbron, Barnes, and Morton), T., 2567.

Methylenediphthalimide (Passerini), A., i, 761.

Methylenediquinaldine dialkylhalides (Hamer), T., 251.

Methylenemalononitrile, amino-, and hydroxy- (Diels, Gartner, and Kaack), A., i, 24.

Methylenephenylacetic acid, hydroxy-, ethyl ester and nitrile, condensation derivatives of (Rupe and Grunholz), A., i, 374.

Methylene*cyclo*propane, preparation of, and its dibromide (Demjanov and Dojarenko), A., i, 1192.

Methylenequinones. See Quinonemethides.

Methylenesuccinimide (Passerini), A., i, 761.

Methylepiglucosamine acetate (Levene and Meyer), A., i, 445.

β-Methyl-α-ethenylglutaric acid, and its derivatives (Bruylants and Gevaert), A., i, 1188.

2-Methylethylamino-$\Delta^{1:1'}$**-*dicyclo*hexenyl**, and its salts (v. Braun and Ritter), A., i, 142.

Methylethylbenzene, *p*-chloro- (Blanc), A., i, 549.

Methylethylbispentamethyleneimines, and their salts (v. Braun, Lemke, and Nelken), A., i, 841.

Methylethylglutaranilic acid (Singh and Thorpe), T., 117.

Methylethylglutaric acid, bromolactonic ester (Singh and Thorpe), T., 118.

ββ-Methylethylglutaric acids, *αα'-di*bromo-, and *αα'-di*hydroxy-, and their derivatives (Singh and Thorpe), T., 117.
Methylethylglyoxalines, and their salts (Windaus and Langenbeck), A., i, 147.
γ-Methyl-δ-ethylhexane-γδ-diol (Locquin and Wouseng), A., i, 433.
δ-Methyl-α-ethylhexoic acid, and its amide and chloride (Tiffeneau), A., i, 387.
Methylethylketen (Staudinger, Schneider, Schotz, and Strong), A., i, 469.
Methyl ethyl ketone, decomposition of (Hurd and Kocour), A., i, 1060.
  condensation products of (Ekeley and Howe), A., i, 997.
  semioxamazone and its sodium derivative (Wilson and Pickering), T., 395.
Methyl ethyl ketone-xyloses. See Xylose *sec.*-butylidene ethers.
1-Methyl-3-ethylphenyl-6 amine, formyl derivative (Maihle), A., i, 458.
cis- and *trans*-**3-Methyl-3-ethyl*cyclo*propane-1:2-dicarboxylic acids**, and their derivatives (Singh and Thorpe), T., 121.
3-Methyl-1-ethylpyrazole, and its picrate (Majima and Kotake), A., i, 151.
2-Methyl-4-ethylquinoline (Knoll & Co.), A., i, 947.
5-Methyl-1-ethyl-1:2:4-triazole, 3-hydroxy-, and its silver salt and hydrochloride (Taipale and Smirnov), A., i, 906.
***N*-Methylethylurethane**, *N*-chloro- (Traube and Gocke), A., i, 189.
γ-Methyl-α-ethylvaleric acid, and its amide and chloride (Tiffeneau), A., i, 387.
Methylfurazan, amino-, and its derivatives (Ponzio and Ruggeri), A., i, 854.
α-Methylglucoside *di*chlorohydrin and its sulphate and metallic salts (Helferich, Löwa, Nippe, and Riedel), A., i, 655.
α- and **β-Methylglucosides**, barium phosphate and sulphates of (Helferich, Löwa, Nippe, and Riedel), A., i, 898.
1-Methylglyoxaline, 4- and 5-chloro-, quaternary salts of (Sarasin), A., i, 711.
4-Methylglyoxaline, bromo-derivatives (Pyman and Timmis), T., 494.
4-Methylglyoxaline-5-carboxylic acid, 2-bromo-, and its ethyl ester (Pyman and Timmis), T., 498.
1-Methylglyoxalone-4-methylcarbamic acid, 5-hydroxy-, lactone (Biltz and Lemberg), A., i, 960.
Methylglyoxime, stereoisomerism of (Dorabialski), A., i, 754.
Methylglyoxime, amino-, diacetyl derivative (Ponzio and Ruggeri), A., i, 854.
Methylguanidine sulphate (Phillips and Clarke), A., i, 903.
8-Methylguanine, and its salts (Traube), A., i, 1136.
Methylheptenols, tertiary (Grignard and Escourrou), A., i, 739, 740.
γ-Methyl-Δ^{γ}-hepten-ε-one, and its derivatives (Ekeley and Howe), A., i, 997.
α-Methylheptylmalonic acid, ethyl ester (Levene and Taylor), A., i, 81.
1-Methyl*cyclo*hexan-3:4-diol, and its diphenylurethane (Godchot and Bédos), A., i, 101.
Methyl*cyclo*hexane, *tri*fluoro-, and its derivatives (Swarts), A., i, 314.
1 Methyl*cyclo*hexane, 2-iodo- (Skita, Hauber, and Schönfelder), A., i, 461.
cis- and *trans*-**1-Methyl*cyclo*hexane-4:5-diols** (Nametkin and Brüssov), A., i, 1082.
Methyl*cyclo*hexan-1-ol, 2:2:6-6-*tetra*hydroxy-, and its penta-acetate and derivatives (Mannich and Brose), A., i, 565.
Methyl*cyclo*hexanols, isomerism of (Mascarelli), A., i, 101; (Skita), A., i, 460.
1-Methyl*cyclo*hexan-2- and -4-ols, and their phenylurethanes (Skita, Hauber, and Schönfelder), A., i, 461.
Methyl*cyclo*hexanol-1-carboxylanilides (Passerini), A., i, 1014.
4-Methyl*cyclo*hexanol-1-carboxylonitrile (Passerini), A., i, 1014.
Methyl*cyclo*hexan-1-one, 2-*mono*-, and 2:2:6:6-*tetra*-hydroxy-, and their derivatives (Mannich and Brose), A., i, 566.
Methyl*cyclo*hexene, *tri*fluoro-, and its derivatives (Swarts), A., i, 314.
1-Methyl-Δ^{1}-*cyclo*hexene, preparation and derivatives of (Nametkin and Jarzey), A., i, 1081.
4-Methyl-Δ^{1}-*cyclo*hexene, and its derivatives (Nametkin and Brüssov), A., i, 1082.
Methyl-Δ^{3}-*cyclo*hexene oxide, and its derivatives (Godchot and Bédos), A., i, 101.
Methyl*cyclo*hexylamines, stereochemistry of (Skita), A., i, 671.
  and their derivatives (Skita, Hauber, and Scharenberg), A., i, 671.

m-**Methyl*cyclo*hexylbenzylamine**, and its salts and nitroso-derivative (v. Braun, Blessing, and Zobel), A., i, 1088.

cis- and *trans*-**1-Methyl*cyclo*hexylcarbinols**, and their benzoates (Skita, Häuber, and Schonfelder), A., i, 461.

cis- and *trans*-*p*-**Methyl*cyclo*hexyldimethylamines**, and their picrates (Skita, Hauber, and Scharenberg), A., i, 672.

1-Methyl-1-*iso*hexylenyl*cyclo*propane, and its derivatives (Kishner), A., i, 385.

cis-and *trans*-*p*-**Methyl*cyclo*hexylmethylamines**, and their picrates (Skita, Häuber, and Scharenberg), A., i, 672.

2-Methyl-1-*n*-hexylpyrrole (Karrer and Smirnov), A., i, 122.

cis- and *trans*-**Methyl*cyclo*hexylthiocarbimides** (Skita, Häuber, and Scharenberg), A., i, 672.

1-Methylhomo-1:2:3:4-tetrahydroquinoline, salts (v. Braun and Seemann), A., i, 147.

4-Methylhydantoin-3-α-*p*-hydroxyphenylpropionic acid (Hahn, Kelley, and Schaeffer), A., i, 487.

1-Methyl-1-α-hydroxyethyl*cyclo*hexane, and its derivatives (Meerwein and Schäfer), A., i, 326.

β-Methylhydroxylamine, preparation of, and its salts (Traube and Schulz), A., i, 1068.

β-Methylhydroxylamine*iso*disulphonic acid, salts of (Traube and Schulz), A., i, 1069.

1-Methyl-2-hydroxymethylglyoxaline, 4-chloro-, and its picrate (Sarasin), A., i, 711.

2-Methyl-2:6:6-*tri*hydroxymethyl*cyclo*hexan-1-ol, and its bisbenzylidene ether (Mannich and Brose), A., i, 566.

4-Methyl-2:2:6:6-*tetra*hydroxymethyl*cyclo*hexan-1-ol, and its penta-acetate (Mannich and Brose), A., i, 566.

Methylhydroxymethylnaphthalenes, and their phenylurethanes (Ziegler and Tiemann), A., i, 30.

des-N-**Methylhydroxythebainol** methyl ether, and its salts (Spey, Selig, and Heil), A., i, 128.

6-Methyl-ψ-indoxyl*spirocyclo*pentane, 9-nitro- (Perkin and Plant), T., 691.

2-Methylindyl-3-β-aminoacrylic acid, ethyl ester (Seka), A., i, 1125.

5-Methylisatin, 7-bromo-, and its derivatives (Ressy and Ortodocsu), A., i, 1227.

7-Methylisatin, and its phenylhydrazone (Posner and Heumann), A., i, 953.

7-Methylisatin, 5-bromo-, and its derivatives (Ressy and Ortodocsu), A., i, 833.

γ-Methylisatoid, bromo- (Heller and Lauth), A., i, 851.

5-Methyl-3-keto-2:3-dihydro-1:4-benzthiazine, 2:2:7-*tri*chloro- (Zahn), A., i, 376.

Methyl ketones, α-hydroxy-, preparation of (Locquin and Wouseng), A., i, 302.
  preparation of pinacones from, by action of Grignard reagents (Locquin and Wouseng), A., i, 433.

Methylmalol (Sando), A., i, 991.

Methylmaltoside, barium sulphate of (Helferich, Löwa, Nippe, and Riedel), A., i, 898.

Methylmercuric hydroxide (Sneed and Maynard), A., i, 194.

Methylmethanetriacetic acid, α-bromo-, diethyl hydrogen ester (Farmer), T., 3337.

10-Methyl-5-methylene-5:10-dihydroacridine (Konig), A., i, 862.

Methylmorphimethines, isomeric (Gulland and Robinson), T., 988.

α- and **β-Methylmuconic acids**, δ-hydroxy-. See γ-Oxalyl-αα- and -ββ-dimethylacrylic acids.

2-Methyl-β-naphtha-α-chromen-4-ol, 3-amino-, and its derivatives (Schneider and Bode), A., i, 700.

2-Methyl-β-naphthachromone-α, compound of ammonia and (Schneider and Bode), A., i, 700.

11-Methyl-α-naphthacridine, and its salts (v. Braun and Wolff), A., i, 144.

2-Methyl-α-naphthafuran-1-carboxylic acid, 4-nitro-, and its salts (Dey and Row), T., 3384.

1-Methylnaphthalene, chloro- (Blanc), A., i, 549.
  2-iodo- (Mayer and Schnecko), A., i, 773.

1-Methylnaphthalene-4-aldehyde, and its derivatives (Ziegler and Tiemann), A., i, 30.

4-Methyl-1:2-α-naphthapyrone, and bromo-, chloro-, cyano-, and iodo-derivatives (Dey and Dalal), T., 3391.

4-Methyl-1:2-α-naphthapyrone, 3-bromo-6-amino- and -6-nitro- (Dey and Row), T., 3383.

2-Methylnaphthathiazole methiodides (Smith), T., 2293.

1-Methyl-2-naphthoic acid, and its ethyl ester (Mayer and Schnecko), A., i, 773.

7-Methyl-α-naphthol (Krollpfeiffer and Schäfer), A., i, 348.

2-Methyl-ββ-naphthoxazole-4:9-quinone, and its diacetate (Fries and Ochwat), A., i, 842.

Methylnitroanthrone (Barnett and Cook), T., 2640.

2-Methyl-2′:4′-*di*nitrodiphenylamine (Linke), A., i, 554.

3-Methyl-2′:4′:6′-*tri*nitrodiphenylamine (Linke), A., i, 554.

γ-Methylnonane (Levene and Taylor), A., i, 81.

β-Methylnonoic acid, and its ethyl ester (Levene and Taylor), A., i, 81.

γ-Methylnonyl alcohol (Levene and Taylor), A., i, 81.

γ-Methylnonyl iodide (Levene and Taylor), A., i, 81.

Methylnopinol (Lipp), A., i, 1215.

Methylnoropianic acid, nitro-, salts and esters of (Wegscheider and Muller), A., i, 1204.

9-Methyloctahydrocarbazole (v. Braun and Ritter), A., i, 142.

γ-Methyloctan-δ-ol, and its allophanate (Vavon and Ivanov), A., i, 998.

2-Methyl-3-*n*-octylindole (Kuroda), A., i, 603.

Methyl-orange, isoelectric point of (Thiel and Dassler), A., i. 937.
- indicator for use instead of (Moir), A , ii, 779.

***dl*-Methylornithine**, and its salts (Thomas, Kapfhammer, and Flaschentrager), A., i, 51.

β- and γ-Methylpentanes, β- and γ-bromo- (Favorski and Sakara), A., i, 431.

Methyl*cyclo*pentan-1-ol, *tetra*hydroxy-, and its acetate and bismethylene ether (Mannich and Brose), A , i, 567.

Methyl*cyclo*pentan-1-one, 2:2·5:5-*tetra*hydroxy-, and its derivatives (Mannich and Brose), A., i, 567.

β-Methyl-Δ^{β}-pentene (van Risseghem), A., i, 526.

δ-Methyl-Δ^{α}-pentene-α-carboxylic acid, derivatives of (v. Auwers, Meissner, Seydel, and Wissebach), A., i, 749.

Methyl pentoses, optical rotation of (Maltby), T., 1404.

α-*N*-Methyl-*p*-phenetylcarbamide (Boehringer & Söhne), A., i, 948.

1- and 4-Methylphenmorpholines, and their salts and derivatives (v. Braun and Seemann), A., i, 146.

6-Methylphenothioxin, 3-nitro- (Krishna), T., 2785.

ω-Methyl-ω′-phenylbiuret (Biltz and Jeltsch), A., i, 1075.

***N*-Methyl-*o*-phenylenediamine**, preparation of (Usherwood and Whiteley), T., 1084.

2(3)-Methyl-*p*-phenylenediarsinic acid, and its salts (Lieb and Wintersteiner), A., i, 409.

γ-Methylphenyl-*n*-propyl alcohol, *o*-hydroxy- (v. Braun and Zobel), A., i, 1209.

α-Methylphthalide, 5-bromo-, **and** 5-chloro- (Teppema), A., i, 258.

Methylphthalimide (Passerini), A., i, 761.

Methylphthalimide, bromo-, **reaction of**, with alcohols (Hopkins), A., i, 340.

1-Methyl-2-piperidone, 3-amino-, **and its** salts (Thomas, Kapfhammer, and Flaschenträger), A., i, 51.

3-Methyl*cyclo*propane-1:2 dicarboxylic-3-acetic acid (Farmer), T., 3337.

trans-**3-Methyl*cyclo*propane-1:2-dicarboxylic acid**, and 1:2-*di*bromo- (Goss, Ingold, and Thorpe), T., 3353.

3-Methyl*cyclo*propane-1:2-dicarboxylic acid, 2:3-*di*bromo-, **and** its ethyl ester, and 3-hydroxy-, lactonic acid (Goss, Ingold, and Thorpe), T., 357.

3-Methyl-Δ^{2}-*cyclo*propene-1:2-dicarboxylic acid, and its ethyl and methyl esters (Goss, Ingold, and Thorpe), T., 348.
- methyl ester, sodium salt, and 1-bromo-(Goss, Ingold, and Thorpe), T., 3356.

***N*-Methylpropionyl*iso*papaverine** (Schneider and Nitze), A., i, 702.

α-Methyl-δ-*iso*propyladipic acids, αδ-*di*hydroxy-, resolution of (Henry and Paget), T., 1878.

Methyl*iso*propylbarbituric acid (Preiswerk), A., i, 299.

Methyl*iso*propylbenzene, *p*-chloro- (Blanc), A., i, 549.

2-Methyl-5-*iso*propylbenzoic acid, 4-chloro- (Wheeler and Giles), A., i, 28.

Methylpropylcarbinol, α-naphthylurethane of (Kurono), A., i, 423.

β-Methyl-γ-propylhexane-βγ-diol (Locquin and Wouseng), A., i, 433.

δ-Methyl-α-propylhexoic acid, and its amide and chloride (Sommaire), A., i, 388.

Methyl*iso*propylidene xylose (Svanberg), A., i, 1178.

2-Methyl-3-*n*- and -*iso*-propylindoles (Kuroda), A., i, 603.

Methyl propyl ketone, *p*-nitrophenylhydrazone of (Kurono), A., i, 423.

Methyl *iso*propyl ketone semioxamazone (Wilson and Pickering), T., 395.

2-Methyl-8-*iso*propylnaphthalene, nitro- (Ruzicka and Stoll), A., i, 119.

2-Methyl-3-*iso*propylphenylethane, β-amino-*αα*-*di*-4-hydroxy-, and its hydrochloride (Hinsberg), A., i, 556.

α-**2-Methyl-3-*iso*propylphenylethane**, β-chloro-*α*-hydroxy-*α*-4-hydroxy- (Hinsberg), A., i, 923.

1-Methyl-2-propylquinolinium picrate (Meisenheimer and Schütze), A., i, 840.

1-Methyl-2-propyl-1:2:3:4-tetrahydroquinoline methiodide (Meisenheimer and Schütze), A., i, 840.

γ-**Methyl-*α*-propylvaleramide** (Sommaire), A., i, 388.

2-Methylpurine, 6-hydroxy-, and its salts (Traube), A., i, 1137.

Methylpurpurogallin (Herzig), A., i, 806.

3(or 5-)**Methylpyrazole**, 4-iodo-, and its salts (Morgan and Ackerman), T., 1315.

3-(or 5-)**Methylpyrazolecarboxylic acid**, 4-iodo-, and its silver salt (Morgan and Ackerman), T., 1316.

2-Methylpyridine, 6-amino- (Chemische Fabrik auf Actien vorm. Schering), A., i, 148.
  6-amino-, 6-chloro-, and nitroamino-, and their salts and derivatives (Zeide), A., i, 600.

Methylpyridinium chlorate (Izmailski), A., ii, 523.

1-Methyl-2-pyridone, 4-chloro-3-cyano-, and 3-cyano-, and its derivatives (Späth and Koller), A., i, 595.

1-Methyl-2-pyridone-6-carboxylic acid (Spath and Koller), A., i, 595.

N-**Methyl-2-pyridyl-2′-pyrrole.** See *α*-Nicotyrin.

3-Methylpyrimidine, 4:5-*di*amino-2:6-*di*hydroxy-, derivatives of (Traube), A., i, 1135.

Methylpyrimidines, aminohydroxy-derivatives and their salts (Traube), A., i, 1137.

Methyl*iso*pyromucic acid, and its benzoyl derivative (Simon and Guillaumin), A., i, 240.

3-Methyl-*α*-pyrone-6-carboxylic acid, and its ethyl ester (Higginbotham and Lapworth), T., 1332.

4-Methyl-*α*-pyrone-6-carboxylic acid, and its ethyl ester (Higginbotham and Lapworth), T., 1328.

2-Methylpyrrole-3-carboxylic acid, 5-nitro-4-hydroxy-, and its ethyl ester (Küster and Maag), A., i, 243.

cis-**1-Methylpyrrolidine-2:5-dicarboxylic acid**, ethyl ester, and its salts (v. Braun and Seemann), A., i, 1117.

α-**Methylpyrryl-*α*-phenyl-Δ^{β}-allene** (Tronov), A., i, 602.

2-Methylquinoline (*quinaldine*), anhydro-base of (Adam), A., i, 1129.

2-Methylquinoline, *ω*-*tri*bromo-, and *ω*-*tri*chloro- (Hammick), T., 2882.

2-Methylquinoline-*p*-nitrophenylhydrazone, and its hydrochloride (Adam), A., i, 1129.

Methyl-red, absorption curve of (Thiel and Dassler), A., i, 1109.
  isoelectric point of (Thiel and Dassler), A., i, 937.

Methyltartronic acid, amino- (Mannich and Bauroth), A., i, 22.

Methylterpenesulphinium hydroxide, and its derivatives (Budnikov and Schilov), A., i, 119.

des-*N*-**Methyltetrahydro-*ψ*-** and -*allo*-*ψ*-**codeines**, and their derivatives (Speyer and Krauss), A., i, 1115.

Methyltetrahydromorphimethine hydrochloride (Wieland and Koralek), A., i, 1222.

ac-**Methyltetrahydronaphthalene**, 1-amino-, derivatives of (v. Braun, Gruber, and Kirschbaum), A., i, 108.

ar-**Methyltetrahydronaphthalene**, 1- and 2-chloro- and 1-cyano- (v. Braun, Gruber, and Kirschbaum), A., i, 108.

5-Methyl-1:2:3:4-tetrahydronaphthalene, 6-amino-, and their derivatives (Mayer and Schnecko), A., i, 773.

5-Methyl-1:2:3:4-tetrahydroquinoline, and its salts and nitroso-derivative (v. Braun and Kühlein), A., i, 837.

Methyltetrahydroquinolines, and their salts and derivatives (v. Braun, Gmelin, and Schultheiss), A., i, 835.

Methyl tetronamide (Clark), A., i, 16.

Methyl tetronolactone (Clark), A., i, 16.

3- and **4-Methyltetrophans** (v. Braun and Stuckenschmidt), A., i, 948.

Methylthebainol methiodide (Gulland and Robinson), T., 1009.

6-Methylthianthren, 3-amino-, and 3-nitro-, and their derivatives (Krishna), T., 2787.

2-Methylthiazole methiodide (Smith), T., 2290.

6-Methylthio-chromanol and **-chromanone**, and their derivatives (Arndt, Flemming, Scholz, and Löwensohn), A., i, 827.

6-Methylthiochromanone semicarbazone (Krollpfeiffer and Schultze), A., i, 1114.

- **Methyl-β-thiocyanohæmin** (Küster), A., i, 1032.
- **6-Methylthioflavanolanil** (Arndt, Flemming, Scholz, and Löwensohn), A., i, 827.
- **6-Methylthioflavanol-*p*-dimethylaminoanil** (Arndt, Flemming, Scholz, and Löwensohn), A., i, 827.
- **6-Methylthioflavanone** (Arndt, Flemming, Scholz, and Löwensohn), A., i, 826.
- **5-Methylthiolanthraquinone-1-butylsulphone** (Hoffman and Reid), A , i, 934.
- **3-Methylthiol-1:4-naphthaquinone,** 2-amino- (Fries and Ochwat), A., i, 842.
- **1-Methylthiol*iso*propylthiolanthraquinones** (Hoffman and Reid), A., i, 933.
- α-*N*-**Methyl-*p*-tolylcarbamide** (Boehringer & Söhne), A., i, 949.
- *N*-**Methyl-2:4 6-trimethylpiperidine** (v. Auwers), A., ii, 706.
- **α-Methylvaleric acid,** α-amino-, and its copper salt (Kurono), A., i, 308.
- **8-Methylxanthine,** salts (Biltz and Schmidt), A., i, 490.
- **3-Methylxanthine-8-acetic acid,** and its methyl ester (Traube), A., i, 1136.
- **3-Methylxanthine-8-carboxylic** acid, salts of (Traube), A., i, 1136.
- **3-Methylxanthine-8-propionic acid,** and its derivatives (Traube), A., i, 1136.
- **Micellæ,** composition of (Wintgren), A., ii, 78.
- **Michler's hydrol.** See Di-*p*-dimethylaminobenzhydrol.
- **Microbes** (*micro-organisms*), action of thorium-*X* on (Aversenq, Jaloustre, and Maurin), A., i, 262.
  - action of, on ammonium molybdate (Levine and Jahr), A., i, 1267.
  - oxidation of sulphur in the soil by (Waksman), A., i, 1042.
  - oxidation of zinc sulphide by (Rudolfs and Helbronner), A., i, 423.
- **Microsublimation,** new process of (Kempf), A., ii, 216.
- **Migranine** (Kremann and Janetzky), A., i, 949.
- **Milk,** cryoscopy of (Bailey), A., ii, 589.
  - secretion of (Brody, Ragsdale, and Turner), A., i, 510.
  - coagulation of, by acid (Anderson), A., i, 1155.
    - by heat (Leighton and Mudge), A., i, 879.
      - action of calcium on (Rona and Gabbe), A., i, 404.
- **Milk,** action of metals on enzymes of (Weichinger), A., i, 1155.
  - serum proteins of (Grimmer, Kurtenacker, and Berg), A., i, 780.
  - cow's, effect of heat on coagulation of (Palmer), A., i, 631.
    - sterol content of (Fox and Gardner), A., i, 510.
  - human, phosphates in, with normal and with rachitic infants (Meysenbug), A., i, 416.
  - detection of phosphoric acid and water in (Kling and Lassieur), A., ii, 505.
  - detection of water in (Castellani), A., ii, 512.
  - estimation of, in milk chocolate (Grossfeld), A., ii, 98.
  - estimation of fat in (Zega and Zega), A., ii, 590.
  - estimation of hypochlorites and chloroamines in (Rupp), A., ii, 177.
- **Mimosa bark,** action of nitric acid on (Einbeck and Jablonski), A., i, 1099.
- **Mine gases,** estimation of methane in (Whitaker), A., ii, 586.
- **Minerals,** Japanese, containing rare elements (Uyemura), A., ii, 692.
  - use of the oxy-acetylene blowpipe in analysis of (de Gramont), A., ii, 429.
- **Mineral sulphates,** from Huelva, Spain (Collins), A., ii, 776.
  - water. See under Water.
- **Mirgeline** chloroaurate (Engeland and Biehler), A., i, 72.
- **Molecular** association (Cardoso and Battista), A., ii, 126.
    - in liquids (Karpen), A., ii, 11.
  - compounds, formation of, and unsaturation (Maass, Boomer, and Morrison), A., i, 769.
  - conductivity of strong electrolytes (Lorenz and Landé), A., ii, 284; (Drucker), A., ii, 724.
  - phases and absorption spectra (Morton and Barnes), T., 2570.
  - state of pure liquids (Kolosovski), A., ii, 378; (Pavlov), A., ii, 378, 380.
  - surface energy, temperature coefficient of (Schenck and Kintzinger), A., ii, 614.
  - symmetry, relation between crystal symmetry and (Shearer), A., ii, 223; (Barker), A., ii, 388, 618; (Evans; Shearer and Astbury), A., ii, 468.
    - models for demonstrating (Mohr), A., ii, 716.
  - volume. See Volume, molecular.
  - weights. See Weights, molecular.

- **Molecules**, structure of (Jenkin), A., ii, 679.
  - dimensions of (Herzfeld), A., ii, 564.
  - catalytic activation of (Norrish), T., 3006.
  - compound, collisions of electrons in vapours of (Foote and Mohler), A., ii, 5.
  - diatomic, chemical constants of (Cox), A., ii, 532.
  - polyatomic, quantum theory of (Born and Hückel), A., ii, 312.
- **Molybdenite**, electrical conductivity of (Waterman), A., ii, 603.
  - crystal structure of (Dickinson and Pauling), A., ii, 571.
- **Molybdenum**, spectra of (Catalán), A., ii, 596.
  - arc spectrum of (Catalán), A., ii, 105.
  - arc spectrum and resonance and ionisation potentials of (Catalán), A., ii, 356.
- **Molybdenum alloys** with iron, electrochemistry of (Tammann and Sotter), A., ii, 825.
  - with tungsten (Geiss and van Liempt), A., ii, 866.
- **Molybdenum** *tri*oxide, hydrates of (Huttig and Kurre), A., ii, 327.
  - **Molybdic acid**, electrolytic reduction of solutions of (Foerster and Fricke), A., ii, 690.
    - and its salts, effect of, on the rotatory power of malic acid (Darmois), A., i, 299.
    - action of, on the rotatory power of tartaric and malic esters (Darmois), A., i, 535.
- **Molybdenum** sulphates, action of sulphur dioxide on (Wardlaw and Sylvester), T., 969.
  - *di*sulphide, photoelectric sensitivity of (Coblentz), A., ii, 280.

Nangapire. See *Eugenia pitanga.*
Naphthacoumarin, thio-, and its chloro-derivatives (Smiles and Hart), T., 2911.
Naphthacoumarin-4-carboxylic acid, thio- (Smiles and Hart), T., 2910.
α-Naphthacridine-7-carboxylic acid, and its salts and methyl ester (v. Braun and Wolff), A., i, 144.
β-Naphthafuran-1:2-dione (Staudinger), A., i, 938.
Naphthalene, constitution of (Challenor and Ingold), T., 2066.
formula of (Orelkin), A., i, 1082.
nucleus, substitution in (Veselý and Jakeš), A., i, 911.
doubly refractive (Kirby), A., i, 317.
spectrochemistry of (v. Auwers and Krollpfeiffer), A., ii, 101.
heat of combustion of (Schläpfer and Fioroni), A., ii, 832.
vapour pressure and latent heat of vaporisation of (Nelson and Senseman), A., i, 774.
binary eutectic mixtures of iodoform, iodine, and (Vasiliev), A., i, 455.
equilibrium of tetrachloroethane with (Cohen, de Meester, and Moesveld), A., ii, 612.
chemistry of, and its derivatives (Voroshcov and Gribov), A., i, 919.
hydrogenation of (Willstätter and Seitz), A., i, 771.
nitration and sulphonation of (Fierz-David), A., i, 1190.
catalytic oxidation of, at high temperatures (Kusama), A., i, 910.
picryl chloride (Efremov), A., i, 552.
derivatives, synthesis of (Challenor and Ingold), T., 2066.
Naphthalene, 4-bromo-α-cyano- (Gomberg and Blicke), A., i, 915.
β-chloro-, and α-nitro-, equilibria of antimony trichloride and (Vasiliev), A., ii, 395.
α-nitro-, fusion curves of binary mixtures of quinol, resorcinol, pyrocatechol, and (Senden), A., i, 461, 921.
substitution in (Veselý and Jakeš), A., i, 911.
6-nitro-2-imino-, acetyl derivative, and 2:6-*di*nitro- (Veselý and Jakeš), A., i, 918.
Naphthalenes, o-*di*hydroxy-, effect of, on electrical conductivity of solutions of boric acid (Böeseken, Anema, and Brevet), A., i, 210.
nitro-, reduction of (Cumming and Steel), T., 2464.
*di*nitro- (Veselý and Dvořák), A., i, 550.
Naphthalene series, azthionium salts of (Kehrmann, Gressly, Chiffère, and Ramm), A., i, 377.
preparation of heterocyclic compounds of (Staudinger), A., i, 938.
Naphthalene azo-colouring matters, affinity of, for cellulose (Voroshcov and Gribov), A., i, 960.

Naphthalene-1′-(2)-azo-1:8-*di*hydroxynaphthalene-3:6-disulphonic acid, 5′-nitro- (MORGAN and JONES), A., i, 1029.

β-Naphthalene-1-azo-β-naphthol-4-sulphonic acid (MORGAN and JONES), A., i, 327.

Naphthalene-β-azoxycarboxylamide (PIERONI and MOGGI), A., i, 613.

Naphthalene-3-carboxylic acids, 2-hydroxy-, methyl esters, dibenzoates, and sulphides (LESSER and GAD), A., i, 563.

Naphthalene-α-diazonium chloride, 4-bromo- (GOMBERG and BLICKE), A., i, 915.

1:2-Naphthalenediazosulphide (BAMBERGER, BAUM, and SCHLEIN), A., i, 1142.

Naphthalene-1:7-dicarboxylic acid (RUZICKA and STOLL), A., i, 119.

Naphthalene-1:8-dicarboxylic acid (*naphthalic acid*), hydrogenation of (CASARES and RANEDO), A., i, 220.

Naphthalene-1:8-dicarboxylic acid, chloro-, and its salts and anhydride (FARNELL), T., 61.

Naphthalenesulphonic acids, 2-cyano-, potassium and sodium salts (BUTLER and ROYLE), T., 1651.

Naphthalene-α- and -β-sulphoniodoamides, potassium and sodium salts (ROBERTS), T., 852.

Naphthalic acid. See Naphthalene-1:8-dicarboxylic acid.

β-Naphthaphenothioxin, 3-nitro-, and its dioxide (KRISHNA), T., 2785.

Naphthapyrones, and hydroxy-, arylsulphone derivatives of (TRÖGER and DUNKEL), A., i, 355.

Naphthapyrones, amino-, diazo-transformations of, and chloro- (DEY and DALAL), T., 3384.

1:4-Naphthaquinone, 3-chloro-2:5-*di*hydroxy-, and 2:3-*di*chloro-1:4:5-*tri*hydroxy-, and their acetates (WHEELER, DAWSON, and MCEWEN), A., i, 1020.
  2:3-*di*chloro- (FRIES and OCHWAT), A., i, 842.
  hydroxy- (WHEELER, DAWSON, and MCEWEN), A., i, 1020.
  5:6-*di*hydroxy-. See Naphthazarin.

β-Naphthaquinone-α-diazide (BAMBERGER, BAUM, and SCHLEIN; BAMBERGER and WILDI), A., i, 1142.

β-Naphthaquinone-β-diazide (BAMBERGER, BÖCKING, and KRAUS), A., i, 1141.

Naphthaquinoneoximes. See α-Naphthol, 2- and 4-nitroso-.

1:2-Naphthaquinonepyridinium salts, and bromo-, bromo*di*hydroxy-, and *di*hydroxy- (BARNETT, COOK, and DRISCOLL), T., 515.

1:4-Naphthaquinone-3-thiolacetic acid, 2-amino- (FRIES and OCHWAT), A., i, 842.

Naphthastyrylacetic acid (DUTT), T., 224.

α-Naphthathiazole-2-carboxyanilide (ZAHN), A., i, 377.

α-Naphthathiazole-2-carboxylic acid, methyl ester, and ethyl ester, and its derivatives (ZAHN), A., i, 376.

β-Naphthathiofuran-1:2-dione (STAUDINGER), A., i, 938.

Naphthazarin, reaction of, with phenylhydrazine (CHARRIER and TOCCO), A., i, 1028.

Naphthenes, catalytic dehydrogenation of (ZELINSKI), A., i, 907.

Naphthenic acids, from Japanese petroleum (TANAKA and NAGAI), A., i, 464.

peri-**Naphthindigotin** (DUTT), T., 224.

Naphthoic acid, nitro- (RUZICKA and STOLL), A., i, 119.

β-Naphthoic acid, amino- and hydroxy-derivatives, and their derivatives (BUTLER and ROYLE), T., 1652.

Naphthoic acids, hydroxy-, and their derivatives (ROYLE and SCHEDLER), T., 1641; (BUTLER and ROYLE), T., 1649.

α-Naphthol, catalytic reduction of (KOMATSU and NODZU), A., i, 782.
  preparation of carbonyl derivatives of (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 928.
  2-mercaptan, 4-chloro- (GIBSON and SMILES), T., 2392.
  detection of (ALOY and VALDIGUIÉ), A., ii, 91.

α-Naphthol, 6-bromo-, dibenzoates and sulphides (LESSER and GAD), A., i, 563.
  4-chloro-, disulphide and thiocarbonate of (GIBSON and SMILES), T., 2392.
  nitro-derivatives (VESELÝ and DVOŘÁK), A., i, 551.
  4- and 6-nitroso-, Beckmann transformation of, and their derivatives (BECKMANN, LIESCHE, and DIETRICH), A., i, 232.
  4-thiocyano- (KAUFMANN and LIEPE), A., i, 766.

β-Naphthol, catalytic ammonolysis of (HOWALD and LOWY), A., i, 557.

β-Naphthol, amino-, action of magnesium ethyl bromide on (PUXEDDU), A., i, 555.

β-Naphthol, 4-amino-, and 4-nitro-, and their toluenesulphonates (Challenor and Ingold), T., 2080.
    6-nitro- (Veselý and Jakeš), A., i, 918.
    1-thiocyano-, and 1-thiol-, and their methyl ethers (Kaufmann and Liepe), A., i, 766.
Naphthols, catalytic hydrogenation of (Brochet and Cornubert), A., i, 105.
    reaction of, with sodium (Kunz-Krause), A., ii, 661.
β-Naphtholazo-α-hydroxybutyrophenone (Porter and Ihrig), A., i, 1027.
β-Naphtholazo-α-hydroxypropionophenone (Porter and Ihrig), A., i, 1027.
β-Naphtholazo-α-hydroxy*iso*valerophenone (Porter and Ihrig), A., i, 1027.
β-Naphtholazophenylcarbazole (G. and M. de Montmollin), A., i, 374.
α-*o*-2-Naphtholazophenylcinnamic acid (Neber and Röcker), A., i, 946.
β-Naphthol-4-carboxylamide, and its *p*-toluenesulphonyl derivative (Challenor and Ingold), T., 2078.
α-Naphthol-β-diazonium chloride (Bamberger, Böcking, and Kraus), A., i, 1141.
α-Naphthol-β-diazosulphonic acid, potassium salt (Bamberger, Böcking, and Kraus), A., i, 1142.
α-Naphthol-2:4-dicarboxylic acid, preparation of (Society of Chemical Industry in Basle), A., i, 678.
α- and **β-Naphthol-digitonins** (Windaus and Weinhold), A., i, 590.
β-Naphthol-4-sulphonic acid, preparation of (Morgan and Jones), A., i, 327.
α and **β-Naphtho-β-naphthylamides** (Beckmann, Liesche, and Correns), A., i, 230.
α- and **β-Naphthonitriles**, catalytic reduction of (Rupe and Becherer), A., i, 1202.
ββ-Naphthoylacrylic acid, and its silver salt and methyl ester (Oddy), A., i, 1099.
Naphthoyl-*o*-benzoic acid, 1:6-*di*hydroxy-, allyl and ethyl esters and 1:5-*di*hydroxy-, ethyl ester (Society of Chemical Industry in Basle), A., i, 110.
1-α-Naphthoyl-9-oxanthronyl (Scholl, Dehnert, and Semp), A., i, 808.
β-1-Naphthoylpropionic acid (Krollpfeiffer and Schäfer), A., i, 344.
α-Naphthoyl*iso*succinic acid (Krollpfeiffer and Schäfer), A., i, 344.
β-Naphthyl sulphides, isomerism of (Lesser and Gad), A., i, 561, 920; (Hinsberg), A., i, 921.
α-Naphthylamine, catalytic reduction of (Komatsu and Nodzu), A., i, 782.
β-Naphthylamine, 6-nitro-, and its sulphates (Veselý and Jakeš), A., i, 918.
Naphthylamines, conductivity, viscosity, and density of systems formed by benzoic acid and (Baskov), A., i, 672.
Naphthylamines, bromonitro- (Veselý and Dvořák), A., i, 918.
    nitro-, condensation of formaldehyde with (Morgan and Jones), A., i, 379.
α-Naphthylamines, substituted (Holliday & Co., Ltd., and Morgan), A., i, 388.
    nitro-, azo-colouring matters from (Morgan and Jones), A., i, 1028.
α- and **β-Naphthylamines**, nitro-, and their acetyl derivatives (Veselý and Dvořák), A., i, 550.
β-Naphthylamine-6-sulphonic acid, 6- and 8-nitro- (Voroshcov and Gribov), A., i, 919.
1-α-Naphthylamino-β-naphthol (Wahl and Lantz), A., i, 210.
γ-α-Naphthylaminopropyl alcohol (Pierce and Adams), A., i, 485.
α-Naphthylcarbamic acid, γ-chloropropyl ester (Pierce and Adams), A., i, 484.
α-Naphthylcarbamido-α-methylvaleric acid (Kurono), A., i, 308.
α-Naphthylcarbamylbenzaldoximes (Brady and Ridge), T., 2169.
α-Naphthylcarbamyl-3:4-dimethoxybenz*anti*aldoxime (Brady and Ridge), T., 2173.
α-Naphthylcarbamyl-*p*-dimethylaminobenz*anti*aldoxime (Brady and Ridge), T., 2173.
α-Naphthylcarbamyl-*o*- and -*p*-methoxybenzaldoximes (Brady and Ridge), T., 2171.
α-Naphthylcarbamyl-3:4-methylenedioxybenzaldoximes (Brady and Ridge), T., 2170.
α-Naphthylcarbamylnitrobenzaldoximes (Brady and Ridge), T., 2172.
Naphthylcarbinols, action of sulphur on (Szperl), A., i, 1191.
Naphthyldeoxybenzoin (McKenzie and Richardson), T., 89.
β-Naphthyl-β-dimethylaminoethyl ether, and its hydrochloride (British Dyestuffs Corporation, Ltd., Perkin, and Clemo), A., i, 453

2:8-Naphthylenediamine-6-sulphonic acid (VOROSHCOV and GRIBOV), A., i, 919.

1-Naphthylethane, β-amino-αα-*di*-2-hydroxy-, and its hydrochloride (HINSBERG), A., i, 556.

β-1-Naphthylethylamine, and its picrate and benzoyl derivative (MAYER and SCHNECKO), A., i, 774.

α-Naphthylglycine-8-carboxylic acid, sodium salt (DUTT), T., 224.

α-Naphthylhydrazinedicarbothionamide, and its diacetyl derivative (GUHA), A., i, 608.

α-Naphthylmethylamine, and its hydrochloride (RUPE and BECHERER), A., i, 1202.

α- and **β-Naphthylmethylamines,** salts and derivatives of (v. BRAUN, BLESSING, and ZOBEL), A., i, 1088.

α- and **β-Naphthylmethyldimethylamines,** and their salts (v. BRAUN and MOLDAENKE), A., i, 1194.

α- and **β-Naphthylmethylmethylamines,** and their salts (v. BRAUN and MOLDAENKE), A., i, 1195.

β-Naphthylmethyl-β-naphthylideneamine (RUPE and BECHERER), A., i, 1202.

α-Naphthylmethyl-β-naphthylmethylmethylamine, and its salts (v. BRAUN and MOLDAENKE), A., i, 1195.

α-Naphthyl-*N*-methylnitroamine (BAMBERGER and SCHLEIN), A., i, 29.

4-β-Naphthyl-2-methylthiazole, and its salts and methiodide (SMITH), T., 2293.

α- and **β-Naphthylmethyltrimethylammonium** bromides (v. BRAUN and MOLDAENKE), A., i, 1195.

  iodides (v. BRAUN, BLESSING, and ZOBEL), A., i, 1088.

α-Naphthyl-β-naphthylketoxime (BECKMANN, LIESCHE, and CORRENS), A., i, 230.

α-Naphthylnitroamine, and its salts (BAMBERGER and SCHLEIN), A., i, 28

2-β-Naphthylpropionic acid, ethyl ester, and its derivatives (MAYER and SCHNECKO), A., i, 773.

3-α-Naphthyltetrahydro-1:3:2-oxazone (PIERCE and ADAMS), A., i, 484.

α- and **β-Naphthylthiocarbimides** (DAINS, BREWSTER, and OLANDER), A., i, 324.

β-Naphthylthiolpropionic acids (KROLLPFEIFFER and SCHULTZE), A., i, 1114.

Narceine, ultra-violet absorption spectrum of (STEINER), A., ii, 450.

Narcosis by inhaled anæsthetics (MEYER and HOPFF), A., i, 632.

Narcotics, effect of, on the swelling of cell colloids (KOCHMANN), A., i, 516.

Narcotine, ultra-violet absorption spectrum of (STEINER), A., ii, 107.

  influence of papaverine on the optical activity of (ANNETT), T., 376.

  estimation of, in opium (ANNETT and BOSE), A., ii, 269.

Nectandra coto, constituents of the bark of (SEIL), A., i, 886.

Neem oil, odorous and bitter constituents of (WATSON, CHATTERJEE, and MUKERJEE), A., i, 1163.

Neoarsphenamine. See Neosalvarsan.

Neodymium, arc spectrum of (KIESS), A., ii, 354.

Neon, formation of, from hydrogen in Geissler tubes (PIUTTI), A., ii, 20; (PIUTTI and BOGGIO-LERA), A., ii, 69.

  lecture experiment for obtaining, from air (v. ANTROPOFF), A., ii, 851.

  spectrum of (LANDÉ), A., ii, 709.

  series spectrum of (WENTZEL), A., ii, 352.

  excitation and ionisation potentials of (HERTZ), A., ii, 281.

  specific heats and heat of vaporisation of (MATHIAS, CROMMELIN, and ONNES), A., ii, 290.

  rectilinear diameter of (MATHIAS, CROMMELIN, and ONNES), A., ii, 70.

  purification of, and its critical temperature (CROMMELIN), A., ii, 634.

Neosalvarsan (MACALLUM), A., i, 70.

  detection of (SCHERINGA), A., ii, 272.

  estimation of (REMY), A., ii, 512.

Nephelometer (KLEINMANN), A., ii, 429.

Nephelometry of colloidal solutions (LEDNICKÝ), A., ii, 137.

Nephritis, constituents of blood-serum in (DENIS and HOBSON), A., i, 514.

  anions and kations in blood plasma in (MARRACK), A., i, 732.

  ammonia in blood in (RUSSELL), A., i, 514.

Nereocystis luetkeana, pigments of (HOWARD), A., i, 1047.

Nernst's theorem (DE DONDER) A., ii, 218.

Nerolidol (*peruviol*), constitution of (RUZICKA), A., i, 691.

dl-**Nerolidol,** synthesis of (RUZICKA), A., i, 691.

Nervous system, phosphorus metabolism of (HECKER and WINTERSTEIN), A., i, 978; (HECKER), A., i, 1039.

Nesquehonite, preparation of, and its solubility (MITCHELL), T., 1897.

Neurosyphilis (Cornwall and Myers), A., i, 1263.

Nickel, meteoric and terrestrial, atomic weights of (Baxter and Hilton), A., ii, 326.
  anodic behaviour of (Sborgi and Cappon), A., ii, 213.
  finely-divided, heat of adsorption of hydrogen by (Foresti), A., ii, 747.
  permeability of, to hydrogen (Lombard), A., ii, 570.
  colloidal, preparation of sols of, in benzene and in toluene (Hatschek and Thorne), A., ii, 390.
  catalytic, preparation and properties of (Brochet), A., ii, 18, 63; (Thomas), A., ii, 64.
  catalysis of the adsorption of gases by (Gauger and Taylor), A., ii, 398.
  catalytic hydrogenation with (Brochet), A., i, 102; (Brochet and Cornubert), A., i, 105; (Boswell), A., ii, 231; (Lush), A., ii, 477.
  effect of alumina and other oxides on the catalytic activity of (Armstrong and Hilditch), A., ii, 551.

Nickel alloys with antimony and sulphur (Guertler and Schack), A., ii, 424.

Nickel salts, density of (Biltz and Birk), A., ii, 768.
  catalytic hydrogenation with (v. Braun and Hahn), A., i, 102; (v. Braun), A., i, 103; (v. Braun, Petzold, and Seemann), A., i, 136; (v. Braun and Ritter), A., i, 141; (v. Braun, Blessing, and Zobel), A., i, 1087; (v. Braun and Kochendörfer), A., i, 1197.

Nickel chloride, anhydrous, specific gravity of (Baxter and Hilton), A., ii, 326.
    solubility of, in water containing hydrochloric acid (Foote), A., ii, 326.
    equilibrium of ammonium chloride, water, and (Rivett and Clendinnen), T., 1634.
  chlorite (Levi), A., ii, 421.
  triple nitrites (Cuttica and Carobbi), A., ii, 76.
  oxide, crystal structure of (Davey and Hoffman), A., ii, 27.
  higher oxide (Howell), T., 669, 1772.
  sulphate, precipitation of solutions of, with cadmium or zinc (Kremann, Angelberger, Bakalarz, Rohrich, and Stöger), A., ii, 866.
  sulphide (Gluud and Mühlendyck), A., ii, 423; (Ephraim), A., ii, 768.

Nickel sulphide, oxidation of (Dunn and Rideal), T., 1242.

Nickel organic compounds:—
  acetylide (Durand), A., i, 1170.
  cyanides, complex (Job and Samuel), A., i, 904.
  dibenzylamine and pyridine potassium sulphates (Spacu and Ripan), A., i, 833.

Nickel detection, estimation, and separation:—
  detection of (Vernon), A., ii, 342.
  estimation of (Löffelbein and Schwarz), A., ii, 435.
  estimation of, gravimetrically (Spacu), A., ii, 585.
  estimation of, volumetrically (Spacu and Ripan), A., ii, 585.
  estimation of, in iron (Eder and Eder), A., ii, 92.
  separation of, from zinc (Artmann and Hartmann), A., ii, 89.

Nicotinamide, 5-chloro-1:3-*di*hydroxy- (Schroeter and Seidler), A., ii, 1124.

Nicotine, estimation of, in tobacco and its extracts (Shedd), A., ii, 798.

Nicotine, amino-, and hydroxy-, and their salts (Tschitschibabin and Buchholz), A., i, 594.

Nicotinonitrile, 5-chloro-1:3-*di*hydroxy-, and its disodium salt (Schroeter and Seidler), A., i, 1124.

α-Nicotyrin, and its salts (Tschitschibabin and Bylinkin), A., i, 955.

Niton (*radium emanation*), quantitative measurement of (Lepape), A., ii, 529.
  decomposition of trypsin by (Hussey and Thomson), A., i, 871.

Nitramine, use of, as an indicator (Kolthoff), A., ii, 888.

Nitrates. See under Nitrogen.

Nitration, studies in (Arnall), T., 3111.

Nitratopentamminecobalti-salts. See under Cobalt.

Nitric oxide. See Nitrogen *di*oxide.

Nitric acid. See under Nitrogen.

Nitrification (Bonazzi), A., i, 74.
  in soils (Schönbrunn; Löhnis), A., i, 1167.

Nitriles, preparation of (v. Auwers, Jordan, Meissner, and Seydel), A., i, 662.
  catalytic reduction of (Rupe and Hodel), A., i, 1199.
  dynamics of the formation of (Kremann, Auer, Oswald, and Zoff; Kremann and Rösler), A., ii, 227.
  reduction of, with hydrogen and nickel (Rupe and Glenz), A., i, 100.

Nitriles, action of organomagnesium compounds on (Baerts), A., i, 191; (Bruylants), A., i, 310, 1003; (de Booseré), A., i, 311.
  action of magnesium phenyl bromide on (Bary), A., i, 226.
  condensation of thioamides with (Ishikawa), A., i, 926.
  δ-ketonic, relation of, to cyclic compounds (Kohler, Graustein, and Merrill), A., i, 54.

*iso***Nitriles**. See Carbylamines.

Nitro-alcohols, aliphatic (Wilkendorf and Trénel), A., i, 288.

Nitro-compounds, heats of combustion and of formation of (Rubcov and Severjanov), A., ii, 218.
  catalytic reduction of (Kohler and Drake), A., i, 666, 1118.
  phytochemical reduction of (Neuberg and Reinfurth), A., i, 987.
  aromatic (Margosches, Kristen, and Scheinost), A., ii, 785.
    estimation of nitrogen in (Margosches and Kristen), A., ii, 431.

Nitroform derivatives, electrical conductivity and reduction of (Henderson, Hirst, and Macbeth), T., 1130.

Nitrogen, atomic weight of (Moles and Clavera), A., ii, 149.
  spectra of, in low voltage arcs (Duffendack), A., ii, 373, 802.
  band spectrum of (Huddleston), A., ii, 2; (Kirschbaum), A., ii, 670.
  band spectrum and molecular structure of (Nagaoka), A., ii, 594.
  effect of an electric field on the band spectrum of (Datta), A., ii, 446.
  ultra-violet spectra of (Hopfield), A., ii, 351, 804.
  active, spectrum of (Rayleigh), A., ii, 45.
    phosphorescence caused by (Lewis), A., ii, 361; (Jevons), A., ii, 451; (Krepelka), A., ii, 598.
    after-glow of (Pirani and Lax), A., ii, 154.
  ionisation of, on collision with electrons (Ayres), A., ii, 111; (Smyth), A., ii, 602.
  ionisation potential of (Smyth), A., ii, 455; (Mackay), A., ii, 821.
  atoms, doubly-linked, stereochemistry of (Mills and Schindler), T., 312.
  tervalent, stereochemistry of (Meisenheimer and Schütze), A., i, 839.
  valency of (Uspenski), A., ii, 484.
  pure, equation of state for (Smith and Taylor), A., ii, 755.
  action of, on the surface of metals (Tammann), A., ii, 624.

Nitrogen, atmospheric, fixation of, by the cyanide process (Terada), A., ii, 631; (Hamburger), A., ii, 755.
    use of calcium carbonate in (Gainey), A., i, 881.

Nitrogen compounds, photosynthesis of, from carbon dioxide and ammonia (Baly, Heilbron, and Stern), T., 185.

Nitrogen *tri*chloride, photochemical decomposition of solutions of (Bowen), T., 1203.
  *mon*oxide (*nitrous oxide*), motion of electrons in (Skinker and White), A., ii, 722.
    boiling point of (Bergstrom), A., ii, 56.
    pharmacological action of (Bart), A., i, 983.
  mono- and *di*-oxides, specific heats of (Partington and Shilling), A., ii, 214.
    velocity of reaction of, on metals (Schröder and Tammann), A., ii, 838.
  *di*oxide (*nitric oxide*), motion of electrons in (Skinker and White), A., ii, 722.
    absorption spectra of compounds of, with copper and ferrous sulphates (Schlesinger and Salathe), A., ii, 673.
    oxidation of (Briner and Malet), A., ii, 485.
    formation of gaseous ions in the oxidation of (Brewer and Daniels), A., ii, 721.
    mixtures of hydrogen chloride and, at low temperatures (Rodebush and Yntema), A., ii, 237.
    estimation of (Kochler and Marqueyrol), A., ii, 178.
  per- or *tetr*-oxide, molecular state of, at low temperatures (Pascal), A., ii, 558.
    velocity of sound in (Selle), A., ii, 297; (Grüneisen and Goens), A., ii, 741.
    oxidation of, by ozone (Wulf, Daniels, and Karrer), A., ii, 23.
    compounds of camphor and (Pascal and Garnier), A., i, 345.
  *pent*oxide, decomposition of (Bodenstein), A., ii, 303.
    decomposition of, in presence of ozone (Daniels, Wulf, and Karrer), A., ii, 24.
  oxides, production of, by the electric discharge (McEachron), A., ii, 685.

Nitrogen oxides, absorption and analysis of (Sanfourche), A., ii, 84.
action of, on unsaturated compounds (Diels), A., i, 822.
Nitric acid, pure, preparation of (E. and R. Urbain), A., ii, 125.
solubility of chromium trioxide in (Mumford and Gilbert), T., 471.
action of, on phenols (Iwata), A., i, 779.
detection of, by ferrous sulphate (Faurholt) A., ii., 179.
estimation of, gravimetrically (Rupe and Becherer), A., ii, 577.
and its salts, estimation of nitrogen in (Webb and Taylor), A., ii, 84.
Nitrates, detection of (Nixon), A., ii, 432.
detection of, by Rodillon's test (Heller), A., ii, 696.
detection of, in presence of organic matter (Sabalitschka and Schmidt), A., ii, 577.
estimation of, in soils (Gimingham and Carter), A., ii, 577.
aliphatic, estimation of (Huff and Leitch), A., ii, 36.
Nitrous acid, detection of (Zlataroff), A., ii, 505.
Nitrites, detection of, in water (Rodillon), A., ii, 37, 178.
Nitrogen detection and estimation:—
detection of, microchemically (Ionescu and Hărsovescu), A., ii, 251.
estimation of, by hydrogen peroxide (Heuss), A., ii, 430.
estimation of, by the Jodlbauer method (Bordas), A., ii, 874.
estimation of, by persulphates, (Wong), A., ii, 431.
estimation of, in leather and in gelatin (Gerngross and Schaefer), A., ii, 653.
estimation of, in nitrates, by Devarda's method (Koehler, Marqueyrol, and Jovinet), A., ii, 179.
estimation of, in nitrates and nitric acid (Webb and Taylor), A., ii, 84.
estimation of, in aromatic nitro-compounds (Margosches and Kristen), A., ii, 431, 653.
estimation of, in plant tissues (Gallagher), A., ii, 334.
estimation of, in proteins (Wilson), A., ii, 576; (Kostytschev), A., ii, 874.
estimation of, in water (Becker and Abbott), A., ii, 784.
Nitrogen detection and estimation:—
amino-, estimation of, in compounds reacting slowly with nitrous acid (Wilson), A., ii, 576.
amino-acid, estimation of, in blood (Blau), A., i, 1250.
carbamide, estimation of, volumetrically (Tillmans and Kruger), A., ii, 36.
non-protein, estimation of, in blood (Cristol and Nikolitch), A., ii, 653.
Nitro-groups, basic properties of (Cherbuliez), A., i, 452.
reduction of, by tissues (Waterman and Kalff), A., i, 415; (Lipschitz), A., i, 875.
γ-**Nitroketones**, reduction of (Kohler and Drake), A., i, 1118.
Nitropentamminecobalti-salts. See under Cobalt.
Nitroprussic acid, sodium salt, electrolytic precipitation with (Kolthoff), A., ii, 257.
Nitroprussides, reaction of hydroxylamine with (Giral Pereira), A., i, 905.
Nitropyrroles (Angeli), A., i, 135.
Nitroso-compounds, action of hydroxylamine and of dihydroxyammonia on (Angeli and Pieroni), A., i, 612.
Nitrosyl *tri*bromide, preparation of (Datta and Chatterjee), A., i, 345.
chloride, preparation of (Pickard and Hunter), T., 441.
catalysis of formation of (Kiss), A., ii, 237.
photochemical decomposition of (Kiss), A., ii, 598.
action of, on metallic oxides (Cuttica, Tarchi, and Alinari), A., ii, 499.
interaction of toluene and (Lynn and Arkley), A., i, 451.
Nitrosylsulphuric acid, absorption spectrum of (Schlesinger and Salathe), A., ii, 673.
Nitrous acid. See under Nitrogen.
Nonadecaldehyde, γ-hydroxy-, and its derivatives (Helferich and Köster), A., i, 1178.
*dicyclo***Nonane** (Meerwein, Kiel, Klösgen, and Schoch), A., i, 222.
dicyclo-[1, 3, 3]-**Nonane**, *trans*-2:6-*di*amino-, and its derivatives (Meerwein, Kiel, Klosgen, and Schoch), A., i, 224.
trans-*dicyclo*[1, 3, 3]-**Nonane-2:6-diol**, and its salts (Meerwein, Kiel, Klösgen, and Schoch), A., i, 222.

tricyclo-[1, 3^3, 3^6, 0]-**Nonane-2:6-diol**, and its salts and diphenylurethane (Meerwein, Kiel, Klösgen, and Schoch), A., i, 222.
dicyclo-[1, 3, 3]-**Nonane-2:6-dione**, and its derivatives (Meerwein, Kiel, Klösgen, and Schoch), A., i, 221.
dicyclo-[1, 3, 3]-**Nonane-2:6-dione-1:3:5:7-tetracarboxylic acid**, and 3-*mono*-, and 3:7-*di*-bromo-, methyl esters, and their derivatives (Meerwein, Kiel, Klösgen, and Schoch), A., i, 222.
tricyclo-[1, 3^3, 3^7, 0]-**Nonane-2:6-dione-1:3:5:7-tetracarboxylic acid**, methyl ester (Meerwein, Kiel, Klösgen, and Schoch), A., i, 223.
Nonan-ε-ol, and its allophanate (Vavon and Ivanov), A., i, 998.
dicyclo-[1, 3, 3]-**Nonan-2-ol**, and its acetate (Meerwein, Kiel, Klösgen, and Schoch), A., i, 222.
dicyclo-[1, 3, 3]-**Nonan-2-one**, and its derivatives (Meerwein, Kiel, Klösgen, and Schoch), A., i, 222.
Nonanones, hydrogenation of (Vavon and Ivanov), A., i, 998.
dicyclo-[1, 3, 3]-Δ^6-**Nonene**, 2-amino- (Meerwein, Kiel, Klösgen, and Schoch), A., i, 224.
Δ^α-**Nonene-α-carboxylic acid**, derivatives of (v. Auwers, Meissner, Seydel, and Wissebach), A., i, 749.
dicyclo-[1, 3, 3]-Δ^6-**Nonen-2-ol**, and its acetate (Meerwein, Kiel, Klösgen, and Schoch), A., i, 222.
dicyclo-[1, 3, 3]-Δ^6-**Nonen-2-one**, and its derivatives (Meerwein, Kiel, Klösgen, and Schoch), A., i, 224.
Nonoic acid, αβ-*di*hydroxy-, and its dinitrate and monoacetyl derivative, and *d*- and *l*-isomerides (Krohs), A., i, 178.
d-γ-**Nonyl** nitrite, rotatory and refractive dispersions and absorption spectrum of (Pickard and Hunter), T., 434.
γ-**Nonylbutan-γ-ol-β-one**, and its semicarbazone (Locquin and Wouseng), A., i, 302.
Nopinene, reactions distinguishing pinene from (Dupont and Brus), A., i, 934.
Nor-π-camphor-7-carboxylic acid. See *iso*Ketopinic acid.
Norcamphorylsulphoxide-*N*-phenylpyrazolone (Wedekind, Schenk, and Stüsser), A., i, 347.
Norcodeiniumpyrrolidinium bromide (v. Braun and Lemke), A., i, 7.
Norgine as protective colloid (Gutbier, Sauer, and Kröner), A., ii, 619.
2-**Nortropyl-1-hydroxytetrahydronaphthalene**, and its salts (v. Braun Braunsdorf, and Kirschbaum), A. i, 106.
Novocaine. See Procaine.
Nucleic acid, isolation of, from tissues (Jones and Folkoff), A., i, 1032.
  preparation of, from tubercle bacilli (Johnson and Brown), A., i, 160.
  in lung tissue (Sammartino), A., i, 414.
  and volutin in yeast (Glaubitz), A., i, 986.
Nucleic acids (Feulgen), A., i, 68.
Nuclein metabolism. See **Metabolism.**
Nucleins, nature of (Nakagawa), A., i, 259.
Nucleoproteins, fission of, by bacteria (Koch and Oelsner), A., i, 422.
Nucleotides from yeast-nucleic acid (Jones and Perkins), A., i, 720.
Nutrition, potassium salts in (Miller), A., i, 414.

O.

Oats, American white, hemicellulose of (O'Dwyer), A., i, 1066.
  German, tannin from (Freudenberg and Vollbrecht), A., i, 124.
Oats, barley, and wheat, effect of respiration on the amount of protein in (McGinnis and Taylor), A., i, 1164.

Oxybuchu-camphor (CUSMANO), A., i, 587.

Oxydases, analogies between methylene-blue and (ASCHMARIN), A., i, 622.

8-Oxy-7:9-dimethylpurine, 2-chloro-6-thiol-, and 2:6-*di*thiol-, and their derivatives (RÂY, CHAKRAVARTI, and BOSE), T., 1960.

Oxygen, refractive index and absorption spectra of (EADIE and SATTERLY), A., ii, 197.

series spectrum of (HOPFIELD), A., ii, 708.

ultra-violet spectra of (HOPFIELD), A., ii, 351, 804.

Röntgen ray absorption coefficients of (OLSON, DERSHEM, and STORCH), A., ii, 365.

ionising potential of (MACKAY), A., ii, 621.

polarisation in the electrolytic generation of (GRUBE and METZGER), A., ii, 118.

Oxygen, isothermals of (KUYPERS and ONNES), A., ii, 735.

boiling point of (KEYES, TOWNSHEND, and YOUNG), A., ii, 376.

absorption of, by copper (MOLES and PAYÁ), A., ii, 165.

coefficient of slip of (STATES), A., ii, 613.

diffusion of, through silver (SPENCER), T., 2124.

solubility of, in metals (SCHMIDT), A., ii, 732.

solubility of, in water (BECKER), A., ii, 228; (BECKER and PEARSON), A., ii, 753.

activation of, by palladium hydride (ZELINSKI and BORISSOW), A., ii, 149.

catalytic action of, on the reaction between hydrogen and sulphur (NORRISH and RIDEAL), T., 1689.

action of, on metals (TAMMANN), A., ii, 624; (SCHRÖDER and TAMMANN), A., ii, 838.

combination of hæmoglobin with (ADAM), A., i, 617; (BAYLISS), A., i, 618; (BROWN), A., i, 964.

combination of hydrogen and (PEASE and TAYLOR), A., ii, 30.

action of light on mixtures of hydrogen and (COEHN and TRAMM), A., ii, 205.

catalytic combination of hydrogen and, in presence of the platinum metals (HOFMANN), A., ii, 477.

reaction of sulphur with (NORRISH and RIDEAL), T., 3202.

Oxygen detection and estimation:—

detection of, biochemically (SCHMALFUSS), A., ii, 783.

estimation of small amounts of, colorimetrically (HAND), T., 2573.

dissolved, Winkler apparatus for estimation of (ALLISON and SHIVE), A., ii, 784.

estimation of, in gaseous exchanges of animals (GODZIKOVSKI and LICHATSCHEV), A., ii, 430.

estimation of, in steel (CHAUDRON and BLANC), A., ii, 35.

estimation of, in water (BECKER and ABBOTT), A., ii, 784.

Oxygen electrodes. See Electrodes.

Oxyhæmocyanin, absorption of light by (QUAGLIARIELLO), A., i, 68.

velocity of reduction of (HARTRIDGE and ROUGHTON), A., ii, 746.

acid character of (HILL), A., i, 1144.

peroxydase activity of (WILLSTÄTTER and POLLINGER), A., i, 1243.

alkali-binding and buffer values of (VAN SLYKE, HASTINGS, HEIDELBERGER, and NEILL), A., i, 162.

- **Oxyluciferin**, electro-reduction of (Harvey), A., i, 260.
- **Oxymykolignic acid** (Grüss), A., i, 535.
- **Oxyproteic acid** (Freund and Sittenberger-Kraft), A., i, 511.
  - in the body (Badzyński and Karczewski), A., i, 876.
- **Ozone**, preparation of (Hartman; Starke), A., i, 754.
  - preparation and molecular weight of (Karrer and Wulf), A., ii, 22.
  - preparation and properties of (Riesenfeld), A., ii, 315.
  - production of, by the electric discharge (McEachron), A., ii, 685.
  - photochemical reactivity of (Griffith and Shutt), T., 2752; (Griffith and MacWillie), T., 2767.
  - photochemical decomposition of (Weigert), A., ii, 814.
  - analogous action of rays and (Fernau), A., ii, 601.
  - as an allotrope (de Pauw), A., ii, 151.
  - effect of thunderstorms on, in the atmosphere (Reynolds), A., ii, 685.
  - action of, on hydrocarbons (Blair and Wheeler), A., i, 997.
  - oxidation of nitrogen tetroxide by (Wulf, Daniels, and Karrer), A., ii, 23.

P.

- **Paints**, oil, swelling of (Coffignier), A., ii, 136.
- **Palladium**, effect of adsorbed hydrogen on the thermo-electric properties of (Holmes), A., ii, 10.
  - the system, hydrogen, crystal structure of (McKeehan), A., ii, 427.
  - occlusion of hydrogen by (Yamada), A., ii, 81.
  - catalytic action of (Hinshelwood and Topley), T., 1020.
- **Palladium alloys** with silver, crystal structure of (McKeehan), A., ii, 428.
- **Palladium** hydride, activation of oxygen and hydrogen peroxide by (Zelinski and Borissow), A., ii, 149.
- **Palladium estimation**:—
  - estimation of, with thiocyanates (Ivanov), A., ii, 263.
- *Palmellococcus miniatus*, pigment of (Boresch), A., i, 277.
- **Palmitic acid**, cellulose and *l*-glucosan esters (Karrer, Peyer, and Zega), A., i, 276.
- **Palmitic acid**, inulin and starch esters (Karrer and Zega), A., i, 1182.
- **Palmitylacetic acid**, copper salt and ethyl ester (Helferich and Köster), A., i, 1177.
- **Palmitylacetoacetic acid**, ethyl ester and sodio-derivative (Helferich and Köster), A., i, 1177.
- **Palmityl-Δ^{γ}-butenyl ketone**, and its semicarbazone (Helferich and Köster), A., i, 1178.
- **Pancreas**, chemistry of (Petschacher), A., i, 1258.
  - enzymes of (Willstätter, Waldschmidt-Leitz, and Hesse), A., i, 507.
  - nucleic acids of (Steudel and Nakagawa), A., i, 628.
  - rennin from (Epstein; Epstein and Rosenthal), A., i, 628.
- **Pancreatic extracts**, influence of, on carbohydrate metabolism (Murlin, Clough, Gibbs, and Stokes), A., i, 878.
  - proteins and lipoids in (Fodor), A., i, 507.
  - See also Insulin.
- **Pancreatic glands**. See Glands.
- **Paniculatine** (Brunner), A., i, 126.
- **Papain**, composition and properties of (Rakuzin and Ivanov), A., i, 872.
- *Papaver somniferum* (Indian poppy), enzymes of the latex of (Annett), A., i, 281.
- **Papaverine**, absorption spectra of (Steiner), A., ii, 49.
  - nitrite, preparation of (Sohn and Stenzil), A., i, 358.
  - estimation of, in opium (Annett and Bose), A., ii, 269.
- *Paracentrotus lividus*, physico-chemical properties of the constituents of eggs of (Vlès, Achard, and Prikelmaier), A., i, 627.
- **Paracetaldehyde**, condensation of, with ammonia (Tschitschibabin and Oparina), A., i, 1123.
- **Paracetaldehyde**, bromo-, preparation and reactions of (Hibbert and Hill), A., i, 439.
- **Paraffin**, oxidation of, by atmospheric oxygen (Grün and Ulbrich), A., i, 285.
- **Paraffins**, ignition of mixtures of air and (Mason), T., 210; (Payman and Wheeler), T., 426.
- ***cyclo*Paraffincarboxylic acids**, esterification of (Advani and Sudborough), A., i, 1009.
- **Paraformaldehyde**, conversion of, into glycollic acid (Hammick and Boeree), T., 2881.
- **Paramagenta*leuco*sulphinic acid**, and its ammonium salt (Scheuing and Berliner), A., i, 859.

Paramagnetism, and atomic structure (Cabrera), A., ii, 123; (Dauvillier), A., ii, 609.
Paramœcium, pharmacological action of various alcohols on (Bills), A., i, 1264.
Parathyroids, function of (Salvesen), A., i, 979.
Paravauxite (Gordon), A., ii, 646.
Parostemine (Seil), A., i, 886.

bromoamino-, bromonitro-, and nitroamino-derivatives (HELLER), A., i, 1092.
3-chloro-4-nitroso- (HODGSON and MOORE), T., 2499.
4-iodo-6-nitro-, and its derivatives, and 2:4-*di*iodo-6-nitro- (ROBERTS), T., 2710.
2:4-*di*nitro-, reduction of, by hydrogen sulphide and ammonia (RAIFORD), A., i, 29.
Phenols, osmotic pressure of aqueous solutions of (GROLLMAN and FRAZER), A., i, 920.
increased solubility of, in water on addition of a third substance (BAILEY), T., 2579.
binary systems of α- and β-chloroacetic acid and (MAMELI and COCCONI), A., i, 555.
mutual solubility of glycerol and (McEWEN), T., 2284.
Phenols, *C*-alkylation of (CLAISEN), A., i, 1094.
and their ethers, reaction of, with aminoacetals (HINSBERG), A., i, 555.
action of aromatic alcohols with, in presence of aluminium chloride (HUSTON), A., i, 30.
aldol condensation between chloral and (PAULY and SCHANZ), A., i, 564.
derived from cymene (BARGELLINI), A., i, 783.
condensation of diphenylformamidine with (SHOESMITH and HALDANE), T., 2704.
protective action of, on dyes (GILLET and GIOT), A., ii, 527; (SISLEY), A., ii, 717.
catalytic hydrogenation of, with nickel (BROCHET), A., i, 102.
condensation products of, with αβ-unsaturated ketones (CHEMISCHE FABRIK VORM. WEILER TER MEER), A., i. 114.
action of methyl sulphate on (SIMON and FRÉJACQUES), A., i, 462.
action of nitric acid on (IWATA), A., i, 779.
nitrosation of (HODGSON and MOORE), T., 2499.
antioxygenising power of (GILLET), A., i, 675.
in presence of uranium salts (ALOY and VALDIGUIÉ), A., i, 554.
detection of, produced by bacteria (BELL), A., i, 1157.
detection of, with phosphotungstic-phosphomolybdic reagent (LEVINE), A., ii, 44.
detection of, with selenious acid (LEVINE), A., ii, 44.
estimation and iodination of, by means of salts of arylsulphonhalogenoamides (ROBERTS), T., 2707.
monohydric, estimation of (HENNINGSEN), A., ii., 343.
estimation of, in blood (RAKESTRAW), A., ii, 587.
Phenols, amino-, thermochemistry of diazotisation of (BÎASZKOWSKA), A., ii, 536.
nitro-, mixtures of camphor with (EFREMOV), A., i, 1104.
alkylation of (IZMAILSKI and RAZORENOV), A., i, 770.
o-thiol-, derivatives of (GIBSON and SMILES), T., 2388.
Phenolcarboxylic acids, migration of acyl groups in (PACSU), A., i, 338.
Phenol-digitonin, *p*-bromo- (WINDAUS and WEINHOLD), A., i, 590.
ψ-Phenolhalogenides (LINDEMANN), A., i, 686.

Phenolmethylbetaine, nitroso-, methyl ester (Leuchs, Winkler, and Leuchs), A., i, 135.

Phenolphthalein, sodium salts (Bassett and Halton), T., 1291.
  detection of (de Benavent), A., ii, 269.
  estimation of (Palkin), A., ii, 796.

Phenolphthaleinoxime, structure of (Orndorff and Yang), A., i, 1016.

Phenolsulphonephthalein, and *tetra*-bromo-, and their salts and derivatives (Orndorff and Sherwood), A., i, 341.

Phenothioxin, chloronitro- and nitro-derivatives of (Krishna), T., 2782.

Phenoxide, thallium (de Forcrand), A., i, 84.

β-Phenoxyacetylaminocrotonic acid, ethyl ester (Benary and Hosenfeld), A., i, 39.

α-Phenoxyacetylcinnamonitrile, β-amino- and β-hydroxy- (Benary and Hosenfeld), A., i, 37.

α-Phenoxyacetylcrotonic acid, β-amino-, ethyl ester (Benary and Hosenfeld), A., i, 39.

α-Phenoxyacetylcrotononitrile, β-amino- and β-hydroxy- (Benary and Hosenfeld), A., i, 37.

α-Phenoxyacetyl-β-*p*-tolylacrylonitrile, β-amino- and β-hydroxy- (Benary and Hosenfeld), A., i, 37.

5-Phenoxyacridine (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1130.

4-Phenoxybenzoic acid, 3-nitro-, ethyl ester (Borsche), A., i, 780.

4-Phenoxybenzonitrile, 3-nitro- (Borsche), A., i, 780.

4-Phenoxybenzophenone-2′-arsinic acid (Lewis and Cheetham), A., i, 408.

Phenoxybutyl alcohol, bromide and *p*-nitrobenzoate of (Marvel and Tanenbaum), A., i, 2.

γ-Phenoxybutyric acid, α-bromo-, ethyl ester (v. Braun and Münch), A., i, 1187.

5-Phenoxy-3-ethoxyacridine (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1130.

5-Phenoxy-3-ethoxyacridine, 2-amino- (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1130.

Phenoxyethylmalonic acid, and its ethyl ester (Staudinger and Schneider), A., i, 465.

***o*-Phenoxymethylbenzyl alcohol,** and its bromide (v. Braun and Zobel), A., i, 1200.

***o*-Phenoxymethylbenzylamine,** and its salts (v. Braun, Zobel, and Blessing), A., i, 372.

Phenoxymethylphenanthrenecarboxylic acid (v. Braun, Zobel, and Kühn), A., i, 1200.

Phenoxypropionic acid, and *o*-nitro-, resolution of (Fourneau and Sandulesco), A., i, 35.

Phenoxypropionic acids, *m*- and *p*-nitro-, resolution of (Fourneau and Sandulesco), A., i, 572.

***o*-γ-Phenoxypropylbenzylamine** (v. Braun, Zobel, and Blessing), A., i, 371.

2-Phenoxypyridine, and its salts (Tschitschibabin), A., i, 598.

ω-Phenoxy-*o*-tolylacetic acid, and its sodium salt and derivatives (v. Braun and Zobel), A., i, 1200.

Phenyl acetate and benzoate, *di*bromoamino-, acetyl and benzoyl derivatives (Raiford and Iddles), A., i, 326.
  allyl ether, *m*-amino-, and its hydrochloride and derivatives, and *m*-nitro- (Wilson and Adams), A., i, 329.
  amyl ether, 2:4:6-*tri*nitro-3-amino- (Davies and James), A., i, 552.
  β-bromoethyl ether, *p*-amino-, and its hydrochloride, and *p*-nitro- (Wilson and Adams), A., i, 329.
  γ-bromopropyl ethers, *m*-nitro-, and *m*-amino- (Wilson and Adams), A., i, 328.
  Δβ-butenyl ether (v. Braun and Schirmacher), A., i, 286.
  β-chloroethyl ether, amino-, acetyl derivative (British Dyestuffs Corporation, Ltd., Perkin, and Clemo), A., i, 453.
  derivatives of silver (Krause and Wendt), A., i, 1150.
  ethers, and their derivatives (Kohn and Safriss), A., i, 559.
  hydrogen sulphate, enzymatic hydrolysis of (Neuberg and Kurono), A., i, 1148.
  mercaptan-digitonin (Windaus and Weinhold), A., i, 590.

Phenylacetamide, α-, *o*-, and *p*-bromo-α-nitro-, α-chloro-α-nitro-, α-iodo-α-bromo-, and α-nitro- (van Peski), A., i, 214.

Phenylacetic acid, amyl and β-phenylethyl esters (Laboratoire-Usine), A., i, 110.

Phenylacetic acid, amino-, aminobenzoyl and nitrobenzoyl derivatives, and their salts and derivatives (Ingersoll and Adams), A., i, 200.
  o-amino-, action of benzaldehydes on (Neber and Röcker), A., i, 945.

Phenylacetic acid, *o*-amino-, benzylidene derivatives, preparation of 3-hydroxyquinoline derivatives of (Kliegl and Schmalenbach), A., i, 834.

Phenylacetonitrile, *p*-amino-, salts of (v. Braun and Blessing), A., i, 1230.

β-Phenylacetylamino-α-phenylpropionic acid (Mannich and Ganz), A., i, 21.

Phenylacetylbenzylcysteine (Shiple and Sherwin), A., i, 673.

β-Phenyl-γ-acetylethylmalonic acid, methyl ester (Kohler and Allen), A., i, 1006.

9-Phenylacetyl-10:11-*di*hydroxyhexahydrocarbazole (Perkin and Plant), T., 694.

6-Phenylacetyl-ψ-indoxyl*spirocyclo*pentane (Perkin and Plant), T., 694.

3-Phenylacetyl-2-methylindole (Seka), A., i, 1125.

9-Phenylacetyltetrahydrocarbazole, and 5-nitro- (Perkin and Plant), T., 693.

Phenylacetyltyrosine, *di*nitro- (Abderhalden and Stix), A., i, 1030.

Phenylacrylamide, α-cyano-β-2-hydroxy- (Curtis, Day, and Kimmins), T., 3139.

Phenylalanine, ethyl ester, hydrochloride (McKenzie and Richardson), T., 90.

Phenylalanine series (Waser and Sommer), A., i, 329; (Waser and Brauchli), A., i, 337; (Waser), A., i, 338.

1-Phenylalanyl-*d*-alanine anhydride (Abderhalden), A., i, 717.

***N*ms-Phenylallophanic acid,** ethyl ester (Biltz and Jeltsch), A., i, 1074.

Phenylallylcyanamide (v. Braun and Schirmacher), A., i, 287.

Phenylallyldibutenylammonium bromide and chloroplatinate (v. Braun and Schirmacher), A., i, 287.

1-Phenylamino-β-naphthol, and its methyl ether (Société Anonyme des Matières Colorantes, Wahl, and Lantz), A., i, 918.

Phenylamino-β-*di*nitrophenyloxyphenylpropionic acid, α-*di*nitro- (Abderhalden and Stix), A., i, 1030.

α-Phenyl-β-*o*-aminophenylpropionic acid (Kirchner), A., i, 913.

Phenylaminopropionic acid, α-*di*nitro-, ethyl ester (Abderhalden and Stix), A., i, 1030.

α-Phenyl-β(3:5-*di*amino-4:1:2-thiodiazolyl)-carbamide, and its derivatives (Fromm, Layer, and Nerz), A., i, 1239.

Phenyl-*p*-anisylpropylene (Skraup and Freundlich), A., i, 669.

1-Phenyl-3-*p*-anisylpyrazoline (Mannich and Lammering), A., i, 44.

9-Phenylanthracene (Barnett and Cook), T., 2638.

10-Phenylanthracene, 9-nitro- (Barnett and Cook), T., 2638.

Phenylanthranilic acids, synthesis of (Tuttle), A., i, 1011.

Phenylanthranyl acetate and methyl ether (Barnett and Cook), T., 2637.

Phenylanthrone (Barnett and Cook), T., 2636.

Phenylanthronylpyridinium bromide (Barnett and Cook), T., 2637.

Phenylarsinic acid, therapeutic action of derivatives of (Fourneau, Navarro-Martin, and (M.) and (Mme) Tréfouel), A., i, 983.

Phenylarsinic acid, *p*-amino-, and its sodium salt, crystalline form of (Gilta; Mélon), A., i, 407.

Phenylarsino-bis*mono*thioglycollic acid, 3-amino-4-hydroxy- (Voegtlin, Dyer, and Leonard), A., i, 1266.

***l*-Phenylasparagine** (Lutz), A., i, 457.

5-Phenylbenziminazole (García Banús, and Guiteras), A., i, 203.

***N*-Phenylbenziminophenyl** ether hydrochloride (Chapman), T., 1152.

***iso*Phenyl-*p*-benzoquinonylsulphoxide** (Hinsberg), A., i, 1102.

β-*p*-Phenylbenzoylacrylic acid, and its salts and methyl ester (Oddy), A , i, 1099.

1-*p*-Phenylbenzoyl-9-oxanthronyl (Scholl, Dehnert, and Semp), A., i, 808.

2-Phenyl-5-benzoyloxymethyloxazoline, salts of (Bergmann and Brand), A., i, 841.

β-*p*-Phenylbenzoylpropionic acid, αβ-*di*bromo-, and its methyl ester (Oddy), A., i, 1099.

2-Phenylbenz-4′:5′-*iso*thiazolium bromide and chloride, 5-nitro- (Fries and Brothuhn), A., i, 842.

2-Phenyl-2:1:3-benztriazole, 6-chloro-5-nitro-, *N*-oxide (Michele and Mario Giua), A., i, 610.

β-Phenylbenzylideneacetophenone. See Phenyl diphenylvinyl ketone.

3-Phenyl-4-benzylidene*iso*oxazolone, oxidation of (Betti and Viansino), A., i, 1024.

β-Phenyl-α-benzylidenetetrazan-γδ-dicarboxylic acid, ethyl ester (Busch, Müller, and Schwarz), A., i, 866.

Phenylbenzylsulphone-*m*-carboxylic acid (Reindel and Siegel), A., i, 917.

Phenylbenzylurethane, *mono-*, *tri-*, *tetra-*, and *penta*-nitro- (Ryan and O'Donovan), A., i, 323.

Phenylbis-3-carbethoxy-2:4-dimethylpyrrylmethane (Fischer and Schneller), A., i, 944.

Phenylbiuret, isomeric (Gatewood), A., i, 254.

ms-**Phenylbiuret** (Biltz and Jeltsch), A., i, 1075.

Phenylbiuret-*p*-sulphonic acid, *o*-bromo- (Scott and Cohen), T., 3186.

Phenylboric acid, and *p*-bromo-, and *p*-chloro- (Krause), A., i, 1035.

Phenyl*apoiso*borneol, and its derivatives (Bredt-Savelsberg and Toussaint), A., i, 349.

Phenyl α-bromo-β-ethoxystyryl ketone (Dufraisse and Gérald), A., i, 113.

α-**Phenyl-β-*p*-bromophenyl-α-allylthiocarbamide** (Dains, Brewster, Blair, and Thompson), A., i, 63.

N-**Phenyl-*p*-bromophenyl-*S*-butylthiocarbamide,** and its hydriodide (Dains and Thompson), A., i, 382.

N-**Phenyl-*p*-bromophenyl-*S*-methylthiocarbamide,** and its hydriodide (Dains and Thompson), A.; i, 382.

N-**Phenyl-*p*-bromophenyl-*S*-propylthiocarbamide,** and its hydriodide (Dains and Thompson), A., i, 382.

Phenyl α-bromostyryl ketone, action of alcohols on (Dufraisse and Gérald), A., i, 113.

δ-**Phenylbutanesulphonic acid,** sodium salt, preparation of (Clutterbuck and Cohen), T., 2510.

γ-**Phenyl-Δ^{β}-butenoic acid** (Mayer and Stamm), A., i, 803.

Phenyl-Δ^{β}-butenylthiocarbamide (v. Braun and Schirmacher), A., i, 287.

Phenyl β-, -*n*-, and -*iso*-butoxystyryl ketones (Dufraisse and Gérald), A., i, 114.

Phenyl-*n*-butylarsine chloride (Tiffeneau), A., i, 766.

Phenylbutylcarbinol, and its urethane (Les Établissements Poulenc Frères), A., i, 1007.

δ-**Phenylbutyldimethylamine,** β-hydroxy-, and its salts (v. Braun and Osterroth), A., i, 1187.

δ-**Phenylbutylene αβ-oxide,** and the corresponding glycol (v. Braun and Osterroth), A., i, 1187.

Phenyl-3-*iso*butylenepyrazole-5-carboxylic acid, 2′-nitro-4′-cyano-, ethyl ester (Borsche and Thiele), A., i, 1220.

α-**Phenyl-β-*n*-butylhexane-αβ-diol** (Tiffeneau and Lévy), A., i, 788.

γ-**Phenyl-*n*-butyric acid,** α-bromo-, ethyl ester (v. Braun and Osterroth), A., i, 1186.

Phenyl-α-*pericycloapo*camphene (Bredt-Savelsberg and Toussaint), A., i, 349.

tert.-**Phenylcamphenilol,** and its dehydration (Bredt-Savelsberg), A., i, 348.

α-**Phenylcamphol-1-carboxylic acid,** α-bromo-3-hydroxy-, and α:β-*di*hydroxy-, lactones (Rupe and Sulzer), A., i, 798.

Phenyl*apo*camphor, and its semicarbazone (Bredt-Savelsberg and Toussaint), A., i, 349.

Phenyl*apo*camphoric acid, and its anhydride (Bredt-Savelsberg and Toussaint), A., i, 349.

Phenylcarbamic acid, and *o*- and *p*-chloro-, γ-chloropropyl esters (Pierce and Adams), A., i, 484.

  γ-chloropropyl ester (Dox and Yoder), A., i, 484.

Phenylcarbamic acids, *o*- and *p*-chloro-, β-chloroethyl esters (Adams and Segur), A., i, 457.

Phenylcarbamide, nitration of (Ryan and O'Toole), A., i, 330.

α-**Phenylcarbamide,** β-hydroxy-, reactions of, and its derivatives (Hurd), A., i, 846.

Phenylcarbamides, *p*-substituted, preparation of (Boehringer & Söhne), A., i, 948.

  sulphonation of (Scott), T., 3191.

Phenylcarbamideglycuronic acid, *p*-hydroxy-, potassium salt (Morinaka), A., i, 271.

Phenylcarbamide-*o*-sulphonic acid, *p*-bromo-, and *p*-chloro-, and their salts (Scott), T., 3198.

  5-chloro-, potassium salt (Scott and Cohen), T., 3184.

Phenylcarbamide-*m*-sulphonic acid, *p*-bromo- (Scott and Cohen), T., 3184.

Phenylcarbamide-*m*-(or-*o*-)sulphonic acid, *p*-amino- (Scott and Cohen), T., 3182.

5-Phenylcarbamido-2:6-*di*hydroxypyrimidine, 4-amino- (Traube), A., i, 1135.

Phenylcarbamylbenzylcysteine (Shiple and Sherwin), A., i, 673.

Phenylcarbamylcysteine (Shiple and Sherwin), A., i, 673.

9-Phenylcarbazole, *p-mono-* and *di*-amino-, *p*-chloro-, *p*-cyano-, and *p*-*mono-* and *di*-nitro-, and their salts and derivatives (G. and M. de Montmollin), A., i, 374.

9-Phenylcarbazole-*p*-diazonium salts (G. and M. de Montmollin), A., i, 373.

Phenylcarbimide, condensation of aromatic aminosulphonic acids with (SCOTT and COHEN), T., 3177.
isosterism of diazobenzeneimide and (CAROTHERS), A., i, 961.

Phenylcarbimide-*p*-carboxylic acid, ethyl ester (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 925.

Phenylcarbylamine chloride, and *p*-*mono*-, and 2:4-*di*-chloro- (BLY, PERKINS, and LEWIS), A., i, 203.

Phenylchloroacetic acid, *l*-menthyl esters, isomeric (MCKENZIE and SMITH), T., 1962.

3-Phenyl-5-*p*-chlorobenzylidenerhodanine (GENDELMAN), A., i, 605.

Phenylchloroform. See **Toluene**, *tri*-ω-chloro-.

Phenyl*tri*chloromethylcarbinol, hydroxy-derivatives (PAULY and SCHANZ), A., i, 564.

Phenyl*tri*chloromethylcarbinyl carbamate (YODER), A., i, 309.

- **Phenylethyl alcohol,** *o*-chloro- (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1132.

Phenylethyl alcohols, primary disubstituted, dehydration of (Ramart and Blondeau), A., i, 676.

Phenylethylamine, anæsthetic and narcotic action of (Abelin), A., i, 1265.

Phenylethylamine, 3:4-dihydroxy-, synthesis of, and its salts, and 3-amino-4-hydroxy-, 3-nitro-4-hydroxy-, and 3:5-*di*nitro-4-hydroxy-, and their salts (Waser and Sommer), A., i, 329.
  β-hydroxy-β-2-amino-4-hydroxy- (Hinsberg), A., i, 465.

β-Phenylethylamine, *p*-amino-, and its salts and derivatives (v. Braun and Blessing), A., i, 1230.

5-Phenylethylamino-3-ethoxyacridine, 5-*p*-hydroxy- (Farbwerke, vorm. Meister, Lucius, & Brüning), A., i, 1130.

α-Phenyl-α-ethylbutaldehyde, and its semicarbazone (Tiffeneau and Lévy), A., i, 788.

β-Phenylethyl-*tert.*-butylcarbinol (Hill, Spear, and Lachowicz), A., i, 789.

Phenylethylcarbamide, *p*-hydroxy- (Cloetta and Wünsche), A., i, 516.

Phenylethylcarbamylbenz*anti*aldoxime (Brady and Ridge), T., 2166.

Phenylethylcarbamyl-3:4-methylenedioxybenz*anti*aldoxime (Brady and Ridge), T., 2166.

Phenylethylcarbamylnitrobenzaldoximes (Brady and Ridge), T., 2167.

Phenylethylcarbinol, *p*-bromo- (Ziegler and Tiemann), A., i, 31.

Phenylethylcarbinol urethane (Les Établissements Poulenc Frères), A., i, 1007.

Phenylethyldi*iso*amylamine, β-hydroxy--β-*tri*hydroxy- (Hinsberg), A., i, 464.

β-Phenylethyldimethylamine, *p*-amino-, and its hydrochloride (Kindler, Burghard, Finndorf, Dehn, Giese, and Körding), A., i, 572.

β-Phenylethyldimethylarsine, and its derivatives (Turner and Bury), T., 2490.

α-Phenylethylene-αβ-dicarboxylic acid, β-cyano-, methyl ester (Kohler and Corson), A., i, 1015.

β-Phenylethylene-ααβ-tricarboxylic acid, trimethyl ester (Kohler and Corson), A., i, 1016.

δ-Phenyl-γ-ethylhexane (Albesco), A., i, 42.

β-Phenylethyl*cyclo*hexylamine, and its salts (v. Braun, Blessing, and Zobel), A., i, 1089.

α-Phenylethylidenemethylamine (Kindler, Burghard, Finndorf, Dehn, Giese, and Körding), A., i, 571.

5-Phenylethylidenerhodanine (Gränacher, Gerö, Ofner, Klopfenstein, and Schlatter), A., i, 707.

β-Phenyl-α-ethylidenetetrazan-γδ-dicarboxylic acid, ethyl ester (Busch, Müller, and Schwarz), A., i, 866.

β-Phenylethylmethylbromoarsine (Turner and Bury), T., 2491.

β-Phenylethylmethylchloroarsine (Turner and Bury), T., 2491.

α-Phenylethylphosphinic acid, β-*mono*- and αβ-*di*-bromo- and -chloro-, and αβ-*di*hydroxy- (Conant and Coyne), A., i, 69.

Phenyl-α-ethylstyryl ketone (Albesco), A., i, 42.

1-β-Phenylethyl-1:2:3:4-tetrahydronaphthalene (v. Braun and Kochendorfer), A., i, 1198.

Phenylethylurethane, 4-*mono*-, and 2:4-*di*-nitro- (Ryan and Connolly), A., i, 322.

β-Phenylfumaric acid, α-cyano- (Kohler and Corson), A., i, 1015.

Phenylfurazan, amino-, and its acetyl derivatives (Ponzio and Avogadro), A., i, 857.

β-Phenylglucoside, barium phosphate of (Helferich, Lowa, Nippe, and Riedel), A., i, 898.

Phenylglycine-*o*-carboxylic acid, preparation of (Haller), A., i, 34.

Phenylglyoxime, and amino-, isomeric, and their salts, and chloro-, and its nickel salt and acetyl derivative (Ponzio and Avogadro), A., i, 472.

Phenylguanazole, and its nitrate (Arndt and Tschenscher), A., i, 1139.

Phenylguanidine-*o*-sulphonic acid, *p*-bromo- and *p*-chloro-, and their potassium salts (Scott and Cohen), T., 3187.

Phenylguanylthiosemicarbazide, and its hydrochloride and methyl ether (Arndt and Tschenscher), A., i, 1139.

ζ-Phenylheptoic acid, chloride and piperidide from (Staudinger and Müller), A., i, 364.

1-Phenyl*cyclo*hexane, 3:5-*di*bromo- (Uspenski), A., i, 669.

5-Phenyl-0:1:3-*bicyclo*hexane (Uspenski), A., i, 669.

γ-Phenylhexane-γδ-diol (Tiffeneau and Lévy), A., i, 788.

***cis*- and *trans*-1-Phenyl*cyclo*hexane-1:2-diols** (Nametkin and Ivanov), A., i, 1097.

2-Phenyl*cyclo*hexanol, and its phenylurethane (v. Braun, Gruber, and Kirschbaum), A., i, 108.
  and its derivatives (Bedos), A., i, 779.
γ-Phenylhexan-δ-one, and its oxime and semicarbazone (Tiffeneau and Lévy), A., i, 788.
2-Phenyl*cyclo*hexanone, oxime and semicarbazone (v. Braun, Gruber, and Kirschbaum), A., i, 108.
Phenyl*cyclo*hexene (Bedos), A., i, 779.
1-Phenyl*cyclo*hexene 1-oxide (Nametkin and Ivanov), A., i, 1097.
ε-Phenylhexoic acid, chloride and piperidide from (Staudinger and Muller), A., i, 363.
2-Phenyl*cyclo*hexylamine, and its salts and derivatives (v. Braun, Gruber, and Kirschbaum), A., i, 108.
***o*-Phenyl*cyclo*hexylmethylethylamine** methiodide (v. Braun), A , i, 839.
α-Phenylhomocampholic acid, α-bromo-β-hydroxy-, magnesium salt (Rupe and Sulzer), A., i, 797.
Phenylhydrazine, electrolytic preparation of (Wachi), A., i, 67.
Phenylhydrazine, 3:4-*di*bromo-, preparation of (Humphries, Bloom, and Evans), T., 1769.
  and its salts and derivatives (Votoček and Jirů), A., i, 961.
  2:4:6-*tri*chloro-, and its hydiochloride (Elliott), T., 812.
Phenylhydrazinedicarbothionamide, *p*-bromo- and *m*-chloro-, and their derivatives (Guha), A., i, 608.
5-Phenylhydrazinoacridine, and 2-nitro-, and its hydrochloride (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 1130, 1131.
5-Phenylhydrazino-3-*iso*amyloxyacridine, 2-nitro- (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 1131.
5-Phenylhydrazino-3-ethoxyacridine (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1131.
5-Phenylhydrazino-8-ethoxyacridine, 2-amino-, and 2-nitro- (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1131.
Phenylhydrazones, formation of (Oddo and Piatti), A., i, 255.
  action of halogens on (Humphries, Bloom, and Evans), T., 1766.
Phenylhydrobenzoin, dehydration of (Danilov), A., i, 579.
β-Phenyl-α-*o*-hydroxybenzylidenetetrazan-γδ-dicarboxylic acid, ethyl ester (Busch, Müller, and Schwarz), A., i, 866.
Phenyl-4′-hydroxy*cyclo*hexylamine, 4-hydroxy- (v. Braun and Hahn), A., i, 103.
Phenylhydroxylamine, condensation of, with hydroxymethylene-compounds and carbinols (Rupe and Diehl), A., i, 117; (Rupe and Grünholz), A., i, 374.
β-Phenylhydroxylamine, conversion of, into quinoline bases (Bamberger and Weitnauer), A., i, 60.
β-Phenylhydroxylamine, 2:4- and 2:6-*di*nitro-, and their salts and derivatives (Borsche), A., i, 778.
***trans*-β-Phenylhydroxylaminomethylenephenylacetic acid**, and its silver salt and ethyl ester (Rupe and Grünholz), A., i, 375.
Phenylimidocarbonic acid, ethyl ester (Houben, Pfankuch, and Kühling), A., i, 1077.
Phenylimido-phosgene. See Phenylcarbylamine chloride.
2-Phenylimino-5-hydroxy-3-*p*-anisylthiazan, and its picrate (Dains, Brewster, Blair, and Thompson), A., i, 63.
2-Phenylimino-5-hydroxy-3-*p*-chlorophenylthiazan (Dains, Brewster, Blair, and Thompson), A., i, 63.
2-Phenylimino-5-hydroxy-3-phenylthiazan, and its derivatives (Dains, Brewster, Blair, and Thompson), A., i, 63.
2-Phenylimino-5-hydroxy-3-*p*-tolylthiazan (Dains, Brewster, Blair, and Thompson), A., i, 63.
1-Phenylimino-2-naphthaquinone, preparation of (Société Anonyme des Matières Colorantes, Wahl, and Lantz), A., i, 1103.
2-Phenylimino-3-phenyl-5-methylthiazolidine and its picrate and 2-*p*-bromo-, (Dains, Brewster, Blair, and Thompson), A., i, 63.
2-Phenylimino-3-phenyloxazolidine (Dains, Brewster, Blair, and Thompson), A., i, 63.
Phenyliminosuccinanil, *p*-chloro- (Chattaway and Parkes), T., 669.
Phenyliminosuccino-*p*-bromoanil, *p*-bromo- (Chattaway and Parkes), T., 668.
Phenyliminosuccino-*p*-chloroanil, and *p*-chloro- (Chattaway and Parkes), T., 668.
2-Phenylimino-3-*p*-tolyl-5-methylthiazolidine, and its picrate and 2-*p*-bromo- (Dains, Brewster, Blair, and Thompson), A., i, 63.
2-Phenylimino-3-*p*-tolylthiazan (Dains, Brewster, Blair, and Thompson), A., i, 6

2-Phenylimino-3-*o*-tolylthiazolidine (Dains, Brewster, Blair, and Thompson), A., i, 63.

Phenylindanylamine, and *p*-nitro- (Courtot and Dondelinger), A., i, 1090.

Phenylindenylamine (Courtot and Dondelinger), A., i, 1090.

Phenyl-leucylglycine, *di*nitro- (Abderhalden and Stix), A., i, 1030.

β-Phenylmaleic acid, α-cyano-, and its potassium hydrogen salt and anhydride (Kohler and Corson), A., i, 1015.

Phenylmercuric mercaptides (Sachs, Antoine, and Schlesinger), A., i, 1248.
  salts, bromo-, chloro-, and iodo- (Hanke), A., i, 725.

9-Phenyl-3-methoxyfluoryl, and its chloride and derivatives (Gomberg and Buchler), A., i, 211.

β-Phenyl-β-methoxyphenyl-α-methylpropiophenone (Albesco), A., i, 42.

Phenyl β-methoxystyryl ketone (Dufraisse and Gerald), A., i, 114.

Phenyl *p*-methoxystyryl ketone, mercuric bromide and chloride (Vorländer and Eichwald), A., i, 684.

3-Phenylmethylamino-2-keto-1-methyl-1:2-dihydroquinoxaline, and its salts and nitroso-derivative (Usherwood and Whiteley), T., 1087.

2-Phenyl-4-methylbenzopyrylium chlorate and chloride, 7-hydroxy-, and the compound of the chloride with resorcinol (Buck and Heilbron), T., 2526.

4-Phenyl-2-methylbenzothiazolenylmethylthiazole methiodide (Mills, Braunholtz, and Smith), T., 2812.

2-Phenyl-5-methylbenzoxazole, 4- and 6-hydroxy- (Henrich, Suntheimer, and Steinmann), A., i, 145.

2-Phenyl-6-methyl-2:1:3-benztriazole, 5-nitro-, 3-oxide (Michele and Mario Giua), A., i, 609.

2-Phenyl-7-methyl-2:1:3-benztriazole, 5-nitro- (Borsche), A., i, 781.

α-Phenyl-β-methyl-Δ^{α}-butylene, and its nitrosite (Tiffeneau and Lévy), A., i, 789.

γ-Phenyl-α-methyl-*n*-butyranilide (Krollpfeiffer and Schäfer), A., i, 344.

γ-Phenyl-α-methylbutyric acid, α-hydroxy-, and its acetyl derivative (Attwood, Stevenson, and Thorpe), T., 1765.

γ-Phenyl-β-methylbutyric acid, β-hydroxy-, and its ethyl ester (Attwood, Stevenson, and Thorpe), T., 1765.

Phenylmethylcarbamide, nitration of (Ryan and Sweeney), A., i, 381.

Phenylmethylcarbinol, *p*-bromo- (Ziegler and Tiemann), A., i, 31.

Phenylmethylcarbinol-digitonin (Windaus and Weinhold), A., i, 590.

γ-Phenyl-β-methylcinnamyl alcohol, and its benzoate (Ziegler and Tiemann), A., i, 31.

Phenylmethyldibutenylammonium bromide and chloroplatinate (v. Braun and Schirmacher), A., i, 287.

4-Phenyl-1-methyldihydropyridine (Emmert, Varenkamp, and Vogt), A., i, 385.

5-Phenyl-3-*mp*-methylenedioxyphenyl-2:3-dihydropyrrole, 1-hydroxy- (Kohler and Drake), A., i, 1119.

5-Phenyl-3-*mp*-methylenedioxyphenyl-2:3-dihydropyrrole-1-benzenesulphone (Kohler and Drake), A., i, 1119.

β-Phenyl-β-methylenedioxyphenyl-α-methylpropiophenone (Albesco), A., i, 42.

β-Phenyl-β-methylenedioxyphenylpropiophenone (Albesco), A., i, 42.

2-Phenyl-4-*mp*-methylenedioxyphenyltetrahydropyrrole, and its hydrochloride (Kohler and Drake), A., i, 1119.

δ-Phenyl-α-methylenevaleric acid, and its silver salt (Mannich and Ganz), A., i, 20.

Phenylmethylethylamine, hydroxy-derivatives (Hinsberg), A., i, 463.

Phenylmethylethylcarbinyl chromate (Wienhaus and Treibs), A., i, 893.

β-Phenyl-α-methyl-β-ethylpropiophenone (Albesco), A., i, 42.

1-Phenyl-3-methyl-5-ethyl-1:2:4-triazole, and its salts, and 5-hydroxy-1-*p*-bromo- (Gastaldi), A., i, 1238.

Phenylmethylguanidine, cyano-, and its hydrochloride (Pellizzari), A., i, 1002.

Phenylmethylguanylcarbamide (Pellizzari), A., i, 1002.

Phenyl-*cis*-*o*-methyl*cyclo*hexylthiocarbamide (Skita, Hauber, and Scharenberg), A., i, 672.

Phenylmethylnitroamine, *tri*nitro-, solubility of, in organic solvents (Taylor and Rinkenbach), A., i, 320.
  freezing-point curve of the mixture, picric acid and (Taylor and Rinkenbach), A., i, 1193.
  2:4:6-*tri*nitro- (*tetryl*), preparation of, from methyl aniline (Nolan and Clapham), A., i, 1086.

5-Phenyl-3-methyl*iso*oxazole, 4-nitroso- (Ponzio), A., i, 470.

Phenylmethyl*iso*oxazolecarboxylic acids (Betti and Sensi), A., i, 1133.

1-Phenyl-2-methyl-3-pentadecylpyrazol-5-one (Helferich and Köster), A., i, 1171.

γ-Phenyl-β-methylpentane (Albesco), A., i, 42.

β-Phenyl-α-methylpropionic acid, α-hydroxy-, and its ethyl ester (Tiffeneau and Lévy), A., i, 789.

γ-Phenyl-β-methylpropyldimethylamine, and its salts (v. Braun, Seemann, and Schultheiss), A., i, 138.

1-Phenyl-3-methylpyrazol-5-one, 4-hydroxy- (Dimroth, Schweizer, and Schaaff), A., i, 745.

2-Phenyl-4-methylpyrimidine-5-carboxylic acid, and its ethyl ester (Mitter and Bardhan), T., 2180.

1-Phenyl-2-methylpyrrole-3-carboxylic acid, 4-hydroxy-, and its methyl ester (Benary and Konrad), A., i, 241.

1-Phenyl-2-methylpyrrole-3-nitrile, 4-hydroxy- (Benary and Lau), A., i, 366.

4-Phenyl-2-methylpyrrolidine, and its *N*-benzoyl derivative (Kohler and Drake), A., i, 1118.

4-Phenyl-2-methylquinoline (Knoll & Co.), A., i, 947.

2- and 3-Phenyl-1-methyl-1:2:3:4-tetrahydroquinolines, and their salts and derivatives (v. Braun, Seemann, and Schultheiss), A., i, 138.

9-Phenyl-3-methyluric acid, 8-thio- (Traube), A., i, 1136.

9-Phenyl-7-methyl-*n*- and -ψ-uric acids (Moore and Gatewood), A., i, 254.

9-Phenyl-3-methylxanthine (Traube), A., i, 1136.

2-Phenyl-αβ-naphthatriazole, oxide of, and 2-*p*-chloro- (Charrier, Crippa, and Agostoni), A., i, 1141.

β-Phenylnaphthindole-1:2-dione (Staudinger), A., i, 938.

Phenyl-β-naphthylamine, 2:4:6-*tri*nitro-3-amino- (Davies and James), A., i, 552.

Phenylnitroanthrone (Barnett and Cook), T., 2642.

β-Phenyl-α-*m*-nitrobenzylidenetetrazan-γδ-dicarboxylic acid, ethyl ester (Busch, Müller, and Schwarz), A., i, 866.

Phenyl-*p*-nitrobenzylurethane (Ryan and O'Donovan), A., i, 323.

Phenyl*di*nitrocarbazole, *p*-amino-, and its acetyl derivative (G. and M. de Montmollin), A., i, 374.

Phenyl-4:6-*di*nitro-*m*-tolyl sulphide and sulphone (Giua and Ruggeri), A., i, 790.

δ-Phenyloctane-δε-diol (Tiffeneau and Lévy), A., i, 788.

δ-Phenyloctan-ε-one, and its **semicarbazone** (Tiffeneau and Lévy), A., i, 788.

3-Phenyl-1:3:4-oxadiazole, 5-hydroxy-, sodium salt and methyl ether (Ponzio), A., i, 1138.

3-*o*- and *p*-Phenyl-2-oxazolidones, chloro- (Adams and Segur), A., i, 458.

1-Phenyl-3-pentadecylpyrazol-5-one (Helferich and Köster), A., i, 1177.

δ-Phenylpentan-β-one, ε-nitro- (Kohler and Drake), A., i, 1118.

δ-Phenylpentenoic acids, and their derivatives (Staudinger, Schneider, and Pfister), A., i, 362.

2-Phenylphenanthriminazole, bromonitro-, bromohydroxy-, nitro-, nitroamino-, and nitrohydroxy-derivatives (A. C. and G. C. Sircar), T., 1561.

1-Phenyl-5-phenoxymethyl-3-methylpyrazole, 4-cyano- (Benary and Hosenfeld), A., i, 37.

1-Phenyl-3-phenoxymethyl-5-methylpyrazole-4-carboxylic acid (Benary and Hosenfeld), A., i, 39.

δ-Phenyl-β-phenylacetylenylbutan-β-ol (Zalkind), A., i, 333.

Phenyl*iso*pilopyrrolidone. See *iso*Pilocarpinanil.

β-Phenylpropaldehyde, *p*-nitro-, and its oxime (Ingold and Piggott), T., 1505.

γ-Phenylpropanesulphonic acid, sodium salt, preparation of (Clutterbuck and Cohen), T., 2509.

Phenylpropiolic acid, velocity of reduction of (Rideal), A., ii, 745.

α-Phenylpropionic acid (*hydratropic acid*), resolution of (Raper), T., 2557.

α-Phenylpropionic acid, β-amino-, hydrochloride (Mannich and Ganz), A., i, 21.

β-Phenylpropionic acid, **ααβ-** and **αββ-*tri*bromo-,** and **their esters,** action of bases on (Ayyar and Sudborough), A., i, 926.

ααβ- and **αββ-*tri*bromo-,** **methyl** esters, and β-chloro-αβ-*di*bromo- (Sudborough and Williams), A., i, 337.

αβ-*di*bromo-α-hydroxy-, ethyl ester (Gault and Weick), A., i, 36.

α-(β-Phenylpropionylamino)-β-piperonylpropionic acid, methyl ester (Hartmann and Kägi), A., i, 605.

β-Phenylpropionyl chloride, *p*-nitro- (INGOLD and PIGGOTT), T., 1505.
β-Phenylpropionylpiperidide (STAUDINGER and MÜLLER), A., i, 363.
Phenyl β-*n*- and -*iso*propoxystyryl ketones (DUFRAISSE and GÉRALD), A., i, 114.
γ-Phenyl-*n*-propylamine, *o*-chloro-, hydrochloride (ROSENMUND, ZETZSCHE, and WEILER), A., i, 800.
Phenylpropylcarbinol and its methane (LES ÉTABLISSEMENTS POULENC FRÈRES), A., i, 107.
δ-Phenylpropyl-α-dimethylaminomethylmalonic acid (MANNICH and GANZ), A., i, 20.
o-β- and γ-**Phenylpropyldimethylanilines**, and their salts (V. BRAUN, SEEMANN, and SCHULTHEISS), A., i, 139.
Phenyl*cyclo*propylketimine, and its derivatives (BARY), A., i, 226.
α-**Phenyl-β-propylpentane-αβ-diol** (TIFFENEAU and LÉVY), A., i, 788.
2-Phenyl-3-propylquinoline-γ:4-*di*carboxylic acid, *o*-hydroxy- (V. BRAUN), A., i, 104.
α-**Phenyl-α-propylvaleraldehyde**, semicarbazone of (TIFFENEAU and LÉVY), A., i, 788.
4-Phenylpyridine methiodide (EMMERT, VARENKAMP, and VOGT), A., i, 385.
Phenylpyridinium iodide, compound of tin tetraiodide and (IZMAILSKI), A., ii, 522.
N-**Phenylpyridinium** salts (IZMAILSKI), A., i, 602.
1-Phenylpyrrole-3-carboxylic acid, 4-hydroxy-, ethyl ester (BENARY and KONRAD), A., i, 241.
1-Phenylpyrrolidine, and its salts (V. BRAUN and LEMKE), A., i, 7.
1-Phenyl-Δ³-pyrroline (V. BRAUN and LEMKE), A., i, 7.
Phenylpyrrylpyrrolenemethane-*o*-carboxylic acid (ODDO and TOGNACCHINI), A., i, 709.
Phenylpyruvic acid, ethyl ester, isomerism of (GAULT and WEICK), A., i, 35.
  derivatives of (FEIST and RAUTERBERG), A., i, 112.
Phenylpyruvic acid, β-bromo-, ethyl ester (GAULT and WEICK), A., i, 36.
3-Phenylquinoline (V. BRAUN, PETZOLD, SEEMANN, and SCHULTHEISS), A., i, 137.
2-Phenylquinoline, 3-amino-, and 3-hydroxy-, and their salts and acetyl derivative (BARGELLINI and BERLINGOZZI), A., i, 483.
2-Phenylquinoline-4-acetic acid, ethyl ester (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 149.
  and its salts (MIESCHER), A., i, 367.
2-Phenylquinoline-3-butyric acid, γ-4-hydroxy- (PERKIN and PLANT), T., 687.
2-Phenylquinoline-4-carboxylic acid, preparation of polycyclic derivatives of (TETRALIN G. M. B. H.), A., i, 1133.
  cyclic analogues of (V. BRAUN and WOLFF), A., i, 143.
2-Phenyl 4-quinolylaminoethanol dihydrochloride (MIESCHER), A., i, 368.
2-Phenyl 4-quinolyl anilinomethyl ketone (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 149.
2-Phenyl-4-quinolyl bromomethyl ketone, and its hydrobromide (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 149.
2-Phenyl-4-quinolyldiethylaminoethanol dihydrochloride (MIESCHER), A., i, 368.
2-Phenyl-4-quinolyl diethylaminomethyl ketone, and its hydrobromide (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 149.
2-Phenyl-4-quinolyldimethylaminoethanol dihydrochloride (MIESCHER), A., i, 368.
2-Phenyl-4-quinolyl dimethylaminomethyl ketone, and its salts (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 149.
α-**2-Phenyl-4-quinolylethanol**, β-amino-, and its dihydrochloride (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 149.
2-Phenyl 4-quinolyl ketones, substituted (MIESCHER),, A., i, 367.
2-Phenyl-4-quinolyl methyl ketone (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 149.
2-Phenyl-4-quinolyl oximinomethyl ketone (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 149.
2 Phenyl-4-quinolyl piperidinomethyl ketone, and its salts (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 149.
2-Phenyl-4-quinolylpiperidylethanol, and its hydrochlorides (MIESCHER), A., i, 368.
Phenylselenoacetamide (KINDLER, BURGHARD, FINNDORF, DEHN, GIESE, and KÖRDING), A., i, 569.
α-**Phenylsemicarbazide, action of iodine on, and its estimation** (DOUCET), A., i. 614.

Phenylstannanes (Böeseken and Rutgers), A., i, 1248.

2-Phenyl-4-styrylbenzopyrylium hydroxide, 4′:7-*di*hydroxy-, and its salts (Buck and Heilbron), T., 2529.

β-Phenyl-β-styrylhydroxylamine *di*bromide (Rupe and Grünholz), A., i, 375.

Phenyl styryl ketone (*benzylideneacetophenone*), interaction of cyanoacetamide, cyanoacetonitrile, and methyl cyanoacetate, and (Kohler and Souther), A., i, 244.
  mercuric bromide and chloride (Vorländer and Eichwald), A., i, 684.
  sulphuric acid derivative of (Vorländer, Osterburg, and Meye), A., i, 683.

1-Phenyl-5-styryl-3-methylpyrazole, 4-cyano- (Benary and Hosenfeld). A., i, 38.

α-Phenylsuccinic acid, β-cyano-α-hydroxy-, methyl ester (Kohler and Corson), A., i, 1015.

Phenylsulphonoxindole-3-aldehyde (Gränacher and Mahal), A., i, 714.

β-Phenylsulphonpropionic acid, *o*-amino-, chloronitro-, and *o*-nitro-, and their derivatives (Mayer and Horst), A., i, 845.

Phenyltaurine, and its homologues (Demars), A., i, 917.

12-Phenyl-5:6:11:13-tetra-acetoxydibenzcarbazole, and 13-*p*-chloro- (Fries and Ochwat), A., i, 843.

3-Phenyltetrahydro-1:3:2-oxazone, and *o*- and *p*-chloro- (Pierce and Adams), A., i, 484.

***N*-Phenyltetrahydro*iso*quinoline,** and its salts (v. Braun, Zobel, and Kühn), A., i, 1201.

3-Phenyl-1:2:3:4- and 5:6:7:8-tetrahydroquinolines, and their salts and derivatives (v. Braun, Petzold, Seemann, and Schultheiss), A., i, 137.

Phenylthioacetodiethylamide (Kindler, Burghard, Finndorf, Dehn, Giese, and Körding), A., i, 572.

Phenylthioacetodimethylamide, and *p*-nitro- (Kindler, Burghard, Finndorf, Dehn, Giese, and Körding), A., i, 569.

Phenylthioacetoethylamide (Kindler, Burghard, Finndorf, Dehn, Giese, and Körding), A., i, 569.

5-Phenylthiocarbamido-2:6-*di*hydroxy-3-methylpyrimidine, 4-amino- (Traube), A., i, 1136.

Phenylthiocarbimide, *p*-bromo-, *p*-chloro-, and *p*-iodo- (Dains, Brewster, and Olander), A., i, 324.

Phenylthiohydantoic acid, as a precipitant for antimony (Lassieur and Lassieur), A., ii, 38.

Phenylthiolacetic acid, and 4-chloro- (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 794.

β-Phenylthiol-β-phenylpropionic acid (Arndt, Flemming, Scholz, and Löwensohn), A, i, 826.

β-Phenylthiolpropionic acid (Arndt, Flemming, Scholz, and Löwensohn), A., i, 82.

β-Phenylthiolpropionic acid, *o*-amino-, chloroamino-, chloronitro-, *o*-cyano-, *o*-hydroxy-, and *o*-nitro-, and their derivatives (Mayer and Horst), A., i, 844.

Phenylthiopropionamide (Kindler, Burghard, Finndorf, Dehn, Giese, and Körding), A., i, 569.

β-Phenylthiopropionodimethylamide (Kindler, Burghard, Finndorf, Dehn, Giese, and Körding), A., i, 569.

δ-Phenylthiosemicarbazide-α-carboxylic acid, ethyl ester (Fromm and Nehring), A., i, 858.

Phenyl-*m*-tolyl sulphoxide, *tri*nitro- (Giua and Ruggeri), A., i, 790.

α-Phenyl-β-*p*-tolyl-α-allylthiocarbamide (Dains, Brewster, Blair, and Thompson), A., i, 63.

β-Phenyl-α-*p*-tolyl-α-allylthiocarbamide and *p*-bromo- (Dains, Brewster, Blair, and Thompson), A., i, 63.

Phenyl-*o*-*m*- and -*p*-tolylamines, 2:4:6-*tri*nitro-3-amino- (Davies and James), A., i, 552.

***s*-Phenyl-*p*-tolylcarbamide-2′-sulphonic acid,** potassium salt (Scott and Cohen), T., 3189.

β-Phenyl-β-*p*-tolyl-α-ethylpropiophenone (Albesco), A., i, 42.

3-Phenyl-5-*p*-tolylidenerhodanine (Gendelman), A., i, 605.

Phenyl *p*-tolyl ketone, semioxamazone (Wilson and Pickering), T., 396.

Phenyl-*p*-tolylmethylallylphosphonium *d*-bromocamphorsulphonate (Radcliffe and Brindley), A., i, 263.

β-Phenyl-β-*p*-tolyl-α-methylpropiophenone (Albesco), A., i, 42.

1-Phenyl-3-*p*-tolyl-5-phenoxymethylpyrazole, 4-cyano- (Benary and Hosenfeld), A., i, 38.

α-Phenyl-β-*p*-tolyl-α-propanolthiocarbamide (Dains, Brewster, Blair, and Thompson), A., i, 63.

β-Phenyl-α-*p*-tolyl-α-propanolthiocarbamide (Dains, Brewster, Blair, and Thompson), A., i, 63.

β-Phenyl-β-*p*-tolylpropiophenone (ALBESCO), A., i, 42.
1-Phenyl-3-*p*-tolylpyrazole-5-carboxylic acid, 4-cyano- (BENARY, SOENDEROP, and BENNEWITZ), A., i, 574.
1-Phenyl-3-*p*-tolylpyrazole-5-carboxyphenylhydrazide, 4-cyano- (BENARY, SOENDEROP, and BENNEWITZ), A., i, 574.
4-Phenyl-1:2:4-triazole, 3-hydroxy-5-thiol-, lead, and phenylhydrazine salts (FROMM and NEHRING), A., i, 858.
  3:5-*di*thio-, and its dibenzyl derivative (FROMM, LAYER, and NERZ), A., i, 1240.
1-Phenyl-1:2:3-triazole-4-carboxylic acid, 5-amino-, 5-chloro-, and 5-hydroxy-, ethyl esters (DUTT), T., 269.
  5-hydroxy-, methyl ester, tautomerism of (DEXTER, MCCOMBIE, and SCARBOROUGH), T., 1234.
β-Phenyltriethylamine, and its methiodide (G. M. and R. ROBINSON), T., 542.
β-Phenyl-*ααβ*-triethylpropiophenone (ALBESCO), A., i, 42.
Phenyltrimethylammonium bromide, *di*-chloride, *di*-iodide, iodobromide, and iodochloride (MCCOMBIE and READE), T., 149.
  chlorate (IZMAILSKI), A., ii, 523.
  chloride iodo-*mono*- and -*tri*-chlorides (MCCOMBIE and READE), T., 150.
  perhalides (MCCOMBIE and READE), T., 141.
Phenyltyrosine, *di*nitro-, and its ethyl ester (ABDERHALDEN and STIX), A., i, 1030.
Phenylurethane-*o*-sulphonic acid, *p*-bromo-, potassium salt (SCOTT), T., 3201.
γ-Phenyl-*n*-valeric acid, and its acid chloride and nitrile (MAYER and STAMM), A., i, 803; (V. BRAUN and STUCKENSCHMIDT), A., i, 947.
δ-Phenylvalerylpiperidide (STAUDINGER and MULLER), A., i, 363.
α-Phenylvinylphosphinic acid, β-bromo- (CONANT and COYNE), A., i, 69.
Phenylxanthene, 3:6-*di*hydroxy-9-*op*-*di*-nitro-, and its calcium salt and *tetra*-bromo-derivative (DOWNEY and LOWY), A., i, 579.
1-Phenyl-4-xanthyl-2:3-dimethylpyrimidone (DORNIER and MARTINET), A., i, 853.
Phlobatannins in plants (JONESCO), A., i, 77.
Phloroglucinoldiphenein (DUTT), T., 227.
Phormidium persicinum, phycoerythrin in (WILLE), A., i, 277.
Phosgene. See Carbonyl chloride.
***Phosphates.** See under Phosphorus.
Phosphato-metal acids, complex (DEDE), A., ii, 31.
Phosphatopentamminecobalt, and its hydrogen phosphate (DUFF), T., 568, 571.
Phosphonium compounds, quaternary, resolution of (RADCLIFFE and BRINDLEY), A., i, 263.
Phosphorescence caused by active nitrogen (KREPELKA), A., ii, 598.
Phosphoric and **Phosphorous acids.** See under Phosphorus.
Phosphorus, ultra-violet absorption spectrum of (PURVIS), A., ii, 520.
  luminescence of (RAYLEIGH), A., ii, 755.
  allotropy of (STOCK), A., ii, 67.
  black (HALL), A., ii, 156.
  red, discovery of (WINDERLICH), A., ii, 406.
  slow oxidation of (GILCHRIST), A., ii, 686.
  reaction on heating potassium cyanide with (ELLIS and GIBBINS), A., i, 904.
  use of, in gas analysis (HOLMES), A., ii, 332.
  metabolism of. See Metabolism.
Phosphorus alloys with carbon and iron (KONSTANTINOV), A., ii, 422.
Phosphorus compounds in blood of children (ANDERSON), A., i, 502.
  in blood-serum (KRAMER and HOWLAND), A., i, 71.
    in rickets (HOWLAND and KRAMER), A., i, 418.
  in serum and plasma (TOLSTOI), A., i, 504.
Phosphorus *penta*bromide, electrolysis of bromine solutions of (PLOTNIKOV), A., ii, 370.
  bromides, compounds of, with alkyl and aluminium bromides (PLOTNIKOV), A., i, 430.
  *tri*chloride, preparation of, from calcium phosphates (BUDNIKOV and SHILOV), A., ii, 763.
  *penta*chloride, action of, on octa-acetylmaltose (BRIGL and MISTELE), A., i, 442.
  halides, additive compounds of (CONANT and COYNE), A., i, 69; (CONANT, BRAVERMAN, and HUSSEY), A., i, 264; (CONANT, WALLINGFORD, and GANDHEKER), A., i, 498.

Phosphorus *pent*oxide (*phosphoric oxide*), dehydrating action of, on ethyl alcohol and ether (Balareff), A., i, 287.
  action of water on (Rakuzin and Arsenéev), A., ii, 237.
 estimation of, in soils (Ravenna), A., ii, 334.
 Phosphoric acid, equilibrium of ferric oxide, water, and (Carter and Hartshorne), T., 2223.
  fixation of, by soils (Fraps), A., i, 1167; (Lemmermann and Fresenius), A., i, 1276.
  organically-combined, bacterial reduction of (Barrenscheen and Beckh-Widmanstetter), A., i, 1156.
  metabolism. See Metabolism.
  neutralisation of, by calcium hydroxide (Wendt and Clarke), A., ii, 417.
  detection of, in milk (Kling and Lassieur), A., ii, 505.
  estimation of, microchemically (Kuhn), A., ii, 696.
  estimation of, by the sulphate-molybdate method (Beckley and Marais), A., ii, 785.
  estimation of, in blood and fæces (Grote), A., ii, 655.
  estimation of, in soils (Bischoff and Marchand), A., ii, 786.
 Phosphates, change of reaction in conversion of, into pyro- and meta-phosphates (Murschhauser), A., ii, 563.
  effect of, on carbohydrate metabolism (Elias and Low; Elias, Popescu-Inotesti, and Radoslav), A., i, 976.
  distribution of, in soils (Leoncini and Rogai), A., i, 1167.
  mixtures of tartrates and, as buffer solutions (Simon and Zivy), A., ii, 175.
  estimation of, volumetrically (Bury), A., ii, 37.
  estimation of, in fertilisers (Robertson and Dickinson), A., ii, 252.
 Orthophosphoric acid, solid, electrical conductivity of (Rabinovitsch), A., ii, 822.
  molecular compounds of ethyl ether and (Rabinovitsch and Jakubsohn), A., i, 1172.
 Metaphosphoric acid, hydration of (Pessel), A., ii, 396.
 Pyrophosphoric acid, hydration of (Pessel), A., ii, 396.
 Tetraphosphoric acid, preparation of (Rakuzin and Arsenéev), A., ii, 237.

Phosphorus:—
 Phosphorous acid, reaction between iodine and (Mitchell), T., 2241.
  estimation of, volumetrically, in presence of phosphoric acid (Wingler), A., ii, 506.
 Hypophosphorous acid, studies on (Mitchell), T., 629.

Phosphorus organic compounds:—
 in soils (Auten), A., i, 1276.
 Phosphoric acid, *cyclo*hexanyl ester, and its salts (Komatsu and Kumamoto), A., i, 205.
 Phosphorous acid, esters (Boyd and Chignell), T., 813.

Phosphorus estimation:—
 estimation of (Lundell and Hoffman), A., ii, 85, 251.
 estimation of, volumetrically, with methylene-blue (Thornton and Elderdice), A., ii, 334.
 estimation of, in light aluminium alloys (Losana and Rossi), A., ii, 696.
 organic, estimation of, gravimetrically (Jones and Perkins), A., ii, 432.
 estimation of, in vanadium ores (Kriesel), A., ii, 252.

Phosphoryl chloride, preparation of (Vanscheidt and Tolstopiatov), A., ii, 559.

Phosphosalicylic acid, methyl ester (Gautrelet), A., i, 796.

Phosphotungstates (Kehrmann and Mellet), A., ii, 77, 497.
 analysis of (Mellet), A., ii, 579.

Phosphotungstic-phosphomolybdic reagent, reaction of proteins with (Levine), A., ii, 44.

Photo-azides (Angeli and Pieroni), A., i, 613.

Photocatalysis (Baly, Heilbron, and Stern), T., 185.

Photochemical decomposition of solids (Noyes), A., ii, 451.
 equivalence law (Kuhn), A., ii, 815.
  application of, to dilute solutions (Grüss), A., ii, 278.
  application of, to dry plates (Eggert and Noddack), A., ii, 526.
 processes, mechanism of (Weigert), A., ii, 3; (Coehn and Tramm), A., ii, 205; (Coehn and Jung), A., ii, 206.
 reactions, theory of (Nernst and Noddack), A., ii, 526.
  influence of drying on (Tramm), A., ii, 716.
  kinetics of (Wegscheider), A., ii, 49; (Lazarev), A., ii, 598.
  temperature coefficient of (Tolman), A., ii, 813.

Photochemical reactions and Einstein's law (Weigert), A., ii, 861.
with chlorine (Weigert), A., ii, 813.
in jellies (Benrath and Schaffganz), A., ii, 50.
studies (Plotnikov), A., ii, 451; (Noyes and Kouperman), A., ii, 527.
Photochemistry and fluorescence (Levaillant), A., ii, 597.
of unstable substances (Bowen), T., 1199.
Photoelectric properties and chemical combination (Gudden and Pohl), A., ii, 528.
sensitivity (Coblentz), A., ii, 280.
Photographic developer, new (Christiansen), A., i, 1093.
films, cause of the darkening of (Rumpf), A., ii, 208.
plates, dry, application of the photochemical equivalence law to (Eggert and Noddack), A., ii, 526.
Photography, applications of, to chemistry (Jolibois), A., ii, 363.
Photo-luminescence, action of red and infra-red radiations on (Curie), A., i, 812.
Photosynthesis, action of light of various colours on (Lubimenko), A., ii, 716.
effect of traces of chemical compounds on (Bose), A., i, 1043.
of amines (Snow and Stone), T., 1509.
plant respiration and (Spoehr and McGee), A., i, 988.
Phototropy (Heilbron, Hudson, and Huish), T., 2273.
of sulphides (Rodriguez Mourelo), A., ii, 109.
Phthalaldehyde (Seekles), A., i, 931.
*iso***Phthalaldehyde**, compound from interaction of benzidine and (Adams, Bullock, and Wilson), A., i, 379.
chloro-derivatives (Cassella & Co)., A., i, 800.
Phthalatodipentamminecobaltic nitrate (Duff), T., 568.
Phthalatopentamminecobaltic nitrate (Duff), T., 569.
Phthaleins, detection of (Calvert), A., ii, 97.
Phthalic acid, ethyl ester, detection of (Calvert), A., ii, 97; (Andrew), A., ii, 663.
detection of, in brandy (Eilles), A., ii, 796.
Phthalic acid, 3- and 4-nitro- preparation of (Ingold and Piggott), T., 1499.
*iso***Phthalic acid**, 2:6-*di*chloro-, methyl ester (Pollak and Rudich), A., i, 27.
*iso***Phthalic acid**, *m*-iodo-, esters (Burton and Kenner), T., 1044.
Phthalide derivatives, stability of the lactone ring of, to hydrazine (Teppema), A., i, 256.
Phthalide, 5-amino-, acetyl derivative (Teppema), A., i, 257.
5-bromo-, and 5-chloro- (Teppema), A., i, 258.
Phthalimide, potassium derivative, interaction of $\beta\beta'$-dichlorodiethyl sulphide, sulphone, and sulphoxide with (Cashmore and McCombie), T., 2884.
4-Phthalimidoacetyl-2:3:5-trimethylpyrrole (Fischer and Zerweck), A., i, 365.
γ-Phthalimido-β-hydroxybutyronitrile (Tomita), A., i, 190.
Phthalimidomethoxyacetic acid ether (Hopkins), A., i, 340.
Phthalimidomethyl ethers (Hopkins), A., i, 340.
m- and *p*-**Phthalimidophenylcarbazoles** (G. and M. de Montmollin), A., i, 373.
Phthalon-2-anilic acid, and its aniline salt (Kuroda and Perkin), T., 2107.
Phthalonic acid, derivatives of (Kuroda and Perkin), T., 2094.
Phthalyldisalicylic acids, esters of (Kaufmann), A., i, 796.
Phthalyl-leucauramine, and its carbinol and *di*nitro- (Bogert and Ruderman), A., i, 32.
Phthalylphenylhydrazide, enantiotropism of (Ishikawa), A., i, 863.
Phycoerythrin in Myxophyceæ (Wille), A., i, 277.
Physiological processes, effect of high altitudes on (Barcroft), A., i, 501.
Physostigmine. See Eserine.
Phytochemical reduction (Neuberg and Reinfurth), A., i, 987.
Picramide, compounds of, with hydrocarbons (Efremov), A., i, 552.
Picric acid, molecular conductivity of, in methyl alcohol (Bjerrum and Zechmeister), A., i, 645.
freezing-point curve of the mixture, trinitrophenylmethylnitroamine and (Taylor and Rinkenbach), A., i, 1193.
freezing-point curve of mixtures of trinitrotoluene and (Taylor and Rinkenbach), A., i, 909.
compounds of, with hydrocarbons (Efremov), A., i, 551.
potassium and sodium salts, detection of, microscopically (Justin-Mueller), A., ii, 656.
estimation of sulphuric acid in (Patterson and Moudgill), A., ii, 505.

- **Picric acid,** *m*-chloro-, salts of (Seckles), A., i, 237.
- **Picryl** chloride, compounds of, with hydrocarbons (Efremov), A., i, 552.
  - sulphide, equilibrium of trinitroanisole with (Chaumeil and Thomas), A., i, 673.
    - equilibrium in the system, tolite and (Roche and Thomas), A., i, 326.
- **Picrylhydroxylamine,** and its derivatives (Borsche), A., i, 1091.
- **Picrylmethylnitroamine.** See Nitramine.
- **Piezo-chemical studies** (Moesveld), A., ii, 142, 740, 746; (Cohen, Voller, and Moesveld), A., ii, 386; (Cohen and Moesveld; Cohen, Ishikawa, and Moesveld), A., ii, 537.
- **Pigments** from bacteria, constitution of (McCombie and Scarborough), T., 3279.
  - of skin (Brahn and Schmidtmann; Lignac), A., i, 980.
- **Pike.** See *Esox lucius.*
- **Pilocarpic acid,** nitro- (Max and Michel Polonovski), A., i, 52.
- *n*- and *iso*-**Pilocarpic acids,** γ-chloro-, ethyl and methyl esters and their nitrates (Max and Michel Polonovski), A., i, 129.
- *iso*-**Pilocarpinanil,** and its salts (Max and Michel Polonovski), A., i, 130.
- *n*- and *iso*-**Pilocarpine,** isomerism of (Max and Michel Polonovski), A., i, 130.
- *n*- and *iso*-**Pilocarpine,** nitro- (Max and Michel Polonovski), A., i, 52.
- **Pilocarpine series** (Max and Michel Polonovski), A., i, 52, 129, 130.
- *d*-**Pimaric acid,** and its derivatives (Ruzicka and Balas), A., i, 818.
- **Pimelic acid,** α-amino- and α-bromo-γ-hydroxy-, and γ-hydroxy-, and their derivatives (Leuchs and Nagel), A., i, 89.
- **Pinacol-pinacolin transformation,** mechanism of (Ingold), T., 1706.
- **Pinacolin transformations** (Tiffeneau and Levy), A., i, 213; (Meerwein and Schafer), A., i, 324.
- **Pinacols,** preparation of, from α-hydroxymethyl ketones (Locquin and Wouseng), A., i, 433.
- **Pinane** (Lipp), A., i, 1214.
  - and nitro- (Nametkin), A., i, 692.

Placental transmission (BOGERT and PLASS), A., i, 974; (PLASS and TOMPKINS), A., i, 975.
Plantago psyllium, seeds of, as protective colloid (GUTBIER, HUBER, and ECKERT), A., ii, 393.
Plants, chemistry of (VOGL), A., i, 990; (ASZKENAZY), A., i, 1044.
  absorption of ions by (HOAGLAND and DAVIS), A., i, 1272.
  synthesis of acid amides in (SMIRNOV), A., i, 636.
  effect of ammonium sulphate on the growth of, and on the availability of iron (JONES and SHIVE), A., i, 1043.
  amylase in (SJÖBERG), A., i, 275.
  effect of light on assimilation of (WARBURG and NEGELEIN), A., ii, 718.
  assimilation of electrolytes by (PRÁT), A., i, 636.
  assimilation of calcium by (HUNT and WINTER), A., i, 1271.
  assimilation of calcium, aluminium, and iron phosphates by (BRIOUX), A., i, 79.

Plants, assimilation of lead by (Hevesy), A., i, 1160.
  synthesis and degradation of asparagine in (Prianischnikov), A., i, 273.
  colloids in (Samec and Isajevič), A., i, 18.
  action of hexamethylenetetramine on the growth of (Blanck, Geilmann, and Giesecke), A., i, 171.
  incrustive substances in (Schmidt, Geisler, Arndt, and Ihlow), A., i, 274; (Schmidt and Miermaster), A., i, 884.
  effect of manganese on the growth of (McHargue), A., i, 1160.
  availability of mineral matter for (Comber), A., i, 79.
  nitrogen metabolism of (Prianischnikov), A., i, 425.
  mechanism of oxidation in (Gallagher), A., i, 1159.
  peroxydase in (Palladin and Manskaja), A., i, 427.
  effect of potassium on the structure and development of (Weiszmann), A., i, 635.
  orthoclase as a source of potassium for (Haley), A., i, 888.
  respiration in (Fernandes; Lyon; Smith), A., i, 1270.
  effect of chloroform on respiration of (Ray), A., i, 520.
  respiration of, and photosynthesis (Spoehr and McGee), A., i, 988.
  action of salt solutions on (Iljin), A., i, 172.
  effect of salts on the synthesis and destruction of starch in (Iljin), A., i, 172.
  soil solution and growth of (Tulaikov), A., i, 992.
  effect of titanium compounds on the growth of (Němec and Káš), A., i, 1161.
  occurrence of urease in (Armstrong), A., i, 1275.
  green, constituents of (Franzen and Helwert), A., i, 77, 520, 637; (Franzen and Keyssner), A., i, 427, 1045; (Franzen and Ostertag), A., i, 636; (Franzen and Kaiser), A., i, 1045.
    assimilation of carbon dioxide and formaldehyde by (Sabalitschka), A., i, 76.
    iron-chlorosis in, caused by manganese (Rippel), A., i, 1160.
  higher, assimilation of ammonia by (Prianischnikov), A., i, 1159.
    action of hexamethylenetetramine on (E. and G. Nicolas), A., i, 77.

Plants, higher, effect of sulphur dioxide on respiration of (Stoklasa, Šebor, Zdobnický, and Nekola), A., i, 521.
  Japanese, chemistry of (Nakamura), A., i, 1046; (Komatsu and Ueda), A., i, 1274.
  leguminous, increase in root nodules of (Werner), A., i, 1046.
  estimation of hydrocyanic acid in (Kohn-Abrest and Ricardoni), A., ii, 889.
Plant cells, permeability of (Raber), A., i, 1272, 1273, 1274; (Brooks), A., i, 1273.
  formation of fat in (Haehn and Kinttof), A., i, 426.
  inorganic ions in the sap of (Hoagland and Davis), A., i, 882.
  effect of organic substances on the formation of starch in (Maige) A., i, 989.
  action of saponins on (Boas), A., i, 273.
Plant extracts, effect of, on blood sugar (Thallinner and Perry), A., i, 967.
Plant products, sublimation of (Viehoever), A., ii, 535.
Plant tissues, effect of desiccation on carbohydrates in (Link and Tottingham), A., ii, 265.
  formation of vitamin-A in (Coward), A., i, 521.
  estimation of nitric nitrogen and total nitrogen in (Gullagher), A., ii, 334.
  estimation of starch in (Denny), A., ii, 95.
Plasmodia, composition of protoplasm of (Lepeschkin), A., i, 990.
Plaster of Paris, setting of (Jolibois and Chassevent), A., ii, 565.
Platinum, native, structure of (Schemtschuschny), A., ii, 502.
  valency of, in mercaptan compounds (Rây), T., 133.
  L-series spectrum of (Rogers), A., ii, 200.
  electromotive polarisation of (Pamfilov), A., ii, 606.
  colloidal, preparation of (Gutbier and Zweigle), A., ii, 60.
    catalytic reduction with (Lochte and Bailey), A., i, 906.
Platinum bases (*platinammines*) (Tschugaev, Grigorieva, and Tscherniaev), A., ii, 499.
Platinum oxide, preparation of, and its catalytic action (Adams and Shriner), A., ii, 773.
    catalytic action of (Carothers and Adams), A., ii, 310.

Platinum organic compounds:—
Platinum bases (*platinammines*) (Schleicher, Henkel, and Spies), A., i, 1120.
Platinum estimation:—
estimation of, with thiocyanates (Ivanov), A., ii, 263.
Platinum black, hydrogenation of aldehydes and ketones by means of (Faillebin), A., i, 92.
catalytic oxidations with (Cusmano), A., i, 586.
Poisoning, acid (Loewy and Münzer), A., i, 421.
chloroform (Underhill and Kapsinow), A., i, 421.
by methyl alcohol (Rief), A., i, 734.
in relation to acidosis (Loewy and Münzer), A., i, 421.
Polarisation of electrodes (Verschaffelt), A., ii, 115, 369.
of double bonds (Lapworth and Robinson), A., ii, 849.
Polarity, influence of the atomic nucleus on (Henstock), A., ii, 233.
induced alternate, octet theory of (Fraser and Humphries), A., ii, 627.
in relation to the tautomeric hydrogen theory (Allsop and Kenner), T., 2296.
Polonium, radioactive constant of (Maracineanu), A., ii, 529.
precipitation of, along with bismuth hydroxide (Escher), A., ii, 602.
Polyacenaphthylene, and bromo- (Dziewónski and Olesiówna), A., i, 776.
*allo***Polyacenaphthylene** (Dziewónski and Olesiówna), A., i, 776.
Polycyclic compounds, chemistry of, in relation to their homocyclic unsaturated isomerides (Ingold, Seeley, and Thorpe), T., 853: (Grimwood, Ingold, and Thorpe), T., 3303.
Polygonum hydropiper, constituents of (Bielecki and Lieberman), A., i, 991.
Polyguaiacylsilicon (Pharmaceutische Industrie, G. m. b. H., and Hauschka), A., i, 30.
Polymerisation (Lebedev, Andreevski, and Matiuschkina), A., i, 770.
Polypeptides, resolution of (Abderhalden and Goto), A., i, 1069; (Abderhalden and Alker), A., i, 1071.
compounds of normal salts with amino-acids and (Pfeiffer), A., i, 308.
Polypeptide hydantoins, synthesis of (Hahn, Kelley, and Schaeffer), A, i, 487.
Polysaccharides (Karrer and Smirnov), A., i, 122; (Karrer and Joos), A., i, 541; (Karrer), A., i, 685; (Karrer, Joos, and Staub), A., i, 1182; (Karrer and Fioroni), A., ii, 460.
constitution of (Irvine and Hirst), T., 518; (Komatsu, Inoue, and Nakai), A., i, 1181.
action of dry hydrogen bromide on (Hibbert and Hill), A., i, 184.
Polysulphides, organic (Riding and Thomas), T., 3271.
Polythionic acids. See under Sulphur.
Pongamia glabra, oil from the seeds of (Desai, Sudborough, and Watson), A., i, 995.
Poppy, Indian. See *Papaver somniferum*.
Porcelain slip, effect of addition of substances to (Kleeman), A., ii, 226.
Porphyrins, natural (Schumm), A., i, 631; (Fischer and Schaumann; Fischer and Hilger), A., i, 964; (Fischer and Schneller), A., i, 1244.
Posidonia, chemistry of the fibre of (Earl), T., 3223.
Potassamide, equilibrium of mixtures of sodamide and (Kraus and Cuy), A., ii, 320.
Potassium, absorption spectrum of (McLennan and Ainslie; Narayan and Gunnayya), A., ii, 357.
multiple lines in the spectrum of (Nissen), A., ii, 671.
ionised, spectra of, and of argon (Zeeman and Dik), A., ii, 670.
positive ray analysis of (Dempster), A., ii, 413.
transport number of (Schneider and Braley), A., ii, 456.
interaction of ethyl acetate and (Scheibler, Ziegner, and Peffer), A., i, 82.
Potassium compounds, effect of, on the structure and development of plants (McHargue), A., i, 635.
Potassium salts, density of dilute solutions of (Hartley and Barrett), T., 398.
absorption of, by animal cells (Stanton), A., i, 508.
nutritive value of (Miller), A., i, 414.
pharmacology of (Rosenmann), A., i, 983.
Potassium ammonioaluminate and **ammoniomanganite** (Bergstrom), A., ii, 31.
carbonate, solubility of, in water (Rubcov), A., ii, 415.

- **Potassium** carbonate, solubility in the system, sodium chlorate and (Iljinski), A., ii, 562.
  - action of, on lead glass (Richmond), A., ii, 687.
- chlorate, decomposition of (Brown, Burrows, and McLaughlin), A., ii, 561.
  - promoters in the decomposition of (Neville), A., ii, 857.
  - oxygen-generating mixture with (Udaka), A., ii, 556.
  - reduction of, by ferrous sulphate (Herschkowitsch), A., ii, 25.
- *per*chlorate, decomposition of, and its catalysis by ferric oxide (Otto and Fry), A., ii, 474.
- chloride, deposits at Solikamsk (Kurnakov, Beloglazov, and Schmatko), A., ii, 246.
  - velocity of formation of (Abel), A., ii, 745.
  - equilibrium of ammonium nitrate and (Perman and Saunders), T., 841.
  - equilibria in the system, calcium chloride, magnesium chloride, water, and (Lee and Egerton), T., 706.
  - solidification of magnesium chloride, barium chloride, and (Valentin), A., ii, 73.
- chloride and nitrate, equilibrium of calcium chloride and nitrate, water, and (Barbaudy), A., ii, 621.
- cupric chlorite (Levi and Cipollone), A., ii, 492.
- chloroiridiate, decomposition of (Gire), A., ii, 162.
- chloropalladite and chloroplatinite, crystal structure of (Dickinson), A., ii, 25.
- fluoborate and permanganate, isomorphism of (Zambonini), A., ii, 70.
- hydrogen fluoride, crystal structure of (Bozorth), A., ii, 758.
- hydride, preparation of (Bardwell), A., ii, 20.
- hydroxide, formation of, from potassium carbonate and lime (Budnikov and Syrkin), A., ii, 634.
  - activity coefficients of ions of (Knobel), A., ii, 116.
  - transport numbers of, in aqueous solution (Knobel, Worcester, and Briggs), A., ii, 119.
- hydrosulphide, hydrolysis of (Wasastjerna), A., ii, 625.
- iodide, equilibrium of lead iodide and (Demassieux), A., ii, 565.
- **Potassium** iodide, reaction between hypochlorites and (Kolthoff), A., ii, 176.
  - estimation of (Matthes and Schutz), A., ii, 433.
- *trï*iodide, Röntgen ray structure of (Clark and Duane), A., ii, 856.
- *per*manganate, electrolytic preparation of (Grube and Metzger), A., ii, 319.
  - photochemistry of (Rideal and Norrish), A., ii, 362, 450.
  - oxidation of phenyl-fatty acids by alkaline (Prshevalski), A., i, 567.
  - preparation and use of standard solutions of (Bruhns), A., ii, 658.
  - stability of solutions of, and their standardisation (Hackl), A., ii, 42.
- nitrate, equilibrium of lead nitrate, water, and (Glasstone and Saunders), T., 2134.
  - freezing-point curves for mixtures of sodium nitrate and (Briscoe and Madgin), T., 1608; (Madgin and Briscoe), T., 2914.
- *tetr*oxide, interaction of, with ice and with dilute sulphuric acid (Hawley and Sand), T., 2891.
- platinocyanide, equilibrium of, with water and with lithium platinocyanide (Terrey and Jolly), T., 2217.
- sulphate, equilibrium of ammonium nitrate and (Perman and Howells), T., 2128.
  - solubility of magnesium sulphate and (Levi), A., ii, 758.
- aluminium sulphate, dilatometric experiments with (Ivanova), A., ii, 295.
- *per*sulphate, preparation of (Fichter and Humpert), A., ii, 562.
  - reduction of, by radium rays (Kailan), A., ii, 601.
- *mono*sulphide, hydrolysis of (Wasastjerna), A., ii, 625.
- *penta*sulphide, action of, on alkyl halides (Riding and Thomas), T., 3271.
- sulphite and hydrogen sulphite, action of formaldehyde on (Estalella), A., i, 181.
- *poly*thionates, constitution and heats of formation of (Martin and Metz), A., ii, 759.

Potassium organic compounds :—
- arylsulphoniodoamides (Roberts), T., 849.

- **Potassium organic compounds**:—
  - cobalti-, chromi-, ferri-, and ferrocyanides, dissociation of (BURROWS), T., 2028.
  - ferricyanide, electrolytic precipitation with (KOLTHOFF), A., ii, 256, 260.
  - ferrocyanide, photoelectric activity of (POOLE), A., ii, 363.
    - use of, in analysis (PORLEZZA), A., ii, 503.
    - detection of (COLE), A., ii, 703.
  - methyl sulphate, action of, on monocarboxylic acids (SIMON), A., i, 290.
- **Potassium detection, estimation, and separation**:—
  - detection of (CUTTICA), A., ii, 497.
  - detection and estimation of, with sodium 3-chloro-5-nitro-*m*-toluenesulphonate (H. and W. DAVIES), T., 2976.
  - estimation of (POZZI-ESCOT), A., ii, 507; (MORRIS), A., ii, 698.
  - estimation of, as alum (DE LA PAULLE), A., ii, 181.
  - estimation of, by the use of bismuth sodium thiosulphate (CUISINIER), A., ii, 38.
  - estimation of, with sodium cobaltinitrite (CLERFEYT), A., ii, 181.
  - estimation of, by Przibylla's sodium hydrogen tartrate method (HUBERT), A., ii, 181.
  - estimation of, volumetrically (BULLI and FERNANDES), A., ii, 507.
  - estimation of, in human blood (MIRKIN and DRUSKIN), A., ii, 507.
  - estimation of, in insoluble silicates (GREEN), A., ii, 255.
  - estimation of, in soils (BISCHOFF and MARCHAND), A., ii, 786.
  - estimation of, and its separation from sodium (SMITH), A., ii, 789.
- **Potatoes**, sweet cooked, maltose in (GORE), A., i, 1163.
  - analysis of (BÖMER and MATTIS), A., ii, 799.
  - estimation of starch in (LING and PRICE), A., ii, 702.
- **Potential** of electrodes (HEYROVSKÝ), A., ii, 114; (GARRISON), A., ii, 115.
  - ionisation. See Ionisation potentials.
  - at the boundary of two liquid phases (BAUER), A., ii, 53.
  - measurements with membranes (HITCHCOCK), A., ii, 530, 826; (PRIDEAUX and CROOKS), A., ii, 728; (HILL), A., ii, 826.
- **Potentiometer**, use of, in the study of photochemical change (RIDEAL and NORRISH), A., ii, 362.
- **Praseodymium**, estimation of (BRINTON and PAGET), A., ii, 581.
- **Precipitates**, velocity of formation of (BOUSSU), A., ii, 144.
  - adsorption by (CHATTERJI and DHAR; DHAR, SEN, and CHATTERJI), A., ii, 615.
  - replacement of substances adsorbed in (CHARRIOU), A., ii, 540.
- **Precipitation**, rhythmic (NOTBOOM; LIESEGANG), A., ii, 395; (JANEK), A., ii, 395, 620.
- **Pressure**, internal, of liquids (KARPEN), A., ii, 11.
- **Pressure regulator**, for use during filtration (RATH), A., ii, 628.
- **Pristane** (TOYAMA), A., i, 890.
- **Procaine**, estimation of (HANSON), A., ii, 798.
- **Procellose**, and its osazone (BERTRAND and BENOIST), A., i, 756.
- **Proline**, synthesis of (PUTOCHIN), A., i, 1225.
- **Proline**, γ-hydroxy-, synthesis of (TRAUBE, JOHOW, and TEPOHL), A., i, 1071.
- ***l*-Prolylglycine anhydride** (ABDERHALDEN), A., i, 717.
- ***l*-Prolyl-*l*-leucine anhydride** (ABDERHALDEN), A., i, 717.
- **Promoters** in catalysis (MEDSFORTH), T., 1452.
- **Propaldehyde**, condensation of, with ammonia (TSCHITSCHIBABIN and OPARINA), A., i, 1123.
- **Propane**, *ααγγ-tetra*bromo- (DEMJANOV and DOJARENKO), A., i, 1189.
- **Propane series**, keto-cyclol change in the (LANFEAR and THORPE), T., 1683.
- *cyclo***Propane**, *di*bromo- (DEMJANOV and DOJARENKO), A., i, 1188.
- *cyclo***Propane series**, tautomerism in the (GOSS, INGOLD, and THORPE), T., 327, 3342.
- *cyclo***Propanecarboxyl chloride**, 1-chloro- (BRUYLANTS and STASSENS), A., i, 213.
- *cyclo***Propanecarboxylic acid**, alkali salts, electrolysis of, and its allyl ester (FICHTER and REEB), A., i, 677.
- *cyclo***Propanecarboxylic acid**, 1-chloro-, and its sodium salt and derivatives (BRUYLANTS and STASSENS), A., i, 213.
- *cyclo***Propane-1:1-dicarboxylic-2:3-diacetic acid**, ethyl ester (FARMER), T., 3336.
- *cyclo***Propanedicarboxylic-diphenylacetic anhydride** (STAUDINGER, SCHNEIDER, SCHOTZ, and STRONG), A., i, 469.
- *cyclo***Propene** (DEMJANOV and DOJARENKO), A., i, 1188.
- *n*- and *iso*-**Propenylbenzene**, *p*-bromo- (ZIEGLER and TIEMANN), A., i, 31.

Propionic acid, lead tetra-salt, preparation of (Schall and Melzer), A., i, 87.
Propionic acid, α-*di*chloroamino-, ethyl ester (Traube and Gockel), A., i, 190.
Propionylpapaverine, and its derivatives (Schneider and Nitze), A., i, 702.
3-Propionylphenylarsinic acid, 4-hydroxy-, *p*-nitrophenyl hydrazone (Albert), A., i, 70.
1-Propiophenone, 3:5-*di*bromo-2:4-*di*hydroxy-, and its phenylhydrazone (Gnagy), A., i, 467.
Propiophenones, substituted, decomposition of, with sodamide (Albesco), A., i, 41.
6-Propoxybenzylacetophenone, α-bromo- (Dufraisse and Gérald), A., i, 114.
Propyl alcohol, βγ-*di*amino-, synthesis of (Philippi and Seka), A., i, 1185.
Propyl *n*-butyl sulphide (v. Braun and Engelbertz), A., i, 894.
  chloride, βγ-*di*amino-, salts of (Philippi, Seka, and Ableidinger), A., i, 1185.
  hypochlorites (Chattaway and Backeberg), T., 3001.
Propylacetoacetic acid, bromo- and chloro-, ethyl esters, action of hydrazine on (Macbeth), T., 1126.
5-*iso*Propyl-5-allylbarbituric acid, (Preiswerk), A., i, 298.
  compound of (Hoffmann-La Roche & Co.), A., i, 155.
Propyl*iso*amylbarbituric acid (Sommaire), A., i, 388.
Propyl*iso*amylbarbituric acids (Shonle and Moment), A., i, 249.
Propyl*iso*amylmalonic acid, and its ethyl ester (Sommaire), A., i, 388.
9-*n*-Propylanthracene, and its picrate (Sieglitz and Marx), A., i, 912.
Propylbenzene, molecular compound of hydrogen bromide and (Maass, Boomer, and Morrison), A., i, 769.
4-*iso*Propylbenzoic acid, 5-chloro-2-amino-, and its hydrochloride and acetyl derivative (Wheeler and Giles), A., i, 28.
o-**Propylbenzylamine**, γ-chloro-, and its salts (v. Braun, Zobel, and Blessing), A., i, 372.
Propylbutylbarbituric acid (Sommaire), A., i, 387.
***iso*Propyl-*n*-butylbarbituric acid** (Shonle and Moment), A., i, 249.
Propyl-*n*- and -*iso*-butylbarbituric acids, and the ethyl ester of the former (Sommaire), A., i, 387.
Propyl-*n*-butyl ketone, and its semicarbazone (Blaise), A., i, 538.
***N*-Propylcarbazoles**, 3-nitro- (Stevens and Tucker), T., 2144.
***p*-*iso*Propylcinnamic acid**, α-thiol- (Gränacher, Gerö, Ofner, Klopfenstein, and Schlatter), A., i, 707.
  and its disulphide (Gendelman), A., i, 605.
***iso*Propyldeoxybenzoin.** See αβ-Diphenyl-γ- methylbutan-α-one.
9-*n*-Propyl-9:10-dihydroanthracene (Sieglitz and Marx), A., i, 913.
***cyclo*Propyldimethylamine, and its salts** (Demjanov and Dojarenko), A., i, 1189.
Propylene, hydration of (Wibaut and Diekmann), A., i, 1049.
  action of selenium oxychloride on (Frick), A., i, 890.
  thiohydrin (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 87.
Propylene glycol, oxidation of, by potassium permanganate (Evans), A., i, 175.
***iso*Propyl-*p*-ethanalbenzene.** See *p*-Cymylacetaldehyde.
***cyclo*Propylethylketimine**, and its hydrochloride (de Booseré), A., i, 311.
β-*iso*Propylglutaramide, αα′-*di*cyano- (Curtis, Day, and Kimmins), T., 3134.
β-*iso*Propylglutaric acid, preparation of (Curtis, Day, and Kimmins), T., 3134.
Propylglycerol, and its triacetate (Delaby), A., i, 85.
Propylglyoxal, and its derivatives (Blaise), A., i, 181.
γ-Propylhexan-γ-ol-β-one, and its derivatives (Locquin and Wouseng), A., i, 302.
α-Propylhexoic acid, and its amide and chloride (Sommaire), A., i, 387.
***iso*Propylhydrazine**, and its derivatives (Lochte, Noyes, and Bailey), A., i, 26.
***iso*Propylhydrobenzoin.** See αβ-Diphenyl-γ-methylbutane-αβ-diol.
***iso*Propylidene compounds**, formation of, from αγ-glycols and acetone (Böeseken and Hermans), A., i, 86.
  of sugars (Freudenberg and Doser), A., i, 632; (Freudenberg and Hixon), A., i, 1179.
***iso*Propylidene-dextrose γ-sulphate, salts** of (Ohle), A., i, 539.
***iso*Propylidene-dextrose-6-sulphuric acid, and its salts, and the monohydrate of its strychnine salt (Ohle)**, A., i, 539.

***iso*Propylidene-*o*-hydroxymethylbenzhydrazide** (Teppema), A., i, 257.

***iso*Propylidene-xylose** (Svanberg and Sjöberg), A., i, 540.

***m*-Propylisatoid**, 5-bromo- (Heller and Lauth), A., i, 852.

***iso*Propylmalonic acid**, derivatives, steric hindrance in (Preiswerk), A., i, 298.
  propyl ester (Shonle and Moment), A., i, 249.

***cyclo*Propylmethyldimethylamine**, and its salts (Demjanov and Dojarenko), A., i, 1193.

***p*-*iso*Propylphenylalanine** (Granacher, Gerö, Ofner, Klopfenstein, and Schlatter), A., i, 707.

3-*iso*Propylphenylethylamine, *di*-4-hydroxy- (Hinsberg), A., i, 463.

***p*-*iso*Propylphenylpropionic acid**, α-oximino- (Granacher, Gerö, Ofner, Klopfenstein, and Schlatter), A., i, 707.

***p*-*iso*Propylphenylpropylalcohol** (Ruzicka and Stoll), A., i, 120.

***p*-*iso*Propylphenylpyruvic acid** (Granacher, Gero, Ofner, Klopfenstein, and Schlatter), A., i, 707.

***iso*Propylphosphinic acid**, α-hydroxy-, and α-hydroxy-β-chloro-, diphenyl esters (Conant, Wallingford, and Gandheker), A., i, 498.

***cyclo*Propyl*cyclo*propanehexacarboxylic acid**, and its sodium salt and ethyl and methyl esters (Farmer), T., 3338.

***cyclo*Propyl*cyclo*propanetetracarboxylic acid** (Farmer), T., 3340.

5-Propyl-2-propiothienone, and its semicarbazone (Steinkopf, Augestad-Jensen, and Donat), A., i, 124.

***n*-Propyl*iso*propylbarbituric acid** (Shonle and Moment), A., i, 249.

Propylpyrazole, *tri*hydroxy-, hydrochloride (Freudenberg and Doser), A., i, 652.

4-*iso*Propylpyridine, 3:5-*di*cyano-2:6-*di*hydroxy- (Curtis, Day, and Kimmins), T., 3135.

2-Propylquinoline methiodide (Meisenheimer and Schütze), A., i, 839.

1-*n*-Propylsemicarbazide, and its hydrochloride (Taipale and Smirnov), A., i, 906.

Propylthiocarbimide, βγ-*di*bromo-, interaction of aliphatic alcohols and (Hahn), A., i, 375.

1-*iso*Propylthiolanthraquinone (Hoffman and Reid), A., i, 933.

5-Propylthiolanthraquinone-1-butylsulphone (Hoffman and Reid), A., i, 934.

1-*iso*Propylthiolanthraquinonesulphonic acids, sodium salts (Hoffman and Reid), A., i, 933.

1-Propylthiol*iso*propylthiolanthraquinones (Hoffman and Reid), A., i, 933.

Propylvinylcarbinol. See **Δ^{α}-Hexen-γ-ol.**

Proteases, nomenclature of (Oppenheimer), A., i, 495.

Proteic acids of urine (Edlbacher), A., i, 617.

Proteins, structure of (Abderhalden), A., i, 717; (Abderhalden and Stix), A., i, 1030.
  studies of (Sörensen and Palitzsch), A., i, 1243.
  physical chemistry of (Cohn and Hendry), A., i, 868.
  action of ultra-violet light on solutions of (Mond), A., i, 868.
  ionisation of chlorides of (Hitchcock), A., i, 259.
  dielectric constants of (Keller), A., ii, 284.
  membrane and cataphoretic potentials (Loeb), A., ii, 285.
  stability of suspensions of (Loeb), A., ii, 301.
  adsorption of degradation products of, by blood corpuscles (Sbarsky), A., i, 411, 1252; (Sbarsky and Michlin), A., i, 1252.
  adsorption of uric acid by (Harpuder), A., i, 389.
  catalytic fission of (Sadikov and Zelinski), A., i, 492; (Brigl), A., i, 1143.
  fermentative and catalytic fission of (Sadikov and Zelinski), A., i, 721.
  hydrolysis of, by acids (Zelinski and Sadikov), A., i, 867.
  humin from acid hydrolysis of (Gortner and Norris), A., i, 399.
  autoclave hydrolysis of (Sadikov), A., i, 492.
  enzymatic hydrolysis of (Rona and Kleinmann), A., i, 1145.
  hydrolysis of, by formic acid (Zelinski and Sadikov), A., i, 721.
  hydrolysis of, by sulphuric acid (Salkowski), A.. i, 259.
  sulphur-containing amino-acid from the hydrolysis of (Mueller), A., i, 869.
  separation of hexone bases from the products of hydrolysis of (Foster and Schmidt), A., i, 963.
  cataphoresis of (Svedberg and Jette), A., i, 614.
  coagulation of (Lepeschkin), A., i, 394; (Bečka), A., i, 717; (Bečka and Sinkora), A., i, 962.

Proteins, decomposition of (Troensegaard), A., i, 615; (Abderhalden and Suzuki), A., i, 718; (Abderhalden), A., i, 1029.
  chemistry of (Blum and Strauss), A., i, 717.
  action of aluminium hydroxide on (Rakuzin), A., i, 867.
  action of chlorophyll and, on carbon dioxide (Eisler and Portheim), A., i, 424.
  action of, on colloidal gold solutions (Reznikoff), A., i, 615.
  hydroxypyrroles in (Troensegaard), A., i, 1243.
  reaction of, with soaps of higher fatty acids (Matsumura), A., i, 396.
  sulphur grouping in (Harris), A., i, 492.
  tryptophan content of (May and Rose), A., i, 160.
  metallic compounds of (Vandevelde), A., i, 962.
  determination of the Hausmann numbers of (Knaggs), A., i, 1143.
  precipitation of, by salts (Howe), A., i, 1253.
  precipitation of, in grasses (O'Dwyer), A., i, 636.
  denaturation of (Harris), A., i, 492.
  concentration of, in tissues (Cohn), A., i, 1260.
  content of, and metabolism (Terroine, Feuerbach, and Brenckmann), A., i, 413.
  effect of, on gaseous metabolism (Leimdörfer), A., i, 420.
  digestibility of, in vitro (Jones and Waterman), A., i, 962.
  rate of digestion of, by pepsin or trypsin (Northrop), A., i, 69.
  effect of acids on the digestion of, by pepsin and trypsin (Northrop), A., i, 260.
  influence of carnosine and of ions on digestion of, by pepsin (Smorodincev), A., i, 619.
  substitution of, with carbamide in ruminants (Honcamp and Schneller), A., i, 977.
  of serum, action of formaldehyde on (Kürten), A., i, 504.
  in yeast, colloid chemistry of (Lüers and Schuster), A., i, 616.
  Bence-Jones, crystallisation of (Wilson), A., i, 868.
  reaction of, with phosphotungstic–phosphomolybdic reagent (Levine), A., ii, 44.
  detection of histidine in (Brunswick), A., ii, 592.
Proteins, estimation of, nephelometrically (Rona and Kleinmann), A., ii, 890.
  estimation of, in blood plasma (Rusznyák), A., ii, 891.
  estimation of, refractometrically, in serum (Neuhausen and Rioch), A., ii, 511.
  estimation of amino-nitrogen in (Wilson), A., ii, 576.
  estimation of cystine in (Harris), A., i, 492.
  estimation of nitrogen in (Kostytschev), A., ii, 874.
  estimation of tryptophan in (Matsuyama and Mori), A., i, 867.
Proteins, chlorinated (Salkowski), A., i, 494.
  iodo- (Blum and Strauss), A., i, 717.
Proteolysis, reactions for detection of (M. and Mme E. Wollman), A., i, 615.
Protoactinium, period of activity of (Mennie), A., ii, 719.
Protocatechualdehyde, synthesis of, and its tetra-acetyl derivative (Glaser and Ueberall), A., i, 820.
Protopectin (Tutin), A., i, 1162.
Protoplasm, colloidal chemistry of (Heilbrunn), A., i, 1153.
  composition of, of plasmodia (Lepeschkin), A., i, 990.
  reaction of reagents on (Seifriz), A., i, 1043.
  action of arsenic on (Voegtlin, Dyer, and Leonard), A., i, 1266.
Prototropy (Lowry), T., 828.
Protozoa, toxicity of alkaloids towards (Henry and Brown), A., i, 986.
Prunus pissardii, constituents of the leaves of (Jonesco), A., i, 77.
Prussian blue (Müller and Lauterbach), A., i, 191.
  solubility of, in solutions of oxalates (Kohn), A., i, 312.
  and Turnbull's blue (Müller and Lauterbach), A., i, 191.
Pseudomerism (Lowry), T., 828.
Pseudomys troosti (terrapin), action of morphine and codeine on the medulla of (Heinekamp), A., i, 1266.
Ptyalin, secretion and activity of (Pringsheim and Gorodiski), A., i, 1146.
  action of arsenic and antimony compounds on (Smorodincev and Iliin), A., i, 1246.
  effect of quinine and urea derivatives on (Smorodincev and Novikov), A., i, 1145.
Puff-ball. See *Lycoperdon gemmatum*.

Purine, 2:6-*di*thiol-8-hydroxy-, and its sodium salt, and dimethyl ester (Rây, Chakravarti, and Bose), T., 1959.
Purines (Moore and Gatewood), A., i, 253; (Gatewood), A., i, 254.
Purine bases, effect of, on metabolism (Underhill and Farrell), A., i, 413.
Purine group, mercaptans of (Rây, Chakravarti, and Bose), T., 1957.
Purity, critical solution temperatures as criteria of (Jones), T., 1374, 1384.
Purple of Cassius, rhythmic formation of (Davies), A., ii, 836.
Purpurogallin (Herzig), A., i, 806.
  constitution of (Willstätter and Heiss), A., i, 1212.
Purpurogallincarboxylic acid, methyl ester (Willstätter and Heiss), A., i, 1213.
Pyocyanine, and its salts (McCombie and Scarborough), T., 3279.
Pyramidone, influence of, on metabolism (Gessler), A., i, 975.
  estimation of (Hanson), A., ii, 800.
Pyranhydrones (Schneider), A., i, 1111.
Pyrargyrite, spectrophotoelectrical sensitivity of (Coblentz and Eckford), A., ii, 206.
Pyrazole series, isomerism in the (v. Auwers and Broche), A., i, 151.
  substitution in the (Morgan and Ackerman), T., 1308.
Pyrazolecarboxylic acid, 4-iodo- (Morgan and Ackerman), T., 1815.
Pyrazolones, 4-amino-, carbamic acid derivatives of (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 858.
Pyrethronic acid, and *di*hydroxy-, and their derivatives (Yamamoto), A., i, 1010.
Pyridine, photosynthesis of (Baly, Heilbron, and Stern), T., 188.
  ultra-violet absorption spectrum of (Fischer and Steiner), A., ii, 2.
  extraction of humus and fatty matter from (Piettre), A., i, 736.
  addition of ethyl bromoacetate to (Dexter, McCombie, and Scarborough), T., 1236.
  iridium compounds of (Delépine), A., i, 480, 944.
  action of sodamide on (Wibaut and Dingemanse), A., i, 486.
  chlorate (Izmailski), A., ii, 523.
  hydroferrocyanide and sodium ferrocyanide, and its separation from *iso*quinoline (Cumming), T., 2461.
  trioxodichloro-osmonate (Scagliarini and Zannini), A., i, 1200.
Pyridine, derivatives of (Benary and Löwenthal), A., i, 53.
  detection of (Spacu), A., ii, 40.
Pyridine, 2-amino-, bromination of (Tschitschibabin and Tiashelova), A., i, 596.
    diazotisation of (Tschitschibabin), A., i, 598.
    nitration of, and 2-chloro-5-bromo-, 2-chloro-3-nitro-, and 3-nitro-2-hydroxy- (Tschitschibabin and Bylinkin), A., i, 595.
    phenylation of (Tschitschibabin), A., i, 597.
    sulphonation of (Tschitschibabin and Tiashelova), A., i, 597.
    hydrochloride (Tschitschibabin and Vorobiev), A., i, 599.
  3-amino-, azo-ester reaction of (Diels and Behnen), A., i, 391.
  2:6-*di*amino-, and its salts and derivatives (Tschitschibabin and Zeide), A., i, 599.
  2- and 4-amino- (Chemische Fabrik auf Actien vorm. Schering), A., i, 148.
  3-bromo-5-nitro-2-amino- (Tschitschibabin), A., i, 597.
  *di*bromo-, bromoamino-, bromohydroxy-, and bromonitro-derivatives (Tschitschibabin and Tiashelova), A., i, 596.
  2-chloro-3-cyano- (Späth and Koller), A., i, 595.
  hydroxy-derivatives, preparation of (Tschitschibabin), A., i, 1121.
Pyridine bases, synthesis of (Tschitschibabin), A., i, 1121.
Pyridine series, azo-colouring matters of (Tschitschibabin), A., i, 613.
2-Pyridine-3-azo-2:6-*di*aminopyridine (Tschitschibabin), A., i, 614.
2-Pyridineazo-α- and -β-naphthols, and the hydrochloride of the β-compound (Tschitschibabin), A., i, 614.
2-Pyridineazoresorcinol, and its sodium salt and hydrochloride (Tschitschibabin), A., i, 614.
Pyridine-3-carboxylamide, 2-hydroxy- (Späth and Koller), A., i, 595.
9-Pyridone-1-acetic acid (Späth and Koller), A., i, 595.
***C*-(2′-Pyridyl)-1-methylpyrroles**, and their salts (Wibaut and Dingemanse), A., i, 1232.
Pyridylmucic acid, *di*amino-, diamide of (Wibaut and Dingemanse), A., i, 1232.
2-Pyridylphenols, and their salts (Tschitschibabin), A., i, 598.
1-(2′-Pyridyl)-pyrrole, and its salts (Wibaut and Dingemanse), A., i, 1232.

- **2-Pyridylpyrroles,** and their salts (Tschitschibabin and Bylinkin), A., i, 954; (Wibaut and Dingemanse), A., i, 1232.
- **Pyrimidine,** 4:5-*di*amino-2:6-*di*hydroxy-, and 2:4:5-*tri*amino-6-hydroxy-, derivatives of (Traube), A., i, 1136.
  - derivatives, behaviour of, in the organism (Hahn and Lintzel), A., i, 1269.
  - metabolism of. See Metabolism.
- **Pyrimidines,** 4:5-*di*amino- (Traube), A., i, 1135.
- **Pyrobiloidanic acid** (Wieland and Schlichtung), A., i, 41.
- **Pyrocatechol,** fusion curves of binary mixtures of quinol, resorcinol, α-nitronaphthalene, and (Senden), A., i, 461.
  - equilibrium of, with resorcinol and α-nitronaphthalene and with quinol and α-nitronaphthalene (Senden), A., i, 921.
  - compounds of, with tervalent chromium and bivalent copper (Weinland and Walter), A., i, 674.
  - bisphenoxyalkyl ethers (Kohn and Safrin), A., i, 559.
  - triphenylmethyl ethers (Speidel and Toeldte), A., i, 331.
  - bromochloroacetyl derivative (Rosenmund, Kuhnhenn, and Lesch), A., i, 1095.
- **Pyrocatechol,** 4-amino- and 5-nitro-4-amino-, acetyl derivatives, diacetates of (Heller, Lindner, and Georgi), A., i, 1095.
  - bromo-, and its dibenzoate (Rosenmund and Kuhnhenn), A., i, 783.
- **Pyrocatecholboric acid** (Hermans), A., i, 558.
- **Pyrocatecholpyridinium** salts and betaine (Barnett, Cook, and Driscoll), T., 514.
- **Pyro-ψ-choloidanic acid,** and its hydrate (Wieland), A., i, 41.
- **Pyrogallol,** bromoacetyl derivative (Rosenmund, Kuhnhenn, and Lesch), A., i, 1095.
- **Pyrogallol,** *mono-* and *di*-bromo-, derivatives of (Rosenmund and Kuhnhenn), A., i, 783.
- **Pyroglutaminoamide** (Cloetta and Wünsche), A., i, 515.
- **Pyromellitic acid,** preparation of (de Diesbach, Schmidt, and Decker), A., i, 798.
- **Pyromucic acid,** antiseptic action of (Kaufmann), A., i, 882.
- **Pyromucyldimethylaminotetrahydronaphthalene** hydrochlorides (González and Campoy), A., i, 209.
- **Pyromucylhydroxamic acid** diacetate (Hurd and Cochran), A., i, 312.
- **Pyronines,** thio-, and their derivatives (Battegay and Fries), A., i, 1114.
- **Pyrophosphoric acid.** See under Phosphorus.
- **Pyrrole,** absorption spectrum of (Korshun and Roll), A., ii, 360.
  - and its derivatives, absorption spectra of (Korschun and Roll), A., ii, 107.
  - action of diazomethane on derivatives of (Küster and Maag), A., i, 242.
  - derivatives (Fischer and Schneller), A., i, 943.
- **Pyrrole,** hydroxy-, derivatives of (Benary and Konrad), A., i, 240; (Benary and Lau), A., i, 366.
- **Pyrroles** (Fischer and Zerweck), A., i, 364; (Pieroni), A., i, 1239.
  - polymeric, constitution of (Pieroni and Moggi), A., i, 613.
  - melanins from (Saccardi), A., i, 185.
- **Pyrroles,** hydroxy-, in proteins (Troensegaard), A., i, 1248.
- **Pyrrole group** (Oddo and Tognacchini), A., i, 709.
- **Pyrrole reaction** (Chotinski), A., ii, 444.
- **Pyrroleazo-colouring matters,** catalytic hydrogenation of (Fischer and Rothweiler), A., i, 391.
- **Pyrrole-3-carboxylic acid,** 5-nitro-2:4-*di*hydroxy-, and its salts and esters (Küster and Maag), A., i, 243.
- **Pyrrolephthalein** (Oddo and Tognacchini), A., i, 709.
- **4-Pyrrolidinoantipyrine,** and its salts (v. Braun and Lemke), A., i, 7.
- **2-Pyrrolidone,** 4-hydroxy- (Tomita), A., i, 190.
- **β-Pyrrolidonepropionamide** (Leuchs and Nagel), A., i, 190.
- **4-Pyrrolidylcarbinol,** and its salts (Putochin), A., i, 1224.
- **4-Δ^3-Pyrrolinoantipyrine** (v. Braun and Lemke), A., i, 7.
- **β-Pyrroylpropionic acid,** and its ethyl ester (Pieroni), A., i, 1239.
- **Pyrryl ketones,** methylation of (Tronov), A., i, 602.
- *Pyrus malus.* See Apples.
- **Pyruvic acid,** formation of, from alanine (Simon and Piaux), A., i, 545.
  - formation of, from lactic acid (Smull and Subkow), A., i, 298.
  - formation and utilisation of, by bacilli (Berthelot), A., i, 881.
  - production of, by microbes (Aubel), A., i, 272.
  - production of, during glycolysis (Simon and Aubel), A., i, 875.
  - **adsorption of, by animal charcoal (Abderhalden and Suzuki), A., i, 519.**

Pyruvic acid, fermentation of (Lebedev and Polonski), A., ii, 633, 634; (Neuberg and v. May), A., i, 1158; (Gottschalk), A., i, 1159.
  action of yeast on (Lieben), A., i, 424.
  acetaldehyde from, in blood (Stepp and Behrens), A., i, 625.
Pyruvic acid, bromo-, and its ethyl ester (Ward), T., 2210.
  *di*chloro-, and its ethyl ester (Klimenko), A., i, 533.
  chlorobromo- (Garino and Muzio), A., i, 24.
Pyruvylhydroxamic acid, phenylhydrazones of, and their derivatives (Gastaldi), A., i, 1237, 1238.
Pyruvylidene-*o*-hydrazinobenzoic acid, and its phenylosazone (Kliegl and Schmalenbach), A., i, 835.
Pyrylium compounds (Dilthey and Fischer), A., i, 699.
Pyrylium salts (Gastaldi and Peyretti), A., i, 478.
  synthesis of (Pratt and Robinson), T., 745.
Pyvureide, *di*chloro- (Garino), A., i, 23.
  chlorobromo- (Garino and Muzio), A., i, 24.
Pyvurin, halogen derivatives (Garino), A., i, 23; (Garino and Muzio), A., i, 24.

Q.

Quantum theory and atomic structure (Bohr), A., ii, 478.
  in relation to isotopes (Nicholson), A., ii, 401.
Quartz, crystal structure of (McKeehan), A., ii, 633.
  influence of various fluxes on (Parravano and del Turco), A., ii, 487.
Quebrachine. See Yohimbine.
Quebracho bark, action of nitric acid on (Einbeck and Jablonski), A., i, 1099.
Quercitrin in fresh and dried tea leaves (Deuss), A., i, 1046.
*iso***Quercitrin** from brown-husked maize (Sando and Bartlett), A., i, 172.
Quinaldine. See 2-Methylquinoline.
Quinaldinic acid, preparation of (Hammick), T., 2882.
*peri***Quindoline,** and its acetyl derivative (Kirchner), A., i, 913.
Quinhydrone electrode. See Electrode.
Quininal, and its salts and derivatives (Seekles), A., i, 237.
Quinine, distribution of, between water and ether (Treadwell, Gonsett, and Tripet), A., i, 1221.
Quinine, action of, on lipase (Rona and Takata), A., i, 402; (Rona and Pavlović), A., i, 403.
  solutions, gel formation in (Rona and Takata), A., i, 357.
  acetoxy-benzoates and -toluates (Farbenfabriken vorm. F. Bayer & Co), A., i, 939.
  ozonide (Seekles), A., i, 238.
  sulphate, hydration of (Chamié), A., ii, 113, 603.
    photochemical oxidation of, by chromic acid in presence of sulphuric acid (Forbes, Woodhouse, and Dean), A., ii, 675.
  derivatives, influence of, on digestion (Smorodincev and Adova), A., i, 412.
    influence of, on fermentation in the organism (Smorodincev and Novikov), A., i, 1145.
  halogen derivatives of (Fränkel, Herschmann, and Tritt), A., i, 360.
  detection of, in presence of antipyrine and pyramidone (Ganassini), A., ii, 592.
Quinol, fusion curves of binary mixtures of α-nitronaphthalene, resorcinol, pyrocatechol, and (Senden), A., ii, 461.
  equilibrium of, with resorcinol and pyrocatechol, and with α-nitronaphthalene and pyrocatechol (Senden), A., i, 921.
  detection of (Aloy and Valdiguié), A., ii, 91.
Quinolbis-*p*-chlorobenzoyloxanthronyl ether (Scholl and Hähle), A., i, 585.
Quinoline, synthesis of (Bamberger and Weitnauer), A., i, 60; (König and Seifert), A., i, 1127.
  electrical resistance of, and its aqueous solutions (Fischer), A., ii, 823.
  conductivity, viscosity, and density of systems formed by benzoic acid and (Baskov), A., i, 672.
  action of sulphur on (Szperl and Jezierski), A., i, 1227.
  methiodide, action of magnesium propyl bromide on (Meisenheimer and Schütze), A., i, 839.
Quinoline, 2-amino-, and its salts (Tschitschibabin and Zacepina), A., i, 604.
  3-amino-, and 3-hydroxy-, and its picrate, preparation of (Bargellini and Settimi), A., i, 1231.
  hydroxy-derivatives, preparation of (Tschitschibabin), A., i, 1121.
  8-hydroxy-, nickel and palladium compounds of (Bargellini and Bellucci), A., i, 1228.

*iso***Quinoline**, ultra-violet absorption spectrum of (Fischer and Steiner), A., ii, 2.
  syntheses of, from benzylamine derivatives (Staub), A., i, 140.
*iso***Quinoline**, 1-amino-, and its salts (Tschitschibabin and Oparina), A., i, 604.
n- **and** *iso*-**Quinolines**, action of sodamide on (Tschitschibabin and Zacepina), A., i, 603; (Tschitschibabin and Oparina), A., i, 604.
  hydroferrocyanides and sodium ferrocyanide (Cumming), T., 2463.
Quinolines, substituted, synthesis of (Tröger and Köppen-Kastrop), A., i, 368.
  3-amino-, and 3-hydroxy- (Berlinozzi), A., i, 847.
  hydroxy-, internal metallic complexes of (Bargellini and Bellucci), A., i, 1228.
*iso***Quinoline alkaloids**, ultra-violet absorption spectra of (Steiner), A., ii, 49, 107, 450.
Quinoline bases, catalytic hydrogenation of, (v. Braun, Petzold, and Seemann), A., i, 136.
Quinoline series, preparation of amino-alcohols of (Society of Chemical Industry in Basle), A., i, 148.
  derivatives of (Miescher), A., i, 367.
Quinolineacrylic acid, and its hydrochloride (Adam), A., i, 1129.
Quinoline-2-aldehyde, salts and derivatives of (König), A., i, 863.
Quinolpyridinium salts, and *di*nitro- (Barnett, Cook, and Driscoll), T., 510.
Quinone. See Benzoquinone.
Quinones, absorption spectra of the vapours of (Purvis), T., 1841.
  energy changes in the reduction of (Conant and Fieser), A., ii, 9, 727.
o-**Quinones** (Schönberg and Malchow), A., i, 115; (Schönberg and Bleyberg), A., i, 116; (Schönberg and Keller), A., i, 928.
Quinonebromomethide, 3:5-*di*bromo- (Lindemann), A., i, 687.
Quinonemethides (Lindemann), A., i, 686.
Quinonoid compounds, heat of formation of (Błaszkowska), A., ii, 535.
Quinoxaline, isomerism of reduced derivatives of (Bennett and Gibson), T., 1570.
Quinoxaline, 2:3-*di*bromo- (Usherwood and Whiteley), T., 1083.
  hydroxy- (Perkin and Riley), T., 2403.
Quiteninone, and its picrate and derivatives (Frankel, Tritt-Zirming, and Gottesmann-Grauer), A., i, 126.

R.

Rabbits, effect of insulin on (Banting, Best, Collip, Macleod, and Noble), A., i, 420.
Racemic acid, optical activation of, by *d*-malic acid (McKenzie, Plenderleith, and Walker), T., 2875.
  crystalline structure of (Astbury), A., i, 996.
  sodium ammonium salt, discovery of (van Deventer), A., i, 751.
  methyl ester, hydrolysis of (Skrabal and Hermann), A., i, 535.
Racemic acids, salts of (Landrieu), A., ii, 59.
Racemic alcohols, resolution of (Windaus, Klänhardt, and Weinhold), A., i, 586.
Racemic amino-acids, resolution of, by enzymes (Abderhalden and Tanaka), A., i, 1070.
  esters, hydrolysis of, by esterase (Abderhalden, Sickel, and Ueda), A., i, 1146.
Radiation, coefficients of absorption of (van der Gon), A., ii, 809.
  transformation, theory of (Weigert), A., ii, 3, 813.
Radiation theory and magnetic valency (Peirce), A., ii, 147.
  of the velocity of reaction (Kiss), A., ii, 837.
Radicles, atomic numbers of (Ríus y Miró), A., ii, 146.
Radioactive constants (Meyer), A., ii, 528.
  elements, disintegration of (Rosseland), A., ii, 366; (Russell), A., ii, 719.
  indicators. See Indicators.
Radiochemistry and fluorescence (Perrin), A., ii, 810.
Radium, chemical action of the penetrating rays of (Kailan), A., ii, 601.
  γ-rays of (de Broglie and Cabrera), A., ii, 109.
  long-range particles from the active deposit of (Kirsch and Pettersson), A., ii, 675, 819.
  emanation. See Niton.
  electrons of, as a reducing agent (Pisarshevski), A., ii, 730.
  salts, normal solutions of, as standards (Ludewig and Lorenser), A., ii, 453.

Radium salts, crystallisation of mixtures of barium salts and (PIETENPOL), A., ii, 819.
estimation of, in radium–barium salts (HESS and DAMON), A., ii, 38.
separation of, from other elements (CIALDEA), A., ii, 318.
Radium-*B* and *-C*, adsorption of, by ferric hydroxide (CRANSTON and HUTTON), T., 1318.
Raffinose, preparation of (HARDING), A., i, 899.
constitution of (HAWORTH, HIRST, and RUELL), T., 3125.
"**Raies ultimes**" (DE GRAMONT), A., ii, 516.
Rapanea lætevirens, constituents of the bark of (DUCLOUX and AWSCHALOM), A., i, 1046.
Rats, effect of air exposed to ultraviolet light on the growth of (HUME and SMITH), A., i, 728.
deposition of strontium in (KINNEY and MCCOLLUM), A., i, 630.
Rays, analogous action of ozone and (FERNAU), A., ii, 601.
cathode, furnace for (GERDIEN and RIEGGER), A., ii, 817.
positive, in gases (MCHENRY), A., ii, 208.
resonance, passage of, through gases (COMPTON), A., ii, 280.
Röntgen, absorption coefficients for (TAYLOR), A., ii, 365.
reflection of, by crystals (CLARK and DUANE), A., ii, 468, 469; (WYCKOFF), A., ii, 743.
spectra of. See under Spectra.
secondary corpuscular rays from (ROBINSON), A., ii, 818.
β-rays produced by (AUGER), A., ii, 601.
production of luminescence by (DE BEAUJEU), A., ii, 818.
photoelectric effect of (M. and L. DE BROGLIE), A., ii, 52.
structure of crystals by means of (BRAGG), A., ii, 836.
excitation of, from metals (HORTON, ANDREWES, and DAVIES), A., ii, 817.
crystal analysis of organic compounds (BECKER and ROSE), A., i, 550.
investigation of organic esters and long-chain compounds by (SHEARER), T., 3152; (MÜLLER and SHEARER), T., 3156.
structure of fatty acids by means of (MÜLLER), T., 2043.
chemical action of (PESKOV), A., ii, 602.
Rays, Röntgen, effect of, on *chemical reactions (OLSON), A., ii, 4.
crystal analysis by (SHEARER), A., ii, 223.
analysis of metals and their alloys and compounds by means of (BECKER and EBERT), A., ii, 519.
biological action of (PETRY), A., i, 520.
α-**Rays**, distribution of the length of (CURIE), A., ii, 207.
influence of, on hæmoglobin and blood-corpuscles (STRAUB and GOLLWITZER-MEIER), A., i, 503.
β-**Rays**, production of, in gases by means of Röntgen rays (AUGER), A., ii, 601.
coloration of glass by (CLARKE), A., ii, 277.
α- and β-**Rays**, absorption and scattering of (BOTHE), A., ii, 719.
ζ-**Rays** (HARKINS and RYAN), A., ii, 720.
Ray liver oil, higher alcohols in (TOYAMA), A., i, 979.
Realgar, conversion of, into orpiment (BHATNAGAR and RAO), A., ii, 756.
Reductases (SMORODINCEV), A., i, 263.
Reduction, theory of (STEINKOPF and WOLFRAM), A., i, 216.
mechanism of (PRINS), A., ii, 548, 839.
Reduction-oxidation process (DIXON and QUASTEL), T., 2943.
Refractive index and rotatory power (HUNTER), T., 1671.
relation of *molecular volume to (LORENZ and HERZ), A., ii, 801.
and volume contraction of liquid mixtures (COUNSON), A., ii, 801.
of mixed solutions (DOROSCHEVSKI and EKAREVA), A., ii, 387.
Refractivity of ions (WASASTJERNA), A., ii, 593.
Refractometer, Pulfrich, temperature control for (LOWRY and PARKER), A., ii, 801.
Rennin, action of (HAMMARSTEN), A., i, 1244.
comparison between pepsin and (FENGER), A., i, 401.
pancreatic, and its action on blood coagulation (EPSTEIN; EPSTEIN and ROSENTHAL), A., i, 628.
Resins, relation between formation of, and chemical constitution (HERZOG and KREIDL), A., i, 1107.
Resin acids, action of heat on (KNECHT; RUZICKA and SCHINZ), A., i, 1202.
Resorcin-benzein, colour of (MOIR), A., ii, 48.

Resorcinol, fusion curves of binary mixtures of *a*-nitronaphthalene, quinol, pyrocatechol, and (Senden), A., i, 461, 921.
 condensation of, with diphenic anhydride (Bischoff and Adkins), A., i, 578.
 ethers, substituted, and their derivatives (Wilson and Adams), A., i, 328.
 bromoacetyl derivative (Rosenmund, Kuhnhenn, and Lesch), A., i, 1095.
Resorcinol, 2-amino-, and 4-nitro-2-amino-, acetyl derivatives and their diacetates (Heller, Lindner, and Georgi), A., i, 1094.
 2-bromo-5-nitro- (Heller and Kammann), A., i, 1092.
 *di*bromo-, diacetate of (Rosenmund and Kuhnhenn), A., i, 783.
 *di*nitro- (Orndorff and Nichols), A., i, 782.
 *di*nitroso-, estimation of cobalt with, in presence of nickel (Orndorff and Nichols), A., ii, 584.
Resorcinoldiphenein, and its diacetyl derivative, and *tetra*bromo- (Dutt), T., 226.
Resorcinoxide, *tri*nitro-, lead salt (Herz), A., i, 675.
Resorcinyl 1-methyl ether, 5:6-*di*bromo- (Heller and Georgi), A., i, 1092.
 phosphate (Chemische Fabrik Griesheim Elektron), A., i, 920.
β-Resorcylaldehyde, synthesis of (Shoesmith and Haldane), T., 2704.
β-Resorcylic acid, 3:5-*di*nitro-, preparation of, and its derivatives (Einbeck and Jablonski), A., i, 1099.
Respiration, studies on (Hutchinson), A., i, 409; (Ray), A., i, 882.
 effect of the carbon dioxide content in blood on (Schneider and Truesdell), A., i, 1035.
 effect of exercise on (Lundsgaard and Möller), A., i, 502, 623, 727.
 influence of the medium on (Ryffel), A., i, 1035.
 of cells, pharmacology of (Ellinger and Landsberger), A., i, 73.
 of plants. See Plants.
 of yeast cells (Rona and Grassheim), A., i, 423.
 in fresh-water fish (Gardner and King), A., i, 162, 727.
 relation of the function of hæmoglobin to (Gesell), A., i, 1249.
Respiratory exchange, effect of adrenaline and insulin on (Lyman, Nicholls, and McCann), A., i, 1035.
Respiratory exchange, effect of administration of amino-acids on (Krzywanek), A., i, 420.
 effect of insulin on (Dudley, Laidlaw, Trevan, and Boock), A., i, 972.
 effect of mental work on (Knipping), A., i, 502.
Respiratory tetany. See Tetany.
Respirometer (Harrington and Crocker), A., i, 424.
Rhamninose (Meulen), A., i, 694.
Rhamnose, preparation of (Harding), A., i, 898.
Rheometer (Arkadiev), A., ii, 402.
Rhinanthus crista-galli, aucubin and mannitol in the stems of (Braecke), A., i, 638.
Rhodanine, use of, in organic syntheses (Granacher, Gerö, Ofner, Klopfenstein, and Schlatter), A., i, 706; (Granacher and Mahal), A., i, 713.
Rhodanines, substituted, and their hydrolysis (Gendelman), A., i, 605.
Rhodanylideneacetic acid, and its potassium salt and ethyl ester (Granacher, Gerö, Ofner, Klopfenstein, and Schlatter), A., i, 707.
Rhodanylideneglyoxylic acid. See Rhodanylideneacetic acid.
3-Rhodanylidene-*N*-methyloxindole (Granacher and Mahal), A., i, 714.
3-Rhodanylideneoxindole, and its pyridine derivative (Granacher and Mahal), A., i, 713.
Rhodium, catalytic action of (Hinshelwood and Topley), T., 1019.
Rhodium organic compounds:—
 ammonium chlorides, complex (Gutbier and Bertsch), A., i, 1184.
 Rhodiates, complex (Gutbier and Bertsch), A., i, 1184.
Rhodium detection and estimation:—
 detection and estimation of, colorimetrically (Ivanov), A., ii, 439.
 estimation of, with thiocyanates (Ivanov), A., ii, 263.
Ribes rubrum, oxalic and succinic acids in (Franzen and Helwert), A., i, 77.
Ricin, action of metallic copper on (Tsuchihashi), A., i, 1152.
Ricinidine. See 1-Methyl-2-pyridone, 3-cyano-.
Ricinine, constitution of (Späth and Koller), A., i, 594.
Rickets (Shipley, Park, McCollum and Simmonds), A., i, 418.
 calcium and phosphorus in (Howland and Kramer; Telfer), A., i, 418.

- **Riebeckite** from Vallone delle Minière (GRILL), A., ii, 81.
- **Rings**, four-membered, additive formation of (INGOLD and PIGGOTT), T., 2745.
- **Ring systems**, hydrogenated polycyclic (SCHRAUTH, WEGE, and DANNER), A., i, 204.
- **Rocks**, analysis of residue from (AURONSSEAU), A., ii, 789.
  - estimation of alkalis in (WALKER), T., 2336.
- **Rosin**, preparation of petroleum from (KWAI), A., i, 195.
- **Rotation**, free (SUGDEN), T., 1862; (LOWRY), T., 1866.
  - optical, in relation to atomic dimensions (BRAUNS), A., ii, 598.
    - of sugars (MALTBY), T., 1404.
- **Rotatory** dispersion. See Dispersion.
  - power (RUPE), A., ii, 278.
  - and chemical constitution (PICKARD, KENYON, AND HUNTER), T., 1; (KENYON and MCNICOL), T., 14; (PHILLIPS), T., 22, 44; (HALL), T., 32, 105; (PICKARD and HUNTER), T., 434; (HUNTER), T., 1671; (BETTI), A., ii, 674.
- **Rubidium**, absorption and fluorescence spectra of (MCLENNAN and AINSLIE), A., ii, 357.
  - spark spectrum of (REINHEIMMER), A., ii, 671.
  - silver gold chloride (WELLS), A., ii, 32.
  - chlorite (LEVI and CIPOLLONE), A., ii, 492.
  - fluoride, crystal structure (WYCKOFF and POSNJAK), A., ii, 858.
  - hydrogen sulphate (DUNNICLIFF), T., 733.
  - sulphide, phosphorescent (TIEDE and REINICKE), A., ii, 240.
- *Rubus fruticosus* (bramble), water-soluble constituents of leaves of (FRANZEN and KEYSSNER), A., i, 1045.
- **Rutaceæ**, chemical constituents of (THOMS), A., ii, 639.
- **Rutæcarpine**, preparation of 2-ethylaminoindole hydrochloride from (ASAHINA and DAIICHI SEIYAKU KABUSHIKI KAISHA), A., i, 953.
- **Ruthenium**, *K*-series spectrum of (AUGER and DAUVILLIER), A., ii, 356.
  - *pent*oxide, preparation of (REMY), A., ii, 329.
- **Ruthenium organic compounds**:—
  - with substituted ammonium halides (GUTBIER), A., i, 659.
  - **Rutheniates**, complex (GUTBIER), A., i, 1184.
- **Rutin**, hydrolysis of (MEULEN), A., i, 694.

S.

- **Sabinene**, oxidation of, with hydrogen peroxide (HENDERSON and ROBERTSON), T., 1849.
- **Sabinol**, conversion of, into thujene (HENDERSON and ROBERTSON), T., 1713.
- **Saccharase** (CANALS), A., i, 160; (V. EULER and JOSEPHSON), A., i, 402, 721.
  - molecular condition and stability of (V. EULER, JOSEPHSON, and MYRBÄCK), A., i, 1245.
  - kinetic researches on (V. EULER and MYRBACK), A., i, 261.
  - from yeast, purification of (JOSEPHSON), A., i, 496.
    - comparison of taka-saccharase and (KUHN), A., i, 1033.
  - purification and adsorption of (V. EULER and MYRBÄCK), A., i, 518.
  - adsorption of, by alumina (V. EULER and MYRBACK), A., i, 620.
  - activity of, in banana extracts (MCGUIRE and FALK), A., i, 872.
  - inactivation of, by formaldehyde, *p*-phenylenediamine, and *p*-toluidine (V. EULER and MYRBÄCK), A., i, 496.
    - by halogens (V. EULER and JOSEPHSON), A., i, 620.
  - inversion of sucrose by (V. EULER and MYRBÄCK), A., ii, 678.
  - analysis of, and inactivation of, by iodine (V. EULER and JOSEPHSON), A., i, 496.
- "**Saccharin**" (*o-benzoicsulphinide*), derivatives of (HOLLEMAN), A., i, 981.
  - sweetness of (MAGIDSON and GORBATSCHOV), A., i, 1097.
  - estimation of *p*-sulphamidobenzoic acid in (BEYER), A., ii, 795.
- ***N*-Saccharinacetic acid.** See *o*-Benzoicsulphinidoacetic acid.
- *iso***Saccharinic acid**, quinine salt (HINTIKKA), A., i, 756.
- *Saccharomyces cerevisiæ*, utilisation of atmospheric nitrogen by (FULMER), A., i, 1158.
- **Safflower**, germination of seeds of (TAMHANE), A., i, 883.
- *iso***Safrole** dithiocyanate (KAUFMANN and LIEPE), A., i, 766.
- **Salicylatotetramminecobaltic salts** (MORGAN and SMITH), T., 1100.
- **Salicylic acid**, second dissociation constant of (KOLTHOFF), A., ii, 834.
  - action of dimethyl sulphate on, and on its methyl ester (SIMON and FRÈREJACQUE), A., i, 1098.

Salicylic acid, and its salts, neutralisation of (Prideaux), T., 1628.
  esters (Hanzlik and Presho), A., i, 879.
  diphenylformamidine ester (Passerini), A., i, 64.
  iodoethyl ester (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 794.
  *di*iodohydrin ester (Humnicki), A., i, 795.
  β-naphthyl ester (*betol*), phenyl ester (*salol*), *p*-aminophenyl ester, acetyl derivative (*salophen*), and *p*-tolyl ester (*cresalol*), detection of (Denigès), A., ii, 267.
  detection of, in serum and similar fluids (Hérissey), A., ii, 268.
Salicylic acid, 5-amino-, 5-bromo-, 3:5-*di*bromo-, and 5-nitro-, phthalidylidene ether esters of (Kaufmann), A., i, 796.
  aminobromo-, and aminothiol-, *iso*valeryl derivatives (Hoffmann-La Roche & Co.), A., i, 35.
  aminothiol, bromoamino- and chloroamino-, acetyl and propionyl derivatives (Hoffmann-La Roche & Co.), A., i, 35.
  3-bromo-, preparation of, and its salts (Meldrum and Shah), T., 1990.
  2-bromo-4-nitro-, and its ethyl ester (Dey and Row), T., 3380.
  iodo-derivatives, and their acetyl derivatives (Brenans and Prost), A., i, 797.
  3:5-*di*nitro-, copper salt (Tuttle), A., i, 1012.
  thiol- (Chemische Fabrik von F. Heyden), A., i, 797.
Salicylides, isomerism of (Anschütz), A., i, 1098.
Salicyloxyacetanilide (Rosenmund, Zetzsche, and Weiler), A., i, 800.
Salicyloxyacetyl dichloride (Rosenmund, Zetzsche, and Weiler), A., i, 800.
Saliva, constituents of, in relation to glandular activity (Morris and Jersey), A., i, 876.
  dielectric constants of (Keller), A., ii, 284.
  concentration of urea in (Hench and Aldrich), A., i, 270; (Schmitz), A., i, 625.
Salol. See Salicylic acid, phenyl ester.
Salophen. See Salicylic acid, *p*-aminophenyl ester, acetyl derivative.
Salts, mutual influence of, on solubility (v. Weimarn), A., ii, 222.
  determination of the degree of hydration of (Terrey and Jolly), T., 1979.
Salts, binary systems of (Jänecke), A., ii, 640.
  precipitation of proteins by (Howe), A., i, 1253.
  double, equilibria of formation of (Rivett and Clendinnen), T., 1634.
    ebullioscopic, measurements of solutions of (Bourion and Rouyer), A., ii, 57.
    in solution (Bourion and Rouyer), A., ii, 534.
  fused (Herz), A., ii, 459.
    compound formation and solubility in mixtures of (Kendall, Crittenden, and Miller), A., ii, 387.
  inorganic, absorption of light by (Macbeth and Maxwell), T., 370.
    complex (Thomas), T., 617.
  insoluble, reactions between (Neuhausen), A., ii, 396.
  solid, effect of temperature on the conductivity of (Vaillant), A., ii, 735.
  See also Metallic salts.
Salt hydrates, dissociation pressures of (Schumb), A., ii, 219.
Salt solutions, electrolytic dissociation of water in (Linde), A., ii, 287.
  eutectic points in (Mondain Monval), A., ii, 387.
Salvarsan (*arsphenamine*), properties of (Christiansen), A., i, 968.
  distribution of sulphur in (Christiansen), A., i, 723.
  derivatives of (Christiansen), A., i, 1148.
  silver derivatives (Gray), T., 635; (Binz and Ludwig), A., i, 161.
  estimation of, colorimetrically, in blood and tissues (Kolls and Youmans), A., ii, 800.
Samarium, arc spectrum of (Kiess), A., ii, 354.
Sand, black Maketu, constituents of (Smithells and Goucher), A., ii, 244.
Sandalwood oil, West Australian (Rao and Sudborough), A., i, 588.
Sandmeyer's reaction (Keme), A., i, 66.
α-Santalene, constitution of (Ruzicka and Stoll), A., i, 120.
Santene, formation of, from α-fenchocamphorol (Ruzicka and Liebl), A., i, 475.
Santonin, sources of (Viehoever and Capen), A., i, 1023.
  detection of (Utz), A., ii, 99.
  estimation of, in tansy (van den Berg), A., ii, 800.

Saponins, action of, on plant cells (BOAS), A., i, 273.
  as protective colloids (GUTBIER and RHEIN), A., ii, 630.
Savin oil (PIGULEVSKI and FICHTENHOLZ), A., i, 817.
Scandium, spectrum of (CATALÁN), A., ii, 104.
Scatole, effect of, on nitrogenous metabolism (UNDERHILL and KAPSINOW), A., i, 165.
Scheelite, of Traversella (CAROBBI), A., ii, 777.
Schiff's bases, formation of (ODDO and TOGNACCHINI), A., i, 224, 255.
Scopine, and its salts (WILLSTÄTTER and BERNER), A., i, 701.
Scopolamine, hydrolysis of (WILLSTÄTTER and BERNER), A., i, 701.
Scopoline (GADAMER), A., i, 239.
Scutellaria baicalensis, baicalin from (SHIBATA, IWATA, and NAKAMURA), A., i, 591,
Sea water. See under Water.
Sechium edule, constituents of the fruit of (YOSHIMURA), A., i, 78.
Seeds, glycerophosphatase in (NĚMEC), A., i, 736. 882.
  iron and manganese content of (McHARGUE), A., i, 635.
  germinating, action of carbohydrates on (BOAS and MERKENSCHLAGER), A., i, 736.
    respiratory enzymes in (BACH and OPARIN; OPARIN), A., i, 425.
Selinenes, constitution of (RUZICKA and STOLL), A., i, 120, 1216.
Selenium, atomic weight of (BRUYLANTS and DONDEYNE), A., ii, 236.
  arc spectrum of (CATALÁN), A., ii, 105.
  vapour, ionisation potential of (UDDEN), A., ii, 4.
  equilibrium in the system, sulphur, tellurium, and (LOSANA), A., ii, 685.
  solubility of, in alkali hydroxides (CALCAGNI), A., ii, 405.
  colloidal (GUTBIER, HUBER, and ECKERT), A., ii, 393; (GUTBIER and RHEIN), A., ii, 630.
  sols, velocity of flocculation of (KRUYT and VAN ARKEL), A., ii, 136.
  effect of, on alkali hydrogen sulphite solutions (SANDONNINI), A., ii, 759.
  action of silver nitrate on (GARELLI and ANGELETTI), A., ii, 241.
  oxidation of, by bacteria (LIPMAN and WAKSMAN), A., i, 735.
Selenium compounds, pharmacology of (LEHMANN), A., i, 419.
Selenium nitride, and its derivatives (STRECKER and CLAUS), A., ii, 152.
Selenium *tri*oxide, preparation and properties of (WORSLEY and BAKER), T., 2870.
  oxychloride, solubility of metallic chlorides in (WISE), A., ii, 484.
    action of, on caoutchouc (FRICK), A., i, 935.
    action of, with metals and their oxides (RAY), A., ii, 754.
    action of, on olefines (FRICK), A., i, 890.
  Selenic acid, refractive indices of (STONE), A., ii, 178.
  Selenious acid, refractive indices of (STONE), A., ii, 178.
    detection of phenols with (LEVENE), A., ii, 44.
Selenium organic compounds (BOGERT and HERRERA), A., i, 240.
  acetylpropionylmethanes, and cyano-, and their copper salts (MORGAN and REEVES), T., 448.
Selenium estimation and separation:—
  estimation of, electrometrically, in presence of tellurium, iron, and copper (WILLARD and FENWICK), A., ii, 430.
  separation of, from copper (ANGELETTI), A., ii, 581.
Selenoacetamide (KINDLER, BURGHARD, FINNDORF, DEHN, GIESE, and KÖRDING), A., i, 569.
Selenopyrines (BATTEGAY and HUGEL), A., i, 1115.
Semen ceratoniæ siliquæ as a protective colloid (GUTBIER, LOCHER, and KREIDL), A., ii, 618.
Semicarbazide-α-carboxylic acid, thio-, ethyl ester (FROMM and NEHRING), A., i, 859.
Semicarbazidedicarboxylic acid, ethyl ester (FROMM and NEHRING), A., i, 859.
α-Semicarbazidobenzoylpropionic acid, and nitroso-, esters of, and their semicarbazones (RICE), A., i, 218.
α-Semicarbazido-3-phenylpyrazolone-4-acetic acid, methyl ester (RICE), A., i, 218.
Semicarbazones, catalytic reduction of (TAIPALE and SMIRNOV), A., i, 905.
Semicarbazones, thio-, reactions of (WILSON and BURNS), T., 799.
Semioxamazide, derivatives of (WILSON and PICKERING), T., 394.
Semi-pinacolin transformations (TIFFENEAU and LÉVY), A., i, 788, 789.
Septentrionaline, and its chloroplatinate and derivatives (WEIDEMANN), A., i, 126.
Serum, distribution of ions in (RONA and PETOW), A., i, 728.

Serum, dielectric constants of (Keller), A., ii, 284.

antitryptic action of (Epstein), A., i, 1253.

diastase-activating properties of (Koga), A., i, 1254.

human, calcium in, after injection of calcium salts (Sieburg and Kessler), A., i, 504.

ultrafiltration and analysis of (Pincus), A., i, 1253.

estimation of proteins in, refractometrically (Neuhausen and Rioch), A., ii, 511.

Serum albumin. See under Albumin.

Sesquiterpenes, carbon framework of (Ruzicka and Stoll), A., i, 120.

Shark liver oil, hydrocarbon from (Toyama), A., i, 890.

higher alcohols in (Toyama), A., i, 979.

Shellac (Harries and Nagel), A., i, 120.

Shellac resin, hydrolysis of (Harries), A., i, 693.

Shellolic acid (*shellenedioldicarboxylic acid*), and its salts and derivatives (Harries and Nagel), A., i, 121.

Shibuol (Komatsu and Matsunami), A., i, 1197.

Silane, *mono*chloro-, reactions of (Stock and Somieski), A., ii, 160.

Silanes, chloro- (Stock and Zeidler), A., ii, 412.

Silica. See Silicon *di*oxide.

Silicic acid. See under Silicon.

Silicohydrocarbon, and its oxides (Kipping), T., 2590.

Silicon, atomic weight of (Baxter, Weatherill, and Scripture), A., ii, 412.

structure of (Küstner and Remy), A., i, 318.

amorphous and crystalline (Manchot), A., ii, 25.

spectrum of (del Campo and Estalella), A., ii, 103.

arc and band spectra of (Porlezza), A., ii, 198, 448.

series spectra of (Fowler), A., ii, 447.

vacuum spark spectrum of (Sawyer and Paton), A., ii, 804.

specific heat of, at high temperatures (Magnus), A., ii, 374.

equilibrium in the system, aluminium, magnesium, zinc, and (Sander and Meissner), A., ii, 641.

Silicon alloys with aluminium (Portevin and Chevenard), A., ii, 166.

Silicon carbide, specific heat of, at high temperatures (Magnus), A., ii, 374.

hydrides (Stock and Somieski), A. ii, 67, 160; (Stock and Zeidler) A., ii, 412; (Stock and Stiebeler), A., ii, 486; (Stock, Stiebeler, and Zeidler), A., ii, 633.

*di*oxide (*silica*) (Tammann and Pape) A., ii, 758.

structure and polymorphism of (Sosman), A., ii, 69, 159.

action of, on electrolytes (Joseph and Hancock), T., 2022.

gels, influence of neutral salts on (Glixelli), A., ii, 561.

esterification by (Milligan and Emmet), A., ii, 18.

colloidal adsorption of plant foods by (Wiley and Gordon), A., i, 524.

estimation of, in water (Diénert and Wandenbulcke), A., ii, 507.

Silicic acid, ammines of (Schwarz and Mathis), A., ii, 318.

sols, electric properties of (Grundmann), A., ii, 608.

Silicic acids, and their salts, magnetic analysis of (Pascal), A., ii, 25.

Silicates, constitution of (Tammann), A., ii, 69.

insoluble, estimation of potassium in (Green), A., ii, 255.

Silicon organic compounds (Kipping), T., 2590, 2598; (Pink and Kipping), T., 2830.

Silicon, estimation of, in aluminium (Guerin), A., ii, 180.

Silk from silkworms, proteins of (Glagolev and Vischniakov), A., i, 630.

Silk fibroin, structure of (Abderhalden and Stix), A., i, 1030.

Silver, ionisation potential of (Shenstone), A., ii, 605.

specific volume of (Sauerwald), A., ii, 172.

visibility of thin films of (Estermann), A., ii, 858, 859.

diffusion of gold into (Weiss and Henry), A., ii, 59.

diffusion of oxygen through (Spencer), T., 2124.

colloidal (Gutbier and Wüterich), A., ii, 393.

preparation of (v. Weimarn), A., ii, 636.

analysis and constitution of (Neureiter and Pauli), A., ii, 636.

ions, complexes of gelatin with (Audubert), A., ii, 286.

- **Silver ions**, adsorption of, by silver bromide (Fajans and Frankenburger), A., ii, 614.
  - organosols, properties of (Giles and Salmon), T., 1597.
  - soap gels (Whitby), A., ii, 18.
  - recovery of, from residues (Firth and Higson), A., ii, 859.
- **Silver alloys** with cadmium, electromotive force of (Schreiner, Simonsen, and Krag), A., ii, 8.
  - with copper and gold, specific resistance of (Fischbeck), A., ii, 10.
  - with gold, crystal structure of (McKeehan), A., ii, 428.
  - with palladium, crystal structure of (McKeehan), A., ii, 428.
- **Silver salts**, adsorption of, by silver and gold surfaces (Rudberg and v. Euler), A., ii, 465.
  - reduction of, by means of manganous salts (Barbieri), A., ii, 859.
  - complex salts of, with diethylamine and with hexamethylenetetramine (Job), A., i, 902.
  - formation of complex ions by solutions of ethylenediamine and (Job), A., i, 307.
- **Silver** bromide, photochemical sensitiveness of (Fajans and Frankenburger), A., ii, 109; (Frankenburger), A., ii, 599; (Herzfeld), A., ii, 600.
    - photochemical decomposition of (Schwarz and Stock), A., ii, 815.
    - adsorption of silver ions by (Fajans and Frankenburger), A., ii, 614.
  - *per*chlorate, reaction of iodine with (Gomberg), A., ii, 235.
  - chloride, equilibrium of copper chlorides and (Edgar and Cannon), A., ii, 139.
    - action of sodium hyposulphite on (Firth and Higson), A., ii, 859.
  - gold chlorides (Wells), A., ii, 32.
  - chromate, rings of, in gelatin (Davies), A., ii, 140.
  - fluoride, ammonia compound of (Dervin and Olmer), A., ii, 71.
  - halides, spectrophotoelectrical sensitivity of (Coblentz and Eckford), A., ii, 279.
    - detection of chlorine, bromine, iodine, and silver in (Schmalfuss), A., ii, 248.
  - iodide, crystal structure of (Wilsey), A., ii, 688.
  - nitrate, decomposition of binary mixtures of, with metallic halides (Bergman), A., ii, 761.
    - reaction of hypophosphorous acid with (Mitchell), T., 629.
    - fusion of mercuric iodide and (Bergman), A., ii, 636.
    - action of selenium on (Garelli and Angeletti), A., ii, 241.
    - inactivation of invertase by (v. Euler and Myrbäck), A., i, 1245.
  - oxide, complex salts of, with copper hydroxide and amines (Traube), A., i, 903.
  - sulphate, dissociation of (Marchal), A., ii, 139.
    - action of, on ethyl bromide in sulphuric acid solution (Schilov), A., i, 2.
  - hydrogen sulphate (Dunnicliff), T., 733.
  - sulphide, electrical properties of (Urazov), A., ii, 454.
    - See also Argentite.
- **Silver organic compounds** (Hoffmann-La Roche & Co.), A., i, 101.
  - preparation of (Hoffmann-La Roche & Co.), A., i, 35.
  - diamminecupribiuret and ethylenediaminecupribiuret (Traube), A., i, 903.
  - phenyls (Reich), A., i, 972; (Krause and Wendt), A., i, 1150.
  - salvarsans (Gray), T., 635; (Binz and Ludwig), A., i, 161.
- **Silver detection and estimation**:—
  - detection of (Schumacher), A., i, 424.
  - detection of, in ores (Silberstein and Wiess), A., ii, 38.
  - detection of, with isatin (Menke), A., ii, 256.
  - detection of, in silver halides (Schmalfuss), A., ii, 248.
  - estimation of, electrometrically, in presence of copper (Müller and Rudolph), A., ii, 880.
  - estimation of, volumetrically, in presence of protective colloids (Treadwell, Janett, and Blumenthal), A., ii, 579.
- **Silver ore**, new (Schaller; Schempp), A., ii, 503.
- **Silver works**, composition of slag from (Hofmann-Degen), A., ii, 163.
- **Sinigrin**, constitution of (Wrede, Banik, and Brauss), A., i, 589.
- **Sinomenine**, and its salts and derivatives (Kondo, Ochiai, and Nakajima), A., i, 1222.
- ***Sinomenium acutum***, **alkaloids** of (Kondo, Ochiai, and Nakajima), A., i, 1222.

Sintering (SMITH), T., 2088.
Sium latifolium, essential oil from (PIGULEVSKI), A., i, 991.
Skin, pigments of (LIGNAC), A., i, 980.
of children, sulphur in (LABORDE), A., i, 168.
Smelting, theory of (GUERTLER and SCHAEK), A., ii, 424.
Soaps, microscopic structure of (MACLENNAN), A., i, 1057.
structure of the curds of (PIPER and GRINDLEY), A., i, 1056.
solutions, constitution of (McBAIN and BOWDEN), T., 2417; (McBAIN), A., ii, 225.
emulsions of mineral oils with water and (GRIFFIN), A., ii, 619.
protective action of, on gold sols in alcohol-water mixtures (RIDEAL and BIRCUMSHAW), T., 1565.
Sodamide, syntheses by means of (HALLER), A., i, 92.
equilibrium of mixtures of potassamide and (KRAUS and CUY), A., ii, 320.
reaction of, with *ααββ*-tetrasubstituted propiophenones (ALBESCO), A., i, 41.
action of, on pyridine (WIBAUT and DINGEMANSE), A., i, 486.
action of, on *n*- and *iso*-quinolines (TSCHITSCHIBABIN and ZACEPINA), A., i, 603; (TSCHITSCHIBABIN and OPARINA), A., i, 604.
Sodammonium, action of, on cyclic amines (PICON), A., i, 199.
Sodiodiphenylamine (PICON), A., i, 200.
Sodio-ethylaniline (PICON), A., i, 200.
Sodio-*o*-toluidine (PICON), A., i, 200.
Sodium, atomic weight of (MOLES and CLAVERA), A., ii, 149.
spectrum of, calculation of (FUES), A., ii, 1.
absorption spectrum of electrically luminescent vapour of (NEWMAN), A., ii, 521.
arc spectrum of, and the spark spectra of aluminium and magnesium (FUES), A., ii, 353.
transport number of (SCHNEIDER and BRALEY), A., ii, 456.
reduction of chlorides of rare metals by (HUNTER and JONES), A., ii, 688.
metallic, decomposition of ethers by (SCHORIGIN), A., i, 207.
action of, on organic compounds, in liquid ammonia solution (KRAUS and WHITE), A., i, 456; (WHITE), A., i, 457.
Sodium alloys with lead, freezing points of (CALINGAERT and BOESCH), A., ii, 687.
Sodium salts, molecular complexity of, in sodium sulphate solution (DARMOIS and PÉRIN), A., ii, 831.
Sodium azide, preparation of (ORELKIN, CHLOPIN, and TSCHERNIAEV), A., ii, 406.
absorption of carbon disulphide by solutions of (CURRIER and BROWNE), A., ii, 158.
arsenate dodecahydrate, dissociation pressures of (PARTINGTON and HUNTINGFORD), T., 168.
bismuthate, decomposition of, with nitric acid (CORFIELD and WOODWARD), A., ii, 691.
borate (*borax*), alkalinity of solutions of (MURSCHHAUSER), A., ii, 563.
fusion of gold particles with (EHRINGHAUS and WINTGEN), A., ii, 390.
*per*borate, analysis of (BURKARDT), A., ii, 87.
acid borates (PONOMAREV), A., ii, 415.
bromate and chlorate, optical activity of crystals of (HERMANN), A., ii, 523.
crystal structure of (VEGARD), A., ii, 162; (KOLKMEIJER, BIJVOET, and KARSSEN), A., ii, 414.
bromide and chlorate, crystal structure of (VÉGARD; KARSSEN), A., ii, 857.
carbonates with the rare earths (ZAMBONINI and CAROBBI), A., ii, 863.
chlorate, preparation of, electrolytically (ILJINSKI), A., ii, 563.
solubility of (BELL), T., 2713.
solubility of the system, potassium carbonate (ILJINSKI), A., ii, 562.
crystal structure of (KIBY), A., ii, 687.
chloride, specific heat of mixtures of sucrose and (BLASZKOWSKA), A., ii, 544.
vapour pressure and density of solutions of (W. R. and C. E. BOUSFIELD), A., ii, 460.
aeration of solutions of (ADENEY, LEONARD, and RICHARDSON), A., ii, 404.
equilibrium of sucrose and (SCHOORL), A., i, 899.
trihydrated (ARTINI), A., ii, 71.
chromate, equilibrium of sodium sulphate, water, and (OSAKA and YOSHIDA), A., ii, 163.
electrolytic precipitation with (KOLTHOFF), A., ii, 88.
chromite (MÜLLER), A., ii, 71.

- **Sodium** fluorophosphate and fluorovanadate from bauxite (Travers), A., ii, 415.
  - hydride, preparation of (Bardwell), A., ii, 20.
  - hydroxide, preparation of, from sodium sulphate (Watson), A., ii, 457.
    - decomposition tensions of mixtures of, with cadmium or zinc oxides (Rolla and Salani), A., ii, 54.
  - equilibrium of, with copper oxide and hydroxide (Müller, Kahlert, Wiegand, Ernst, and Keil), A., ii, 567.
  - hypobromite, preparation of solutions of, for urea analyses (Collins), A., ii, 442.
    - reaction of ammonia with (Nanji and Shaw), A., ii, 874.
  - hypochlorite, action of ammonia on (Joyner), T., 1114.
    - catalytic decomposition of, by cobalt peroxide (Howell), A., ii, 634.
  - hyposulphite (*hydrosulphite*), purification of (Christiansen and Norton), A., ii, 71.
    - action of cupric chloride on solutions of (Firth and Higson), T., 1515.
    - action of, on silver chloride (Firth and Higson), A., ii, 859.
    - estimation of (Merriman), A., ii, 338; (Wilkes), A., ii, 698.
  - iodide, conductivity of solutions of, in phenol (Kraus and Kurtz), A., ii, 7.
  - nitrate, equilibrium of lead nitrate, water, and (Glasstone and Saunders), T., 2134.
    - freezing-point curves for mixtures of potassium nitrate and (Briscoe and Madgin), T., 1608; (Madgin and Briscoe), T., 2914.
  - nitrite, electrolysis of, with an aluminium anode (Jeffrey), A., ii, 729.
  - metaphosphate, preparation of (Pascal), A., ii, 489.
  - hydrogen phosphate, estimation of (Moerk and Hughes), A., ii, 875.
  - silicate, crystalline hydrates of (Erdenbrecher), A., ii, 26.
  - sulphate, electrolysis of (Watson), A., ii, 457.
    - heat of coagulation of ferric oxide hydrosols with (Browne), A., ii, 248.
    - equilibrium of sodium chromate, water, and (Osaka and Yoshida), A., ii, 163.
    - decahydrate, cryoscopy in (Darmois and Périn), A., ii, 831.
- **Sodium** sulphates (Pascal and Ero A., ii, 488.
  - sulphate and sulphite, equilibrium of water and (Rivett and Lewis), A., ii, 857.
  - sulphide, phosphorescent (Tiede and Reinicke), A., ii, 240.
    - hydrates of (Sanfourche and Liebaut), A., ii, 26.
    - estimation of, volumetrically (Anon), A., ii, 792.
  - sulphide and hydrosulphide, dissociation of, in aqueous solution (Jellinek and Czerwinski), A., ii, 14.
  - telluride, molecular weight of, in liquid ammonia (Kraus and Zeitfuchs), A., ii, 162.
  - *di*thionate, equilibrium of barium dithionate, water, and (de Baat), A., ii, 637.
  - thiosulphate, stability of solutions of (M. and M. L. Kilpatrick), A., ii, 760.
    - fate of, in the organism (Nyiri), A., i, 1263.
- **Sodium organic compounds,** arylsulphoniodoamides (Roberts), T., 849.
  - cresylate. See Tolyloxide, sodium.
  - cyanide, vapour pressure curve for (Ingold), T., 885.
  - ethyl (Hein), A., i, 98.
  - ferrocyanide, dissociation of (Burrows), T., 2028.
- **Sodium estimation and separation:**—
  - estimation of, microchemically (Blanchetière), A., ii, 579.
  - estimation of, in blood (Richter-Quittner), A., ii, 256.
  - estimation of, in human blood (Mirkin and Druskin), A., ii, 507.
  - estimation and separation of (Willard and Smith), A., ii, 182.
  - estimation of, and its separation from potassium (Smith), A., ii, 789.
- **Soils,** relation of adsorption to the structure of (Hager), A., i, 1047.
  - absorption in, by colloidal and non-colloidal constituents (Anderson, Fry, Gile, Middleton, and Robinson), A., i, 279.
  - catalytic action of (Osugi), A., i, 524.
  - acidity of (Mukherjee), A., i, 79; (Arrhenius; Vincent), A., i., 283; (Karraker), A., i, 1166.
    - determination of (Parker and Bryan), A., i, 639.
    - in relation to the lime requirements (Wherry), A., i, 524; (Carleton), A., i, 1168.

Soils, chemical denudation of (WHITNEY), A., i, 80.
  hydrogen-ion concentration of, and its effect on plant distribution (OLSEN), A., i, 522.
  effect of hydrogen-ion concentration in, on the adsorption of plant food (STARKEY and GORDON), A., i, 523.
  extraction of humus and fatty matter from (PIETTRE), A., i, 736.
  influence of precipitation on composition of (SIEVERS and HALTZ), A., i, 1048.
  moisture in, and its relation to salt balance for plants (SHIVE), A., i, 283.
  colloidal clay in (NOVÁK and SMOLÍK), A., i, 640.
  amount and distribution of colloids in (DAVIS), A., i, 640.
  availability of mineral matter in (COMBER), A., i, 79.
  effect of aluminium, iron, and manganese in, on toxicity (CARR and BREWER,) A., i, 1275.
  influence of the calcium–magnesium ratio in (HILL), A., i, 284.
  effect of calcium and magnesium on the outgo of sulphates in (MACINTYRE, SHAW, and YOUNG), A., i, 1168.
  production of carbon dioxide in (LUNDEGÅRDH), A., i, 284.
  fungi in (ABBOTT), A., i, 1167.
  effect of magnesium compounds in (MACINTYRE and YOUNG), A., i, 1168.
  nitrification in (SCHONBRUNN; LOHNIS), A., i, 1167.
  variability of nitrates and total nitrogen in (PRINCE), A., i, 1047.
  nitrogen-fixing bacteria in (GAINEY), A., i, 1166.
  oxygen-supplying power of (HUTCHINS and LIVINGSTONE), A., i, 1166.
  organic constituents in (FRAPS), A., i, 640; (CARLSON; SIEVERS), A., i, 1048.
  relative solubility of phosphoric acid in (LEMMERMANN and FRESENIUS), A., i, 1276.
  fixation of phosphoric acid by (FRAPS), A., i, 1167.
  distribution of phosphates in (LEONCINI and ROGAI), A., i, 1167.
  organic phosphorus in (AUTEN), A., i, 1276.
  oxidation of sulphur in, by bacteria (WAKSMAN), A., i, 1042.
  changes in sulphur compounds in (LANTZSCH), A., i, 80.
Soils, sterilisation of (WAKSMAN and STARKEY), A., i, 1167.
  acid, aluminium content and hydrogen-ion concentration of (BURGESS), A., i, 1047.
    hydrogen-ion concentration in (SALTER and MORGAN), A., i, 523.
  arable, fixation of bases in (SCURTI), A., i, 1047.
  basic, acidity of (MCGEORGE), A., i, 1275.
  Dutch, manganese in (WESTER), A., i, 640.
  Truog test for acidity of (PARKER and TIDMORE), A., i, 1166.
  detection of the reaction of, with litmus paper (CARLETON), A., i, 1166.
  estimation of adsorbed bases in (HISSINK), A., i, 992.
  estimation of carbon in (SIMON), A., ii, 506.
  estimation of colloids in, microscopically (FRY), A., ii, 892.
  estimation of humus in (AGAFONOFF), A., ii, 668.
  estimation of hydrogen-ion concentration in (GIMINGHAM), A., ii, 668.
  estimation of nitrates in (GIMINGHAM and CARTER), A., ii, 577.
  estimation of phosphoric anhydride in (RAVENNA), A., ii, 334.
  estimation of phosphoric acid and potassium in (BISCHOFF and MARCHAND), A., ii, 786.
Soil solution, preparation of, by aid of pressure (TULAIKOV and KUZMIN), A., i, 992.
  relation of concentration of, to nitric nitrogen in (ANON), A., i, 1048.
  comparison of, with 1:5 water extracts (BURGESS), A., i, 282.
  in relation to calcium carbonate and fertiliser chemicals (MORSE), A., i, 639.
  importance of, in plant growth (TULAIKOV), A., i, 992.
Soja-agglutinin, isolation of (FUJIWARA), A., i, 1151.
Soja bean, urease from (KAY), A., i, 722; (KATÔ), A., i, 1034.
Soja bean oil, constituents of (BAUGHMAN and JAMIESON), A., i, 281.
Solanine, estimation of, in potatoes (BÖMER and MATTIS), A., ii, 799.
Solids, photochemical decomposition of (NOYES), A., ii, 451.
  adsorption of gases by (EVANS and GEORGE), A., ii, 296.
  surface tension of (ANTONOFF), A., ii, 12.

- **Solids**, velocity of reaction in (NIVEN), A., ii, 396.
  - transference of acid radicles in (HEDVALL and HEUBERGER), A., ii, 860.
- **Solid solutions.** See Solutions, solid.
- **Solidification** of binary systems (GIUA; BELL), A., ii, 611.
- **Solubility** (EPHRAIM), A., i, 32; ii, 644; (TAYLOR and HILDEBRAND), A., ii, 315.
  - determination of, at high pressures (COHEN, VOLLER, and MOESVELD), A., ii, 386.
  - apparatus for determination of, at high pressures of carbon dioxide (MITCHELL), T., 1894.

    - continuous (KULENKAMPFF), A., ii, 363.
    - photo-electric, increase of dispersion in (LEDRUS), A., ii, 208.
- **Spectra**, series, Balmer lines in (McLENNAN), A., ii, 594.
    - raies ultimes in (DE GRAMONT), A., ii, 516.
  - spark, resolution of (L. and E. BLOCH), A., ii, 350.
  - Tesla-luminescence (McVICKER, MARSH, and STEWART), T., 642, 2147; (McVICKER and MARSH), T., 817.
  - ultra-red (BONINO), A., ii, 711, 712.
  - ultra-violet absorption, measurement of (WINTHER), A., ii, 519.
    - of cresols (KLINGSTEDT), A., ii, 201.
    - of vitamin extracts (DAMIANOVICH), A., i, 170.
    - Röntgen ray (STUHLMAN), A., ii, 207.
    - series (DAVIES), A., ii, 281.
  - vacuum arc, of metals (PERRETTE), A., ii, 801.
- **Spectral lines**, effect of gas pressure on intensity of (STRUM), A., ii, 802.
  - relation between supplied energy and intensity of (HAMBURGER), A., ii, 822.
  - behaviour of, at the positive pole of the metallic arc (MERRILL), A., ii, 355.
- **Spectrochemistry** (v. AUWERS and WISSFBACH), A., ii, 593; (v. AUWERS), A., ii, 705, 706.
  - and constitution (LEY and MANECKE), A., ii, 202.
  - of polynuclear aromatic compounds (KROLLPFEIFFER; v. AUWERS, and KROLLPFEIFFER), A., ii, 101.
- **Spectrograph**, Röntgen ray, and its use in analysis (GÜNTHER and STRANSKI), A., ii, 802.
  - vacuum grating (WOOD), A., ii, 805.
- **Spectroscope** for measurement of absorption bands (HARTRIDGE), A., ii, 105.
- **Spectroscopic analysis.** See Analysis.
- **Spectroscopy**, Röntgen ray, in chemical analysis (COSTER), A., ii, 648.
- **Sperm oil**, tetradecenoic acid from (TSUJIMOTO), A., i, 297.
- **Spermatogenesis**, histochemistry of (STEUDEL and SUZUKI), A., i, 626.
- **Spinacane** (CHAPMAN), T., 770.
- **Spinacene**, constitution, oxidation, and decomposition of (CHAPMAN), T., 769.
- **Spinels**, electronic structures of (HUGGINS), A., ii, 646.
- **Spirans** (RADULESCU and TANASESCU), A., i, 1197, 1211; (RADULESCU), A., i, 1240.
- **Spleen**, cholesterol in, during aseptic autolysis (MARINO), A., i, 415.

Spleen, proteolytic enzymes of (Hedin), A., i, 168.
Spring and mineral waters. See under Water.
Spruce fir oil, constituents of (Pigulevski and Nikitina), A., i, 816.
Squalene, constitution of, and its hexaozonide (Majima and Kubota), A., i, 1, 174.
Squalus acanthias, oil from the liver of (Berlingozzi and Tomasini), A., i, 597.
Stannic acid. See under Tin.
Stannous chloride. See under Tin.
Starch (Ling and Nanji), T., 2666; (Pringsheim and Goldstein), A., i, 899.
  constitution of (Irvine), T., 910.
  lattice structure of (Sponsler), A., i, 999.
  preparation of, for use in diastatic assays (Astruc and Renaud), A., ii, 512.
  measurement of the liquefaction of (Olsson), A., i, 497.
  swelling of (Lepeschkin), A., i, 303.
  action of acetyl bromide on (Zechmeister), A., i, 306.
  fission of, by amylase (Josephson), A., ii, 662.
  diastatic degradation of (Lintner and Kirschner), A., i, 304.
  hemicellulose from (Schryver and Thomas), A., i, 1066.
  hydrolysis of (Haehn), A., i, 443.
    by salts (Biedermann), A., i, 655.
    influence of organic compounds on (Sherman and Caldwell; Sherman and Naylor), A., i, 262.
  distribution of iodine between chloroform and (Firth and Watson), A., ii, 574.
  compound of iodine with (Berczeller), A., i, 304.
  phosphorus in (Tiebackx), A., i, 442.
  effect of salts on the synthesis and destruction of, in plant cells (Iljin), A., i, 172.
  effect of organic substances on the formation of, in plant cells (Maige), A., i, 989.
  nutritive value of (v. Wendt), A., i, 1256.
  soluble, preparation and properties of (Reychler), A., i, 656.
  dilaurate (Gault), A., i, 1064.
  hexapalmitate and hexastearate (Karrer and Zega), A., i, 1182.
  sulphuric acid ester of (Tamba), A., i, 1181.
Starch, estimation of (Alpers and Ziegenspeck), A., ii, 662; (Tempus), A., ii, 701; (Ling and Price), A., ii, 702.
  estimation of, in plant tissues (Denny), A., ii, 95.
  estimation of, in presence of polysaccharides (Walton and Coe), A., ii, 588.
Stearic acid, oxidation of, by atmospheric oxygen (Zerner), A., i, 994.
  cellulose, inulin, and starch esters (Karrer and Zega), A., i, 1182.
  heptadecyl ester (Heiduschka and Ripper), A., i, 894.
Stearic acid, *hexa*bromo-, *n*-butyl ester, and *octo*bromo-, methyl ester (Brown and Beal), A., i, 648.
  hydroxy-, and its derivatives (Radcliffe and Gibson), A., i, 177.
  λ-hydroxy-, methyl ester (Brochet), A., i, 750.
Steel. See under Iron.
Stenocalix pitanga. See *Eugenia pitanga*.
Stereochemistry, studies in (Groth and Holmberg), A., i, 246.
  electron theories of valency and (Sugden), T., 1861.
Steric hindrance (Détrie), A., i, 1213.
  and catalysis (Vavon and Husson), A., i, 464.
Steric series, nomenclature of (Wohl and Freudenberg), A., i, 182.
Sterigmatocystis nigra. See *Aspergillus niger*.
Sterols, detection of (Whitby), A., ii, 344.
Stibine. See Antimony trihydride.
Sticklebacks, toxicity of acids towards (Gueylard and Duval), A., i, 271.
Stilbene, *di*nitro- and nitrohydroxy-derivatives (Cullinane), T., 2056.
Stilbene compounds, chromoisomerism of (Cullinane), T., 2053.
Still, for production of conductivity water (Kraus and Dexter), A., ii, 20.
Stirlingia latifolia, essential oil from (Anon), A., i, 1275.
Stirring as an aid to chemical action (Milligan and Reid), A., ii, 837.
Stokes–Einstein law (Cohen and Bruins), A., ii, 130.
Stomach, enzymes of, in the calf and pig (Hammarsten), A., i, 1244.
  estimation of lactic acid in (Ege), A., ii, 266.
Straw, lignin from, and its derivatives (Paschke), A., i, 658.
Strontium, series spectra of (Saunders), A., ii, 104.

Strontium bases (*strontium ammines*), halides of (Hüttig), A., ii, 28.
Strontium salts, deposition of, in rats (Kinney and McCollum), A., i, 630.
Strontium amide, hydride, and nitride, heats of formation of (Guntz and Benoit), A., ii, 738.
  selenide, crystal structure of (Slatterly), A., ii, 860.
  sulphide, structure of (Holgersson), A., ii, 321.
  hydrogen sulphate (Dunnicliff), T., 734.
Strontium, estimation and separation of (Leo), A., ii, 434.
Strophanthidin, and its salts and derivatives (Jacobs and Heidelberger), A., i, 123.
Strophanthin (Jacobs and Heidelberger), A., i, 123.
Strychnine (Oliveri-Mandalà and Comella), A., i, 702.
  and bromo-, oxide of, and its salts (Oliveri-Mandalà and Comella), A., i, 1223.
  phosphates (Bouillot), A., i, 53.
*iso***Strychnine**, and its semicarbazone, and bromo- (Oliveri-Mandalà and Comella), A., i, 1223.
Strychnos alkaloids (Leuchs, Grüss, and Heering), A., i, 131; (Leuchs and Nitschke), A., i, 132; (Leuchs, Winkler, and Leuchs), A., i, 133; (Leuchs and Zander), A., i, 359; (Leuchs and Hempel; Leuchs and Gladkorn), A., i, 941.
Stuffer's law, extension of (Rây), T., 2174.
Styphnic acid, compounds of, with hydrocarbons (Efremov), A., i, 670.
Styrene, *p*-bromo- (Ziegler and Tiemann), A., i, 31.
  ω-nitro-, hydrogenation of (García Banús and Pascual Vila), A., i, 770.
Styrylbenzopyrylium salts (Buck and Heilbron), T., 2521.
β-Styrylglutaramide, **αα′-***di*cyano- (Curtis, Day, and Kimmins), T., 3136.
2-Styryl-3-methylchromone, and its salts (Heilbron, Barnes, and Morton), T., 2565.
Styryl methyl ketone (*benzylideneacetone*), reaction of, with cyanoacetic esters (Kohler and Allen), A., i, 1005.
  semioxamazone, and its potassium and sodium derivatives (Wilson and Pickering), T., 396.
Styryl methyl ketone, 5-bromo- and 5-nitro-2-hydroxy- (Heilbron and Whitworth), T., 240.
Suberone, *di*chloro- (Favorski and Boshovski), A., i, 679.
Sublimation in analysis (Hortvet), A., ii, 573.
  of plant and animal products (Viehoever), A., ii, 535.
Submicrons, formation of, and cohesion pressure (Traube), A., ii, 126.
Substance $C_2N_2S_5$, and its ethiodide, from 2:5-dithiol-1:3:4-thiodiazole and sulphur monochloride (Chakravarti), T., 967.
  $C_2H_2O_3NBrNa_2$, from β-bromo-β-nitropropane-αγ-diol, alcoholic sodium ethoxide and bromonitromethane (Wilkendorf and Trénel), A., i, 288.
  $C_4H_{10}S_4$, from ethyl mercaptan and sulphur monochloride (Chakravarti), T., 966.
  $C_4H_{10}S_6$, from dithioethylene glycol and sulphur monochloride (Chakravarti), T., 966.
  $C_4H_7ON_2Br$, from dibromopropylcarbamide and sodium ethoxide (Diels, Werner, Bernhardt, and Röhricht), A., i, 952.
  $C_6H_{12}O_2$, from cotton and sodium hydroxide (Clifford and Fargher) A., i, 637.
  $C_6H_9O_3N_3$, from heating 4-hydroxy-3:7-dimethyl-4:5-dihydrouric acid (Biltz and Lemberg), A., i, 957.
  $C_7H_{14}N_4S_2$, from thioacetamide and sulphur monochloride (Chakravarti), T., 968.
  $C_8H_2Cl_8$, from thionyl chloride and *m*-xylene-2:4-disulphonyl chloride (Pollak and Rudich), A., i, 27.
  $C_8H_4Cl_6$, from thionyl chloride and *o*-xylene-4:6-disulphonyl chloride (Pollak and Rudich), A., i, 27.
  C_9H_5NS, and its salts, from action of sulphur on quinoline (Szperl and Tadeusz), A., i, 1227.
  $C_9H_7O_3N$, and its derivatives, from nitration of 1-hydrindone (Ingold and Piggott), T., 1493.
  $C_8H_7O_7N_7$, and its derivatives, from carbamazide and barbituric acid (Curtius), A., i, 850.
  C_9H_9ON, from acraldehyde and β-phenylhydroxylamine (Bamberger and Weitnauer), A., i, 60.
  $C_{10}H_{10}Cl_4$, from methylchavicole and sulphuryl chloride (Durrans), T., 1429.
  $C_{10}H_{20}O$, from cotton and sodium hydroxide (Clifford and Fargher), A., i, 637.
  $C_{10}H_{12}OCl_4$, from anethole and sulphuryl chloride (Durrans), T., 1428.

Substance $C_{10}H_{12}O_3N_2$, from sodium ethoxide and ethyl orthoformate (DIELS and PETERSEN), A., i, 16.

$C_{11}H_{11}N_5$, from benzenediazonium chloride and 2:6-diaminopyridine (TSCHITSCHIBABIN and ZEIDE), A., i, 600.

$C_{12}H_8O_5$, from shibuol and potassium hydroxide (KOMATSU and MATSUNAMI), A., i, 1197.

$C_{12}H_{10}N_4$, from hydroxylamine and *p*-nitrosodiphenylamine (ANGELI and PIERONI), A., i, 612.

$C_{12}H_{10}S_4$, from phenyl mercaptan and sulphur monochloride (CHAKRAVARTI), T., 966.

$C_{12}H_{15}N_2$, from reduction of *cyclo*-hexanone-*o*-nitrophenylhydrazone (PERKIN and RILEY), T., 2408.

$C_{12}H_{16}O$, and its derivatives, in distillation of wood spirit from pyroligneous acid (CEDERQUIST and HOLMBERG), A., i, 226.

$C_{12}H_{13}O_3N_3$, from hydrolysis of ω-hydantylscatole (MAJIMA and KOTAKE), A., i, 156.

$C_{12}H_{15}O_2N_3$, from ethyl chloroformate, imidoacetyl acetonitrile,and pyridine (BENARY and HOSENFELD), A., i, 38.

$C_{13}H_8O_5$, from kakigoma and potassium hydroxide (KOMATSU and MATSUNAMI), A., i, 1197.

$C_{13}H_{24}O_7S_2$, from neem oil (WATSON, CHATTERJEE, and MUKERJEE), A., i, 1163.

$C_{14}H_{14}S_4$, from benzyl mercaptan and sulphur monochloride (CHAKRAVARTI), T., 967.

$C_{14}H_{12}N_2S$, from thiobenzamide and sulphur monochloride (CHAKRAVARTI), T., 968.

$C_{15}H_{20}O_5$, from neem oil (WATSON, CHATTERJEE, and MUKERJEE), A., i, 1163.

$C_{16}H_{10}N_4S_8$, and its derivatives, from 5-thiol-2-thio-3-phenyl-2:3-dihydro-1:3:4-thiodiazole and sulphur monochloride (CHAKRAVARTI), T., 967.

$C_{16}H_{19}O_5N$, from lactone ester $C_{12}H_{18}O_6$ (LEUCHS and NAGEL), A., i, 89.

$C_{17}H_{16}O_4N_4$, from *iso*nitrosomalondimethylanilide and water (USHERWOOD and WHITELEY), T., 1081.

$C_{17}H_{24}O_5N_4$, from hydrolysis of goose feathers (ABDERHALDEN), A., i, 1030.

$C_{17}H_{18}O_6NCl_3$, from *ON*-dibenzoylaminopropylene glycol and phosphoryl chloride (BERGMANN and BRAND), A., i, 841.

Substance $C_{18}H_{30}O$, from cotton and sodium hydroxide (CLIFFORD and FARGHER), A., i, 637.

$C_{18}H_{14}O_3N$, from *o*-aminobenzaldehyde and acetonylphthalimide (BARGELLINI and BERLINGOZZI), A., i, 483.

$C_{19}H_{14}O_5N_2$, from 6-aminopiperonaldehyde and acetonylphthalimide (BERLINGOZZI and NAPOLITANO), A., i, 847.

$C_{19}H_{18}N_3Cl$, from thiocarbanilide and sulphur monochloride (CHAKRAVARTI), T., 968.

$C_{19}H_{19}O_3N_5$, and its salts and derivatives, from ethyl azodicarboxy-3-pyridylamidate, β-naphthylamine, and pyridine (DIELS and BEHNEN), A., i, 391.

$C_{20}H_{14}N_4$, from 2:6-diphenyl-4-hydroxymethylpyridine-3:5-dicarboxylonitrile (BENARY and LÖWENTHAL), A., i, 54.

$C_{20}H_{14}S_4$, from β-naphthyl mercaptan and sulphur monochloride (CHAKRAVARTI), T., 968.

$C_{20}H_{28}O_2N_2$, and its derivatives, from hydrogenation of phenetidine (V. BRAUN and HAHN), A., i, 103.

$C_{21}H_{17}O_7N_3$, from indigotin and ethyl malonate (POSNER and PYL), A., i, 253.

$C_{21}H_{18}O_3S$, from phenyl styryl ketone and benzenesulphinic acid (VORLANDER and FRIEDBERG), A., i, 684.

$C_{21}H_{14}NMgBr$, from magnesium α-naphthyl bromide and β-naphthonitrile (BECKMANN, LIESCHE, and CORRENS), A., i, 230.

$C_{22}H_{16}N_{10}$, from diazotised benzidine and 2:6-diaminopyridine (TSCHITSCHIBABIN and ZEIDE), A., i, 600.

$C_{22}H_{12}O_4$, and its derivatives, from 1-acetyl-β-naphthol and sodium hydroxide (FRIES and EHLERS), A., i, 825.

$C_{22}H_{14}S_2$, from β-naphthylcarbinol and sulphur (SZPERL), A., i, 1192.

$C_{22}H_{20}O_4S$, from phenyl *p*-methoxystyryl ketone and benzenesulphinic acid (VORLÄNDER and FRIEDBERG), A., i, 684.

$C_{23}H_{16}O_3N_2$, from *o*-aminobenzaldehyde and phenacylphthalimide (BARGELLINI and BERLINGOZZI), A , i, 483.

$C_{23}H_{20}O_3S$, from distyryl ketone and benzenesulphinic acid (VORLÄNDER and FRIFDBERG), A., i, 684.

$C_{24}H_{42}O_3$, and its derivatives, from *Alchemilla alpina* (VOGL), A., i 990.

Substance $C_{24}H_{13}O_3NS$, from 2-chloro-3-anilino-1:4-naphthaquinone and hydroxythionaphthen (Fries and Ehlers), A., i, 830.
  $C_{25}H_{44}O_7$, from oxidation of the peroxide product of spinacene (Chapman), T., 774.
  $C_{25}H_{28}O_5N_2$, from ethyl 4-hydroxy-2-methylpyrrole-3-carboxylate and ethyl 4-aldehydo-1-*p*-tolyl-2:5-dimethylpyrrole-3-carboxylate (Fischer and Loy), A., i, 719.
  $C_{25}H_{22}O_3S$, from 1:3-dibenzylidene*cyclo*pentan-2-one and benzenesulphinic acid (Vorländer and Friedberg), A., i, 684.
  $C_{26}H_{12}O_4S_2$, from 2:3-dichloro-1:4-naphthaquinone and hydroxythionaphthen (Fries and Ehlers), A., i, 830.
  $C_{27}H_{48}O_8$, from spinacene and hydrogen peroxide (Chapman), T., 773.
  $C_{28}H_{22}O_2$, from *a*-ketotetrahydronaphthalene and terephthalaldehyde (Herzog and Kreidl), A., i, 61.
  $C_{28}H_{15}O_4N$, from 2-chloro-3 anilino-1:4-naphthaquinone and 4:5-benzocoumaran-2-one (Fries and Ehlers), A., i, 830.
  $C_{28}H_{30}O_6N_4$, from $C_{21}H_{25}O_6N_3$ and phenylcarbimide (Leuchs, Grüss, and Heering), A., i, 131.
  $C_{30}H_{27}O_5N$, from vanillin and *β*-naphthylamine (Klason), A., i, 187.
  $C_{30}H_{44}O_3N_2$, from *d*-longif-1:2-dionemonoxime and benzenesulphonyl chloride (Simonsen), T., 2665.
  $C_{34}H_{16}O_8$, from 2:3-dichloro-1:4-naphthaquinone and benzocoumaranone (Fries and Ehlers), A., i, 830.
  $C_{36}H_{39}O_6I$, from rye lignin (Beckmann, Liesche, Lehmann, and Lindner), A., i, 1000.
  $C_{52}H_{79}O_7Cl$, from condensation of dehydrodeoxycholic acid (Shimizu), A., i, 40.
  $C_{72}H_{83}O_{12}I$, from maple wood lignin (Beckmann, Liesche, Lehmann, and Lindner), A., i, 1000.
  $C_{108}H_{98}O_{18}I$, from pinewood lignin (Beckmann, Liesche, Lehmann, and Lindner), A., i, 1000.
Substitution, influence of, on equilibria in binary systems (Kremann, Sutter, Sitte, Strzelba, and Dobotzky), A., i, 45; (Kremann, Mauermann, Müller, and Rösler), A., i, 332; (Kremann, Mauermann, and Oswald), A., i, 336; (Kremann and Mauermann), A., i, 378; (Kremann, Hönigsberg, and Mauermann), A., i, 908.
Substitution, effect of, on chemical properties (Thomson), A., ii, 682.
Succinamic acid, ethyl ester (Rubcov), A., i, 309.
Succinic acid in plants (Franzen and Helwert), A., i, 77; (Franzen and Ostertag), A., i, 636.
Succinite, gedanite and (Tschirch, Aweng, de Jong, and Hermann), A., i, 351.
Succinoabietinol (Tschirch, Aweng, de Jong, and Hermann), A., i, 351.
Succinoabietinolic acid (Tschirch, Aweng, de Jong, and Hermann), A., i, 351.
Succinoresen (Tschirch, Aweng, de Jong, and Hermann), A., i, 352.
Succinoresinol (Tschirch, Aweng, de Jong, and Hermann), A., i, 352.
Succinosilvinic acid (Tschirch, Aweng, de Jong, and Hermann), A., i, 352.
Succinoxyabietic acids (Tschirch, Aweng, de Jong, and Hermann), A., i, 351.
Succinyl *peroxide*, decomposition of (Fichter and Fritsch), A., i, 438.
Succinyleosin, and its salts and derivatives (Biggs and Pope), T., 2939.
Succinylfluorescein, and its derivatives, and *di*bromo-, *di*nitro-, and *tetra*nitro- (Biggs and Pope), T., 2934.
Succinyl-leucauramine (Bogert and Ruderman), A., i, 32.
Succinyl*di*nitroleucauramine (Bogert and Ruderman), A., i, 32.
Sucrase in ovarian cysts (Lucène and Bierry), A., i, 979.
Sucrose (*saccharose; cane-sugar*), constitution of (Haworth and Linnell), T., 294; (Haworth and Mitchell), T., 301.
  structure of (Bergmann), T., 1277; A., i, 654.
  optical rotation of solutions of, with salts (Doroschevski), A., ii, 386.
  heat of combustion of (Verkade and Coops), A., ii, 294; (Schläpfer and Fioroni), A., ii, 832.
  specific heat of mixtures of sodium chloride and (Blaszkowska), A., ii, 544.
  vapour pressure of concentrated solutions of (Perman and Saunders), A., ii, 737.
  surface tension and density of solutions of (Butler), T., 2060.
  equilibrium of citric acid, water, and (Kremann and Eitel), A., ii, 622.
  equilibrium of sodium chloride and (Schoorl), A., i, 899.

Sucrose (*saccharose; cane sugar*), decomposition of humic substances from (FISCHER, SCHRADER, and TREIBS), A., i, 188.
inversion of (MORAN and TAYLOR), A., ii, 143; (SCATCHARD), A., ii, 626.
inversion of, by saccharase (v. EULER and MYRBÄCK), A., ii, 678.
influence of, on electrolysis (IZGARYSCHEV and STEPANOV), A., ii, 372.
effect of, on the activities of ions (CORRAN), A., ii, 607.
nutritive value of (v. WENDT), A., i, 1256.
barium monosulphate dialcoholate (SODA), A., i, 441.
detection and identification of (CASTELLANI and TAYLOR), A., ii, 265.
estimation of, by means of iodine (CAJORI), A., ii, 94.
estimation of, in mixtures of invert-sugar and lactose (JESSEN-HANSEN), A., ii, 882.
Sugar, invert-. See Invert-sugar.
Sugars, nomenclature of (WOHL and FREUDENBERG), A., i, 182.
optical rotation of (MALTBY), T., 1404.
in hydrochloric acid (ZECHMEISTER), A., i, 183.
mutarotation of (HIRSCH and KOSSUTH), A., i, 440.
chemistry of (KILIANI), A., i, 1059.
methylation of (BRIDEL), A., i, 998.
characterisation of acids derived from (SIMON and GUILLAUMIN), A., i, 240.
constitution of the monocarboxylic acids derived from (PRYDE), T., 1808.
acetone compounds (*iso*propylidene ether) of (FREUDENBERG and DOSER), A., i, 652.
reaction between amino-acids and (KOSTYTSCHEV and BRILLIANT), A., i, 659.
fermentation of mixtures of (WILLSTÄTTER and SOBOTKA), A., i, 75.
equivalence of acetaldehyde and glycerol in (GEHLE; NEUBERG, HIRSCH, and REINFURTH), A., i, 171.
by dried yeast, in presence of phosphates and sulphites (HEMMI), A., i, 736.
unsaturated reduction products of (BERGMANN, SCHOTTE, and LESCHINSKY), A., i, 653; (BERGMANN and MIEKELEY), A., i, 1053.
in blood (HEWITT), A., i, 973; (ROSENBERG), A., i, 1154.
Sugars in blood, concentration of (FOSTER), A., i, 503.
distribution of (JOHN), A., i, 973.
effect of ergotamine on (LESSER and ZIPF), A., i, 1150.
effect of insulin on (WINTER and SMITH), A., i, 727.
effect of plant extracts on (COLLIP), A., i, 728.
effect of yeast on (WINTER and SMITH), A., i, 513.
content of, in cerebrospinal fluid (MIFUJI), A., i, 73.
excretion of, in dogs (BENEDICT and OSTERBERG), A., i, 730.
fluoroacetyl derivatives (BRAUNS), A., i, 441.
acylated, hydrolysis of (ZEMPLÉN and KUNZ), A., i, 897.
aldose, Rosanoff's diagram of (WILLAMAN and MORROW), A., i, 654.
rare, preparation of (HARDING), A., i, 898, 1062, 1064, 1181.
reducing, retardation of reduction with, by trichloroacetic acid (MARGOSCHES and STEINDLER), A., i, 998.
estimation of (LASAUSSE), A., ii, 41; (FLEURY and BOUTOT), A., ii, 345.
estimation of, electrometrically (DAGGETT, CAMPBELL, and WHITMAN), A., ii, 345.
estimation of, by the picramic acid method, in presence of phenol (SWEANY), A., ii, 793.
stereoisomeric, affinity of enzymes for (WILLSTÄTTER and KUHN), A., i, 721.
tables of analysis of (ELSDON), A., ii, 882.
detection of, in urine (LEVINE), A., ii, 44.
estimation of, in blood (HAGEDORN and JENSEN), A., ii, 265, 440; (ROSENTHAL), A., ii, 265; (CALVERT), A., ii, 345; (DENIGÈS), A., ii, 661.
estimation of, in liquids poor in protein (MESTREZAT and GARREAU), A., ii, 345.
estimation of dextrose in mixtures of (BRUHNS), A., ii, 440.
γ-Sugars (IRVINE), T., 915.
Sulphamide, and its salts and derivatives (TRAUBE and REUBKE), A., ii, 630.
***p*-Sulphamidobenzoic acid**, estimation of, in "saccharin" (BEYER), A., ii, 795.
Sulpharsphenamine (VOEGTLIN and JOHNSON), A., i, 70.

Sulpharsphenamine polyarsenide (CHRISTIANSEN), A., i, 1149.

Sulphatase (NEUBERG and KURONO), A., i, 1148.

Sulphates. See under Sulphur.

Sulphinic acids (v. BRAUN and KAISER), A., i, 316.

2-Sulphino-5′(or 3′)-carboxydiphenyl sulphide, 4-nitro-, and its ammonium salt (KRISHNA), T., 2789.

2-Sulphino-4′:6′-dimethyldiphenyl sulphide, 4-nitro-, sodium salt (KRISHNA), T., 2788.

2-Sulphinodiphenyl ether, 4′-chloro-4-nitro- and 4-nitro- (KRISHNA), T., 2783.

  sulphide, chloronitro-derivatives (KRISHNA), T., 2789.

    4-nitro- (KRISHNA), T., 157.

2-Sulphino-4′-methyldiphenyl ether, 4-nitro- (KRISHNA), T., 2785.

  sulphide, 4-nitro- (KRISHNA), T., 2787.

2-Sulphinophenyl β-naphthyl ether, 4-nitro- (KRISHNA), T., 2785.

Sulphides and **Sulphites.** See under Sulphur.

Sulphoacetatopentamminecobaltic nitrate (DUFF), T., 566.

Sulphoacetic acid, dissociation constants of (BACKER), A., i, 88, 537.

  as a condensing agent (SCHNEIDER and SACK), A., i, 937.

Sulphoacetyl*di*cyanodiamidine, ammonium salt (ANDREASCH), A., i, 546.

Sulphoacetylguanidine (ANDREASCH), A., i, 546.

Sulphoacetylmethylcarbamide, barium and potassium salts (ANDREASCH), A., i, 546.

Sulphoacetylphenylcarbamide, potassium salt (ANDREASCH), A., i, 546.

3′-Sulphobenzene-4-azo-8-nitro-α-naphthylamine (MORGAN and JONES), A., i, 1029.

m-**Sulphobenzoic acid,** *p*-amino-, and its ethyl ester (SCOTT and COHEN), T., 3180.

n-**Sulphobutyric acids,** and their salts (BACKER and DE BOER), A., i, 536.

Sulpho-chromic oxidation, influence of structure on (SIMON), A., i, 81.

5-Sulpho-2-hydroxybenzoic acid, 3-bromo-, preparation of, and its salts (MELDRUM and SHAH), T., 1989.

p-**Sulpho-*o*-methoxybenzeneazodimethyl-*x*-naphthylamine,** as an indicator for use instead of methyl orange (MOIR), A., ii, 779

Sulphomonas thio-oxidans, oxidation of sulphur by (WAKSMAN and STARKEY), A., i, 273.

Sulphonamides, alkyl and aryl (CLUTTERBUCK and COHEN), T., 2507.

Sulpho-β-naphthoic acids, potassium salts (BUTLER and ROYLE), T., 1652.

1:4-Sulphonazan-4-acetic acid, and its salts and ethyl ester (CASHMORE and MCCOMBIE), T., 2888.

Sulphones, aromatic, preparation of (FOUQUE and LACROIX), A., i, 317.

Sulphonic acids, aliphatic, carbamide and guanidine derivatives of (ANDREASCH), A., i, 546.

  aromatic, esters, preparation of (IZMAILSKI and RAZORENOV), A., i, 770.

Sulphonic acids, *p*-hydroxy-, action of bromine on (MELDRUM and SHAH), T., 1982.

Sulphonyl bromides and chlorides, preparation of (CHERBULIEZ and SCHNAUDER), A., i, 434.

α-**Sulphopropionic acid,** dissociation constants of (BACKER), A., i, 88, 537.

Sulphosalicylic acid, constitution of, and its methyl ether, and derivatives (MELDRUM and SHAH), T., 1986.

Sulpho*iso*valerylcarbamide, ammonium salt (ANDREASCH), A., i, 546.

Sulphoxidocamphor, π-chloro-, and its phenylhydrazone (WEDEKIND and STÜSSER), A., i, 808.

d-, *l*- and *r*-**Sulphoxidocamphor,** chloro-, (WEDEKIND, SCHENK, and STÜSSER), A., i, 347.

Sulpho-*m*-xylyl-*n*-butyric acid, sodium salt (KROLLPFEIFFER and SCHÄFER), A., i, 344.

Sulphur in coke and carbon (POWELL), A., ii, 151.

  in the skin of children (LABORDE), A., i, 168.

  series spectrum of (HOPFIELD), A., ii, 708.

  boiling point of (MENZIES), A., ii, 216.

  solubility of, in hydrogen persulphides (WALTON and WHITFORD), A., ii, 315.

  amorphous, solubility of (HUERRE), A., ii, 754.

  rhombic, effect of high pressures and temperatures on (ROSE and MÜGGE), A., ii, 852.

  equilibrium in the system, selenium, tellurium, and (LOSANA), A., ii, 685.

  interaction of hydrogen and (NORRISH and RIDEAL), T., 696, 1689, 3202.

  reaction of oxygen with (NORRISH and RIDEAL), T., 3202.

  oxidation of, by bacteria in soils (WAKSMAN), A., i, 1042.

Sulphur, removal of, from metals (Bogitch), A., ii, 151.
action of, on quinoline (Szperl and Jezierski), A., i, 1227.
and its compounds, action of, on terpenes (Budnikov and Schilov), A., i, 118.
Sulphur alloys, with antimony and nickel (Guertler and Schack), A., ii, 424.
Sulphur compounds in soils, changes in (Lantzsch), A., i, 80.
Sulphur *mono*chloride, action of, on ammonia, and on organic bases (Macbeth and Graham), A., ii, 855.
action of, on anthracene (Friedländer and Simon), A., i, 109.
action of, on mercaptans (Chakravarti), T., 964.
action of mercuric oxide with (Oddo and Giachery), A., ii, 322.
Sulphuryl chloride, preparation of (Bert), A., ii, 67; (Pope), A., ii, 853.
thermal decomposition of (Hinshelwood and Prichard), T., 2727.
action of organomagnesium salts on (Cherbuliez and Schnauder), A., i, 434.
action of, on organic compounds (Durrans), T., 1424.
Thionyl chloride, action of, on substituted benzenesulphonyl chlorides (Pollak and Rudich), A., i, 27.
Sulphides, phototropy of (Rodriguez Mourelo), A., ii, 109.
Sulphur *di*oxide, preparation of, from alkaline earth sulphates and iron or iron sulphide (Martin and Fuchs), A., ii, 66.
molecular structure of (Rankine and Smith), A., ii, 66.
liquid electrolysis in (Centnerszwer and Drucker), A., ii, 370.
vapour pressure of (Mund), A., ii, 152.
boiling point of (Bergstrom), A., ii, 56.
solution of, in acetone, as a solvent (Schmitt), A., i, 14.
liquid, solubility of *cyclo*hexane in (Seyer and Dunbar), A., i, 313.
catalytic hydrogenation of (Tomkinson), A., ii, 66.
oxidising properties of (Wardlaw and Sylvester), T., 969, 3417.
action of, on carbon (Rassow and Hoffmann), A., ii, 158.
Sulphur *di*oxide, kinetics of the reaction between ferrous phosphate and (Carter and Butler), T., 2370, 2380.
action of, on metallic sulphides (Wöhler, Martin, and Schmidt), A., ii, 852.
complex compounds with (Ephraim and Aellig), A., i, 292.
effect of, on respiration of plants (Stoklasa, Šebor, Zdobnický, and Nekola), A., i, 521.
estimation of (Marcille), A., ii, 35.
*tri*oxide (Smits), A., ii, 556.
physical properties of (Berthoud), A., ii, 315.
Sulphurous acid, and its salts (Foerster, Lange, Drossbach, and Seidel), A., ii, 853.
reaction between aldehydes and (Estalella), A., ii, 98.
alkali hydrogen, effect of selenium on solutions of (Sandonnini), A., ii, 759.
detection of, with silver nitrate (Hackl), A., ii, 505.
Sulphuric acid, preparation of, from sulphur dioxide and chlorine (Neumann and Wilczewski), A., ii, 630.
preparation of, from sodium sulphate (Watson), A., ii, 457.
manufacture of, by the chamber process (Briner and Rossignol), A., ii, 556.
vapour pressure of solutions of (Thomas and Ramsay), T., 3256.
solutions of colourless substances in (Moir), A., ii, 809.
equilibrium in the system, ammonium and lithium sulphates, water, and (van Dorp), A., ii, 621.
analysis of, containing nitric and nitrous acids (Graire), A., ii, 785.
estimation of, microchemically, in organic compounds (Zimmerlund and Svanberg), A., ii, 177.
estimation of, in picric acid (Patterson and Moudgill), A., ii, 505.
Sulphates, acid (Dunnicliff), T., 731.
detection of, in presence of ferric salts (Hahn), A., ii, 652.
estimation of, by Hahn's method (Kolthoff and van Cittert), A., ii, 874.
estimation of, volumetrically (Bensch), A., ii, 430.

Sulphur:—
Persulphuric acid, estimation of (WOLFFENSTEIN and MAKOW), A., ii, 652.
Thiosulphates, thermodynamics of (BICHOWSKY), A., ii, 832.
instability of solutions of (ABEL), A., ii, 483; (FEIGL), A., ii, 854.
action of cupric salts with (BASSETT and DURRANT), T., 1279.
detection of (HACKL), A., ii, 249, 250.
estimation of, colorimetrically, in presence of sulphites (HACKL), A., ii, 333.
Trithionates, estimation of, in presence of tetrathionates (RIESENFELD, JOSEPHY, and GRÜNTHAL), A., ii, 333.
Pentathionic acid, formation and stability of (BASSETT and DURRANT), T., 1288.
Polythionic acids (FOERSTER and HORNIG), A., ii, 23.
Sulphur organic compounds, structure and absorption spectra of (GIBSON, GRAHAM, and REID), T., 874.
Sulphides, action of cyanogen bromide on (v. BRAUN and ENGELBERTZ), A., i, 893.
aromatic, preparation of (GIUA and RUGGERI), A., i, 790.
o-hydroxy-, isomerism of (LESSER and GAD), A., i, 561.
Sulphur estimation:—
estimation of, by sinter-oxidation (FEIGL and SCHORR), A., ii, 784.
and its compounds, estimation of (TAYLOR), A., ii, 651.
total, estimation of, in biological material (STOCKHOLM and KOCH), A., ii, 695.
estimation of, in iron (NIKOLAI), A., ii, 35; (ASHIDA), A., ii, 575
estimation of, in cast iron (KITAJIMA), A., ii, 873.
estimation of, in organic compounds (ZIMMERLUND and SVANBERG), A., ii, 177: (HOFFMANN and GORTNER), A., ii, 333.
estimation of, in organic compounds in presence of halogens (LEONARD), A., ii, 177.
free, estimation of, in petroleum (ORMANDY and CRAVEN), A., ii, 504.
estimation of, electrometrically, in soluble sulphides (WILLARD and FENWICK), A., ii, 332.
Sulphuric and **Sulphurous acids**. See under Sulphur.
Sulphuryl chloride. See under Sulphur.
Sunflower oil, constituents of (JAMIESON and BAUGHMAN), A., i, 281.
ceryl cerotate from (BAREUTHER), A., i, 647.
Sunlight, tropical, temperature coefficients of reactions in (DHAR), T., 1856.
Supersaturation (BOUSSU), A., ii, 543.
analysis by means of the degree of (RÖDER), A., ii, 83.
Suprarenal glands, relation of lipoids to the physiology of (BAUMANN and HOLLY), A., i, 629.
Surface tension, determination of, by the drop-weight method (IREDALE), A., ii, 379.
influence of, on melting point (RIE), A., ii, 459.
of solids (ANTONOFF), A., ii, 12.
Suspensoids, velocity of coagulation of (LEPESCHKIN), A., ii, 231.
Sweat, citric acid in (LEAKE), A., i, 1153.
Swelling, nature of (KNOEVENAGEL, HOGREFE, and MERTENS), A., i, 17; (KNOEVENAGEL and VOLZ), A., i, 306; (KNOEVENAGEL), A., i, 757.
Symbols and formulæ (WALKER), T., 939.
Syphilis (FORDYCE, ROSEN, and MYERS), A., i, 1263.
Systems, thermodynamics of (DE DONDER), A., ii, 124.
binary. See Binary systems.
disperse, classification of (v. WEIMARN), A., ii, 136.
distribution of size of particles in (SVEDBERG and RINDE), A., ii, 394.
heterogeneous, kinetics of (YAMAZAKI), A., ii, 63.
symmetrical triad, mobility of (INGOLD and PIGGOTT), T., 1469.

T.

Taka-saccharase, comparison of yeast-saccharase and (KUHN), A., i, 1033.
Tamarind, acids of (FRANZEN and KAISER), A., i, 1045.
Tamarindus indica. See Tamarind.
Tannic acid, precipitation of, by gelatin (THOMAS and FRIEDEN), A., ii, 664.
Tannin viscosity of solutions of (DUMANSKI and TARASOV), A., ii, 378.
effect of amino-acids on the equilibrium of hide powder with (MOELLER), A., i, 1154.
extracts, measurement of the colour of brown solutions of (PROCTER), A., ii, 270.

Tannin, sugar-free (Nierenstein), A., i, 1109.
detection of (Thomas and Frieden), A., ii, 661.
Tannins (Freudenberg and Vollbrecht), A., i, 124; (Freudenberg and Purrmann), A., i, 697; (Karrer, Widmer, and Staub), A., i, 1218; (Freudenberg and Cohn), A., i, 1219.
Chinese (Herzig), A., i, 235; (Freudenberg and Szilasi), A., i, 236. (Karrer, Salomon, and Peyer), A., i, 352.
Turkish (Karrer, Widmer, and Staub), A., i, 1218.
Tanning, vegetable, theory of (de Jong), A., i, 821.
Tansy, estimation of santonin in (van den Berg), A., ii, 800.
Tantalum, L-series spectrum of (Auger and Dauvillier), A., ii, 356.
fluorides (Hahn and Pütter), A., ii, 773.
Tantalic acid, non-volatility of (Hahn and Pütter) A., ii, 773.
Tantalum, estimation and separation of (Headden), A., ii, 93.
Tar, primary (Schütz), A., i, 195, 452; (Warrington and Moehrle), A., i, 451.
low temperature (Schütz, Buschmann, and Wissebach), A., i, 525, 1088; (Fromm and Eckard), A., i, 526; (Broche), A., i, 907.
low-temperature and coke oven, relation of, to petroleum (Fischer), A., i, 889.
See also Coal tar.
Tartar, crude, analysis of (Chem. Fabr. vorm. Goldenburg, Geromont & Cie), A., ii, 886.
Tartaric acid, crystalline structure and properties of (Astbury), A., i, 178.
photolysis of (Volmar), A., ii, 279.
neutralisation of, in presence of metallic chlorides (Simon), A., i, 12.
preparation of derivatives of oxalacetic acid from (Chattaway and Parkes), T., 663.
in green plants (Franzen and Helwert), A., i, 520.
salts, mixtures of phosphates and, as buffer solutions (Simon and Zivy), A., ii, 175.
double salts, action of light on (Volmar), A., ii, 453.
potassium antimonyl and uranyl salts, rotation of (Darmois), A., i, 751.
potassium and sodium salts, detection of, microscopically (Justin-Mueller), A., ii, 656.
Tartaric acid, sodium potassium salt, tetrahydrate, physical properties of (Valasek), A., i, 649.
esters, action of molybdic acid on rotatory power of (Darmois), A., i, 535.
estimation of (Kling), A., ii, 97.
Tartaric acids, methyl esters, rate of hydrolysis of (Skrabal and Hermann), A., i, 535.
1-Tartrato-di-(mercurimethyl-1:2-dihydrobenzfuran (Mills and Adams), A., i, 971.
Taste of salts (Kionka and Strätz), A., i, 416.
Taurine, preparation and properties of (Reychler), A., i, 758.
Tautomerism and additive reactions (Usherwood), T., 1717.
keto-enolic (Kaufmann), A., i, 90.
ring-chain (Singh and Thorpe), T., 113; (Bains and Thorpe), T., 1206; (Lanfear and Thorpe), T., 1683, 2865; (Pandya and Thorpe), T., 2852.
three-carbon (Birch, Kon, Norris, and Thorpe), T., 1361; (Birch and Kon), T., 2440.
Taxine (Winterstein and Guyer), A., i, 942.
and its bromides (Kondo and Amano), A., i, 361.
Taxus baccata (yew), taxine from (Kondo and Amano), A., i, 361.
Tea, dried, quercitrin in (Deuss), A., i, 1046.
Teeth, decalcification of (Howe), A., i, 269.
Teleosts, digestion in (Bodansky and Rose), A., i, 625.
Tellurium, atomic weight of (Bruylants and Michielsen), A., ii, 153.
allotropy of (Damiens), A., ii, 154.
potential of, with respect to its bivalent ion (Kasarnowsky), A., ii, 824.
position of, in the voltaic series (Kasarnowsky), A., ii, 828.
colloidal (Gutbier, Huber, and Eckert), A., ii, 393.
equilibrium in the system, selenium, sulphur, and (Losana), A., ii, 685.
Tellurium compounds, pharmacology of (Lehmann), A., i, 419.
Tellurium halides (Damiens), A., ii, 316.
Tellurium organic compounds:—
with β-diketones, bactericidal action of (Morgan, Cooper, and Burtt), A., i, 517.
acetylpropionylmethane, and its salts (Morgan and Reeves), T., 450.

Tellurium organic compounds:—
O-ethylacetylpropionylmethane trichloride (Morgan and Reeves), T., 431.

Tellurium, estimation of, volumetrically (Lenher and Wakefield), A., ii, 576.

Temperature coefficients of reactions in tropical sunlight (Dhar), T., 1856.

Terbium, arc spectrum of (Eder), A., ii, 47.

Terephthalaldehyde, derivatives of (Adams, Bullock, and Wilson), A., i, 379.
chloro-derivatives (Cassella & Co.), A., i, 800.

Terephthalyldisalicylic acid, and its esters (Kaufmann), A., i, 796.

Ternary systems, equilibrium in (Urazov), A., ii, 547.

Terpene, $C_{14}H_{18}$, from Spanish oil of thyme (Schimmel & Co.), A., i, 49.

Terpenes, action of fuller's earth on (Venable), A., i, 474.
action of sulphur and sulphur compounds on (Budnikov and Schilov), A., i, 118.

Terpene compounds (Ruzicka and Stoll), A., i, 119, 1216; (Ruzicka), A., i, 691; (Ruzicka and Schinz), A., i, 818, 1202; (Ruzicka and Balas), A., i, 818; (Ruzicka, Balas, and Schinz), A., i, 819; (Ruzicka, Pontalti, and Balas), A., i, 1217.

Terpene series, preparation of polycyclic hydrocarbons of (Schering), A., i, 47.

dl-α-**Terpineol**, resolution of (Windaus, Klänhardt, and Weinhold), A., i, 586.

d- and *l*-**Terpineol-digitonins** (Windaus and Weinhold), A., i, 590.

Terrapin See *Pseudomys troosti.*

Tetany (Ross), A., i, 982; (Gamble, Ross, and Tisdall; Gamble and Ross), A., i, 1038.
causes of (Denis, v. Meysenbug, and Goddard), A., i, 1263.
experimental (Cruickshank), A., i, 515.
respiratory, chemistry of (György and Vollmer), A., i, 1150.

Tethelin (Robertson), A., i, 508.

α-**Tetra-acetyl**-*d*-**glucosidoglycerol**, and its derivatives (Karrer and Hurwitz), A., i, 93.

Tetra-acetyl-*d*-**glucosido**-α-**trimethylammonium** hydroxide and salts (Karrer and ter Kuile), A., i, 93.

Tetra-allyltetrazen (Diels), A., i, 1079.

3′:5′:7:8-Tetra-anilino-4′-hydroxy-2-phenylphenanthriminazole (A. C. and G. C. Sircar), T., 1565.

Tetra*iso***amyldipyridylviolet** iodide (Emmert, Varenkamp, and Döllein), A., i, 384.

Tetra-anhydrotetrakisdi-*p*-**tolylsilicanediol** (Pink and Kipping), T., 2837.

Tetra-aquodiamminemagnesium sulphate. See under Magnesium.

Tetra-azido-*p*-**benzoquinone** (Fries, Ochwat, and Pense), A., i, 844.

Tetrabenzyl-α-**anthrapinacolin** (Barnett and Matthews), T., 392.

Tetrabenzyldipyridylviolet bromide and chloride (Emmert and Varenkamp), A., i, 384.

Tetrabenzyldi-2:6:2′:6′-tetradimethyldipyridylviolet iodide (Emmert, Varenkamp, and Ludwig), A., i, 384.

Tetradecanaphthenic acid, and its methyl ester (Tanaka and Nagai), A., i, 464.

Tetradecenoic acid, from sperm and dolphin oils (Tsujimoto), A., i, 297.

2:6:2′:6′-Tetradimethyldipyridyl dibenzyliodide (Emmert, Varenkamp, and Ludwig), A., i, 384.

Tetradi*iso***propylidenegalactosyltetrazen** (Freudenberg and Hixon), A., i, 1179.

Tetraethyl*di***aminopentanol**, and its picrate (Delaby), A., i, 1055.

Tetraethylammonium (Schlubach and v. Zwehl), A., i, 1068.
mercuribromide (Hann), A., i, 901.
perhalides (Chattaway and Hoyle), T., 658.

2:2:′4:5-Tetraethyltetrahydronaphth-αβ-hydrindene (Fleischer and Retze), A., i, 221.

Tetragalloylglucose, 1-bromo- (Karrer, Salomon, and Peyer), A., i, 352.

Tetraguaiacylsilicomethane (Pharmaceutische Industrie, G. m. b. H. and Hauschka), A., i, 30.

5:6:7:8-Tetrahydroanthracene, 1-hydroxy- (Krollpfeiffer and Schafer), A., i, 344.

Tetrahydro-1:3:6-benztriazole, and its hydrochloride (Society of Chemical Industry in Basle), A., i, 156.

Tetrahydrocarbazole, derivatives of (Perkin and Plant), T., 676; (Perkin and Riley), T., 2399.

Tetrahydrocarbazole, amino-derivatives, and their salts and derivatives (Edwards and Plant), T., 2393.
8-amino- (Perkin and Riley), T., 2406.

Tetrahydrocarbazole-9-acetic acid, and its ethyl ester (Perkin and Riley), T., 2401.

Tetrahydrocarbazole-8-aminoacetic acid (Perkin and Riley), T., 2407.

Tetrahydrocarbazole-9-carboxylic acid, and its ethyl ester, and 5-nitro- (Perkin and Plant), T., 691.

Tetrahydrocarbazolenine, 11-hydroxy- (Parkin and Plant), T., 689.

Tetrahydrocarbazole-7-oxamic acid (Edwards and Plant), T., 2398.

Tetrahydrocarvones, 8-bromo-, and 8-hydroxy-, isomerism of, and their derivatives (Cusmano and Boccucci), A., i, 1214.

Tetrahydro-ψ-chlorocodide (Speyer and Krauss), A., i, 1116.

Tetrahydro*allo*-ψ-codeine, and its diacetate (Speyer and Krauss), A., i, 1115.

Tetrahydrodigitaligenin, and its acetate (Windaus and Bandte), A., i, 1108.

Tetrahydrolinalyl chromate (Wienhaus and Treibs), A., i, 893.

Tetrahydronaphthalene derivatives, formation of, from γ-phenyl fatty acids (Attwood, Stevenson, and Thorpe), T., 1755.

Tetrahydronaphthalene, 3-bromo-2-hydroxy- (González and Campoy), A., i, 209.

ac-**Tetrahydronaphthalene**, 2-amino- and 2-amino-1-hydroxy-, and their derivatives (v. Braun, Braunsdorf, and Kirschbaum), A., i, 106.

Tetrahydronaphthalene-1:8-dicarboxylic acid, methyl and ethyl esters (Casares and Ranedo), A., i, 221.

1:2:3:4-Tetrahydronaphthalene-2:2-dicarboxylic acid, and its ethyl ester (v. Braun, Zobel, and Kühn), A., i, 1201.

2-Tetrahydronaphthalene-2′-indole-indigotin. See 1-Keto-2:(2′)-indoxyl-tetrahydronaphthalene.

Tetrahydronaphthalene-β-sulphinic acid (v. Braun and Kaiser), A., i, 316.

Tetrahydronaphthalene-β-sulphonylpiperidide (v. Braun and Kaiser), A., i, 316.

1:2:3:4-Tetrahydronaphtha*iso*quinoline, and its salts and derivatives (Mayer and Schnecko), A., i, 774.

dl-*ac*-**Tetrahydro-β-naphthol**, resolution of (Windaus, Klänhardt, and Weinhold), A., i, 586.

ac- and *ar*-**Tetrahydro-α- and -β-naphthols**, and their phenylurethanes (Brochet and Cornubert), A., i, 105.

α-**Tetrahydronaphthol-α-carboxylic acid**, and its methyl ester (Tetralin G. m. b. H.), A., i, 36.

ac-**Tetrahydro-β-naphtholdigitonin** (Windaus and Weinhold), A., i, 590.

β-2-Tetrahydronaphthoylpropionic acid (Krollpfeiffer and Schäfer), A., i, 344.

1-Tetrahydronaphthylacetic acid (v. Braun, Gruber, and Kirschbaum), A., i, 108.

Tetrahydro-β-naphthylamine, and its derivatives, constitution and physiological action of (Cloetta and Waser), A., i, 984.

γ-**Tetrahydronaphthyl-*n*-butyric acid** (Krollpfeiffer and Schäfer), A., i, 344.

β-*ar*-**Tetrahydronaphthyl-ω-dimethylaminoethylcarbinol**, and its hydrochloride (Mannich and Lammering), A., i, 45.

β-Tetrahydronaphthyl β-dimethylaminoethyl ketone, and its hydrochloride (Mannich and Lammering), A., i, 45.

β-2-Tetrahydronaphthylthiolpropionic acid (Krollpfeiffer and Schultze), A., i, 1114.

d-**Tetrahydropalmatine**, and its hydrochloride (Späth, Mosettig, and Tröthandl), A., i, 593.

Tetrahydro-4-pyrone, derivatives of (Borsche and Thiele), A., i, 1110.

Tetrahydro-γ-pyrones (Borsche and Thiele), A., i, 1110, 1220.

1:2:3:4-Tetrahydroquinoline, 6-chloro-, and its salts and nitroso-derivative (v. Braun, Petzold, and Seemann), A., i, 136.

Tetrahydro*iso*quinoline, synthesis of (Kondo and Ochiai), A., i, 837.

5:6:7:8-Tetrahydroquinolines (v. Braun, Gmelin, and Schultheiss), A., i, 835; (v. Braun, Petzold, and Schultheiss), A., i, 836.

β-Tetrahydro*iso*quinolinoethyl phenyl ketone, and its hydrochloride (Mannich and Lammering), A., i, 44.

Tetrahydrotetrophan. See 5:6:6*a*:7:12:12*a*-Hexahydro-α-naphthacridine-7-carboxylic acid.

2:3:4:5-Tetrahydro-1:3:4-thiadiazole, 2:5-*di*imino-, and its salts (Guha), A., i, 609.

Tetrahydrothiophen-3:3:4:4-tetracarboxylic acid, ethyl ester (Mann and Pope), T., 1175.

Tetrahydrotruxenetricarboxylic acid, *tri*hydroxy-, and its calcium salt (Dziewoński and Podgórska), A., i, 777.

Tetralin. See Tetrahydronaphthalene.
α-Tetralone, dyes derived from (Herzog and Kreidl), A., i, 61.
1:2:6:7-Tetramethoxy-10-anthrone (Bistrzycki and Krauer), A., i, 1211.
3′:4′:5:6-Tetramethoxydiphenylmethane-2-carboxylic acid (Bistrzycki and Krauer), A., i, 1211.
4:6:3′:4′-Tetramethoxy-αγ-diphenylpropane, 2-hydroxy- (Freudenberg and Cohn), A., i, 1219.
2:4:3′:4′-Tetramethoxy-6-ethoxy-αγ-diphenylpropane (Freudenberg and Cohn), A., i, 1219.
4′:4″-Tetramethyl*di*aminoanthrafuchsone, preparation and derivatives of (Mason), T., 1546.
pp′-**Tetramethyl*di*aminoazobenzene,** hydrochlorides of (Vorländer and Wolferts), A., i, 717.
αδ-Tetramethyl*di*amino-Δ^{β}-butene, action of cyanogen bromide on (v. Braun and Lemke), A., i, 6.
Tetramethyl*di*aminodiphenylmethane hydroferrocyanide (Cumming), T., 2458.
4:4′-Tetramethyl*di*amino-2:2′-oxidodiphenyldiphenein (Dutt), T., 227.
Tetramethylammonium chloroiodides (Rae), A., i, 901.
  fluoride, thermal decomposition of (Núñez), A., i, 188.
  *per*halides (Chattaway and Hoyle), T., 655.
  iodide, conductivity of solutions of, in phenol (Kraus and Kurtz), A., ii, 7.
Tetramethylanthragalloldianthrone (Breare and Perkin), T., 2609.
3:4:3′:4′-Tetramethylbenzil. See 4:4-*o*-Xylil.
Tetramethyl*iso*catechin, and its derivatives (Nierenstein), A., i, 1096.
Tetramethycatechins (Freudenberg and Purrmann), A., i, 697.
NN′-**Tetramethyl-*NN′*-di-γ-hydroxypropyl-Δ^{β}-butenylenediammonium** bromide and chloroplatinate (v. Braun and Lemke), A., i, 7.
NN′-**Tetramethyl-*NN′*-di-γ-hydroxypropyltetramethylenediammonium** bromide (v. Braun and Lemke), A., i, 7.
1:4:8:11-Tetramethyl-5:7:12:14-dinaphthanthradiquinone (Philippi, Seka, and Hausenbichl), A., i, 576.
ββιι-**Tetramethyl-*εζ*-diphenyldecan-*γθ*-dione** (Hill, Spear, and Lachowicz), A., i, 789.
3:5:3′:5′-Tetramethyldiphenylethane, *tri*chloro-4:4′-*di*hydroxy- (Goldschmidt and Bernard), A., i, 1096.
Tetramethylene dithio-carbamate, -carbamide, -carbimide, and -cyanate (v. Braun and Lemke), A., i, 6.
Tetramethyleneatophan (v. Braun and Wolff), A., i, 144.
1:2:3:4-Tetramethyl-4-ethyl-Δ^{1}-*cyclo*hexen-6-one (Ekeley and Howe), A., i, 998.
Tetramethyl-γ-fructose, oxidation of, with nitric acid (Haworth and Linnell), T., 299.
  oxidation of, with permanganate (Haworth and Mitchell), T., 305.
  reduction of (Haworth and Mitchell), T., 309.
Tetramethylgalactonolactone (Pryde), T., 1808.
Tetramethylglucose, nitrogenous derivative of (Pryde), A., i, 308.
Tetramethylglycerol. See βδ-Dimethylpentane-βγδ triol.
Tetramethylisatoid (Hantzsch), A., i, 1227.
ββγδ-**Tetramethylpentane-*γδ*-diol** (Locquin and Wouseng), A., i, 483.
1:2:2:6-Tetramethylpiperidine, 4-hydroxy-, benzilic and tropic esters of (Kipping), T., 3117.
2:3:4:5-Tetramethylpyrrole picrate (Fischer and Zerweck), A., i, 365.
1:2:3:5-Tetramethylpyrrole-4-carboxylic acid, ethyl and methyl esters (Korschun and Roll), A., i, 1119.
3:5:3′:5′-Tetramethylstilbene, 4:4′-*di*hydroxy-, and its diacetate (Goldschmidt and Bernard), A., i, 1096.
Tetramine from *Actinia equina* (Ackermann, Holtz, and Reinwein), A., i, 1155.
Tetraphenylallene, reduction of, and its derivatives (Vorländer and Weinstein), A., i, 670.
1:1:3:3-Tetraphenyl*cyclo*butane (Lebedev, Andreevski, and Matiuschkina), A., i, 771.
ααδδ-**Tetraphenylbutan-*β*-one** (Rack), A., i, 681.
Tetraphenylbutinenediol, action of potassium hydroxide on (Arbuzov and Temnikova), A., i, 789.
ααγγ-**Tetraphenyl-Δ^{α}-butylene,** derivatives of (Lebedev, Andreevski, and Matuischkina), A., i, 771.
Tetraphenyldiarsine (Borgstrom and Dewar), A., i, 264.
ααζζ-**Tetraphenyl-*n*-hexane** (Vorländer, Rack and Leister), A., i, 682.
ααζζ-**Tetraphenylhexane-*γδ*-dione,** and its derivatives (Vorländer, Rack, and Leister), A., i, 682.

ααζζ-Tetraphenylhexan-γ-ol (Vorländer, Rack, and Leister), A., i, 682.

ααζζ-Tetraphenylhexan-γ-ol-δ-one, and its derivatives (Vorländer, Rack, and Leister), A., i, 681.

Tetraphenylthiol-*p*-benzoquinone, *tetra-o*-nitro- (Fries, Ochwat, and Pense), A., i, 844.

Tetraphosphoric acid. See under Phosphorus.

Tetra-*n*-propylammonium perhalides (Chattaway and Hoyle), T., 661.

Tetratolylbutinenediol, action of potassium hydroxide on (Arbuzov and Temnikova), A., i, 789.

Tetra(triacetylgalloyl)-1-acetylglucose (Karrer, Salomon, and Peyer), A., i, 352.

Tetra(triacetylgalloyl)glucose, 1-bromo- (Karrer, Salomon, and Peyer), A., i, 352.

Tetra(triacetylgalloyl)-α- and -β-methylglucosides (Karrer, Salomon, and Peyer), A., i, 353.

2:3:5:6-Tetrazine, 4-amino-1-thiol-, and its derivatives (Fromm, Layer, and Nerz), A., i, 1239.

Tetryl See Phenylmethylnitroamine, 2 4:6-*tri*nitro-.

Textile fabrics, spectrophotometry of colouring matters in (Uspenski and Woronkov), A., ii, 674.

Thallium, spectrum of (Mohler and Ruark), A., ii, 806.
  absorption spectrum of (Grotrian), A., ii, 106; (Carroll), A., ii, 354
  electrical resistance of (Onnes and Tuyn), A., ii, 724.
  potentials of the vapour of (Mohler, Foote, and Ruark), A., ii, 605.
  heat of solution of, in its amalgams (Richards and Smyth), A., ii, 538.

Thallium alloys with bismuth, conductivity of (Guertler and Schulze), A., ii, 772.
  with cadmium (Di Capua), A., ii, 418.
  with lead, electrical conductivity of (Guertler and Schulze), A., ii, 418.

Thallium compounds (Berry), T., 1109.

Thallium salts, constitution of aqueous solutions of (Drucker), A., ii, 29.
  complex compounds of copper salts and (Canneri), A., ii, 74.

Thallium halides, spectrophotoelectrical sensitivity of (Coblentz and Eckford), A., ii, 279.
  nitrate, equilibria of, with mercuric bromide and chloride (Bergman, Henke, and Isaïkin), A., ii, 764.

Thallium nitrate, miscibility of mercuric iodide and (Bergman), A., ii, 568.
  double sulphites (Canneri), A., ii, 492.
  Thallic compounds, reduction of, with ferrous sulphate and with sodium arsenite (Berry), T., 1109.
    selenates and sulphates (Meyer), A., ii, 637.
  Thallous chloride, crystal structure of (Davey and Wick), A., ii, 26.
    hydroxide (de Forcrand), A., ii, 420.
    chlorovanadate (Cuttica, Tarchi, and Alinari), A., ii, 499.
    sulphate, electrolysis of (Gutbier and Dieterle), A., ii, 860.

Thallium organic compounds:—
  Thalliumdiethyl hydroxide, salts and derivatives of (Goddard) T., 1166.
  Thalliumdiphenyl hydroxide, salts and derivatives of (Goddard), T., 1164.
  Thallous alkyloxides (de Forcrand), A., i, 84.

Thebaine, constitution of (Faltis and Heczko), A., i, 358.

Thebainol, and its derivatives (Gulland and Robinson), T., 1005.

Thebainol, hydroxy-, and its salts and derivatives (Speyer, Selig, and Heil). A., i, 128.

Thebainone, preparation of (Gulland and Robinson), T., 1003.

Thebainone, hydroxy-, and its salts and derivatives (Speyer, Selig, and Heil), A., i, 128.

Thebaizone (Gulland and Robinson), T., 984.

Thebenine, constitution of (Gulland and Robinson), T., 992.

Theobromine, estimation of, in cocoa (Ugarte), A., ii, 592

Theophyllineacetic acid (Traube), A., i, 1136.

Thermal ionisation of gaseous elements (Noyes and Wilson), A., ii, 112.
  of gases (Becker), A., ii, 820.

Thermodynamics of systems (de Donder), A., ii, 124.

Thermometer for vapour pressure measurements (Stock), A., ii, 736.

Thermoregulator for electric furnaces (Solari), A., ii, 610.

Thermostat, method for control of (D. J. and J. J. Beaver), A., ii, 290.
  erection of (Tian), A., ii, 458.
  for low temperatures (Simon and Lange), A., ii, 458.
  air electrical (Isobe), A., ii, 12.
  refrigerator for (Hickmann), T., 3416.

Thevetia neriifolia, glucoside from (Weitz and Boulay), A., i, 1023.

Thianthren, 3-amino-, and 3-nitro-, and their salts and derivatives (Krishna), T., 158.
  chloroamino- and chloronitro-derivatives (Krishna), T., 2789.

Thianthrens, synthesis of (Krishna), T., 156, 2786.

Thianthren-7(or 5)-carboxylic acid, 8-amino-, hydrochloride and 3-nitro-, and its tetroxide (Krishna), T., 2789.

Thioaldehydes, isomerism of (Fromm and Schultis), A., i, 580.

Thioamides, condensation of nitriles and (Ishikawa), A., i, 926.

Thiocarbamide ethers (Dains and Thompson), A., i, 382.

Thiocarbamides, aromatic, complex silver compounds of (Hoffmann-La Roche & Co.), A., i, 101.
  substituted (Dains, Brewster, Blair, and Thompson), A., i, 62.

3-Thiocarbamido-10-methylacridine, 6-amino-, silver compound of (Hoffmann-La Roche & Co), A., i, 101.

p-**Thiocarbamidosalicylic acid**, *p*-hydroxyphenylthiocarbamide, silver compound of (Hoffmann-La Roche & Co.), A., i, 101.

Thiocarbimide reaction (Kodama), A., i, 100.

Thiocarbonic acid, and chloro-, esters of (Rivier and Schalch), A., i, 798.
  Perthiocarbonic acid (v. Halban, Mackert, and Ott), A., ii, 808.
  Trithiocarbonic acid (v. Halban, Mackert, and Ott), A., ii, 808.

Thiocyanates, action of ferric salts on (Clarens), A., i, 903; (Durand and Bailey), A., ii, 582.
  aromatic, formation of, by the diazo-reaction (Korczynski, Kniatowna, and Kaminski), A., i, 159.
  detection of (Spacu), A., ii, 40.
  estimation of, gravimetrically (Spacu), A., ii, 585.
  estimation of, iodometrically (Schulek), A., ii, 591.

Thiocyanic acid, action of, on unsaturated compounds (Challenger, Smith, and Paton), T., 1046.
  complex bismuth salts (Paciello and Foà), A., i, 1076.
  phototropic mercury derivative of (Venkataramaiah and Rao), A., i, 764.

Thiocyanogen, action of, on unsaturated compounds (Challenger, Smith, and Paton), T., 1046.
  additive reactions of (Kaufmann and Liepe), A., i, 765.

Thiodiazole, interaction of platinic chloride with (Rây), T., 138.

4:1:2-Thiodiazole, 3:5-*di*amino-, preparation and derivatives of (Fromm, Layer, and Nerz), A., i, 1239.

Thiohydrins, preparation of (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 87.

9-Thiolanthracene, and its derivatives (Friedländer and Simon). A., i, 109.

2-Thionaphthen-2′-hydroxynaphthalene-1′-indolignone-4′-anil. See 4-Anilo-2-hydroxy-1-(oxythionaphthenylidene)dihydronaphthalene.

2-Thion-4-methylthiazoline-3-acetic acid, and its salts and esters (Groth and Holmberg), A., i, 246.

Thionyl chloride. See under Sulphur.

Thiophen, constitution of (Steinkopf, Augestad-Jensen, and Donat), A., i, 124.
  mercury compounds of (Steinkopf, Bielenberg, and Augestad-Jensen), A., i, 125.

Thiophen series (Steinkopf, Bielenberg, and Augestad-Jensen), A., i, 125.

Thiosinamine, xanthyl derivative (Fosse and Hieulle), A., i, 860.

Thiosulphates. See under Sulphur.

1:4-Thioxan sulphoxide (Cashmore), T., 1741.

Thorium, spectrum of (Ross), A., ii, 808.
  γ-rays of (de Broglie and Cabrera), A., ii, 109.
  adsorption of, by charcoal (Freundlich and Wreschner), A., ii, 833.
  crystal structure of (Hull), A., ii, 32.
  chemistry of (Spicin), A., ii, 427.
  chromates (Britton), T., 1429.
  molybdate (Zambonini), A., ii, 499, 691.
  oxides, crystal structure of (Goldschmidt and Thomassen), A., ii, 644.

Thorium-*B* and **-*C***, adsorption of, by ferric hydroxide (Cranston and Hutton), T., 1318.

Thorium-*X*, action of, on bacteria (Lemay and Jaloustre), A., i, 170.
  action of, on diastases and micro-organisms (Aversenq, Jaloustre, and Maurin), A., i, 262.
  action of, on liver catalase (Maubert, Jaloustre, and Lemay), A., i, 723.

Thrombin, origin and nature of (Nolf), A., i, 876.
  action of (Stuber and Sano), A., i, 410.

- **Thrombokinase**, action of (Stuber and Sano), A., i, 411.
- **Thuja oil** (Pigulevski and Nikitina), A., i, 816.
- **Thujene**, preparation of, from sabinol (Henderson and Robertson), T., 1713.
- **Thulium**, Röntgen ray spectrum of (Coster), A., ii, 807.
- **Thunderstorms**, origin of electricity in (Armstrong), A., ii, 722; (Simpson), A., ii, 822.
  - effect of, on ozone in the atmosphere (Reynolds), A., ii, 685.
- **Thyme oil**, Spanish, terpene from (Schimmel & Co.), A., i, 49.
- **Thymic acid**, composition of (Feulgen), A., i, 964.
- **Thymol**, preparation of (Howard & Sons, Ltd., and Blagden), A., i, 781.
  - manufacture of (Howard & Sons, Ltd., and Blagden), A., i, 1006.
  - synthesis of, from *p*-cymene (Phillips and Gibbs; Phillips), A., i, 781.
  - action of bromine on (Jost and Richter), A., i, 208.
- **Thymol**, *p*-amino-, preparation of (Graybeal and Kremers), A., i, 1093.
  - chloro-, sulphide (Lesser and Gad), A., i, 563.
- **2:5-Thymoquinol**, diacetyl derivative (Bargellini), A., i, 784.
- *o*-**Thymotamide** (Mameli), A., i, 62.
- **Thymus-nucleic acid**, action of alkalis on (Steudel and Nakagawa), A., i, 720.
- **Thyroid**, regulation of calcium metabolism by the (Parhon), A., i, 973.
  - isolation of a hormone from (Romeis), A., i, 267.
  - estimation of iodine in (Fabre and Pénau), A., ii, 575.
- **Thyroxin**, physiological action of (Hildebrandt), A., i, 506; (Romeis), A., i, 1251.
- *Tiliacora acuminata*, constituents of the bark of (van Itallie and Steenhauer), A., i, 281.
- **Tiliacorine** (van Itallie and Steenhauer), A., i, 281.
- **Timothy grass bacilli.** See Bacilli.
- **Tin**, atomic heat of (Rodebush), A., ii, 582.
  - and its alloys, dilatation and thermal curves of (Losana), A., ii, 689.
  - density of (Hoffmann and Stahl), A., ii, 78.
  - white, crystal structure of (Mark and Polányi), A., ii, 768.
- **Tin alloys**, with aluminium and zinc (Crepaz), A., ii, 323, 641; (Losana and Carozzi), A., ii, 766.
- **Tin alloys** with arsenic (Mansuri), T., 214.
  - with bismuth (Bornemann and Siebe), A., ii, 169.
  - with bismuth and lead, crystallography of (Bux), A., ii, 419.
  - with bismuth and zinc (Muzaffar), T., 2341.
  - with cadmium and mercury, potential of (Kremann, Prammer, and Helly), A., ii, 825.
  - with copper, melting point of (Bauer and Vollenbruck), A., ii, 640.
    - colour and texture of (Chikashige), A., ii, 30.
  - with lead, potentials of (Muzaffar), A., ii, 285.
- **Tin bases** (*tin ammines*) (Biltz and Fischer), A., ii, 867.
- **Tin** halides, melting point curves of mixtures of (Räder), A., ii, 867.
  - *tetra*iodide, Röntgen ray structure of (Mark and Weissenberg), A., i, 760.
    - crystal structure of (Dickinson), A., ii, 425.
    - eutectic mixtures of (Vasiliev), A., ii, 425.
    - compound of phenylpyridinium iodide and (Izmailski), A., ii, 522.
  - *di*oxide, reduction of, by carbon monoxide (Fraenkel and Snipischski), A., ii, 78.
  - **Stannous** chloride, adsorption of, by stannic acid (Collins and Wood), T., 452.
  - **Stannic acid**, adsorption of colouring matters by (Morley and Wood), A., ii, 425.
    - adsorption of stannous chloride by (Collins and Wood), T., 452.
    - peptisation of, by alkali (Wintgren), A., ii, 78.
    - complex compounds of (de la Puente), A., ii, 169.
  - **Stannic acids**, magnetic analysis of (Pascal), A., ii, 79.
- **Tin detection, estimation, and separation:—**
  - detection of (Feigl), A., ii, 585; (Ortodocsu and Ressy), A., ii, 659.
  - estimation of, by the molybdenum-blue reaction (Hüttig), A., ii, 437.
  - estimation of, in alloys (Jilek), A., ii, 186, 436, 659.
  - estimation of, in human organs (Misk), A., i, 269.
  - estimation of, in wolfram (Lubatti), T., 1409.

Tin detection, estimation, and separation:—
estimation of, and separation from arsenic and antimony (JÄRVINEN), A., ii, 254.
separation of, from other metals (FURMAN), A., ii, 881.
separation of arsenic and (McCAY), A., ii, 509.
separation of, from arsenic and antimony (LUFF), A., ii, 578.
Tissues, reduction of nitro-groups by (WATERMAN and KALFF), A., i, 415; (LIPSCHITZ), A., i, 875.
concentration of proteins in (COHN), A., i, 1260.
animal. See Animal tissues.
estimation of lipoids in (LEMELAND), A., ii, 347.
estimation of salvarsan in, colorimetrically (KOLLS and YOUMANS), A., ii, 800.
Titanium, atomic weight of (BAXTER and FERTIG), A., ii, 498.
spectrum of (BROWN), A., ii, 2.
arc spectrum of (C. C. and H. K. KIESS), A., ii, 596.
crystal structure of (HULL), A., ii, 32.
Titanium alloys with aluminium (VAN ERCKELENS), A., ii, 569.
Titanium compounds, effect of, on the growth of plants (NĚMEC and KÁŠ), A., i, 1161.
Titanium *tri*chloride, crystalline, preparation of (MEYER, BAUER, and SCHMIDT), A., ii, 769.
*tetra*chloride, reduction of (RUFF and NEUMANN), A., ii, 868.
*di*oxide, catalytic action of (HINSHELWOOD and TOPLEY), T., 1021.
Titanic acid, adsorption of colouring matters by (MORLEY and WOOD), A., ii, 426.
Titanous compounds, estimation of, electrometrically (HENDRIXSON and VERBECK), A., ii, 42.
Titanium estimation and separation:—
estimation of (KANO), A., ii, 700.
estimation and separation of (HEADDEN), A., ii, 98.
separation of, from aluminium and iron (MOSER and IRÁNYI), A., ii, 438.
Tobacco, and its extracts, estimation of nicotine in (SHEDD), A., ii, 798.
Tolite, equilibrium in the system, picryl sulphide and (ROCHE and THOMAS), A., i, 326.
p-**Toluacetodinitrile**, oxalic acid derivatives (BENARY, SOENDEROP, and BENNEWITZ), A., i, 573.

Toluene compounds, Me = 1.
Tolualdehydes, hydroxy-, solubility of (SIDGWICK and ALLOTT), T., 2819.
Toluene, ultra-violet absorption spectrum of (KLINGSTEDT), A., ii, 48; (HENRI and WALTER), A., ii, 275.
freezing point of (KEYES, TOWNSHEND, and YOUNG), A., ii, 376.
volatilisation of, in steam (BARBAUDY), A., i, 768.
vapour, adsorption of, by glass surfaces (CARVER), A., ii, 129.
interfacial tension between gelatin solutions and (SHEPPARD and SWEET), A., ii, 136.
interaction of nitrosyl chloride and (LYNN and ARKLEY), A., i, 451.
Toluene, 3- and 5-amino-2:4-*di*hydroxy-, 3- and 5-nitro-2:4-*di*hydroxy-, and 5-nitroso-2:4-*di*hydroxy-, and their derivatives (HENRICH, SUNTHEIMER, and STEINMANN), A., i, 145.
tri-ω-chloro-, physical constants of (SWARTS), A., i, 197.
ααα-3-*tetra*fluoro- (SWARTS), A., ii, 273.
nitro-, catalytic reduction of (HENKE and BROWNE), A., i, 201.
*tri*nitro-, freezing point curve of mixtures of picric acid and (TAYLOR and RINKENBACH), A., i, 909.
γ-*tri*nitro-, action of hydroxylamine on (GIUA), A., i, 1189.
2:4:6-*tri*nitro-, solubility of, in organic solvents (TAYLOR and RINKENBACH), A., i, 315.
6-nitro-3:4-*di*nitroso- (GIUA), A., i, 1190.
Toluenes, *di*nitro-, preparation of (PAGE and HEASMAN), T., 3235.
equilibrium of, with amines and hydrocarbons (KREMANN, HÖNIGSBERGER, and MAUERMANN), A., i, 908.
*tri*nitro-, isomeric (BRUNSWIG), A., i, 814.
action of benzylidenemethylamine on (GIUA), A., i, 455.
equilibria of phenylenediamines and (KREMANN and MAUERMANN), A., i, 878; (GIUA and GIUA), A., i, 485.
p-**Toluene-1-azo-β-naphthol-4-sulphonic acid** (MORGAN and JONES), A., i, 327.
Toluene-*p*-4-azo-5-nitro-α-naphthylamine, and its hydrochloride (MORGAN and JONES), A., i, 1029.
1-*p*-**Tolueneazo-5-nitro-β-naphthylamine** (HOLLIDAY & CO., LTD., and MORGAN), A., i, 388.
Toluene-*p*-sulphinic acid, sodium salt, preparation of (WHITMORE, HAMILTON, and THURMAN), A., i, 501.

Toluene compounds, Me = 1.

Toluene-*p*-sulphinyl chloride, and its derivatives (v. Braun and Kaiser), A., i, 316.

Toluene-*p*-sulphochloramide, sodium salt, effect of, on organic substances (Engfeldt), A., i, 454.

Toluene-3-sulphonacetic acid, 4-hydroxy- (Gibson and Smiles), T., 2391.

Toluene-ω-sulphonanilide, and *p*-chloro- and *p*-nitro- (Clutterbuck and Cohen), T., 2514.

Toluene-ω-sulphonhydrazide, and *p*-chloro- and *p*-nitro- (Clutterbuc and Cohen), T., 2514.

Toluenesulphonic acid, 4-amino-β-naphthyl and 4-nitro-β-naphthyl esters (Challenor and Ingold), T., 2080.

Toluene-*m*-sulphonic acid, 6-chloro-5-nitro-, sodium salt, as a reagent for potassium (H. and W. Davies), T., 2976.

Toluene-*p* sulphonic acid, halogen-alkyl esters, interaction between organomagnesium halides and (Gilman and Beaber), A., i, 453.

β-chloroethyl ester (British Dyestuffs Corporation, Ltd., Perkin, and Clemo), A., i, 453.

γ-chloropropyl ester (Gilman and Beaber), A., i, 454.

Toluenesulphoniodoamides, potassium and sodium salts (Roberts), T., 851.

Toluene-ω-sulphonphenylhydrazide, and *p*-chloro- and *p*-nitro- (Clutterbuck and Cohen), T., 2514.

p-**Toluenesulphonylanthranilic acid,** anhydrides from (Heller and Grundmann), A., i, 245.

1-*p*-**Toluenesulphonyl-3-benzoylamidopiperidone** (Thomas, Kapfhammer, and Flaschenträger), A., i, 51.

δ-*p*-**Toluenesulphonyl-α-benzoyl-δ-methylornithine** (Thomas, Kapfhammer and Flaschenträger), A., i, 51.

δ-*p*-**Toluenesulphonyl-α-benzoylornithine** (Thomas, Kapfhammer, and Flaschentrager), A., i, 51.

3-*p*-**Toluenesulphonylcarbostyril,** and its sodium salt and *O*-ethyl ether (Tröger and Köppen-Kastrop), A., i, 370.

α-*p*-**Toluenesulphonylcinnamonitrile,** *o*-nitro- (Tröger and Köppen-Kastrop), A., i, 370.

3-*p*-**Toluenesulphonyldiacetoxycoumarins** (Tröger and Dunkel), A., i, 357.

Toluene compounds, Me = 1.

3-*p*-**Toluenesulphonyl-5:7-diethoxycoumarin** (Tröger and Dunkel), A., i, 357.

3-*p*-**Toluenesulphonyl*di*hydroxycoumarins** (Tröger and Dunkel), A., i, 357.

δ-*p*-**Toluenesulphonyl-δ-methylornithine** and its hydrochloride (Thomas, Kapfhammer, and Flaschenträger), A., i, 51.

2-*p*-**Toluenesulphonyl-β-naphthapyrone,** and hydroxy- (Tröger and Dunkel), A., i, 356.

3-*p*-**Toluenesulphonyl-2-phenylquinoline,** and its salts (Tröger and v. Seelen), A., i, 1129.

3-*p*-**Toluenesulphonylquinoline,** 2-amino-, and its salts, and chloro-derivatives (Tröger and Köppen-Kastrop), A., i, 370.

3-*p*-**Toluenesulphonyl-2-*p*-toluenesulphonylmethylquinoline** (Tröger and v. Seelen), A., i, 1127.

m--**Toluic acid,** 3-hydroxy-, quinine salt (Farbenfabriken vorm. F. Bayer & Co.), A., i, 939.

o-**Toluidine,** catalytic preparation of (Henke and Browne), A., i, 201.

o-**Toluidine,** *p*-bromo- (Ressy and Ortodocsu), A., i, 833.

Toluidines, ultra-violet absorption spectra of (Klingstedt), A., ii, 106.

β-*o*- and *p*-**Toluidinoethyl alcohols** (Adams and Segur), A., i, 458.

2-*p*-**Toluidino-5-hydroxy-1:4-naphthaquinone,** 3-chloro- (Wheeler, Dawson, and McEwen), A., i, 1021.

1-*o*- and *p*-**Toluidino-β-naphthols** (Wahl and Lantz), A., i, 210.

γ-*o*- and *p*-**Toluidinopropyl alcohols** (Pierce and Adams), A., i, 484.

p-**Tolumethylamide,** thio- (Kindler, Burghard, Finndorf, Dehn, Giese, and Körding), A., i, 571.

β-*p*-**Toluoylacrylic acid,** methyl ester (Oddy), A., i, 1098.

β-*p*-**Toluoyl-Δ^{α}-butenoic acid** (Mayer and Stamm), A., i, 803.

β-*p*-**Toluoyl-*n*-butyric acid,** and its oxime (Mayer and Stamm), A., i, 802.

m-**Toluoylformic acid,** esters and phenylhydrazone of (Posner and Heumann), A., i, 954.

β-*p*-**Toluoyl-α-methylacrylic acid** (Mayer and Stamm), A., i, 803.

β-*p*-**Toluoyl-α-methylpropionic acid,** and its oxime (Mayer and Stamm), A., i, 802.

1-*p*-**Toluoyl-9-oxanthronyl** (Scholl, Dehnert, and Semp), A., i, 808.

Toluene compounds, Me = 1.

β-*p*-**Toluoylpropionic acid**, αβ-*di*bromo-, and α-chloro- (Oddy), A., i, 1098.

Tolyl acetate and benzoate, bromo- and *di*bromo-amino-, acetyl and benzoyl derivatives (Raiford and Iddles), A., i, 326.

m-**Tolyl** methyl ether, sulphonic acids of (Haworth and Lapworth), T., 2982.
  amino-, acetyl derivatives (Haworth and Lapworth), T., 2987.
  4:6-*di*bromo- (Haworth and Lapworth), T., 2995.
  2-nitro- (Gibson), T., 1273.

  use of oxalyl chloride in synthesis of (ZOLLER), A., i, 51.
  leuco-sulphinic acids of (SCHEUING and BERLINER), A., i, 859.
Triphenylmethanesulphonic acid, *di*-hydroxy-, and its sodium salt (ORNDORFF and SHERWOOD), A., i, 341.
Triphenylmethoxyphosphorus dichloride (BOYD and CHIGNELL), T., 815.
Triphenylmethyl (GOMBERG and BUCHLER), A., i, 211; (GOMBERG and NISHIDA), A., i, 212; (GOMBERG and BLICKE), A., i, 913.
  ethers (SPEIDEL and TOELDTE), A., i, 331.
  *di*sulphide, dissociation of (BLICKE), A., i, 1007.
Triphenylmethyl, *o*-hydroxy-, polymerised (GOMBERG and NISHIDA), A., i, 212.
Triphenylmethylamine, formation of, from triphenylmethylaniline (PETRENKO-KRITSCHENKO and GANDELMAN), A., i, 554.
Triphenylmethylaniline, formation of triphenylmethylamine from (PETRENKO-KRITSCHENKO and GANDELMAN), A., i, 554.
Triphenylmethylphosphorous acid (BOYD and CHIGNELL), T., 816.
αβγ-Triphenylpropane-αβ-diol, and its monoacetate (ORÉKHOV and SCHAPIR), A., i, 454.
ααγ-Triphenylpropan-α-ol (ZALKIND and CICIANOVA), A., i, 333.
αγγ-Triphenylpropylamines, γ-hydroxy- (MCKENZIE and RICHARDSON), T., 90.
Triphenylstibine hydroxide (KAUFMANN), A., i, 874.
  dithiocyanate and hydroxythiocyanate (CHALLENGER, SMITH, and PATON), T., 1052.

1:2:3-Triphenylstilbazonium *ψ*-base, 6-chloro- (Brand and Wild), A., i., 252.

***NN'N''*-Triphenyl-2:2':2''-trimethylpararosaniline** (Baines and Driver), T., 1217.

Triphenylvinyl alcohol, true constitution of (Ley and Manecke), A., ii, 202.

Triphosphonucleic acid (Feulgen and Rossenbeck), A., i, 618.

Triphthalimidomethyl glyceryl ether (Hopkins), A., i, 340.

Tripyrocatechylantimonic acid, salts of (Weinland and Scholder), A., i, 1196.

Tri-8-quinolyl phosphate (Chemische Fabrik Griesheim Elektron), A., i, 920.

Tri-2-quinolylbromomethane, and its *di*picrate (Scheibe, Pflock, Scholl, and Friedel), A., i, 251.

Tri-2-quinolylcarbinol, acetate of (Scheibe, Pflock, Scholl, and Friedel), A., i, 251.

Tri-2-quinolylmethane, and its derivatives, colour of (Scheibe), A., i, 250.

Tri-2-quinolylmethyl ethyl ether (Scheibe, Pflock, Scholl, and Friedel), A., i, 251.

Trisilane, action of chloroform on (Stock and Stiebeler), A., ii, 486.

Tristriazomesitylene (Morgan and Davies), T., 237.

Trisuccinimidotrimethyleneamine (Passerini), A., i, 761.

Trithionates. See under Sulphur.

Tri-*p*-tolyl phosphate (Chemische Fabrik Griesheim Elektron), A., i, 920.

***p*-Tritolylstibine** hydroxide (Kaufmann), A., i, 874.

2'-(3'':6'':9''-Trixanthenyl)diphenyl-2-carboxylic acid, 3'':6'':9''-*tri*hydroxy-, 9-lactone, and its *tetra*bromo-derivative (Bischoff and Adkins), A., i, 578.

Tri-*m*- and -*p*-xylylarsines, preparation of, and their reactions with thallic chloride (Goddard), T., 1170.

Tri-*m*-xylylstibine, and *tri*amino-, *tri*bromo-, *tri*iodo-, and *tri*nitro-, and their derivatives (Goddard), T., 2315.

Tri-*p*-xylylstibine, and its dichloride (Goddard), T., 1170.

Trochol, and its salts and derivatives (Yanagisawa and Takashima), A., i, 1008.

Trocholic acid, and its diacetate (Yanagisawa and Takashima), A., i, 1009.

Trocholone (Yanagisawa and Takashima), A., i, 1008.

Tropacocaine benzoate (de Jong), A., i, 1222.
  estimation of, in coca leaf (de Jong), A., ii, 798.

Tropane, and its derivatives, spectrochemistry of (v. Auwers), A., ii, 705.

***ψ*-Tropine** hydrochloride, dimercurichloride of (de Jong), A., i, 1222.

Trout, respiratory exchange in (Gardner and King), A., i, 162.

Truxene (Dziewoński and Podgórska), A., i, 777.

Truxenequinonetricarboxylic acid, trimethyl ester (Dziewoński and Podgórska), A., i, 777.

Truxenol (Dziewoński and Podgórska), A., i, 777.

***α*-Truxillamic acid**, and its salts (Stoermer, Wegner, and Carl), A., i, 930.

***γ*-Truxillanil** (Stoermer, Wegner, and Carl), A., i, 930.

***α*- and *γ*-Truxillanilic acids**, and their salts and derivatives (Stoermer, Wegner, and Carl), A, i, 929.

***α*-Truxilldianilide** (Stoermer, Wegner, and Carl), A., i, 929.

***n*-Truxillic acid**, and its anhydride (Stobbe and Zschoch), A., i, 337.

***α*-Truxillic acid**, distillation of (Stobbe and Zschoch), A., i, 337.

Truxillic acids, constitution of (de Jong), A., i, 574.
  stereochemistry of (Stoermer, Wegner, and Carl), A., i, 929.

Truxinic acids, constitution of (de Jong), A., i, 574.

Trypanosomes, action of selenium and tellurium compounds on (Lehmann), A., i, 419.

Trypsin, decomposition of, by radium emanation (Hussey and Thomson), A., i, 871.
  adsorption of, by charcoal (Northrop), A., i, 1033.
  influence of reaction on the action of (Ringer), A., i, 260.
  hydrolysis of collagen by (Thomas and Seymour-Jones), A., i, 871.
  action of, on colloids (Stiasny and Ackermann), A., ii, 301.
  equilibrium between antitrypsin and (Hussey and Northrop), A., i, 261.
  rate of digestion of proteins by (Northrop), A., i, 69.
  detection of (Pfeiffer and Standenath), A., ii, 892.
  estimation of (Northrop and Hussey), A., ii, 271.

Tryptophan, preparation of, from lactalbumin (Waterman), A., i, 868.

Tryptophan, researches on (Fürth and Lieben), A., i, 166.

content of, in proteins (May and Rose), A., i, 160.

in blood proteins (Kiyotaki), A., i, 399.

estimation of (Holm and Greenbank), A., ii, 666.

estimation of, in proteins (Matsuyama and Mori), A., i, 867.

r-**Tryptophan**, synthesis of (Majima and Kotake), A., i, 156, 495.

Tsuga canadensis and *heterophylla*, essential oils from (Schimmel & Co.), A., i, 49.

Tuberculinic acid (Johnson and Brown), A., i, 160.

sugar in (Brown and Johnson), A., i, 965.

analysis of (Brown and Johnson), A., i, 1244.

Tuberculosis, chemotherapy of acridine dyes in (Smith), A., i, 422.

Tubotoxin, and its diacetyl derivative (Kariyone and Atsumi), A., i, 477.

Tumours, zinc in (Cristol), A., i, 512.

Tumour extracts, hydrolysis of esters by (Sugiura, Noyes, and Falk), A., i, 1246.

Tungsten, *K*-series spectrum of (Crofutt), A., ii, 710.

L-series spectrum of (Rogers), A., ii, 200.

Röntgen ray spectrum of (Cork), A., ii, 364.

equilibria of, and its oxides with hydrogen and water vapour (Reinders and Vervloet), A., ii, 621.

and its oxides, equilibria of, with hydrogen and water vapour and with carbon oxides and oxygen (van Liempt), A., ii, 328.

and its oxides, equilibrium of steam with (Wöhler and Günther), A., ii, 471.

Tungsten alloys with iron and carbon (Ozawa), A., ii, 244.

with molybdenum (Geiss and van Liempt), A., ii, 866.

Tungsten carbides (Andrews), A., ii, 327.

di- and *pent*-oxides, preparation of (van Liempt), A., ii, 328.

*tri*oxide, precipitation of (van Liempt), A., ii, 867.

estimation of molybdenum in (King), A., ii. 342.

Turacin (Fischer and Hilger), A., i, 964.

Turnbull's blue (Müller and Lautersbach), A., i, 191.

Turpentine, Indian, constituents of (Simonsen and Rau), T., 549.

from *Pinus longifolia* (Simonsen), T., 2642.

Spanish, pinene of (Madinaveitia), A., i, 235.

sulphite, *p*-cymene in (Komatsu, Nakamura, and Kurata), A., i, 769.

Turpentines, fractionation of (Dupont and Desalbres), A., i, 1215.

Turpentine oil, action of a saturated solution of hydrogen chloride in acetic acid on (Huerre), A., i, 812.

Tyramine, amino-, and nitro- (Cloetta and Wünsche), A., i, 515.

*di*iodo-, influence of, on gaseous exchange (Abelin), A., i, 874.

Tyrosinase (Onslow), A., i, 723.

bacterial (Stapp), A., i, 1247.

action of, on tyrosine (Abderhalden and Sickel; Raper and Wormall), A., i, 1146.

Tyrosine, and its derivatives, rotation-dispersion of (Waser), A., i, 338.

production of, by anærobic bacteria (Hall and Finnerud), A., i, 985.

hydrogenation of (Waser and Brauchli), A., i, 337.

bacterial decomposition of (Hirai), A., i, 423.

action of tyrosinase on (Abderhalden and Sickel; Raper and Wormall), A., i, 1146.

in blood proteins (Kiyotaki), A., i, 399.

estimation of, in blood (Haas; Haas and Trautmann), A., ii, 443.

Tyrosine, 3-bromo- (Rosenmund, Kuhnhenn, and Lesch), A., i, 1095.

*di*iodo-, influence of, on gaseous exchange (Abelin), A., i, 874.

Tyrosine-melanic acid (Adler), A., i, 1218.

Tyrosine-melanin (Adler), A., i, 1218.

U.

Ultra-filters, cellulose acetate for (Fricke and Klempt), A., ii, 752.

Ultrahumins (Pearson), A., ii, 246.

Umoregi, constituents of (Komatsu and Ueda), A., i, 1274.

Units, Ångström (Lowry), A., ii, 147.

Unsaturated compounds, chemistry and pharmacology of (v. Braun and Lemke), A., i, 4; (v. Braun and Schirmacher), A., i, 286.

transformations in (Gillet), A., ii, 147.

- **Unsaturated compounds**, action of hydrogen sulphide, thiocyanogen, and thiocyanic acid with (Challenger, Smith, and Paton), T., 1046.
  - homocyclic, chemistry of polycyclic compounds in relation to isomeric (Ingold, Seeley, and Thorpe), T., 853; (Grimwood, Ingold, and Thorpe), T., 3303.
- **Uraninite**, chemical formula of (Schoep), A., ii, 647.
- **Uranium**, radioactive products of (Guy and Russell), T., 2618.
  - relation of, to actinium (Russell), A., ii, 497, 719.
- **Uranium salts**, catalytic oxidation with (Aloy and Valdiguié), A., ii, 552.
  - oxidation and reduction by, under the influence of light (Aloy and Valdiguié), A., i, 554.
  - normal solutions of, as standards (Ludewig and Lorenser), A., ii, 453.
- **Uranium** oxides, crystal structure of (Goldschmidt and Thomassen), A., ii, 644.
- **Uranium estimation and separation**:—
  - estimation of, electrometrically (Gustavson and Knudson), A., ii, 185.
  - separation of glucinum and (Brinton and Ellestad), A., ii, 257.
  - separation of, from thorium and the rare earths in pitchblende (Riss), A., ii, 792.
- **Uranium-*X***, γ-rays of (Hahn and Meitner), A., ii, 676.
- **Uranium-X_1**, β-ray spectrum of (Meitner), A., ii, 675.
  - adsorption of, by charcoal (Freundlich and Wreschner), A., ii, 833.
- **Uranium-*Z*** (Hahn), A., ii, 111.
- **Uranium-lead**, atomic weight of Honigschmid and Birckenbach), A., ii, 764.
- **Uranium minerals** (Schoep), A., ii, 870.
  - relative activities of radioactive constituents of (Widdowson and Russell), A., ii, 819.
- **Urates**, colloid chemistry of jellies of (Keeser and Zocher). A., ii, 135.
- **Urazole**, 4-aminoiminothio-, 4-amino-*di*thio-, and their salts and derivatives (Arndt and Bielich), A., i, 612.
  - *di*thio-, dimethyl ether, methyl sulphone of, and its hydrochloride (Arndt, Milde, and Eckert), A., i, 1079.
- **Urea** (*carbamide*) rôle of the liver in production of (Gottschalk and Nonnenbruch), A., i, 1255.
  - distribution of, in blood and secretions (Cohen), A., i, 1037.
  - in blood and liver (Marie), A., i, 74.
  - concentration of, in blood and saliva (Schmitz), A., i, 625.
  - concentration of, in saliva (Heuch and Aldrich), A., i, 270.
  - rate of excretion of (Addis and Drury), A., i, 511, 731; (Drury), A., i, 511.
  - replacement of proteins by (Honcamp; Scheunert, Klein, and Steuber), A., i, 266.
  - zymolysis of (Fearon), A., i, 497.
  - estimation of (Margosches and Rose), A., ii, 348.
  - use of potassium or sodium bromide in estimation of (Collings), A., ii, 348.
  - estimation of, with hypobromite (Collins), A., ii, 442; (Margosches and Rose), A., ii, 590.
  - estimation of, by means of urease (Fox and Geldard), A., ii, 591; (Wishart), A., ii, 666.
  - estimation of, in blood (Boggs and McElroy), A., ii, 443; (Behre), A., ii, 666.
  - estimation of, in urine (Levy-Simpson and Carroll), A., ii, 654.
  - See also Carbamide.
- ***iso*Urea**, derivatives, pharmacology of (Basterfield), A., i, 420.
- **Urease** (Fearon), A., i, 497; (Lövgren), A., i, 622.
  - occurrence of, in plants (Armstrong), A., i, 1275.
  - action of light on (Pincussen and Kato), A., i, 405.
  - synthesis and decomposition of carbamide by (Mack and Villars), A., i, 405.
  - effect of glycine and potassium cyanide on the action of (Takahata), A., i, 1148.
  - from bacteria (Beijerinck; Takahata), A., i, 1157.
  - in fungi (Goris and Costy), A., i, 171, 405.
  - *Robinia* and soja bean (Nakagawa), A., i, 1246.
  - soja bean, constituents of (Katô), A., i, 1034.
    - action of (Kay), A., i, 722.
    - influence of glycine on the fermentation action of (Katô), A., i, 622.
- **Urethane**, *N*-*di*chloro- (Houben, Pfankuch, and Kühling), A., i, 1077.

Urethanes, preparation of (LES ÉTABLISSEMENTS POULENC FRÈRES), A., i, 1007.
  photo-sensitiveness of (KORCZYNSKI), A., i, 560.
Urethanobenzoic acid, p-chloro-, and its ethyl ester and acid chloride (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 924.
Uric acid, adsorption of, by animal charcoal, colloids, and proteins (HARPUDER), A., i, 389.
  solubility of, in water (BILTZ and HERRMANN), A., i, 489.
  influence of hydrogen-ion concentration on the solubility of (JUNG), A., i, 860.
  behaviour of, in protein solutions (PINCUSSEN), A., ii, 270.
  action of acetic anhydride on (BILTZ and SCHMIDT), A., i, 489.
  metabolism. See Metabolism.
  biological decomposition of (STEUDEL and IZUMI), A., i, 1039.
  in blood (WEIL and GUILLAUMIN), A., i, 728; (SCHEUNERT and v. PELCHRZIM; SCHMIDT-KRAHMER), A., i, 973.
  compound of, in blood (DAVIS, NEWTON, and BENEDICT; NEWTON and DAVIS), A., i, 165.
  elimination and destruction of, in the body (CHANTRAINE), A., i, 417.
  effect of organic acids on excretion of (GIBSON and DOISY), A., i, 732.
  excretion of, on diet poor in purines (STEUDEL), A., i. 270.
  sodium salt, solubility of (BARKAN), A., i, 158.
  detection of, microchemically, in kidneys (WALTER), A., i, 1154.
  estimation of, in blood (SACHNOVSKA and ZALESKI; BROWN and RAIZISS; ROGERS), A., ii, 510.
  estimation of, in urine and blood-serum (CHANTRAINE), A., ii, 270.
  estimation of, iodometrically, in urine (FÜRTH, URBACK, and WERMER), A., ii, 889.
Uric acid glycols, reduction of (BILTZ and LEMBERG), A , i, 955.
Urine, effect of acids and bases in diet on composition of (BORAK), A., i, 510.
  secretion of (MARSHALL and CRANE), A., i, 628.
  excretion of acids and ammonia in (HUBBARD and MUNFORD), A., ii, 169.
  concentration of alcohol in (MILES), A., i, 71.
  colouring matters of (WEISS), A., i, 417.
Urine, excretion of cholesterol in (GRUNKE), A., i, 169.
  creatine in (PALLADIN), A., i, 631.
  excretion of creatinine in (LAUFBERGER), A., i, 732.
  of children, formic acid in (MCNEAL and ELDRIDGE), A., i, 631.
  excretion of lactic acid in (KNOOP and JOST), A., i, 1261.
  elimination of nitrogen compounds in, under various conditions (FONTÈS and YOVANOVITCH), A., i, 879.
  effect of antipyretics on the distribution of nitrogen in (MORINAKA), A., i, 1040.
  effect of fats and carbohydrates on nitrogen distribution in (CATHCART), A., i, 169.
  elimination of phenol, p-bromophenol, and bromobenzene as ethereal sulphates in (RHODE), A., i, 74.
  precipitation of, by picric acid and sodium chloride (SCHÜLER and THIELMANN), A., i, 1261.
  proteic acids of (EDLBACHER), A., i, 617.
  purine bases in (STEUDEL and ELLINGHAUS), A., i, 732.
  diabetic, aldol in (FRICKE), A., i, 73.
    detection of acetoacetic acid in (FAVREL), A., ii, 97.
Urine, analytical methods relating to:—
  detection of acetone in (VAN KETEL), A , ii, 665.
  detection of albumin in (EXTON), A., ii, 511.
  detection of bismuth in (DEZANI), A., ii, 342; (GANASSINI), A., ii, 439.
  detection of dextrose in (INGHILLERI), A., ii, 587.
  detection of sugar in (LEVINE), A., ii, 44.
  estimation of acetone and β-hydroxybutyric acid in (LUBLIN), A., ii, 268.
  estimation of albumin in (BOLOTOV), A., ii, 511.
  estimation of ammonia in (LJUNGDAHL; MESTREZAT and JANET), A., ii, 654.
  estimation of ammonia and urea in (LEVY-SIMPSON and CARROLL), A., ii, 654.
  estimation of bismuth in (GANASSINI), A., ii, 93.
  estimation of citric acid in (MCCLURE and SAUER), A., ii, 267.
  estimation of dextrose and lactose in (THALLINNER and PERRY), A., ii, 440.

- **Urine, analytical methods relating to:—**
  - estimation of formic acid in (BENEDICT and HARROP), A., ii, 96.
  - estimation of uric acid in (CHANTRAINE), A., ii, 270.
  - estimation, iodometrically, of uric acid in (FÜRTH, URBACK, and WERMER), A., ii, 889.
- **Urobilin**, detection of (BARRENSCHEEN and WELTMANN), A., ii, 800.
  - detection of, in blood and cerebrospinal fluid (RODILLON), A., ii, 100.
- **Urochromogen** (WEISS), A., i, 417.
- **Uropicrates** (BERGELL), A., i, 1155.

V.

Velocity of saponification of esters, influence of the base on (Cashmore, McCombie, and Scarborough), T., 197.
  methyl esters (Jones, McCombie, and Scarborough), T., 2688.
Velocity of sound. See Sound.
Velocity of vaporisation (Herz), A., ii, 142.
o-**Veratric acid**, 5-bromo- (Davies), T., 1587.
Veratrole, ultra-violet absorption spectrum of (Steiner), A., ii, 276.
Veratryl β-diethylaminoethyl ketone, and its derivatives (Mannich and Lammering), A., i, 45.
Veratrylmethoxyacetaldehyde, semicarbazones of (Pratt and Robinson), T., 757.
Verbenalin (Riedel), A., i, 821.
Veronal, hydrolysis of xanthyl derivatives of (Fabre), A., i, 486.
Veronica hederæfolia, aucubin in the seeds of (Charaux), A., i, 281.
Vertebrates, dextrose in eggs of (Gori), A., i, 72.
Vesuvius, sodium sulphate in the products of eruption from (Zambonini), A., ii, 869.
Vinyl alcohol, preparation of esters and ethers of (Consortium für Elektrochemische Industrie), A., i, 893.
Vinylacetonitrile, melting-point curve of the binary mixture, aniline, and (Lafortune), A., i, 1193.
  action of organo-magnesium compounds on (Bruylants and Gevaert), A., i, 1188.
β-Vinylacrylic acid, ethyl ester (v. Auwers and Heyna), A., ii, 706.
Vinylarsine chlorides, *mono*-, *di*-, and *tri*-β-chloro- (Wieland and Bloemer), A., i, 499.
Vinylarsinic acids, *mono*- and *di*-β-chloro- (Wieland and Bloemer), A., i, 499.
Vinyldiacetonalkamines, derivatives of (Kipping), T., 3115.
Viscose, use of pyrogallol fibres of, in analysis (Cole), A., ii, 94.
Viscosin of fungi (Ivanov), A., i, 735.
Viscosistalagmometer, new (v. Hahn), A., ii, 379.
Viscosity, Einstein's formula for (Dumanski and Tarasov), A., ii, 378.
  effect of, on neutralisation and isomorphism (Simon), A., ii, 219.
  of lyophile colloids (de Jong), A., ii, 132.
  of lubricating oils (Okochi and Majima), A., ii, 463.
  of saturated solutions (Hrynakowski), A., ii, 538.
Vitamins, ultra-violet absorption spectra of extracts of (Damianovich), A., i, 170.
  from carrots (v. Euler and Bernton), A., i, 498.
  extraction of, from yeast and rice polishing (Funk, Harrow, and Paton), A., i, 1247.
  rôle of, in cell processes (Hess), A., i, 636.

Vitamins, effect of, on pathogenic bacteria (Ascoli), A., i, 1268.
  as colloidal catalysts (Rocasolano), A., i, 263.
Vitamin-*A*, formation of, in plant tissues (Coward), A., i, 521.
  chemistry of (Takahashi and Kawakami), A., i, 968.
Vitamin-*B*, synthesis of, by yeast (MacDonald), A., i, 170.
  detection of (Jendrassik), A., ii, 892.
Vitamins-*B* and ***-D*** (Funk and Paton), A., i, 263.
Vitamin-*D* (Heaton), A., i, 170.
Vivianite, formation of, in an arable soil (Kunz-Krause), A., ii, 325.
Volatile substances, composition of eutectic mixtures of (Vasiliev), A., ii, 395.
Volume of gaseous mixtures at varying pressures (Masson and Dolley), A., ii, 462.
  atomic, and solubility (Flatt), A., ii, 538.
  relation between Young's modulus and (Portevin), A., ii, 741.
  molecular, in relation to refractive index (Lorenz and Herz), A., ii, 801.
Volution and nucleic acid in yeast (Glaubitz), A., i, 986.

W.

Wagner-Meerwein transformation, mechanism of (Ingold), T., 1706.
Wagner rearrangement (Ruzicka and Liebl), A., i, 475.
Walden inversion (Phillips), T., 44; (Uspenski), A., i, 664.
Waldenase (Fränkel and Gallia), A, i, 898.
Walnut oil (Matsumoto and Uyeda), A., i, 521.
Water, structure of molecules of (Langmuir), A., ii, 21.
  variation of the refractive index of, with temperature (Hall and Payne), A., ii, 197.
  effect of dissolved substances on the ultra-red absorption spectrum of (Collins), A., ii, 357.
  vapour, ultra-violet spectrum of (Hopfield), A., ii, 1.
  optical constants of (Tear), A., ii, 593.
  electrolytic dissociation of, in salt solutions (Linde), A., ii, 287.
  electrolytic transport of, and its association with ions (Remy), A., ii, 731.
Water, ionisation of, in solutions of electrolytes (Doumer), A., ii, 117.
  vapour, ionising potential of (Mackay), A., ii, 821.
  absorption of, by alumina (Fisher, Faust, and Walden), A., ii, 83.
  adiabatic cooling of, and temperature of its maximum density (Pushin and Grebenshchikov), T., 2717.
  aeration of (Adeney, Leonard, and Richardson), A., ii, 404.
  vapour, catalysis of the interaction of carbon and (Neville and Taylor), A., ii, 24.
    catalytic action of carbon monoxide on (Medsforth), T., 1464.
    equilibrium of, with iron and tungsten and their oxides (Wöhler and Günther), A., ii, 471.
  solubility of glass in (Collins and Riffenburg), A., ii, 83.
  Conductivity water, still for preparation of (Kraus and Dexter), A. ii, 21.
  Natural water:—
  action of, on lead (Thresh), A., ii, 73.
  Potable or drinking water, estimation of carbon dioxide in (Lehmann and Reuss), A., ii, 697.
  Sea water, of the Strait of Georgia, B.C., chlorine, bromine, and iodine in (Cameron), A., ii, 428.
    estimation of magnesium in (Denigès), A., ii, 183.
    estimation of sulphates in, volumetrically (Giral Pereira), A., ii, 178.
  Spring and mineral waters, estimation of carbonates in, in presence of sulphides (Touplain and Dubief), A., ii, 337.
    estimation of iodine in, in presence of sulphides (Dubief), A., ii, 332.
Water analysis:—
  detection of, in milk (Kling and Lassieur), A., ii, 505; (Castellani), A., ii, 512.
  detection of nitrites in (Rodillon), A., ii, 37, 178.
  estimation of ethyl alcohol in (Kolthoff), A., ii, 248.
  estimation of oxygen and nitrogen in (Becker and Abbott), A., ii, 784.
  estimation of silicon dioxide in (Diénert and Wandenbulcke), A., ii, 507.
Weights, molecular, determination of (Rast), A., ii, 312.
  determination of, in solution (Jablczyński), A., ii, 535.

(o-*Xylene*, *Me* : *Me* = 1:2 ; m-*xylene*, *Me* : *Me* = 1:3 ; p-*xylene*, *Me* : *Me* = 1:4.)

Weights, molecular, determination of, in a melting-point apparatus (RAST), A., ii, 57.
  of liquids, determination of, by the camphor method (HOUBEN), A., ii, 735.
    calculation of, from critical data (HERZ), A., ii, 742.
  of β-alkyl glucosides (COLIN and CHAUDUN), A., i, 897.
Welsium (EDER), A., ii, 47.
Wheat, amino-acids and polypeptides in the ungerminated kernels of (JODIDI and MARKLEY), A., i, 1164.
  barley and oats, effect of respiration on the amount of protein in (McGINNIS and TAYLOR), A., i, 1164.
  genesis of carbohydrates in (COLIN and BELVAL), A., i, 282.
  carbohydrate in grains of (COLIN and BELVAL), A., i, 1044.
  effect of lactic acid on respiration of (SMITH), A., i, 1270.
  nitrogen content of (OLSON), A., i, 1164.
Wheat flour, hemicellulose of (CLAYSON and SCHRYVER), A., i, 1066.
Wines, estimation of aldehydes and volatile acids in (ESTALELLA), A., i, 882.
  estimation of volatile acids in (MALVEZIN), A., ii, 589.
Wogonin, and its derivatives, from *Scutellaria baicalensis* (SHIBATA, IWATA, and NAKAMURA), A., i, 592.
Wolfram, estimation of tin in (LABATTI), T., 1409.
Wood, hydrolysis of (HEUSER, ZEH, and ASCHAN), A., i, 196.
  fossil, constituents of (KOMATSU and UEDA), A., i, 1274.
  Karafuto, constituents of (NAKAMURA), A., i, 1046.
Wood spirit oil, constituents of (PRINGSHEIM and LEIBOWITZ), A., i, 1052.
Wool, adsorption of colouring matters by (REINMUTH and GORDON), A., ii, 616.
  hydrolysis of (MARCHLEWSKI and NOWOTNÓWNA), A., i, 870.

X

X-rays. See Rays, Röntgen.
Xanthic acid, cellulose ester (WOLFFENSTEIN and OESER), A., i, 541.
Xanthone, *tetra*hydroxy-, lead salt (WIECHOWSKI), A., i, 591.
Xanthosine, action of diazomethane on (LEVENE), A., i, 611.
Xanthoxylum acanthopodium, alatum, and *Budrunga,* essential oils from (SIMONSEN and RAU), A., i, 48.
Xanthylallantoic acid, potassium salt (FOSSE and HIEULLE), A., i, 938.
Xanthylallantoin (FOSSE and HIEULLE), A., i, 860, 938.
Xanthylantipyrine, detection of (FABRE), A., ii, 99.
Xanthylcarbamido*iso*hexoic acid, ethyl ester (FOSSE, HAGÈNE, and DUBOIS), A., i, 938
Xanthyl*iso*fenchyl alcohol, amides of (NAMETKIN and RUSHENCEVA), A., i, 692.
Xanthylhydantoic acid, ethyl ester, amide, and potassium salt (FOSSE, HAGÈNE, and DUBOIS), A., i, 938.
Xanthylium chloride, 1:3:6:8-*tetra*hydroxy- (PRATT and ROBINSON), T., 740.
"**Xanthylsaccharin**" (FABRE), A., i, 852.
Xenon, red spectrum of (SOMMER), A., ii, 352.
  Rontgen ray spectrum of (DE BROGLIE and LEPAPE ; LEPAPE and DAUVILLIER), A., ii, 518.
Xylan, constitution of (KOMATSU, INOUE, and NAKAI), A., i, 1181.
  hydrolysis of (HEUSER and BRUNNER), A., i, 184.
  hydrolysis and oxidation of, with nitric acid (HEUSER and JAYME), A., i, 1061.
  from straw cellulose (HEUSER and BRADEN), A., i, 183.
  acetyl derivatives of (HEUSER and SCHLOSSER), A., i, 184.
Xylene, non-volatile residue from heating of (DEKKER), A., i, 1189.
m-**Xylene,** molecular compound of hydrogen bromide and (MAASS, BOOMER, and MORRISON), A., i, 769.
m-**Xylene,** *di*nitro-derivatives, reactions of, and 2:4-*di*nitro-6-amino-, and its derivatives (IBBOTSON and KENNER), T., 1267.
p-**Xylene,** 5-bromo-2-amino-, hydrobromide and 2-acetyl derivative (WHEELER and CONSTABLE), A., i, 1026.
Xylenes, ultra-violet absorption spectra of (KLINGSTEDT), A., ii, 48.
  separation of (CLARKE and TAYLOR), A., i, 451.
Xylenes,*di*cyano- (DE DIESBACH, PERRIG, BETSCHART, and STREBEL), A., i, 805.
Xylenesulphonmethylamide, preparation of (BADER and NIGHTENGALE), A., i, 317.

(o-*Xylene*, *Me*:*Me* = 1:2; m-*xylene*, *Me*:*Me* = 1:3; p-*xylene*, *Me*:*Me* = 1:4.)

s-*m*-**Xylenol,** chloro- and chlorobromo derivatives, and their sulphides (Lesser and Gad), A., i, 563.

o-**Xylenols,** chloro- (Hinkel, Collins, and Ayling), T., 2968.

Xylenol-blue, bromo-, as an indicator (Cohen), A., ii, 779.

p-**Xylic acid,** sulphonation of (Coffey), A., i, 1218.

s-*m*-**Xylidine,** 4-nitro-, and its acetyl derivative (Ibbotson and Kenner), T., 1266.
 5-nitro-, and its acetyl derivative (Ibbotson and Kenner), T., 1268.

4:4-*o*-Xylil (Coffey), A., i, 696.

Xylose structure of (Hirst and Purves), T., 1352.
 preparation of (Harding), A., i, 898.
 preparation of, from maize cobs (Ling and Nanji), T., 620.
 fermentation of, by bacteria (Fred, Peterson, and Anderson), A., i, 1157.
 sec.-butylidene ethers (Svanberg and Sjöberg), A., i, 754.
 fluorotriacetyl derivative (Brauns), A., i, 441.
 *iso*propylidene compounds of (Svanberg and Sjöberg), A., i, 540.
 *iso*propylidene *sec.*-butylidene ethers (Svanberg and Sjöberg), A., i, 754.

Xylo-trimethoxyglutaric acid, and its methyl ester and diamide (Hirst and Purves), T., 1358.

1-*m*-Xyloyl-9-oxanthronyl (Scholl, Dehnert, and Semp), A., i, 808.

m-**Xylyl 1-anthraquinonyl ketone** (Scholl, Dehnert, and Semp), A., i, 808.

2′-*p*-Xylylazo-β-naphthol, 1:5′-bromo- (Wheeler and Constable), A., i, 1027.

m-**Xylylene*di*thioglycol** diphenyl ether (Reindel and Siegel), A., i, 917.

m-**Xylylenyl** diphenyl ethers (Reindel and Siegel), A., i, 916.

Xylylindanylamine (Courtot and Dondelinger), A., i, 1090.

p-**Xylyl-β-phenylethylamine,** and its hydrochloride (v. Braun, Blessing, and Zobel), A., i, 1089.

m-**4-Xylylthiocarbimide** (Dains, Brewster, and Olander), A., i, 324.

β-*m*-**Xylylthiolpropionic acid** (Krollpfeiffer and Schultze), A., i, 1114.

Y.

Yeast, autofermentation of (v. Euler and Myrbäck), A., i, 517, 1042.
 fermentation of amino-acids by (Kurono), A., i, 423.
 fermentation of pyruvic acid by (Neuberg and v. May), A., i, 1158; (Gottschalk), A., i, 1159.
 selective fermentation of various sugars by (Sobotka), A., i, 75.
 effect of iodine on autolysis of (Neuberg and v. May), A., i, 1158.
 respiration of cells of (Rona and Grassheim), A., i, 423.
 coagulative enzymes of (Nastukov and Piatnicki), A., i, 633.
 ergosterol in (Windaus and Grosskopf), A., i, 75.
 influence of oxygen on the activity of (Lundin), A., i, 1268.
 action of, on acetaldehyde and pyruvic acid (Lieben), A., i, 424.
 action of, on calcium lactate (Kayser), A., i, 986.
 action of, on hexoses (Robison), A., i, 86.
 action of, on pyrimidine derivatives (Hahn and Lintzel), A., i, 1269.
 synthesis of vitamin-B by (MacDonald), A., i, 170.
 volutin and nucleic acid in (Glaubnitz), A., i, 986.
 dried, fermentation of sugars by, in presence of phosphates and sulphites (Hemmi), A., i, 736.
 estimation of glycogen in (Mayer), A., ii, 441.

Yeast-cells, alcoholic fermentation with (Abderhalden and Glaubach), A., i, 518; (Abderhalden), A., i, 518, 519; (Abderhalden and Stix), A., i, 519.

Yeast extracts, effect of, in diabetes (Winter and Smith), A., i, 982.

Yeast-nucleic acid, hydrolysis of (Levene), A., i, 399.
 action of alkalis on (Steudel and Nakagawa), A., i, 720.
 nucleotides from (Jones and Perkins), A., i, 720.

Yeast-nucleic acids (Steudel and Peiser), A., i, 720.

Yew. See *Taxus baccata.*

Yohimbic acid, esters of (Field), T., 3003.
 sulphuric ester (Barger and Field), T., 1041.

*apo***Yohimbic acid,** and its hydrochloride (Barger and Field), T., 1041.

Yohimbine (Barger and Field), T., 1038; (Field), T., 3003.

*apo***Yohimbine,** and its hydrochloride (Barger and Field), T., 1040.

Young's modulus, relation between atomic volume and (PORTEVIN), A., ii, 741.

Z.

Zein, amino-acids of (DAKIN), A., i, 1243.

Zeolites, analyses of (SCURTI), A., i, 1047.

Zinc, spectrum of (CATALÁN), A., ii, 710; (WOOD); A., ii, 805.
  positive-ray analysis of (DEMPSTER), A., ii, 418, 805.
  allotropy of (LOSANA), A., ii, 763.
  isotopes of (EGERTON), A., ii, 28; (EGERTON and LEE), A., ii, 490.
  equilibrium in the system, aluminium, magnesium, silicon, and (SANDER and MEISSNER), A., ii, 641.
  content of marine animals (SEVERY), A., i, 415.
  content of, in the organism and in certain organs (BERTRAND and VLADESCO), A., i, 630.
  in tumour tissues (CRISTOL), A., i, 512.

Zinc alloys with aluminium (FEDOROV), A., ii, 422.
  with aluminium and tin (CREPAZ), A., ii, 641; (LOSANA and CAROZZI), A., ii, 766.
  with antimony (SAUERWALD), A., ii, 172.
  with antimony and bismuth, electrochemistry of (KREMANN, LANGBAUER, and RAUCH), A., ii, 825.
  with bismuth and tin (MUZAFFAR), T., 2341.
  with cadmium, vapour pressure of (EGERTON and RALEIGH), T., 3024.
  with copper, vapour tension of (GUILLET and BALLAY), A., ii, 74.
  with tin (CREPAZ), A., ii, 323.

Zinc salts, reaction of hydrogen on solutions of (IPATIEV and STARYNKEVITSCH), A., ii, 639.

Zinc chlorite (LEVI and CIPOLLONE), A., ii, 492.
  iodide, heat of formation and free energy of (WEBB), A., ii, 461.
  nitride, preparation of (BENTLY and STERN), A., ii, 28.
  oxide, luminescence of, above red heat (NICHOLS), A., ii, 2.
    decomposition tensions of mixtures of sodium hydroxide and (ROLLA and SALANI), A., ii, 54.
  sulphate, electrolysis of, in presence of colloids (IZGARYSCHEV and TITOV; IZGARYSCHEV), A., ii, 371.

Zinc sulphate, purification of solutions of, with mercury (FIELD and HARRIS), A., ii, 764.
  sulphide, influence of light on (LENARD), A., ii, 109; (MAAS and KEMPF), A., ii, 491; (SCHLEEDE, HERTER, and KORDATZKI), A., ii, 813.
    phosphorescent (SCHMIDT), A., ii, 73; (TIEDE and SCHLEEDE), A., ii, 242; (GUNTZ), A., ii, 674.
    action of red and infra-red radiation on photo-luminescence of (CURIE), A., ii, 812.
    photochemical reduction of (JOB and EMSCHWILLER), A., ii, 600.
    action of sulphur dioxide on (WÖHLER, MARTIN, and SCHMIDT), A., ii, 852.
    oxidation of, by micro-organisms (RUDOLFS and HELBRONNER), A., i, 423.

Zinc organic compounds, syntheses by means of (BLAISE), A., i, 181, 538.
  acetylide (DURAND), A., i, 449.
  ethyl, electrolysis of (HEIN), A., i, 98.
    action of acetylene on (DURAND), A., i, 449.
  dibenzylamine and pyridine sulphates (SPACU and RIPAN), A., i, 833.

Zinc detection, estimation, and separation:—
  precipitation of, by copper sulphide (KOLTHOFF and VAN DIJK), A., ii, 39.
  detection of (SPACU), A., ii, 699.
  estimation of (SCHERINGA), A., ii, 185; (SPACU and RIPAN), A., ii, 879.
  estimation of, electrometrically (MÜLLER and ADAM), A., ii, 260.
  estimation of, gravimetrically (SPACU), A., ii, 580.
  estimation of, by Schaffner's method (BOY), A., ii, 791.
  estimation of, as sulphate (HILLEBRAND), A., ii, 791.
  estimation of, electrometrically, in presence of cadmium (MÜLLER), A., ii, 879.
  estimation of, in presence of carbon (KAHLBAUM), A., ii, 879.
  estimation of, in gelatin (MEHURIN), A., ii, 891.
  estimation of, in minerals (OLIVIER), A., ii, 259.
  estimation of, in presence of lead (MÜLLER and GÄBLER), A., ii, 90.
  estimation and separation of (ARTMANN; ARTMANN and HARTMANN), A., ii, 89.

Zinc, separation of cadmium and, electrolytically (SALANI), A., ii, 508.
separation of, from magnesium, calcium, and aluminium (HAHN, DORNAUF, and OTTO), A., ii, 39.
Zinc blende. See Blende.
Zinc ores, fusion of, with sodium peroxide (STERNBERG), A., ii, 40.
Zirconium, crystal structure of (HULL), A., ii, 32.
Zirconium *di-*, *tri-*, and *tetra*-chlorides, reduction of (RUFF and WALLSTEIN), A., ii, 868.
Zirconium *tetra*chloride, reaction of acetylene and methane with (VENABLE and DEITZ), A., ii, 170.
oxide, preparation of (v. SIEMENS and ZANDER), A., ii, 170.
*di*oxide, purification and analysis of (JACKSON and SHAW), A., ii, 170.
Zirconium, estimation and separation of (HEADDEN), A., ii, 93.
Zirconium ores, hafnium content of (HEVESY and JANTZEN), T., 3218.
Zirkite (THOMPSON), A., ii, 79.

INDEX TO PATENTS.

Austrian Patents.
86131, A., i, 30
88673, A., i, 941
British Patents.
169185, A., i, 18

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, January 18th, 1923, at 8 p.m., SIR JAMES WALKER, D.Sc., F.R.S., President, in the Chair.

The President referred to the loss sustained by the Society, through death, of the following Fellows:

	Elected.	Died.
Georg Lunge (Honorary Fellow)	March 4th, 1909.	Jan. 3rd, 1923.
Alfred Edward Carey	Feb. 16th, 1888.	Dec. 30th, 1922.
Robert George Grimwood	May 4th, 1893.	Dec. 24th, 1922.
William Alfred Squance	Feb. 17th, 1921.	Dec. 9th, 1922.
John Robert Tustin	Feb. 2nd, 1871.	Dec. 24th, 1922.
Frank Edwin Weston	June 16th, 1898.	Jan. 4th, 1923.

The PRESIDENT announced:

That the following vacant places fall due to be filled at the Annual General Meeting on March 22nd, 1923, in accordance with the Bye-Laws:

President	One vacancy.
Vice-Presidents who have filled the office of President	Two vacancies.
Vice-Presidents who have not filled the office of President	Three vacancies.
Treasurer	One vacancy.

Ordinary Members of Council:

(*a*) Town Members (*i.e.* those living within a radius of 50 miles from London)	Three vacancies.
(*b*) Country Members (*i.e.* those living beyond a radius of 50 miles from London)	Three vacancies.

The Council has nominated Prof. W. P. Wynne to the office of President.

It has also nominated Prof. J. F. Thorpe to the office of Treasurer.

The names of the Members of Council who retire at the Annual General Meeting on the 22nd March, 1923, and who are ineligible for re-election to the same office until the lapse of one year, are as follows :

President :
Sir James Walker.

Vice-Presidents who have filled the office of President :
Prof. H. E. Armstrong, Prof. W. H. Perkin.

Vice-Presidents who have not filled the office of President :
Prof. F. S. Kipping, Prof. S. Smiles.

Ordinary Members of Council :
(*a*) Town Members :
Prof. A. J. Allmand, Mr. F. H. Carr, Prof. J. M. Thomson.
(*b*) Country Members :
Prof. T. S. Patterson, Mr. W. Rintoul, Prof. R. Robinson.

Messrs. L. Bains, J. W. Farmery, and C. A. Silberrad were formally admitted Fellows of the Chemical Society.

Certificates were read for the first time in favour of :

William Bennett Adam, B.A., Belcaro, Enfield, Middlesex.
Alfred Berthoud, The University, Neuchâtel, Switzerland.
Ernest Alfred Blench, 74, Squires Lane, Finchley, N.3.
Joseph Cofman-Nicoresti, 16, Crediton Hill, N.W.6.
Augustine Malcolm Manhkram David, B.Sc., Murray College, Sialkote, India.
John Norman Dean, B.Sc., A.I.C., Goodbury, Kemsing, Sevenoaks.
Albert Edward Gray, 23, Gauden Road, Clapham, S.W.4.
Laurence Horton, B.Sc., A.R.C.S., 45, Steade Road, Sheffield.
Joseph Kenneth Marsh, M.Sc., 28, Lansdowne Road, Belfast.
Dhirendra Nath Mukerji, M.Sc., 1, Gobinda Bose Lane, Bhowanipore, Calcutta.
George Alan Redfern, B.A., 44, Talbot Road, Highgate, N. 6.
Andreas Smits, The University, Nieuwe Prinsengracht 126, Amsterdam.
John Smeath Thomas, D.Sc., 179, Kingsley Road, Liverpool.
John Thompson, 20, Marchmont Road, Edinburgh.
Hubert William Thorp, B.Sc., 92, Queen's Road, Dalston, E. 8.

A Certificate has been authorised by the Council for presentation to ballot under Bye-Law I (2) in favour of :

Clinton N. Laird, M.A., Canton Christian College, Canton, China.

The following papers were read :

"The estimation of acetone in methyl alcohol and the purification of methyl alcohol by sodium hypoiodite." By H. H. BATES, L. M. MULLALY, and H. B. HARTLEY.

"Rhythmic crystallisation." By W. E. GARNER and F. C. RANDALL.

"The densities of dilute solutions of potassium salts and the volume changes occurring on solution." By H. B. Hartley and W. H. Barrett.

"The chemistry of the glutaconic acids. Part XIV. Three-carbon tautomerism in the *cyclo*propane series. (Addendum)." By F. R. Goss, C. K. Ingold, and J. F. Thorpe.

LECTURE.

On Thursday, February 22nd, 1923, at 8 p.m., in the Lecture Hall of the Institution of Mechanical Engineers, Storey's Gate, S.W.1., Principal J. C. Irvine, C.B.E., F.R.S., will deliver his Lecture entitled "Some Constitutional Problems of Carbohydrate Chemistry."

THE PATERNÒ MEDAL.

A Committee has been formed at Rome to celebrate the 75th birthday of Professor Emanuele Paternò, the well-known Italian Chemist, who is one of the Honorary Fellows of this Society. It is proposed to institute a Paternò Medal to be awarded annually to the chemist in Italy or elsewhere who makes the most important discovery of the year. Subscriptions towards the institution of this medal will be welcomed, and any British contributions can be forwarded through the Treasurer of the Chemical Society.

List of Papers received between December 22nd, 1922, and January 18th, 1923:

"The estimation of acetone in methyl alcohol and the purification of methyl alcohol by sodium hypoiodite." By H. H. Bates, L. M. Mullaly, and H. B. Hartley.

"Derivatives of semioxamazide. Part I. Ketonic semioxamazones." By F. J. Wilson and E. C. Pickering.

"The constitution of catechin. Part V. The conversion of acacatechin tetramethyl ether into the tetramethyl ether of high-melting catechin." By M. Nierenstein.

"On interfacial tensions." By J. R. Pound.

"Studies in the anthracene series. Part IV." By E. de B. Barnett and M. A. Matthews.

"The formation of quaternary ammonium salts. Part I." By E. de B. Barnett, J. W. Cook, and E. P. Driscoll.

"Action of sulphur monochloride on mercaptans." By G. C. Chakravarti.

"The electromotive behaviour of magnesium." By A. Smits.

"Determination of the *iso*electric point of gelatin. A criticism of Patten and Kellem's method." By T. S. PRICE.

"Note on the supposed enantiotropy of lead monoxide." By S. GLASSTONE.

"Researches on *pseudo*-bases. Part IV. A new synthesis of tertiary amines of the form $R \cdot CH_2 \cdot NR^1R^2$." By G. M. ROBINSON and R. ROBINSON.

"An electrolytic method for the preparation of mercury dimethyl." By J. L. MAYNARD and H. C. HOWARD.

"The constituents of Indian turpentine from *Pinus longifolia*, Rox. Part II." By J. L. SIMONSEN and M. G. RAU.

"Rhythmic crystallisation." By W. E. GARNER and F. C. RANDALL.

"The isotope ratio of a sample of chlorine of volcanic origin." By A. D. MONRO.

"The densities of dilute solutions of potassium salts and the volume changes occurring on solution." By H. B. HARTLEY and W. H. BARRETT.

"The system chromium trioxide–nitric acid-water." By S. A. MUMFORD and L. F. GILBERT.

"A new sesquiterpene and other substances in the essential oil of Manuka (*Leptospermum scoparium*)." By R. GARDNER.

"Some factors governing the complete sorption of iodine by carbon from solution." By J. B. FIRTH and F. S. WATSON.

"The chemistry of the glutaconic acids. Part XIV. Three-carbon tautomerism in the *cyclo*propane series. (Addendum)." By F. R. GOSS, C. K. INGOLD, and J. F. THORPE.

"Rotatory dispersion of the esters of lactic acid. Part I. Normal esters." By C. E. WOOD, J. E. SUCH, and F. SCARF.

"Studies in the chroman series. Part II." By H. F. DEAN, A. I. M. KAHIL, and M. NIERENSTEIN.

"The constitution of catechin. Part VI." By H. F. DEAN and M. NIERENSTEIN.

"Preparation of hydrazine by the Raschig reaction." By R. A. JOYNER.

"The configuration of the doubly linked tervalent nitrogen atom. The resolution of the pyridylhydrazone of *cyclo*hexenedithiocarbonate." By W. H. MILLS and H. SCHINDLER.

"Perhalides of quaternary ammonium salts." By F. D. CHATTAWAY and G. HOYLE.

"The tautomerism of amidines. Part I. 2 : 4- and 2 : 5-Diphenylglyoxalines." By R. BURTLES and F. L. PYMAN.

"The tautomerism of amidines. Part II. The alkylation of open-chain amidines." By F. L. PYMAN.

CERTIFICATES OF CANDIDATES FOR ELECTION AT THE BALLOT TO BE HELD AT THE ORDINARY SCIENTIFIC MEETING ON THURSDAY, FEBRUARY 15TH, 1923.

N.B.—The names of those who sign from " General Knowledge " are printed in *italics*.

Adam, William Bennett, " Belcaro," Enfield, Middlesex. Scottish. On technical staff of Messrs. J. S. Fry & Sons, Ltd., Bristol, and engaged on chemical research at Bristol University. B.A. (Cantab.), Natural Sciences Tripos, Parts I and II (Chemistry). (*Signed by*) W. H. Mills, Eric K. Rideal, Charles T. Heycock.

Alexander, George James, 1, Terrace Road, Upton Manor, London, E.13. British. Chemical Student. B.Sc. (London), Honours Chemistry. (*Signed by*) J. R. Partington, W. H. Patterson, Frank W. Bury.

Attwood, Arthur John, 11, Frederick Crescent, S.W.9. British. Student (Royal College of Science). Present position, Associate of, and Research Student at, the Royal College of Science, London, in the department of Chemistry. (*Signed by*) James C. Philip, C. K. Ingold, H. L. Howard.

Bailey, Kenneth Claude, 137, South Circular Road, Dublin. British. Lecturer in Exptl. Science, Trinity College, Dublin. B.A. (Hons.) in Exptl. Science, and M.A. (T.C.D.). Paper on " La Synthèse Directe de l'Urée à partir de l'Ammoniaque et du Gaz Carbonique " in the " Comptes Rendus de l'Académie des Sciences," July, 1922. (*Signed by*) Sydney Young, Emil A. Werner, A. G. G. Leonard.

Berthoud, Alfred, Neuchâtel, Suisse. Suisse. Professeur de Chimie physique à l'Université de Neuchâtel. Principaux travaux originaux, concernent la thermo dynamique dans ses applications aux vitenes des reactions chimiques, et les propriétés des fluides. Ouvrages : La Constitution des atomes ; Les Nouvelles conceptions de la Matière et de l'atome. (*Signed by*) William J. Pope, T. Martin Lowry, Henry E. Armstrong.

Blench, Ernest Alfred, 74, Squires Lane, Finchley, N.3. English. Chemistry Student desiring to become Research Chemist. Engaged in Research on Carbon–Oxygen Adsorption. Have held position of Junior Analyst at Borax Consolidated, Ltd., and British Drug Houses, Ltd. (*Signed by*) J. N. Collie, F. G. Donnan, W. E. Garner.

Bousfield, John Southwell, 2, Lyndale, Child's Hill, London, N.W.2. Schoolmaster. A.R.C.S. Chemistry, 1921, 2nd Class. Served in army 1914–1919. Teaching 1922– (Rugby school, Jan.–Aug., 1922). (*Signed by*) H. B. Baker, James C. Philip, H. F. Harwood.

Bradshaw, Frederick, 78, Rothbury Terrace, Heaton, Newcastle-on-Tyne. British. Librarian and University Lecturer. M.A. (Oxford), D.Sc. (London). I desire to consult and keep abreast of recent chemical literature. (*Signed by*) W. N. Haworth, J. A. Smythe, H. V. A. Briscoe.

Broughton, Charles Crossley Mann, 2, Upton Road, Bexley Heath, Kent. British. Research student at Royal College of Science, S.W.7. B.Sc. Hons., Lond. (*Signed by*) Jocelyn Thorpe, C. K. Ingold, M. A. Whiteley.

Buckley, Harold Eugene, 273, Wigan Road, Bolton. British. Assistant Lecturer in Crystallography at Manchester University. B.Sc. (2nd Class

Hons., 1921). Research on "Adsorption" for 12 months, 1921–1922, with Dr. Burt and Mr. Bangham. Dec. 1922, M.Sc. From Sept. 29th, 1922, Assistant Lecturer in Crystallography. (*Signed by*) Henry A. Miers, Arthur Lapworth, H. B. Dixon.

CALLOW, ROBERT KENNETH, 17, Sutherland Street, London, S.W.1. British. Student. Exhibitioner of Christ Church, Oxford. B.Sc. (1st Class Hons. Chemistry), University of London, 1922. Part I, Final Honour School of Natural Science, University of Oxford, 1922. At present engaged in research for Part II. (*Signed by*) W. H. Perkin, N. V. Sidgwick, S. G. P. Plant.

COFMAN-NICORESTI, JOSEPH, 16, Crediton Hill, London, N.W.6. British. Pharmacist. Licentiate in Pharmacy, University of Bucarest (Roumania). Member of the Pharm. Society of Great Britain. Late Analytical Chemist in the Roumanian Army (1894–5). (*Signed by*) Jules Cofman-Nicoresti, Gabriel Cofman-Nicoresti, Hartley Shaw, Gerald H. Martin.

COUTIE, ALEXANDER, 4, Priestfield Road, Edinburgh. Scottish. Research Chemist. Assistant in Department of Chemistry, University of Edinburgh. (*Signed by*) James Walker, Sydney A. Kay, H. Gordon Rule.

COUZENS, LESLIE JOHN, 101, Kensington Avenue, Manor Park, E.12. Assistant Analytical Chemist. Assistant Analytical Chemist to Messrs. Burgoyne, Burbidge & Co., Ltd., East Ham. Student at the Sir John Cass Technical Institute for the Final B.Sc. (Honours Chemistry), University of London (1924). (*Signed by*) W. H. Barker, E. D. Griffiths, W. T. Clough.

COWARD, KATHERINE HOPE, 14, Parliament Hill, N.W.3. Assistant, Physiology (Biochemistry). University College, London University. Joint authorship of several papers on Accessory Food Factors in the *Biochemical Journal*, together with Dr. J. C. Drummond, D.Sc., of University College. M.Sc. of Manchester University. (*Signed by*) J. C. Drummond, K. A. Burke, Irvine Masson.

CRAVEN, ERNEST CECIL, 59, Southern Road, Plaistow, E.13. English. Chemist. Assistant to Dr. W. R. Ormandy, 18, Belsize Grove, N.W.3. 5 years analytical work, India Rubber Gutta Percha and Telegraph Works, Ltd., Silvertown. 2½ years as works and research chemist, U.K. Chem. Products (afterwards H.M. Factory, Sutton Oak). Since 1917 with Dr. Ormandy. Part author of various papers relating to miscibility, combustion, etc. (*Signed by*) W. R. Ormandy, A. E. Dunstan, F. B. Thole, J. S. S. Brame, J. E. Hackford.

DAVID, AUGUSTINE MALCOLM MANHKRAM, Sialkote City, India. Indian. Professor of Chemistry, Murray College, Sialkote City. B.Sc. Punjab. 2 years' teaching experience. Research on essential oils. (*Signed by*) Edwin Theodore Dean, N. A. Yajnik, S. R. Khosla.

DEAN, JOHN NORMAN, Goodbury, Kemsing, Kent. British. Assistant Research Chemist at the Gutta Percha Company, London. B.Sc. (Hons. Chemistry), King's College, Lond., Oct., 1921. A.I.C., March, 1922. (*Signed by*) Claude S. Grace, A. J. Allmand, H. W. Cremer, Samuel Smiles.

DUFF, JAMES COOPER, 13, Queen's Rd., Erdington, Birmingham. British. Lecturer, Chemistry Dept., Birmingham Technical School. M.Sc. (Manc.), F.I.C. 5 years' chemical works experience. 8 years a Lecturer on Chemistry. Author of four papers on Cobaltammines and one paper on Dimethylindigotin, all published in Trans. Chemical Society. (*Signed by*) J. Newton Friend, T. Slater Price, Harry Berry.

EARLE, ALLAN ROBERT, 90, Shadwell Rd., Portsmouth. English. Student, King's College, Cambridge. Passed Part I Natural Science Tripos (2nd Cl.)

in Chemistry, Physics, and Mineralogy. Reading for Part II in Chemistry. (*Signed by*) Eric K. Rideal, Hamilton McCombie, Harold A. Scarborough.

Fenton, Samuel Gray, 27, Somerset Rd., Harrow, Middx. Pharmacist. Dispenser to John M. Pletts, M.D., L.S.A. Admiralty Surgeon and Agent, Ryde, I.W., 3 years. Senior Assistant to E. Boussin, Pharmacien, Dinard, France, 2 years. Student of Pharmacy, London Temperance Hospital, 2 years. Student of H. Wootton, B.Sc. Lond., London College, Clapham, S.W., 2 years. Student of the late Col. E. F. Harrison, Anti-Gas Dept., War Office, 1½ years. Qualified as Pharmacist, Examination of the Pharmaceutial Society of Great Britain, July 15th, 1905. Works Chemist to Messrs. Bush & Co., Manufacturing Chemists, London, W., 3 years. Member of the Pharmaceutial Society. Pharmacist, War Office Technical Staff, Army Medical Service, Whitehall, S.W., 3 years. (*Signed by*) Frank Radcliffe, Gabriel Cofman-Nicoresti, Stanley J. Peachey.

Fisk, Phillip Marcus, 92, Aldborough Rd., Seven Kings, Essex. Chemical Student. Associate of Finsbury Technical College (A.C.G.F.C.). Inter. Science (Lond.). (*Signed by*) M. A. Whiteley, W. S. Norris, F. R. Goss.

Giles, John Kenneth, Hillcrest, Arkley, Barnet. British. Research Student. B.Sc., Lond. Engaged on research on Physical Chemistry at King's College, Lond. (*Signed by*) A. J. Allmand, C. S. Salmon, H. W. Cremer.

Graham, Thomas, 47, Canada Rd., Cardiff. Analytical Chemist. Chief Chemist to F. Campbell Harry & Co., Cardiff, for several years past and to date. Formerly Assistant Chemist with Messrs. Harry Dougall & Co., Maryport, Cumberland. (*Signed by*) Geo. R. Thompson, H. E. Cox, J. Groves, Pattinson B. Melmore, R. W. Atkinson.

Gray, Albert Edward, 23, Gauden Rd., Clapham, London, S.W.4. British. Pharmacist with analytical experience. Appointed works chemist to the Fibrous Paper and By-products, Ltd,, a company shortly to be formed for paper manufacture and by-products of methyl alcohol, acetone, etc., from reeds by the Dinman process. (*Signed by*) Alfred Thomas, Charles Alexander McKerrow, F. C. Ray, A. Houssa.

Griffiths, John Preedy, 15, Hazelwood Lane, Palmers Green, N.13. British. Student (Research, Royal College of Science. London). A.R.C.S. (Lond.). B.Sc. Hons., Chemistry (Lond.). Organic Research, Royal College of Science, London. (*Signed by*) Jocelyn Thorpe, C. K. Ingold, H. J. T. Ellingham.

Harris, Leslie Julius, B.Sc., 18, The Park, Ealing, London, W.5. British. Research worker in Biochemistry, Cambridge University. "Analyst," XLIII, **508**, 263 *et seq.*; **511**, 345–8; **512**, 375–8; XLIV, **515**, 43–6; **521**, 314–318, and papers in other chemical journals. (*Signed by*) F. Gowland Hopkins, O. Rhys Howell, J. H. Quastel.

Harrison, Thomas Arthur, 64, Eastwood Road, Goodmayes, Essex. British. Chemist (Analytical and Consulting), Fertilisers and Disinfectants. Director, Whaller's Sanitary Fluid Co. Passed major examination Pharmaceutical Society. (*Signed by*) Charles S. Roy, Thomas D. Morson, Arthur E. Pitt.

Hewitt, Leslie Frank, 8, Maze Rd., Kew, Surrey. British. Research Student. Bachelor of Science, with First Class Honours in Chemistry, of the University of London; Associate of the Institute of Chemistry. (*Signed by*) Robert H. Pickard, J. Kenyon, Harold Hunter.

Horton, Laurence, 45, Steade Road, Sheffield. British. Chemistry Research Student. A.R.C.S. (1st Class). B.Sc. Hons. (1st Class), London.

One year as Assistant Chemist with A. H. Allen & Partners, Public Analysts, Sheffield. (*Signed by*) C. K. Ingold, M. A. Whiteley, H. J. T. Ellingham.

Ingham, John, 19, Greyhound Road, Tottenham, N.17. British. Bacteriological Chemist. Student, Technical College, Blackburn. Five years Chemistry and Chemical Technology. Diploma (London, 1918). Pathological Society Certificates. Bacteriological Technique. Pathological Technique. Morbid Secretion Technique. Hæmatological and Serological Technique. At present interested in Biochemistry and Chemistry of Drugs. (*Signed by*) Robert H. Pickard, Geraldine Le Bas, Archibald Knox, J. Kenyon.

Laker, John, 8, Allerton Rd., N.16. British. Research Student in Organic Chemistry at the Royal College of Science. Associate of the Royal College of Science. Hons. B.Sc. (Chem.). (*Signed by*) M. A. Whiteley, James C. Philip, Jocelyn Thorpe.

Linnell, Wilfred Herbert, 12, Highbury, Monkseaton, Whitley Bay. British. Advanced Research Student, Armstrong College, Durham University. 1st Class Honours, B.Sc. Associate of the Institute of Chemistry. Johnston Scholar. Major Diploma of the Pharmaceutical Society. Research experience of one year. (*Signed by*) W. N. Haworth, J. A. Smythe, G. C. Leitch.

Marsh, Joseph Kenneth, 28, Lansdowne Road, Belfast. British. Senior Assistant, Chemical Department, Queen's University, Belfast. M.Sc. (Belfast). (*Signed by*) A. W. Stewart, H. Graham, E. W. McClelland.

Medley, George Arnold, 45, Hill Top Rd., Dalton, Huddersfield. British. Pharmacist. Oleum, analytical, and research laboratories, British Dyestuffs Corp., Ltd., Huddersfield. (*Signed by*) James Bruce, H. H. Gray, L. Gordon Paul.

Mehta, Ramprasad Pitamberdas, Organic Chemistry Dept., University College, London. Indian (Hindu). Research Student for Ph.D., Organic Chemistry. M.A. (Chemistry), Bombay University, 1911. Fellow in Chemistry (1910), St. Xavier's College, Bombay. Asst. Professor of Chemistry, St. Xavier's College, Bombay, 1912–13. 2nd Asst., Rajkumar College, Rajkot (India), since 1914. Acting Professor of Chemistry, Gujarat College, Ahmedabad, 1920–21 (Ag. I.E.S.). (*Signed by*) O. L. Brady, R. C. Ray, W. Pohl.

Miller, Herbert Frederick, Griffith John College, Hankow, China. English. Teacher of Chemistry in above College. Associate of the Institute of Chemistry (July 1922). B.Sc. (Hons. 2nd Class), 1922. Honours Course 3 years, Birkbeck College, London. (*Signed by*) George Senter, Arthur J. Chapman, S. Sugden.

Mukerji, Dhirendra Nath, 1, Gobinda Bose Lane, Bhowanipore, Calcutta, India. Superintendent of Excise and Salt, Bengal, in charge of Distilleries, Warehouses, and Laboratories. (1) Obtained the M.Sc. degree of the Calcutta University in Chemistry in 1916 with First Class Honours, standing first in order of merit. (2) Author of (*a*) Colouring matters from 1 : 2 : 4 : 5-Tetrahydroxybenzene and related substances (*J.C.S.*, T., 1922, **121**, 545); (*b*) Vat Dyes of the Azo Series (ordered for publication in the Transactions of the *J.C.S.*). (*Signed by*) E. R. Watson, R. L. Jenks, R. L. Datta, P. C. Rây.

Murch, William Owen, National Institute for Medical Research, Hampstead, N.W.3. British. Chemical Lab. Assistant. B.Sc. (Lond.). I wish to join in order to receive publications and enjoy use of library, to keep up with current research. (*Signed by*) Harold King, H. W. Dudley, P. C. L. Thorne.

Oliver, James Herbert, 22, Avenue Gardens, Acton, W.3. British. Research Worker. B.Sc. (Lond.). Research Student, Royal College of Science, London. Formerly 1st Assistant Analyst, Olympia Agricultural Coy. Research Station, Offchurch, Leamington. (*Signed by*) Jocelyn Thorpe, E. H. Farmer, F. R. Goss.

Orr, Thomas Workman, Antofagasta, Chile. Scottish. Chemist. Royal Technical College, Glasgow, 1894–97. Research Student, 1897–98. Demonstrator, 1898–99. Since continuously engaged as chemist or manager in S. Africa (1899–1901), assayer and cyaniding, and in Chile (1902–1922); chiefly in connexion with the nitrate industry. Associate of the Institute of Chemistry. (*Signed by*) G. G. Henderson, Thomas Gray, James Roberts.

Osborn, William James, 12, West Square, Southwark, S.E.1. Chemical Assistant. L.C.C., Greenwich Power Station, Greenwich, S.E. Physics, Morley College, 1910–11. Chemistry, Sir John Cass Inst., 1911–13. War service, 1915–1919. Chemistry, Borough Polytechnic, 1920–21. Chemical Assistant, Greenwich Power Station, L.C.C., Greenwich, S.E. Associated Member, London Section, Inst. of Metals. (*Signed by*) J. H. Coste, E. J. Jackman, Arthur J. Chapman.

Patterson, Jocelyn, 106, Market St., St. Andrews, N.B. British. Chemical Research Assistant in University of St. Andrews. B.Sc., 1st Class Hons., Chemistry (Dunelm). M.Sc. (Dunelm). Ph.D. (St. Andrews). Publication, Acetone Derivatives of Glucose and Fructose, Irvine and Patterson, *J.C.S.*, 1922, **121**, 2146. (*Signed by*) J. C. Irvine, R. Robinson, A. Killen Macbeth, E. L. Hirst.

Paxon, Francis James, 30, St. Georges Rd., Palmers Green, N.13. British. Research Student in Organic Chemistry at Royal College of Science. Associate, Royal College of Science. B.Sc. Hons., Lond. (*Signed by*) M. A. Whiteley, Jocelyn Thorpe, C. K. Ingold.

Perren, Edward Arthur, 70, Denton Road, London, N.8. British. Research Student at Imperial College of Science and Technology. Have undertaken research in Organic Chemistry which has been recorded in the Journal of the Society. (*Signed by*) Jocelyn Thorpe, F. W. Helsby, James C. Philip.

Press, Edwin William Stanley, 4, Porchester Sq., Hyde Park, W. Student. With F. J. Lloyd, Agricultural and Consulting Chemist, for two years. Last three years, full time student at Birkbeck College, studying for Honours Degree at University of London and Associateship of Institute of Chemistry. (*Signed by*) George Senter, F. Barrow, S. Sugden, F. J. Thorneycroft, Wm. W. Myddleton, E. J. Warren, A. Hamilton Bateman, F. J. Lloyd.

Pine, Edward Ebenezer, The Haven, Dorman's Park, Surrey. British. Chartered Accountant (not in practice). For the last 20 years I have been greatly interested in chemical theory, and I have recently published a book entitled "Atomic Form" (Longmans, Green & Co.). I am desirous of obtaining the advantage of membership of the Chemical Society in order that I may be able to extend my knowledge of Chemistry by the use of the Society's Library and Journal and by attendance at its meetings. (*Signed by*) E. F. Armstrong, W. G. Ramsay, G. Walter Knox.

Raleigh, Frank Victor (6, Cavendish Rd., Harringay, N.4). Johannesburg, South Africa. British. Student. B.Sc., B.A. (Oxford). (*Signed by*) Alfred C. Egerton, N. V. Sidgwick, Wm. Macnab.

Rana, Tara Chand, III Bridge, Srinagar, Kashmir. Indian. Making preparations for the start of Sulphuric Acid Industry from Gypsum in Kashmir. After taking the B.Sc. degree of the Punjab University, I worked for some time as Assistant to the Chemical Examiner, Jammu and Kashmir State. In 1922 I took the M.Sc. degree of the same University. My subject of special study was "Adsorption of binary mixtures by animal charcoal," on which I have written a paper which was submitted to the University. (*Signed by*) N. A. Yajnik, S. R. Khosla, Edwin Theodore Dean.

RANDALL, HELENA CHARLOTTE, 57, Farnham Road, Guildford, Surrey. British. Science Mistress. A.R.C.S., B.Sc. I am desirous of keeping in touch with chemical literature. (*Signed by*) James C. Philip, H. B. Baker, M. A. Whiteley.

REDFERN, GEORGE ALAN, 44, Talbot Road, Highgate, N.6. Student of Chemistry at the University of Cambridge, proceeding to the profession of Chartered Patent Agent. Passed the examinations in Chemistry and Engineering for the ordinary B.A. degree. (*Signed by*) A. J. Berry, Charles T. Heycock, R. H. Atkinson.

ROBERTSON, JERRY, 38, Church St., Heckmondwike. British. Student for major examination of the Pharmaceutical Society, also F.S.M.C. Diploma. Chemist, minor qualifications of the Pharmaceutical Society. Was employed for 2 years as laboratory assistant with Messrs. Goodhall, Backhouse, Manufacturing Chemists, Leeds. Later, student at the South-Western Polytechnic Institute, Chelsea. (*Signed by*) C. Morton, Francis Arnall, F. H. Lowe, J. B. Coleman.

SANDERS, EDGAR, The White House, Blackwell, Worcs. British. Student of Chemistry, University of Birmingham. Final Chemistry examination for B.Sc. degree. (*Signed by*) G. T. Morgan, C. E. Wood, S. R. Carter, Wm. Wardlaw.

SHOESMITH, JOHN BALDWIN, c/o Dunnill, 10, Spottiswoode Rd., Edinburgh. British. Lecturer in Chemistry, Edinburgh University. Articled pupil, Public Analyst, Burnley, 1913–16. B.Sc. (Chemistry, 1st Class Hons.), Manchester University, 1919. Graduate Scholar, Manc. University, 1919. M.Sc., Manc. University, 1920. Lecturer in Chemistry, Edinburgh University, 1921. Publication, T., 1922, **121**, 1391. (*Signed by*) James Walker, H. Gordon Rule, Sydney A. Kay.

SLOMAN, HEDLEY ARCHIBALD, "Robinhood," Undercliff Gardens, Leigh-on-Sea, Essex. British. Chemist. 1st Class, Part I, Nat. Sci. Tripos, Cambridge, in Chemistry, Physics, and Geology. 2nd Class, Part II, Nat. Sci. Tripos, Cambridge, in Chemistry. Associate of Institute of Chemistry. Desires to use the Library, attend the meetings, and receive the Journal. (*Signed by*) W. J. Pope, C. T. Heycock, W. H. Mills.

SMITS, ANDREAS, The University, Nieuwe Prinsengracht 126, Amsterdam, Holland. Dutch. Director of the Laboratorium Algemeeneen Anorganische Chemie der Universiteit, Amsterdam. Author of several papers in numerous chemical journals. (*Signed by*) James C. Philip, Jocelyn Thorpe, Irvine Masson.

SNELLGROVE, DOUGLAS ROSEBERY, 73, Millbrook Rd., Southampton. British. Research Student. B.Sc. (Hons. Chem., 1st Class). Now a Research Student at Battersea Poly. (*Signed by*) J. Kenyon, J. L. White, A. Houssa.

STARK, ARTHUR ROY, 76, De la Pole Avenue, Hull. British. Cement Works Chemist (chief). 6 years' training Technical College (Chemistry Dept.), Hull. Works experience in analysis of oils, residual meals, water, etc. Experimental work on treatment of coal at various temperatures. Experimental work on effect of various reagents and colours on the setting and hardening of Portland cement and concrete. At present chief chemist at

Messrs. G. & T. Earle, Ltd., Cement Manufacturers. (*Signed by*) Frank S. Wood, T. Luxton, Harry Thompson, Edward Chapman.

TEBBIT, REGINALD ERNEST, 120, Lordship Lane, E. Dulwich, London, S.E.22. English. Student. Graduate of Finsbury Technical College (A.C.G.F.C.) (4th year Student.) I am desirous of attending the meetings and of using the library of the Society. (*Signed by*) Arthur J. Hale, J. E. B. Price, Julius Jung, H. M. Atkinson.

THOMAS, JOHN SMEATH, 179, Kingsley Road, Liverpool. British. Senior Lecturer on Analytical Chemistry, University of Liverpool. D.Sc. (Liverpool). For several years Senior Lecturer on Analytical and Inorganic Chemistry in the University of Liverpool. Recently appointed Professor of Inorganic Chemistry in the University of Cape Town. Contributions to scientific journals. (*Signed by*) E. C. C. Baly, W. C. McC. Lewis, I. M. Heilbron, F. C. Guthrie, Harold Rogerson, Herbert H. Froysell.

THOMPSON, JOHN, 20, Marchmont Road, Edinburgh. Refinery Chemist with Messrs. Burmah Oil Coy., Rangoon. Four years under Dr. Thos. Drinkwater, College of Surgeons, Edinburgh. Two years of this period was in the capacity of demonstrator to D. P. H. Classes. Two years with H.M. Dept. of Explosives, Craigleith. (*Signed by*) Francis Arnall, L. Beaumont Tansley, F. H. Lowe.

THORP, HUBERT WILLIAM, 92, Queen's Road, Dalston, London, E.8. British. Assistant Research Chemist. Student, University College, London, Oct. 1919–Nov. 1921. Obtained B.Sc. degree, London University, Nov. 1921. (*Signed by*) T. J. Drakeley, G. J. Avey, Raymond R. Butler.

TIDESWELL, FREDERICK VINCENT, Department of Fuel Technology, The University, St. George's Square, Sheffield. British. Research Chemist, Mines Department Experimental Station, Department of Fuel Technology, The University, Sheffield. M.Sc. (Vict.), 1917. "The Constitution of Coal in relation to its Spontaneous Combustion," *Proc. S.W. Inst. Engineers*, 1920, **36**, i, 183. "A recent theory of Coking," *Fuel*, 1922, **1**, vi, 101. Joint author of following : "A chemical investigation of banded bituminous coal. Studies in the composition of coal," T., 1919, **115**, 619; "The oxidation of coal," T., 1919, **115**, 895; "The oxidation of the ingredients of banded bituminous coal. Studies in the composition of coal," T., 1920, **117**, 794; "On Dopplerite. Studies in the composition of coal," T., 1922, **121**, 2345. (*Signed by*) R. V. Wheeler, W. Payman, W. A. Batley.

TONG, ERIC WILFRED, Hollingbourne, Maidstone, Kent. English. Science Master in Secondary School. As a student of Chemistry at the Royal College of Science, London, 1919–1921. Associate of Royal College of Science (A.R.C.S.), 1921. B.Sc. (Hons.), 1st Class, Chemistry, London University, 1922. (*Signed by*) James C. Philip, H. F. Harwood, M. A. Whiteley.

TRITTON, FREDERIC JENNER, 1 Vicarage Mansions, West Green, N.15. English. Chemist, just finished degree course. Pupil assistant to Mr. W. C. Young, F.I.C. Public Analyst for six months. Analyst at Messrs. T. Morson and Sons, Ltd., Ponders End, for 15 months. B.Sc. (Lond.), Honours Chemistry, 2nd Class. (*Signed by*) Samuel Smiles, J. Huck, A. J. Allmand, Arthur Fairbourne.

VANDERSTICHELE, PAULE LAURE, Bedford College, Regent's Park, London, N.W.1. Belgian. Demonstrator in Organic Chemistry at Bedford College. M.Sc. (London). Teaching experience : Demonstrator in Chemistry at Bedford College (1917–1922). Recognised teacher of the University of London for 1922–1923. Publication : The use of $\alpha\beta$-dichlorovinylethylether for the preparation of chloroacetates and acid chlorides (Crompton and Vanderstichele, *J.C.S.*, April 1920). The molecular refractions of chloro-, dichloro-, and chlorobromo-acetates. Thesis for the London M.Sc. examination presented May 1922. (*Signed by*) H. Crompton, J. F. Spencer, P. V. McKie, M. S. Crewdson.

Weaver, Stanley Douglas, 27, Hastings Road, Maidstone. British. Research Student in Organic Chemistry at the Royal College of Science. Associate of the Royal College of Science. B.Sc. (Honours), to be awarded on completion of third years' study. (*Signed by*) M. A. Whiteley, C. K. Ingold, James C. Philip.

Williams, Montague, Cleveland Cottage, The Grove, Isleworth. English. At present, none. B.Sc. degree, London, 1922. 1st Class Honours in Chemistry. [Trained at University College, Reading.] (*Signed by*) H. Bassett, J. W. Dodgson, D. Roy Maxted, Reginald G. Durrant.

Williams, Thomas Arthur, Ridgeway House, Mill Hill, N.W.7. British. Science Master, Mill Hill School. I have been engaged in teaching Chemistry in Secondary Schools since 1912, and am desirous of keeping abreast of developments in the Science, by means of the Society's lectures and publications, and of doing original work. (*Signed by*) D. Ll. Hammick, E. J. Bowen, C. N. Hinshelwood, H. B. Hartley, T. A. Quilliam.

Wood, Harold, 39, Edmund St., Seedley, Manchester. British. Chemical Research for M.Sc. (Organic Chemistry). B.Sc., 1st Class Honours Chemistry, 1922, Manchester University. Graduate Prize. Leblanc Medal in Organic Colouring Matters. (*Signed by*) Arthur Lapworth, Henry Stephen, J. E. Myers, W. K. Slater, Arnold Weston, Colin Campbell, Wilson Baker.

Certificates have been accepted by the Council under Bye-Law I (2) in favour of the following:

Andrews, Donald Hatch, Sterling Chemical Laboratory, New Haven, Conn., U.S.A. American. Assistant Instructor, Department of Chemistry, Yale University. In 1920 received the degree of B.A. in the Honours Chemistry Course at Yale University. For three years Silliman-Larned Fellow in the Graduate School of Yale University. Candidate for the degree of Ph.D. in Yale University, June 1923. Have been employed as Analyst for the United States R.R. Administration. Research Chemist, Fisk Rubber Co. (*Signed by*) L. W. Bass.

Laird, Clinton N., Canton Christian College, Canton, China. Professor of Chemistry at Canton Christian College. B.A., 1903. M.A., 1905, University of Pennsylvania, Philadelphia, Pennsylvania, U.S.A. Undergraduate work at University of Pennsylvania. Graduate work at University of Pennsylvania and Columbia University, New York City. At Canton Christian College, 1905 to date. Prof. of Chemistry, 1910 to date. Wish to keep in closer touch with development of chemistry in England through the Journal that I can through the abstracts now available, and to have the Journal available for use by my students. Member of Society of Chemical Industry; American Chemical Society; Franklin Institute, American Association for the Advancement of Science. (*Signed by*) E. R. Dovey.

Little, Arthur D., Charles River Road, Cambridge, Mass., U.S.A. American. Chairman of the Committee of the Corporation of the Massachusetts Institute of Technology in the Departments of Chemistry and Chemical Engineering. President of the American Chemical Society, 1912–1914. President of the American Institute of Chemical Engineers, 1919. (*Signed by*) C. F. Cross.

ADDITIONS TO THE LIBRARY.

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, February 1st, 1923, at 8 p.m., SIR WILLIAM A. TILDEN, D.Sc., F.R.S., Past-President, in the Chair.

The following were formally admitted Fellows of the Chemical Society: E. Hope, J. Kenyon, E. A. Peach, and S. G. P. Plant.

Certificates were read for the first time in favour of:

Frank Arthur Boys, 197, St. James' Road, Croydon.
Richard Burtles, M.Sc.Tech., 1, Romanby Place, 286, Wellington Road North, Heaton Chapel, Stockport.
Ernest Alfred Coppen, 137, Hambrough Road, Southall.
William Everard Davies, 51, Lancaster Gate, W. 2.
Hildyard John Eglinton Dobson, 44, Harold Road, Upper Norwood, S.E. 19.
Maxwell Bruce Donald, A.R.C.S., A.I.C., Royal College of Science, S. Kensington, S.W. 7.
Robert George Evans, 264, Bolton Road, Ashton-in-Makerfield, Wigan.
Thomas Shirley Hele, M.A., Emmanuel College, Cambridge.
Robert Fergus Hunter, 7, St. Mary's Road, Canonbury, N. 1.
Joseph Gilbert Jackson, B.Sc., 33, Crescent Road, Sheffield.
Wilfrid Lawson, M.Sc., A.I.C., 15, Barrington Road, Sefton Park, Liverpool.
Ronald Arthur Punter, B.Sc., A.I.C., The Kraal, Bishop's Stortford.
John Sunderland, B.Sc., 70, Thornbury Drive, Bradford.
Harold George Turley, B.Sc., 150, Clonmore Street, Southfields, S.W. 18.

The following papers were read:

"Derivatives of tetrahydrocarbazole. Part II." By W. H. PERKIN and S. G. P. PLANT.

"Isolation of the oxide of a new element." By ALEXANDER SCOTT.

"The chemistry of polycyclic structures in relation to their homocyclic unsaturated isomerides. Part IV. The simulation of benzenoid properties by the five-carbon intra-annular nucleus." By C. K. INGOLD, E. A. SEELEY, and J. F. THORPE.

Ordinary Scientific Meeting, Thursday, February 15th, 1923, at 8 p.m., Prof. T. M. LOWRY, Vice-President, in the Chair.

The CHAIRMAN referred to the loss sustained by the Society, through death, of:

	Elected.	Died.
Frederick James Lloyd	Feb. 3rd, 1876.	Feb. 9th, 1923.

The CHAIRMAN announced that in accordance with Bye-Law II, the following were proposed by the Council as Honorary Fellows of the Society and that a ballot for their election would be held at the next Ordinary Scientific Meeting on March 1st.

Bohnslav Brauner.
Ernst Cohen.
Gilbert Newton Lewis.
Charles Moureu.
Amé Pictet.
Theodor Svedberg.

Certificates were read for the first time in favour of:

Kundan Lal Aggarwal, M.Sc., 93, Botley Road, Oxford.
Sidney Hartley Bales, M.Sc., A.I.C., 338, High Road, Lee, S.E. 12.
Hugh Findlay, F.I.C., 50, Bothwell Street, Glasgow.
Mary Beatrice Ford, B.Sc., 9, Heath Street, Hampstead, N.W. 3.
George Philip Gibson, B.Sc., 136, Wilford Grove, Nottingham.
Donald Bennett Huntingford, M.Sc., St. Paul's School, Jalapahar, Darjeeling, India.
Mary Evelyn Laing, M.Sc., 35, Henleaze Road, Bristol.
Stephen Miall, 157, Haverstock Hill, N.W. 3.
Victor Wallace Slater, B.Sc., 139, Ashburnham Road, Luton.
Charles Arthur Waters, B.Sc., Bank House, Queen's Avenue, Muswell Hill, N. 10.
Edith Muriel Whincop, M.Sc., 26, Eatington Road, Leyton, E. 10.

Messrs. J. D. Pratt and J. N. Sugden were elected Scrutators, and a ballot for the election of Fellows was held. The following were subsequently declared elected as Fellows:

William Bennett Adam, B.A.
George James Alexander, B.Sc.
Donald Hatch Andrews, B.A.
Arthur John Attwood, A.R.C.S.
Kenneth Claude Bailey, M.A.
Alfred Berthoud.
Ernest Alfred Blench.
John Southwell Bousfield, A.R.C.S.
Frederick Bradshaw, M.A., D.Sc.
Charles Crossley Mann Broughton, B.Sc.
Harold Eugene Buckley, M.Sc.
Robert Kenneth Callow, B.A., B.Sc.
Joseph Cofman-Nicoresti.
Alexander Coutie.
Leslie John Couzens.
Katherine Hope Coward, M.Sc.
Ernest Cecil Craven.
Augustine Malcolm Manhkram David, B.Sc.
John Norman Dean, B.Sc., A.I.C.
James Cooper Duff, M.Sc., F.I.C.
Allan Robert Earle, B.A.
Samuel Gray Fenton.
Phillip Marcus Fisk.
John Kenneth Giles, B.Sc.
Thomas Graham.
Albert Edward Gray.
John Preedy Griffiths, B.Sc., A.R.C.S.
Leslie Julius Harris, B.Sc.
Thomas Arthur Harrison.
Leslie Frank Hewitt, B.Sc., A.I.C.

Laurence Horton, B.Sc., A.R.C.S.
John Ingham.
Clinton N. Laird, M.A.
John Laker, B.Sc., A.R.C.S.
Wilfred Herbert Linnell, B.Sc., A.I.C.
Arthur D. Little.
Joseph Kenneth Marsh, M.Sc.
George Arnold Medley.
Ramprasad Pitamberdas Mehta, M.A.
Herbert Frederick Miller, B.Sc., A.I.C.
Dhirendra Nath Mukerji, M.Sc.
William Owen Murch, B.Sc.
James Herbert Oliver, B.Sc.
Thomas Workman Orr, A.I.C.
William James Osborn.
Jocelyn Patterson, M.Sc., Ph.D.
Francis James Paxon, B.Sc., A.R.C.S.
Edward Arthur Perren.
Edwin William Stanley Press.
Edward Ebenezer Price.
Frank Victor Raleigh, B.A., B.Sc.
Tara Chand Rana, M.Sc.
Helena Charlotte Randall, B.Sc., A.R.C.S.
George Alan Redfern, B.A.
Jerry Robertson.
Edgar Sanders.
John Baldwin Shoesmith, M.Sc.
Hedley Archibald Sloman, B.A., A.I.C.
Andreas Smits.
Douglas Rosebery Snellgrove, B.Sc.
Arthur Roy Stark.
Reginald Ernest Tebbit.
John Smeath Thomas, D.Sc.
John Thompson.
Hubert William Thorp, B.Sc.
Frederick Vincent Tideswell, M.Sc.
Eric Wilfred Tong, B.Sc., A.R.C.S.
Frederic Jenner Tritton, B.Sc.
Paulo Lauro Vanderstichele, M.Sc.
Stanley Douglas Weaver, A.R.C.S.
Montague Williams, B.Sc.
Thomas Arthur Williams.
Harold Wood, B.Sc.

The following papers were read:

"Spinacene: its oxidation and decomposition." By A. Chaston Chapman.

"Investigations on the dependence of rotatory power on chemical constitution. Part XIX. The rotatory and refractive dispersion of *d*-γ-nonyl nitrite." By R. H. Pickard and H. Hunter.

"Investigations on the dependence of rotatory power on chemical constitution. Part XX. The rotatory dispersive powers of oxygen compounds containing the secondary octyl radical." By H. Hunter.

"Studies on hypophosphorous acid. Part V. Its reaction with silver nitrate." By A. D. Mitchell.

"Communication from Drs. Hevesey and Koster concerning disparity between *X*-ray spectra of hafnium and the New Zealand element." By Alexander Scott.

"The form of the vapour-pressure curve at high temperatures. Part II. The curve for sodium cyanide." By C. K. Ingold.

"The properties of ammonium nitrate. Part V. The reciprocal salt-pair ammonium nitrate and potassium chloride." By E. P. Perman and H. L. Saunders.

"The morphine group. Part I. A discussion of the constitutional problem." By J. M. Gulland and R. Robinson.

"The morphine group. Part II. Thebainone, thebainol, and dihydrothebainone." By J. M. Gulland and R. Robinson.

"A synthesis of pyrylium salts of anthocyanidin type. Part II." By D. D. PRATT and R. ROBINSON.

List of Papers received between January 19th and February 15th, 1923:

"Tesla-luminescence spectra. Part I. The apparatus and the spectrum of benzene." By W. H. MCVICKER, J. K. MARSH, and A. W. STEWART.

"The formation of derivatives of oxalacetic acid from tartaric acid." By F. D. CHATTAWAY and G. D. PARKES.

"Derivatives of tetrahydrocarbazole. Part II." By W. H. PERKIN and S. G. P. PLANT.

"Heterogeneous equilibria between the chlorides of calcium, magnesium, potassium, and their aqueous solutions." By W. B. LEE and A. C. G. EGERTON.

"The constitution of polysaccharides. Part VI. The molecular structure of cotton cellulose." By J. C. IRVINE and E. L. HIRST.

"Calculation of fundamental constants." By E. F. MORRIS.

"Electrolysis of acetone solutions of potassium chloro- and trichromates." By E. F. MORRIS.

"Spinacene: its oxidation and decomposition." By A. CHASTON CHAPMAN.

"Isolation of the oxide of a new element." By A. SCOTT.

"The chemistry of polycyclic structures in relation to their homocyclic unsaturated isomerides. Part IV. The simulation of benzenoid properties by the five-carbon intra-annular nucleus." By C. K. INGOLD, E. A. SEELEY, and J. F. THORPE.

"The labile nature of the halogen atom in organic compounds. Part VIII. The action of hydrazine on the halogen derivatives of acetoacetic and benzoylacetic esters and benzoylacetone." By A. K. MACBETH.

"The higher oxide of nickel." By O. R. HOWELL.

"Triethylene tri- and tetra-sulphides. Part III. The sulphones, sulphinic and sulphonic acids of the series. Extension of Stuffer's law." By Sir P. C. RÂY.

"Dyes derived from thiodiphenylamine." By B. K. SEN and S. DUTT.

"Dyes derived from carbazole. Part I." By S. DUTT.

"The preparation and some reactions of bromopicrin." By L. HUNTER.

"The intermittent glow of phosphorus." By K. R. K. IYER.

"The preparation of xylose from maize cobs." By A. R. Ling and D. R. Nanji.

"The effect of pressure on the limits of inflammability of mixtures of the paraffin hydrocarbons with air." By W. Payman and R. V. Wheeler.

"Inorganic complex salts. Part II. Erdmann's salt and its derivatives." By W. Thomas.

"The action of dimethyl sulphate on diphenylamine and on methyldiphenylamine." By C. S. Gibson and D. C. Vining.

"Investigations on the dependence of rotatory power on chemical constitution. Part XIX. The rotatory and refractive dispersion of *d*-γ-nonyl nitrite." By R. H. Pickard and H. Hunter.

"Investigations on the dependence of rotatory power on chemical constitution. Part XX. The rotatory dispersive powers of oxygen compounds containing the secondary octyl radical." By H. Hunter.

"Studies on hypophosphorous acid. Part V. Its reaction with silver nitrate." By A. D. Mitchell.

"The catalytic decomposition of hydrogen peroxide solution by sugar carbon." By J. B. Firth and F. S. Watson.

"Chloroiodoacetic acid." By H. Crompton and K. M. Carter.

"On the calorific power of carbon compounds." By D. Konovalov.

"The form of the vapour-pressure curve at high temperatures. Part II. The curve for sodium cyanide." By C. K. Ingold.

"The properties of ammonium nitrate. Part V. The reciprocal salt-pair ammonium nitrate and potassium chloride." By E. P. Perman and H. L. Saunders.

"The molecular refractions of chloro-, dichloro-, and chlorobromoacetates." By P. L. Vanderstichele.

"On the conditions of reaction of hydrogen with sulphur." By R. G. W. Norrish and E. K. Rideal.

"Photochemical reactions of the halogen hydrides." By W. H. Rodebush and J. Nevyas.

"Studies of the glucosides. Part II. Arbutin." By A. K. Macbeth and J. Mackey.

"The action of sulphur and sulphur compounds on the terpenes and the adaptation of the products of reaction for making a preparation of liquid gold for ceramic industry." By P. P. Budnikoff and E. A. Shilov.

"Sur le yodure d'azote." By C. Glugliotto.

"The combustion of complex gaseous mixtures. Part II. Mixtures of carbon monoxide and hydrogen with air." By W. Payman and R. V. Wheeler.

"Bromo-derivatives of 4-methylglyoxaline." By F. L. Pyman and G. M. Timmis.

"The morphine group. Part I. A discussion of the constitutional problem." By J. M. Gulland and R. Robinson.

"The morphine group. Part II. Thebainone, thebainol, and dihydrothebainone." By J. M. Gulland and R. Robinson.

"A synthesis of pyrylium salts of anthocyanidin type. Part II." By D. D. Pratt and R. Robinson.

"The bromination of glyoxaline-4-carboxyanilide." By H. King and W. O. Murch.

"Phosphorous acid esters. The influence of the character of the groups R′R″R‴ upon the stability of the molecular complexes $R'R''R'''C{-}OPCl_2$ and $R'R''R'''C{-}OP(OH)_2$. Part I." By D. R. Boyd and G. Chignell.

"Co-ordination compounds and the Bohr atom." By N. V. Sidgwick.

"Silver salvarsan." By W. H. Gray.

ANNUAL GENERAL MEETING.

The Annual General Meeting will take place on Thursday, 22nd March, 1923, at 4 p.m. when Sir James Walker will deliver his address entitled "Symbols and Formulæ."

ANNIVERSARY DINNER.

The Anniversary Dinner will be held at the Hotel Cecil, Strand, on March 22nd, at 7 for 7.30 p.m., the day of the Annual General Meeting. The presence of ladies will be welcomed.

Tickets, price 12*s*. 6*d*. each (not including wine), can be obtained from the Assistant Secretary, to whom application should be made as soon as possible.

ADDITIONS TO THE LIBRARY.

I. *Donations.*

Belaiew, Nicholas Timothy. Crystallisation of metals: being a course of advanced lectures in metallurgy. London [1923]. pp. 144. ill. 7*s*. 6*d*. net. (*Recd.* 22/1/23.) From the Author.

Cross, Charles Frederick, and Dorée, Charles. Researches on cellulose. IV (1910–1921) (Vol. IV of the series "Cross and Bevan"). London 1922. pp. x + 254. ill. 15*s*. net. (*Recd.* 1/2/23.) From the Authors.

Hemming, Emile. Plastics and molded electrical insulation. New York 1923. pp. viii + 314. ill. $5 net. (*Recd.* 7/2/23.)

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, March 1st, 1923, at 8 p.m., Professor H. B. DIXON, C.B.E., F.R.S., Past-President, in the Chair.

It was announced that the Society had lost, through death, Mr. Frank Hughes, who was elected on Feb. 15th, 1894.

The following List of Nominations for vacant places on the Council was read from the Chair:

President.—W. P. Wynne.

Vice-Presidents who have filled the office of President (*two vacancies*).—Sir William J. Pope; Sir James Walker.

Vice-Presidents who have not filled the office of President (*three vacancies*).—J. T. Hewitt; G. T. Morgan; J. M. Thomson.

Treasurer.—J. F. Thorpe.

Ordinary Members of Council: (*a*) Town Members, that is, those resident within 50 miles of Charing Cross (three vacancies).—C. K. Ingold; G. W. Monier-Williams; J. Reilly. (*b*) Country Members, that is, those resident beyond 50 miles from Charing Cross (three vacancies).—E. F. Armstrong, W. N. Haworth; H. McCombie.

Messrs. G. J. Alexander, E. A. Blench, P. M. Fisk, W. O. Murch, R. E. Tebbit, W. Thomas, F. J. Tritton, and M. Williams were formally admitted Fellows of the Chemical Society.

Certificates were read for the first time in favour of:

Joseph Arthur Baume, 21, Watcombe Circus, Carrington, Nottingham.
Thomas Vincent Blake, 208, Albany Road, Cardiff.
Joseph Brown, 24, Riversdale Terrace, Sunderland.
Basil Elmsley Coke, O.B.E., B.A., Army and Navy Club, Pall Mall, S.W. 1.
Gordon William Dorrell, B.Sc., 1, Niederwald Road, Sydenham, S.E. 26.
Willis Alexander Gibbons, A.M., Ph.D., 561, West 58th Street, New York.
John Thomas Holden, B.Sc., 123, Percy Road, Shepherd's Bush, W. 12.
Robert Barry Johns, 36, Chapel Road, Northenden, Manchester.

William Hugh Jones, B.Sc., Victoria Villa, Burgess Tower, Denbigh.
Narain Das Kehar, B.Sc., Rupar District, Amballa, India.
Wilfrid Leslie Lamb, M.A., St. Laurence College, Ramsgate.
Arthur Milnes Morley, M.Sc.Tech., A.I.C., 158, Oldham Road, Miles Platting, Manchester.
Kanwal Nain, c/o S. M. A. Shah, Esq., Royal Veterinary College, Camden Town, N.W. 1.
Charles Ashe Pelley, Burton Garth, Courtland Road, Paignton.
Albert Rose, 4, Moorland View, Higher Eldwick, Yorks.
Sidney Walter Saunders, B.Sc., 139, Riverdale Road, Erith.
Christopher Caiger Smith, B.Sc., The Ferns, Eversley Crescent, Isleworth.
Daniel Whitehead Steuart, B.Sc., Melrose, Uxbridge Road, Southall.
Allan Miles Ward, B.Sc., The Croft Cottage, Bridge Street, Walton-on-Thames.
Edward Johnson Wayne, 20, Cowper Street, Leeds.
Mahomed Yacob, M.B., B.S., c/o S. M. A. Shah, Esq., Royal Veterinary College, Camden Town, N.W. 1.

Miss F. M. G. Micklethwait and Dr. M. A. Whiteley were appointed Scrutators, and a ballot for the election of Honorary Fellows was held. The following were subsequently declared duly elected as Honorary Fellows: Bohuslav Brauner, Ernst Cohen, Gilbert Newton Lewis, Charles Moureu, Amé Pictet, Theodor Svedberg.

The following papers were read:

"Co-ordination compounds and the Bohr atom." By N. V. SIDGWICK.

"Silver salvarsan." By W. H. GRAY.

"On the propagation of the explosion-wave. Part I. Hydrogen and carbon monoxide mixtures." By H. B. DIXON and N. S. WALLS.

"The molecular configuration of polynuclear aromatic compounds. Part II. 4 : 6 : 4′-Trinitrodiphenic acid and its resolution into optically active components." By G. H. CHRISTIE and J. KENNER.

"Physostigmine. Part I. Alkylation products of eseroline." By G. BARGER and E. STEDMAN.

Ordinary Scientific Meeting, Thursday, March 15th, 1923, at 8 p.m., Prof. T. M. LOWRY, C.B.E., F.R.S., Vice-President, in the Chair.

It was announced that the Society had lost, through death, the following Honorary Fellow:

	Elected.	Died.
Johannes Diderik van der Waals	Jan. 20th, 1898.	March 8th.

The following were formally admitted Fellows of the Chemical Society: D. A. Hoffert, F. J. Paxon, and S. D. Weaver.

Certificates were read for the first time in favour of:

Jyoti Prokash Bose, M.B., 25, Mohendra Bose Lane, Shambazar, Calcutta.
John Dexter, B.A., B.Sc., King's College, Cambridge.
Khwaja Habib Hassan, B.Sc., B.Sc.Agric., Industrial Laboratory, Hyderabad, Deccan, India.
Ernest Avery Roff, B.Sc., Roseville, St. Margaret's, Twickenham.
Eugene Rothstein, 8, Woodchurch Road, N.W. 6.
Norman Frederick Watterson, B.Sc., A.I.C., Constitution Hill, Wellington, Salop.

The following papers were read:

"The oxime of mesoxamide (*iso*nitrosomalonamide) and some allied compounds. Part III. Ring formation in the tetrasubstituted series." By E. H. USHERWOOD and M. A. WHITELEY.

"The preparation and stability of cuprous nitrate and other cuprous salts in the presence of nitriles." By H. H. MORGAN.

"The interaction of hydrogen sulphide, thiocyanogen, and thiocyanic acid with unsaturated compounds." By F. CHALLENGER, A. L. SMITH, and F. J. PATON.

"The polarity of double bonds." By T. M. LOWRY.

"A direct synthesis of certain xanthylium derivatives." By D. D. PRATT and R. ROBINSON.

BAEYER MEMORIAL LECTURE.

The Baeyer Memorial Lecture will be delivered by Professor W. H. Perkin, LL.D., F.R.S., in the Lecture Hall of the Institution of Mechanical Engineers, Storey's Gate, Westminster, on Thursday, May 10th, 1923, at 8 p.m.

List of papers received between February 16th and March 15th, 1923:

"On the propagation of the explosion-wave. Part I. Hydrogen and carbon monoxide mixtures." By H. B. DIXON and N. S. WALLS.

"Absorption of light by some acids and their salt solutions; a new method of determining extinction-coefficient in the ultraviolet." By J. C. GHOSH.

"Condensation of fluorenone with phenols." By B. K. SEN and S. DUTT.

"The oxidation of triethylene tetrasulphide with potassium permanganate." By P. C. RÂY.

"The nitro-derivatives of *m*-cresol." By G. P. GIBSON.

"The application of the Hofmann reaction to substituted carbamides." By G. R. ELLIOTT.

"The molecular configuration of polynuclear aromatic compounds. Part II. 4 : 6 : 4′-Trinitrodiphenic acid and its resolution into optically active components." By G. H. Christie and J. Kenner.

"Reactions of thiosemicarbazones. Part II. Action of esters of α-halogenated acids." By F. J. Wilson and R. Burns.

"The ignition of mixtures of hydrogen and oxygen by sudden compression." By H. T. Tizard.

"The oxime of mesoxamide (*iso*nitrosomalonamide) and some allied compounds. Part III. Ring formation in the tetrasubstituted series." By E. H. Usherwood and M. A. Whiteley.

"Physostigmine. Part I. Alkylation products of eseroline." By G. Barger and E. Stedman.

"The preparation and stability of cuprous nitrate and other cuprous salts, in the presence of nitriles." By H. H. Morgan.

"The oxidising properties of sulphur dioxide. Part IV. Molybdenum sulphates." By W. Wardlaw and N. D. Sylvester.

"Synthesis of 1 : 2-dimethyl-4-hydroxyanthraquinone." By A. Fairbourne and J. M. Gauntlett.

"The interaction of hydrogen sulphide, thiocyanogen, and thiocyanic acid with unsaturated compounds." By F. Challenger, A. L. Smith, and F. J. Paton.

"The polarity of double bonds." By T. M. Lowry.

"Organo-derivatives of thallium. Part VI. Compounds of the type R_2TlX." By A. E. Goddard.

"Studies on the dolomite system. Part I. The nature of the substance dolomite." By A. E. Mitchell.

"Studies in organic compounds containing sulphur. Part I. The effect on general absorption due to the valency and mode of linkage of the sulphur atom." By D. T. Gibson, H. Graham, and J. Reid.

"The influence of nitro-groups on the reactivity of substituents in the benzene nucleus. Part VII. Reactions of 2 : 5- and 4 : 5-dinitro-*m*-xylenes." By K. Ibbotson and J. Kenner.

"A direct synthesis of certain xanthylium derivatives." By D. D. Pratt and R. Robinson.

"The isomerism of the crotonic and the β-chloro-crotonic acids." By F. H. McDowall.

"The velocity of reaction in mixed solvents. Part V. *a.* The velocity of formation of quaternary ammonium salts. *b.* The study of an intramolecular change." By J. Dexter, H. McCombie, and H. A. Scarborough.

"The chemistry of the three-carbon system. Part I. The influence of the *cyclo*hexane ring on the $\alpha\beta$-$\beta\gamma$-change." By S. F. Birch, G. A. R. Kon, and W. S. G. P. Norris.

"Imino-aryl ethers. Part II. The thermal decomposition of *N*-arylaryliminoaryl ether hydrochlorides." By A. W. Chapman.

"The Tesla-luminescence of compounds. Part II. The effect of varying temperature and pressure on the benzene spectrum." By W. H. McVicker and J. K. Marsh.

"The fluorescence spectrum of benzene vapour." By W. H. McVicker and J. K. Marsh.

"Dyes derived from phenanthraquinone. Part II. Phenanthraimidazoles." By A. C. Sircar and G. C. Sircar.

"Studies on thallium compounds. Part II. The reduction of thallic compounds with ferrous sulphate and with sodium arsenite." By A. J. Berry.

"The photochemistry of unstable substances." By E. J. Bowen.

"The labile nature of the halogen atom in organic compounds. Part IX. The electrical conductivities and the reduction of derivatives of nitroform." By T. Henderson, E. L. Hirst, and A. K. Macbeth.

"The molecular configurations of polynuclear aromatic compounds. Part III. $3:5:3':5'$-Diphenyl tetracarboxylic acid." By H. Burton and J. Kenner.

"The viscosity of some cellulose acetate solutions." By E. W. J. Mardles.

CERTIFICATES OF CANDIDATES FOR ELECTION AT THE BALLOT TO BE HELD AT THE ORDINARY SCIENTIFIC MEETING ON THURSDAY, MAY 3RD, 1923.

N.B.—The names of those who sign from "General Knowledge" are printed in *italics*.

Aggarwal, Kundan Lal, 93, Botley Road, Oxford. Indian. Student. Passed the M.Sc. exams. of the Punjab University in 1922, standing first in the Province, getting a 1st Class. Acted as a student demonstrator in Chemistry to the B.Sc. class for two years at the Forman Christian College, Lahore (India). (*Signed by*) Vidya Sagar Puri, Hubert T. S. Britton, Alan Newton Campbell.

Bales, Sidney Hartley, 338, High Road, Lee, S.E. 12. British. Chemist. M.Sc. (Leeds). Associate Institute of Chemistry. Nearly seven years' analytical and experimental investigation work in Directorate of Chemical Inspection, Royal Arsenal, Woolwich (present post). Principal author of "Note on Hydrolysis of $\beta\beta'$-Dichlorodiethyl Sulphide (*Trans.*, Oct. 1922). (*Signed by*) A. Vincent Elsden, W. L. Baillie, Alex. J. Boyd, E. Francis Smith.

Baume, Joseph Arthur, 21, Watcombe Circus, Carrington, Nottingham. Dyestuff and Chemical Merchant. Student at Nottingham University College, studying Organic and Inorganic Chemistry, and also Dyeing and Bleaching. (*Signed by*) F. S. Kipping, F. C. Laxton, S. J. Pentecost.

Blake, Thomas Vincent, 208, Albany Road, Cardiff. English. Industrial Chemist (Gas Works) to Cardiff Gas Light & Coke Company. 6 years Chief Chemist at Leicester Gas Works. 4 years Chief Chemist at Cardiff Gas Works. Full technological certificates in both Gas Engineering and Gas Supply (1921–22) with Inorg. and Organic Chemistry and Building Construction as qualifying subjects. (*Signed by*) D. Owen Davies, Harold M. Royle, J. H. Canning.

Bose, Jyoti Prokash, M.B., 25, Mohendra Bose Lane, Shambazar, Calcutta, India. Indian, Bengali. Research Scholar on Diabetes, School of Tropical Medicine and Hygiene, Calcutta. (1) Bachelor of Medicine, Calcutta University, 1919. (2) Gold medallist in chemistry and physics of the Indian Association for the Cultivation of Science, 1913. (3) Post-graduate worker in Analytical Chemistry, Chemical Laboratory, Medical College, Calcutta, 1920. (4) Post-graduate worker in Bio-chemistry with special reference to research work on Diabetes at St. Bartholomew's Hospital, London, 1921–1922. (5) Author of a new colorimetric method for quantitative determination of sugar in normal urine (in collaboration with Dr. Mackenzie Wallis, of Bart.'s, London). (6) Author of the following papers: (*a*) "Glycosuria in Pregnancy" (jointly with Dr. Mackenzie Wallis of Bart.'s), Journal of Obstetrics and Gynæcology of the British Empire, Vol. 29, summer, 1922. (*b*) "General Review on Diabetes," Indian Journal of Medicine, January 1923. (*c*) "Glucose Tolerance Tests and their Interpretations," read at the Science Congress, January 1923. (*Signed by*) Chuni Lal Bose, Sudhamoy Ghosh, Beni Madhub Chakravarti.

Boys, Frank Arthur, 197, St. James' Road, Croydon. British. Pharmacist. Reason for desiring admission: To keep in touch with the developments of chemistry, and to have the use of the Society's Library. (*Signed by*) Reginald C. Bickmore, F. W. MacMahon, Fredk. G. W. Knapman.

Brown, Joseph, 24, Riversdale Terrace, Sunderland. Final Honours student in Chemistry at Armstrong College, Newcastle-on-Tyne. Have studied Chemistry at Armstrong College for three years as an Honours student. (*Signed by*) W. N. Haworth, G. C. Leitch, H. V. A. Briscoe.

Burtles, Richard, 1, Romanby Place, 286, Wellington Rd. North, Heaton Chapel, Stockport. British. Research Chemist (student). M.Sc.Tech. (Manchester). Studying for degree of Ph.D. Eighteen months' research at Manchester College of Technology. Joint author with Professor Pyman of a paper on "Tautomerism of Amidines" about to be published in the *Transactions*. (*Signed by*) Frank Lee Pyman, Edmund Knecht, John K. Wood.

Coke, Basil Elmsley, O.B.E., Order of St. Suva, Army and Navy Club, Pall Mall, London, S.W. 1. English. Major, Royal Engineers (retd.). B.A. (Hons.) Cantab. Pt. I. Natural Sciences Tripos (Physics, Chemistry, Geology). (*Signed by*) Hamilton McCombie, Harold A. Scarborough, A. E. Cashmore.

Coppen, Ernest Alfred, "Exmoor," 137, Hambrough Road, Southall, Middx. British. Lecture Assistant, Imperial College of Science (Chemistry Dept.). Solar Physic Dept. (Sir Norman Lockyer), 1884–1890. Chemistry Dept., R.C.S., 1890 to date. (*Signed by*) H. B. Baker, Jocelyn Thorpe, James C. Philip.

Davies, William Everard, 51, Lancaster Gate, W. 2. Welsh. Chemical Engineer and Chemist. (1) Student: Demonstrator, Chemical Dept., South Wales and Mon. School of Mines, Treforest, Glam., 3 yrs. (2) Chief Chemist, Lewis Merthyr Consolidated Collieries, Ltd., Trehafod, for Mine and Coke-oven Chemistry, 2 yrs. (3) Research Chemist and Inventor and Patentee of the Everard Davies System of Fuel Distillation, embracing Gas-works Carbonisation and Gasification Plant, Coke-ovens, and Low Temperature Plant. Articles *re* same recently appeared in Gas Journal, World, and Iron and Coal Trades Review, etc. Patents secured: 127940; 131105; 136880; 165825; 143602, etc. (*Signed by*) Jenkyn A. Griffiths, Stephen N. Wellington, David Brownlie.

Dexter, John, King's College, Cambridge. English. Research Student. B.A. (Cambridge, 1st Cl. Hons., Nat. Sci. Tripos, Part II). B.Sc. (London, 1st Cl. Hons., Chemistry). (*Signed by*) Hamilton McCombie, Harold A. Scarborough, A. E. Cashmore.

Dobson, Hildyard John Eglinton, 44, Harold Road, Upper Norwood, S.E. 19. English. Post-graduate Research Student and Student Demonstrator at University College, Gower St., London, in the Department of Chemistry. (*Signed by*) J. N. Collie, Irvine Masson, F. G. Donnan.

Donald, Maxwell Bruce, Royal College of Science, London, S.W. 7. British. Demonstrator at the Royal College of Science, London. A.R.C.S., 1921 (Chemistry). A.I.C., M.S. (M.I.T.), 1922. Chemical engineering practice. (*Signed by*) Arthur A. Eldridge, H. J. T. Ellingham, R. S. Colborne.

Dorrell, Gordon William, 1, Niederwald Rd., Sydenham, S.E. 26. British. Post-graduate. Chemistry Research at University College, London. B.Sc. (Hons., Lond.), 1st Class in Chem., 1922. (*Signed by*) W. E. Garner, Thomas Iredale, Allan E. Mitchell.

Evans, Robert George, 264, Bolton Road, Ashton-in-Makerfield, Wigan. Welsh. Mining Engineer. London University Matriculation, Sept. 1919. Assoc. Institute of Mining Engineers and the Manchester Geological and Mining Society. 3 years full-time course at Wigan Technical College, where Chemistry and the Chemistry of Fuels was taken up to London University B.Sc. standard. Desirous of keeping in touch with the developments of Chemistry so that I may continue to assist with chemical operations required in the mine. (*Signed by*) E. B. Naylor, Wilfred Harrison, Charles R. Gardner.

Findlay, Hugh, 50, Bothwell Street, Glasgow. British. Consulting Chemist to Messrs. J. and P. Coats, Ltd., Glasgow. Fellow of the Institute of Chemistry. 30 years' experience in textile chemistry as Chemist, Works Manager, Research Chemist, and Consultant. (*Signed by*) F. J. Wilson, John A. Cranston, A. D. Gardiner, F. W. Harris.

Ford, Mary Beatrice, 9, Heath Street, Hampstead, N.W. 3. British Student. B.Sc. degree, London, 1915. Two years employment as temporary chemical assistant in the Government Laboratory, London. Since then I have spent two years in study in America and am at present engaged in research at the Birkbeck College. (*Signed by*) Geo. Stubbs, Eileen M. Chatt, Wm. W. Myddleton.

Gibbons, Willis Alexander, 561, West 58th Street, New York, U.S.A. American. In charge of Chemical Research Department, U.S. Rubber Company, General Laboratories. A.M., Ph.D., Assistant in Chemistry and Graduate Student, Cornell University, 1910–1912. Graduate Student, Columbia University, 1913–1914. Author or joint-author of various articles on Inorganic and Physical Chemistry and on the vulcanization of rubber. Patentee of various processes in connection with the manufacture of rubber goods. Assistant Military Attaché, American Embassy, London, 1917–1918. Captain, Ordnance Department, U.S. Army. Chief of the Loading Branch Artillery Ammunition Division, Ordnance Department, 1918–1919. (*Signed by*) Wilder D. Bancroft, T. Martin Lowry, William J. Pope, Robert Robertson, R. C. Farmer.

GIBSON, GEORGE PHILIP, 136, Wilford Grove, Nottingham. British. Research Student. Student, Univ. College, Nottm., 1919 onwards. B.Sc. (Lond.), 1921, 2nd Class Hons. Chem. (*Signed by*) F. Stanley Kipping, E. B. R. Prideaux, B. D. Shaw.

HASSAN, KHWAJA HABIB, Hyderabad, Deccan, India (Industrial Laboratory). Indian. Chemist. Bachelor of Agriculture (India). Bachelor of Science, Leeds University. Two contributions to the Journal of Leather Trades Assocn. on Indian Vegetable Tannins and Effect of Acids on Tan Solution. (*Signed by*) J. B. Cohen, W. Lowson, Arthur Smithells, P. K. Dutt.

HELE, THOMAS SHIRLEY, Emmanuel College, Cambridge. British. Lecturer in Biochemistry, University of Cambridge. Fellow of Emmanuel College, Cambridge. Papers on Metabolism in Journal of Physiology. (*Signed by*) F. G. Hopkins, W. H. Hurtley, Marjory Stephenson.

HOLDEN, JOHN THOMAS, 123, Percy Rd., Shepherds Bush, W. 12. British. Assistant Chemist to the British Launderers Research Association. B.Sc. (Lond.). In order to keep in touch with recent developments of Chemistry, and to use the Library. (*Signed by*) R. G. Parker, Harold Hunter, E. C. Edgar.

HUNTER, ROBERT FERGUS, 7, St. Mary's Rd., Canonbury, N. 1. British. Student of Chemistry at the Royal College of Science. Intermediate B.Sc., Honours. Studying for B.Sc. Honours and A.R.C.Sc., to be followed by Ph.D. (*Signed by*) H. B. Baker, P. C. Bull, H. F. Harwood.

HUNTINGFORD, DONALD BENNETT, St. Paul's School, Jalapahar, Darjeeling, India. Student, East London College, Oct. 1916–Oct. 1919. Graduated with 2nd Class Hons., Oct. 1919. Lecturer and Demonstrator, East London College, Oct. 1919–Jan. 1923. Admitted as Associate of the Institute of Chemistry, Nov. 1922. Passed M.Sc. Degree, Jan. 1923. Royal Microscopical Society's Journal, "Reduction of Osmic Acid by Lipoids," Nov. 1920, and Journal, Chemical Society, "Dissociation Pressures of Salt Hydrates" (in collaboration with Prof. J. R. Partington), Jan. 1923. (*Signed by*) J. R. Partington, F. W. Bury, Eustace E. Turner, W. H. Patterson, J. H. Coste, F. G. Pope.

JACKSON, JOSEPH GILBERT, 33, Crescent Rd., Sheffield. British. Research Student, Sheffield University. B.Sc. (1st Class Hons.) (Sheffield). Engaged in Research in Organic Chemistry at Sheffield University. (*Signed by*) W. P. Wynne, J. Kenner, Cecil H. Desch, M. A. Whiteley, James C. Philip.

JOHNS, ROBERT BARRY, 36, Chapel Road, Northenden, near Manchester. British. Relief Manager and Chemist of Essence and Chemical Depts., Merchant Taylors' School, Great Crosby, near Liverpool. Complete course in Chemistry, chiefly organic, extending over fully five years. With Messrs. C. W. Field, Ltd., Liverpool, for 7 years as technical representative for essences, flavours, drugs, etc. With Messrs. Bratby and Hinchliffe, Ltd., from 1913 to date as technical representative for ditto, also for 1 year as Assistant Chemist. Wish to join Chemical Society in order to keep abreast of modern advances in organic Chemistry through the publications of the Society. (*Signed by*) W. McHutchison, Andrew S. Matchett, R. T. Thomson.

JONES, WILLIAM HUGH, Victoria Villa, Burgess Tower, Denbigh (165, Ramsay Rd., Forest Gate, London, E. 7). British. Teacher (L.C.C. School). B.Sc. (Hons.) (Wales), 1921, University College of North Wales, Bangor. Inter. Science (1914–1915), University College of North Wales, Bangor. Final and Honours (1919[Apl.]–1921), University College of North Wales, Bangor. 3rd Class at Honours in Chemistry. (*Signed by*) Kennedy J. P. Orton, G. W. Robinson, H. B. Watson.

Kehar, Narain Das, B.Sc., Rupar Dist., Amballa (Punjab). Hindu (non-Brahmin). Consulting chemist to the " Punjab Modern Shellac Works," Balarampur Dist., Manbhum (B.N. Ry.). I carried out special research work on " Soap Manufacture " during the last two years, submitted thesis on the subject, and won the University scholarship. At present carrying on experiments on Lac dye, Lac cultivation, and its manufacture. (*Signed by*) Edwin Theodore Dean, N. A. Yajnik, S. R. Khosla.

Laing, Mary Evelyn, 35, Henleaze Road, Bristol. Research Assistant in Physical Chemistry at the University of Bristol. M.Sc., Bristol, 1919. Publications in *Trans. Chem. Soc.*, 1918, **113**, 435; 1919, **115**, 1280; 1920, **117**, 1506; 1921, **119**, 1671; 1922, **121**, 621. (*Signed by*) F. Francis, J. W. McBain, M. Taylor.

Lamb, Wilfrid Leslie, St. Laurence College, Ramsgate. British. Senior Chemistry Master. Open exhibitioner in Natural Science, Christ Church, Oxford, 1911. M.A. Head of Routine Laboratory, H.M. Factory, T.N.T. explosive, 1915–16. R.E. (Water Filtration), Mesopotamia, 1917–19. 2nd chemistry master, Oundle School, 1919–20. Senior chemistry master, St. Laurence College, Ramsgate, 1920–. (*Signed by*) H. B. Baker, Humphrey Paget, W. H. Gray.

Lawson, Wilfrid, 15, Barrington Road, Sefton Park, Liverpool. British. Research Chemist at the Bland-Sutton Institute of Pathology, the Middlesex Hospital, W. 1. M.Sc., School of Chemistry, Liverpool University, 1919 (B.Sc., Hons., 1917). A.I.C., June 1919. Research assistant to Professor R. Robinson, D.Sc., F.R.S., Jan. 1920–Oct. 1921. (*Signed by*) E. C. C. Baly, Herbert H. Froysell, William Doran, F. C. Guthrie.

Miall, Stephen, 157, Haverstock Hill, London, N.W. 3. British. Director of a public company; formerly studied Chemistry at the Yorkshire College, Leeds. (*Signed by*) Henry E. Armstrong, William J. Pope, James C. Philip.

Morley, Arthur Milnes, 158, Oldham Road, Miles Platting, Manchester. British. Demonstrator in Chemical Technology, College of Technology, Manchester. B.Sc.Tech. (Honours division), 1920. Research in physical chemistry, leading up to M.Sc.Tech. (1922). Associate of the Institute of Chemistry (1922). Joint author with Dr. J. K. Wood of the two following papers read before the Manchester Section of the Society of Dyers and Colourists on Jan. 19th, 1923 : (1) " The Behaviour of Titanic Acid towards Dyestuffs " ; (2) " The Behaviour of Stannic Acid towards Dyestuffs." (*Signed by*) Frank Lee Pyman, John K. Wood, F. M. Rowe.

Nain, Kanwal, Kashmir. Indian. Chemical Examiner and Bacteriologist to Govt., Kashmir. L.M.S., Punjab, D.T.M. and H., London, D.P.H., London. Fellow of the Royal Society of Tropical Medicine and Hygiene. Fellow of the Royal Institute of Public Health. Has worked as chemical examiner for the last twelve years. (*Signed by*) V. S. Puri, H. C. Cocks, R. G. Franklin.

Pelley, Charles Ashe, Burton Garth, Courtland Road, Paignton. British. Assistant Engineer and Chemist, Paignton Gas Company. Studied chemistry (practical and theoretical), Royal Albert Memorial College, Exeter, under Prof. W. H. Lewis, M.A., F.I.C. 17 years' experience gasworks chemistry. Desirous of joining Society in order to keep in touch with chemical developments. (*Signed by*) G. W. Slatter, C. D. Birks, Ernest Quant, *B. A. Burrell.*

Punter, Ronald Arthur, The Kraal, Bishop's Stortford. British· Chemist with Messrs. Nobel Industries, Ltd. B.Sc. (London). A.I.C. Eleven years with Nobels and the Ministry of Munitions (Department of Explosives Supply) on the manufacture and development of the explosives and allied chemicals. "The Application of Researches on the viscosity of Cotton Cellulose in Industry," published in the *Journal of the Society of Chemical Industry*, 1920. (*Signed by*) Wm. Macnab, Robert Robertson, W. H. Gibson.

Roff, Ernest Avery, Roseville, St. Margarets-on-Thames. British· Chemist. Student, Battersea Polytechnic, 1913–17. B.Sc. Hons. (London)' 1917. Assistant chemist to Messrs. Thomas Tyrer & Co., Stratford, E.' 1917–18. Chief analytical chemist to the above-named firm since 1918.' (*Signed by*) Thos. Tucker, F. G. Mann, J. L. White.

Rose, Albert, 4, Moorland View, Higher Eldwick, nr. Bingley, Yorks. English. Chemist-in-charge of laboratory of works manufacturing heavy chemicals. 11 years assistant chemist in a works at St. Helens and 7 years chemist-in-charge of laboratories at works in Kilwinning (Ayrshire), Manchester, and Bradford (Yorks). Author of: "Process for manufacture of a magnesium oxy-chloride cement as a binding material in the manufacture of emery wheels, in competition with the German wheel"; "A method of burning kelp to produce the maximum amount of soluble potash and iodine salts"; "An improvement in the process of manufacture of caustic soda solution from soda-ash and lime, effecting a large saving in steam consumption." (*Signed by*) J. Alexander Reddie, F. W. Richardson, A. Jaffé.

Rothstein, Eugene, 8, Woodchurch Road, London, N.W. 6. British. Student. Third year undergraduate at the Imperial College of Science and Technology in chemistry. (*Signed by*) H. B. Baker, James C. Philip, H. F. Harwood.

Saunders, Sidney Walter, 139, Riverdale Road, Erith, Kent. British. Research student at University College, London. B.Sc. (Lond.). 1st class Hons. Chem., 1922. (*Signed by*) W. E. Garner, F. G. Donnan, O. L. Brady.

Slater, Victor Wallace, 139, Ashburnham Road, Luton. British. Chemist. B.Sc. (London). Asst. chief chemist, Messrs. B. Laporte, Ltd., Luton. (*Signed by*) R. Barclay Craig, J. de Carle Smith, W. D. Scouller, R. Tennant.

Smith, Christopher Caiger, The Ferns, Eversley Crescent, Isleworth, Middlesex. British. Research Student at University College, London. B.Sc. (London). 1st Class Hons., 1922. (*Signed by*) F. G. Donnan, O. L. Brady, W. E. Garner.

Steuart, Daniel Whitehead, "Melrose," Uxbridge Road, Southall. Scots. Biological Chemist. B.Sc. (Agric. Edin.), 1911. Research assistant, Agric. Chem. Dept., Leeds University, 1911–14. Teacher of Agric. Chem. and Dairy Bacteriology, University College, Cardiff, 1914–17. Biological chemist, Maypole Works, Southall, 1917–. (*Signed by*) D. R. Steuart, Alexander Lauder, G. Van B. Gilmour.

Sunderland, John, 70, Thornbury Drive, Bradford. British. Assistant Master, Hanson Sec. School, Bradford. Chemistry Master, Truro College, 1912–15. Chemistry Master, Yeadon and Guiseley Sec. School, 1915–18 (except for war service, 1½ years). Chemistry Master, Hanson Sec. Boys'

School, 1918–. B.Sc., London. (*Signed by*) T. M. Lowry, C. E. Womersley, R. S. Cahill.

Turley, Harold George, 150, Clonmore St., Southfields, S.W. 18. English. Research Student. Student in chemistry for 4 years. B.Sc. (Lond.), 1st Class in Honours Chemistry. I desire through the Society's publications and meetings to keep in touch with modern thought and development in chemistry. (*Signed by*) Robert H. Pickard, J. L. White, J. Kenyon.

Ward, Allan Miles, The Croft Cottage, Bridge St., Walton-on-Thames. British. Graduated B.Sc. (London), 1922, with 1st Class Honours in Chemistry. Now engaged on research course at Birkbeck College. (*Signed by*) George Senter, F. Barrow, F. B. Thole.

Waters, Charles Arthur, Bank House, Queen's Avenue, Muswell Hill, N. 10. British. Industrial Chemist. B.Sc., 3rd Class Honours in Chemistry, London. I apply for election so that I may keep in touch with the latest developments of chemistry. (*Signed by*) Irvine Masson, Henry Terrey, O. L. Brady.

Watterson, Norman Frederick, Constitution Hill, Wellington, Salop. British. Chemistry Master, Wrekin College, Wellington, Salop. (1) B.Sc. (Lond.). A.I.C. (2) Chemist at H.M. Explosive Factory, Oldbury, July 1915 to Jan. 1919. (3) Chemistry Master, Wrekin College, Jan. 1919 to present. (*Signed by*) Frank E. Thompson, G. D. Elsdon, P. J. Lycett.

Wayne, Edward Johnson, 20, Cowper Street, Leeds. Student. Studying for Hons. B.Sc. in Chemistry at the University of Leeds. Examination in June 1923. "The Aldehydosalicylic Acids and their Derivatives" (with Prof. J. B. Cohen), *Trans. Chem. Soc.*, June 1922. (*Signed by*) Arthur Smithells, J. B. Cohen, M. S. Leslie, H. M. Dawson, J. R. Scott, P. W. Clutterbuck.

Whincop, Edith Muriel, 26, Eatington Road, Leyton, London, E. 10. English. Teacher. M.Sc. degree in chemistry. In conjunction with Mr. G. M. Bennett, F.I.C., M.A., have published a paper in the *J.C.S.* entitled "Some Derivatives of Monothioethyleneglycol." I am still continuing research work in chemistry. (*Signed by*) J. H. Davies, G. M. Bennett, H. C. Bell.

Yacob, Mahomed, Lahore, India. British subject. Medical Practitioner. M.B., B.S. (Punjab), D.T.M. and H. (England), D.P.H. (Oxford), F.R.Inst.P.H. (London). I did my chemistry for my M.B., B.S., and also passed an "additional test" in chemistry, and during the past 9 months have been doing analytical chemistry in the laboratory of the Royal Institute of Public Health (London), under Col. Sir William Smith and Dr. Stewart. (*Signed by*) V. S. Puri, H. C. Cocks, E. W. Maddison.

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, April 19th, 1923, at 8 p.m., Professor W. P. WYNNE, D.Sc., F.R.S., President, in the Chair.

The PRESIDENT referred to the loss sustained by the Society through the death of Sir James Dewar, and announced that the Council had passed the following resolution :—

> "On behalf of the Chemical Society the Council desires to express its sense of the great loss that the Society in particular and British science in general have sustained in the death of Sir James Dewar, who served as President from 1897—1899 and as Vice-President during a period of twenty-eight years."

On the suggestion of the President, the Fellows present expressed their concurrence in this resolution by standing.

The following deaths also were intimated :—

	Elected.	Died.
George Embrey	Feb. 5th, 1885.	Mar. 10th. 1923.
Herbert Henry Froysell	Feb. 15th, 1917.	Feb. 25th, 1923.
Thomas Howard	Mar. 4th, 1875.	Mar. 12th, 1923.
Robert Binnie Pettigrew	Dec. 6th, 1917.	Aug. 2nd, 1922.
Henry Walker	Dec. 4th, 1913.	Apl. 4th, 1923.
John Sanders Wilkes	Dec. 2nd, 1920.	Feb. 8th, 1923.

It was announced that the following Committees for 1923—1924 had been appointed by the Council :—

Finance Committee.—E. F. Armstrong, A. Chaston Chapman, C. A. Hill, G. T. Moody, and the Officers.

House Committee.—J. L. Baker, Sir Herbert Jackson, Alexander Scott, Sir William A. Tilden, E. W. Voelcker, and the Officers.

Library Committee.—P. P. Bedson, O. L. Brady, A. J. Greenaway (Editor), Sir Thomas K. Rose, Sir John Russell, J. M. Thomson (Chairman), Sir William A. Tilden, the Librarian, and the Officers, together with the following representatives of contributing Societies:

J. L. Baker, C. Dorée, J. C. Drummond, A. Harden, J. P. Longstaff, R. L. Mond, and G. Senter.

Publication Committee.—E. C. C. Baly, O. L. Brady, C. H. Desch, C. S. Gibson, I. M. Heilbron, J. C. Irvine, T. M. Lowry, J. W. McBain, W. H. Mills, R. H. Pickard, T. Slater Price, N. V. Sidgwick, and the Officers.

Research Fund Committee.—H. B. Baker, Sir James J. Dobbie, F. G. Donnan, G. G. Henderson, R. H. Pickard, Sir William J. Pope, R. Robinson, N. V. Sidgwick, S. Smiles, Sir James Walker, and the Officers.

The following were formally admitted Fellows of the Chemical Society: C. C. M. Broughton, J. P. Griffiths, A. B. P. Page, F. W. Stoyle, and C. Harold Wright.

Certificates were read for the first time in favour of:

Vinayak Keshav Bhagwat, M.Sc., 528, Shanwar Peth, Poona City, India.
Frederick Beaumont Hirst, Walmore, Mackenzie Street, Sharples, Bolton.
Gen-itsu Kita, Institute of Chemical Technology, Imperial University, Kyoto, Japan.
Shunzo Koizumi, Furukawa-cho, Sanjyo-minami, Kyoto, Japan.
Robert Oswald M'Cardell, 11, Gladstone Road, Urmston, Manchester.
Douglas Stewart Mitchell, 33, Loraine Road, Holloway, N. 7.
Frederick Aldis Nurse, B.Sc., 30, Oakhill Road, Sutton.
Cyril Vernon Oliver, B.Sc., 10, Hayle Road, Maidstone.
Kali Charan Pakrasi, B.Sc., Dakshineswar, Aridat P.O., Bengal, India.
Arthur Osborne Ponder, B.A., Dominion Tar and Chemical Co., Ltd., Montreal, Canada.
John Rankin, B.Sc., A.I.C., Exeter College, Oxford.
Henry Ralph Champion Scott, 5, Selwood Terrace, S. Kensington, S.W. 7.
Edward Russell Trotman, B.Sc., 3, Wellington Circus, Nottingham.
Louis Veillon, Ph.D., Brookside, Weston Rhyn, Salop.
Cyril Mason Willcox, B.A., B.Sc., 4, Worple Avenue, Wimbledon, S.W. 19.
Edwin Williams, B.Sc., A.I.C., Arosfa, Risca, Mon.
Francis George Willson, Langley, Westmount Road, Eltham, S.E. 9.

The following papers were read:

"The influence of nitro-groups on the reactivity of substituents in the benzene nucleus. Part VII. Reactions of 2 : 5- and 4 : 5-dinitro-*m*-xylenes." By K. IBBOTSON and J. KENNER.

"The chemistry of the three-carbon system. Part I. The influence of the *cyclo*hexane ring on the $\alpha\beta$–$\beta\gamma$-change." By S. F. BIRCH, G. A. R. KON, and W. S. G. P. NORRIS.

"On the promotion of catalytic reactions. Part I." By S. MEDSFORTH.

"The action of halogens on phenylhydrazones. Part I. The action of bromine." By J. E. HUMPHRIES, E. BLOOM, and R. EVANS.

"The mobility of symmetrical triad systems. Part II. The conditions relating to systems terminated by the *o*-phenylene group. Derivatives of indene." By C. K. INGOLD and H. A. PIGGOTT.

MEETINGS AND LECTURES.

The next Ordinary Scientific Meeting will be held on Thursday, May 3rd, 1923, at 8 p.m., when a ballot for the election of Fellows will be held.

The Baeyer Memorial Lecture will be delivered by Professor W. H. Perkin, F.R.S., in the Lecture Hall of the Institution of Mechanical Engineers, Storey's Gate, Westminster, on Thursday, May 10th, 1923, at 8 p.m.

On Thursday, June 14th, 1923, at 8 p.m., in the Society's Rooms, a Lecture will be delivered by Professor Charles Moureu entitled: "Les Gaz Rares des Sources Thermales, des Grisous et Autres Gaz Naturels."

The next Informal Meeting will be held on Thursday, May 17th, 1923, after the conclusion of the formal business of the Ordinary Scientific Meeting, to be held at 8 p.m.

RESEARCH FUND COMMITTEE.

A meeting of the Research Fund Committee will be held in June next. Applications for Grants, to be made on forms which can be obtained from the Assistant Secretary, Chemical Society, Burlington House, W. 1, must be received on or before Friday, June 1st, 1923.

All persons who received grants in June, 1922, or in June of any previous year, whose accounts have not been declared closed by the Council, are reminded that reports must be returned by June 1st.

LIST OF FELLOWS, 1923.

The Council has decided to supply the List of Fellows for 1923 to those Fellows only who make application to the Assistant Secretary before August 31st, 1923.

REPORT OF THE INTERNATIONAL COMMITTEE ON CHEMICAL ELEMENTS.

Copies of this Report, which embodies a Table of Isotopes and a Table of the Radioactive Elements and their Constants, will be supplied to those Fellows only who make application to the Assistant Secretary before August 31st, 1923.

INDIAN TECHNICAL PUBLICATIONS.

At the request of the Indian Trade Commissioner, the Council desires to draw the attention of Fellows to the library of Indian Technical Publications attached to the office of the Indian Trade Commissionerat at 60, Winchester House, Old Broad Street, E.C. 2.

Fellows are cordially invited to consult any of the technical publications, a list of which may be seen in the Library of the Chemical Society.

List of Papers received between March 16th and April 19th, 1923:

"The behaviour of dilute solutions of iodine in chloroform in contact with aqueous starch solution." By J. B. Firth and F. S. Watson.

"Dyes of the aurin type. Part I." By H. Baines and J. E. Driver.

"The optical rotations of the sugars. Part II. The methyl pentoses and the glucosides." By J. G. Maltby.

"Investigations of the mannan present in vegetable ivory." By J. Patterson.

"The hydration of agar-agar." By F. Fairbrother and H. Mastin.

"On the promotion of catalytic reactions. Part I." By S. Medsforth.

"Change of properties of substances on drying. Part II." By H. B. Baker.

"The sodium salts of phenolphthalein." By H. Bassett and P. Halton.

"The action of thiosulphates on cupric salts." By H. Bassett and R. G. Durrant.

"The propagation of flame from a spark in a closed tube through a homogenous inflammable mixture." By O. C. de C. Ellis.

"Mercury cleansing apparatus." By A. E. Dixon and J. L. McKee.

The sulphides of ammonium." By J. S. Thomas and R. W. Riding.

"On the energy of activation in heterogeneous gas reactions with relation to the thermal decomposition of formic acid vapour." By C. N. Hinshelwood and B. Topley.

"Researches on vertical retort tar. Part I. The phenolic constituents." By G. S. Currey.

"The oxidation of nickel sulphide." By J. S. Dunn and E. K. Rideal.

"Benzbisthiazoles. Part III." By S. R. H. Edge.

"Anodic formation of a perchloride of manganese." By A. N. Campbell.

"The action of hypochlorous acid on bornylene." By G. G. Henderson and J. A. Mair.

"Yohimbine (quebrachine). Part II. Apoyohimbine and desoxyyohimbine." By G. Barger and E. Field.

"Isolation of the oxide of a new element. A correction." By A. Scott.

"The structure of saccharose." By M. Bergmann.

"The action of halogens on phenylhydrazones. Part I. The action of bromine." By J. E. Humphries, E. Bloom, and R. Evans.

*"The $\alpha\alpha'$-dichlorodialkyl sulphides." By F. G. Mann and W. J. Pope.

"The isomeric trithioacetaldehydes." By F. G. Mann and W. J. Pope.

*"The isomerism of the oximes. Part XI. Carbethoxy-derivatives." By O. L. Brady and G. P. McHugh.

"The influence of temperature on two alternative modes of decomposition of formic acid." By C. N. Hinshelwood and H. B. Hartley.

"The conversion of malonic acid into *d*-malic acid." By A. McKenzie and H. J. Plenderleith.

"The structure of the normal monosaccharides. Part I. Xylose." By E. L. Hirst and C. B. Purves.

"The ternary system ammonium chloride–ferric chloride–water." By F. W. J. Clendinnen.

"A critical solution temperature for solids in the binary system ammonium chloride–manganous chloride dihydrate." By F. W. J. Clendinnen and A. C. D. Rivett.

"The mobility of symmetrical triad systems. Part II. The conditions relating to systems terminated by the *o*-phenylene group. Derivatives of indene." By C. K. Ingold and H. A. Piggott.

"Some factors which influence the volumes of precipitates." By J. H. Jackson and A. W. Stewart.

"The ultra-violet absorption spectra of eugenol and *iso*eugenol." By G. Thompson.

"Some mercaptans of the purine group. Part I." By P. C. Rây, G. C. Chakravarti, and P. K. Bose.

"Condensation of amidines with ethoxymethylene-β-ketonic esters and β-diketones." By P. C. Mitter and J. C. Bardhan.

"Ring-chain tautomerism. Part V. The effect of the *gem*-

dipropyl grouping on the carbon tetrahedral angle." By L. **Bains** and J. F. **Thorpe**.

"The preparation and properties of 4 : 4′-tetramethyldiaminoanthrafuchsone." By F. A. **Mason**.

"The theory of acid alkali solution equilibrium as applied to salts of moderately strong but sparingly soluble acids." By E. B. R. **Prideaux**.

"The conditions of reaction of hydrogen with sulphur. Part II. The catalytic effect of oxygen. Part III. On the mechanism of the reaction of hydrogen with sulphur and its catalysis by oxygen." By R. G. W. **Norrish** and E. K. **Rideal**.

"Researches on residual affinity and co-ordination. Part XVI. Normal and acid salicylatotetramminocobaltic salts." By G. T. **Morgan** and J. D. M. **Smith**.

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

ANNIVERSARY DINNER.

The Anniversary Dinner of the Chemical Society, to which several eminent French Chemists were invited as Guests of Honour, was held at the Hotel Cecil, Strand, on Thursday, March 22nd, 1923, at 7.30 p.m., Sir JAMES WALKER, F.R.S., President, in the Chair. The following is a list of those present :

Armstrong, E. F., *President, Society of Chemical Industry.*
Armstrong, H. E., *Past-President.*
Atkinson, H. M.
Austin, P. C.
Baker, H. B.
Baker, Mrs. H. B.
Baker, J. L.
Baker, Mrs. J. L.
Baker, Miss S.
Barr, A. J. A. W.
Bearder, E. A.
Bedson, P. P.
Belaiew, N. T.
Bonzon, L. L., *French Consul-General.*
Bowdler, A. W.
Brame, J. S. S.
Brazier, S. A.
Briggs, S. H. C.
Brown, L. N.
Brown, R. B.
Brown, Mrs. R. B.
Brown, R. G., *President, Inst. of Mining and Metallurgy.*
Bull, P. C.
Burton, T. F., *Editor, J. Soc. Chem. Ind.*
Calam, H.
Carlton, Miss M.
Carr, S. E., *Assistant Secretary.*
Chapman, A. C., *President, Institute of Chemistry.*
Clarke, F. S.
Clifford, F. W., *Librarian.*
Codd, L. W.
Cofman, V.
Cofman-Nicoresti, J.
Cofman-Nicoresti, Mrs. J.
Cohen, J. B.
Colgate, R. T.
Colgate, Mrs. R. T.
Colman, H. G.
Cooper, A. J. B.
Cooper, H. C.
Coward, H. F.
Crossley, A. W., *Foreign Secretary.*
Daily Telegraph.
Desch, C. H.
Deschiens, M., *La Société de Chimie Industrielle.*
Donald, M. B.
Doolan, J. J.
Dorée, C.
Druce, J. G. F.
Dyer, B.
Egerton, A. C. G.
Egerton, Mrs. A. C. G.

Eldridge, A. A.
Eldridge, Mrs. A. A.
Ellingham, H. J. T.
Evans, E. V.
Eyre, J. V.
Finnemore, H.
Ford, S. F.
Fox, J. J.
Garner, W. E.
Gérard, J., *Secrétaire, La Société de Chimie Industrielle.*
Gibbons, W. M.
Gibson, C. S.
Gilbard, J. F. H.
Gillick, E. G.
Goldsmith, J. N.
Goldsmith, L. D.
Gosling, F.
Gray, R. W.
Gray, W. H.
Greenaway, A. J., *Joint Editor.*
Gregory, Sir R., *Editor of " Nature."*
Hale, A. J.
Henry, T. A.
Henry, Mrs. T. A.
Hepworth, H.
Hewitt, Miss A. M.
Hewitt, J. T., *Vice-President.*
Heywood, W. R.
Hinchley, J. W.
Hinchley, Mrs. J. W.
Hooper, E. G.
Hope, E.
Horton, E.
Howard, D. L.
Howard, H. L.
Hudleston, L. J.
Hulton, H. F. E.
James, T. C.
Jones, W. P.
Jones, Mrs. W. P.
Kenner, J.
Kestner, P., *Président, La Société de Chimie Industrielle.*
King, H.
Kingston, Miss H. L.
Kirby, Miss E. M.
Kon, G. A. R.
Koran, V.
Laidlaw, P. P.
Laker, J.
Laker, J., Senr.
Lamb, W.
Le Bas, Miss G.
Le Bel, J. A., *La Société Chimique de France.*
Le Chatelier, H. L., *La Société Chimique de France.*
Le Good, P.
Leitch, Miss G. C.
Le Pla, Miss M.
Le Rossignol, R.
Lessing, R.
Levy, P. J.
Lightfoot, Miss C. H.
Lowry, T. M., *Vice-President.*
McBain, J. W.
McCombie, H.
Maclean, Mrs. I. S.
Macnab, W.
Macnab, Mrs. W.
Manning, A. B.
Marlow, G. S. W.
Masson, I., *Secretary.*
Masson, Mrs. I.
Matthews, F. E.
Miall, S., *Editor, " Chemistry and Industry."*
Miall, Mrs. S.
Micklethwait, Miss F. M. G.
Micklewright, H. G. F.
Mond, E. S.
Mond, Mrs. E. S.
Moody, G. T.
Moody, Mrs. G. T.
Morgan, G. T., *Vice-President.*
Morgan, H. H.
Moritz, E. R., *President, Institute of Brewing.*
Morning Post.
Morrell, R. S.
Morris, H. J.
Nathan, Sir F. L.
Nathan, Lady.
Neathercoat, E. T., *President, Pharmaceutical Society.*
Nicklin, G. N.
Orton, K. J. P.
Paget, H.
Paget, Mrs. H.
Pentecost, S. J., *President, Society of Dyers and Colourists.*
Perkin, W. H., *Past-President.*
Perkin, Mrs. W. H.
Perry, R. G., *President, Assoc. British Chem. Mfrs.*

Philip, J. C., *Secretary.*
Philip, Mrs. J. C.
Phillips, P. P.
Pickard, R. H.
Pilley, J. J.
Plant, S. G. P.
Pope, Sir W. J., *Past-President.*
Press Association.
Price, T. S.
Prince, A. J.
Raleigh, F. V.
Reavell, J. A.
Reilly, J.
Richards, P. A. E., *President, Society of Public Analysts.*
Rideal, E. K.
Rintoul, W.
Robertson, Sir R., *President, Faraday Society.*
Robertson, Lady.
Rodd, E. H.
Roff, E. A.
Russell, A. S.
Russell, A. Scott.
Savage, E. G.
Scott, A., *Past-President.*
Scott, Mrs. A.
Sharp, T. M.
Sherrington, Sir C. S., *President, Royal Society.*
Shilling, W. G.
Sidgwick, N. V.
Sinkinson, E.
Smith, C., *Joint Editor.*
Smithells, C. J.
Spielmann, P. E.
Taylor, G.
Thomas, R. N. G.
Thomson, W.
Thorpe, J. F., *Treasurer.*
Thorpe, Mrs. J. F.
Tilden, Sir W. A., *Past-President.*
Tilden, Lady.
Times.
Topley, B.
Tripp, E. H.
Tucker, T.
Tunstall-Behrens, B.
Turner, Miss W.
Urbain, G., *La Société Chimique de France.*
Urbain, Madame.
Vanderstichele, Miss M.
Vanderstichele, Miss P.
Voelcker, E.
Voelcker, J. A.
Walker, Sir J., *President.*
Walker, Miss M. E.
Wayland, Sir W. A.
Whetham, C. D.
Whiteley, Miss M. A.
Williams, T. A.
Woolcock, W. J. U., *Gen. Manager, Assoc. British Chem. Mfrs.*
Worsley, R. R. Le G.
Wyatt, Miss A. D.
Wynne, Miss D. P.
Wynne, W. P., *President-elect.*
Yeoman, E. W.

The following Toasts were proposed :—

By THE PRESIDENT, SIR JAMES WALKER, D.Sc., LL.D., F.R.S. :

1. "His Most Gracious Majesty the King." 2. "Their Majesties the Queen and Queen Alexandra, His Royal Highness the Prince of Wales, and other Members of the Royal Family."

By SIR CHARLES S. SHERRINGTON, G.B.E., M.A., D.Sc., President of the Royal Society :—

3. "The Chemical Society, coupled with the name of The President."

By DR. ARTHUR W. CROSSLEY, C.M.G., C.B.E., D.Sc., F.R.S., Foreign Secretary of the Chemical Society :—

4. "Our French Guests, coupled with the names of Monsieur le Professeur Henri L. Le Chatelier, Foreign Member Royal Society, Honorary Fellow of the Chemical Society, representing La Société

Chimique de France; and Monsieur Paul Kestner, representing La Société de Chimie Industrielle."

By PROFESSOR W. P. WYNNE, D.Sc., F.R.S., President-elect of the Chemical Society :—

5. "The Other Guests, coupled with the names of A. Chaston Chapman, Esq., F.R.S., President of the Institute of Chemistry, and Sir Richard Gregory, Editor of *Nature.*"

The Loyal Toasts having been honoured, Sir CHARLES S. SHERRINGTON, G.B.E., P.R.S., in proposing "The Chemical Society," said :—

Mr. President, Ladies and Gentlemen, I have the privilege, and a great privilege I esteem it, of proposing to this company to-night the toast of "The Chemical Society." That toast in any company, and least of all in this, you will agree with me, needs no commendation from me or from any others, nor can anything that I can say, I feel, enhance it further to you.

The science that this Society represents is second to none in its triumphs and in its importance to the world. And the Society has a tradition of representing that science for something over eighty years; in fact, it was on my tongue to refer to it as an old Society, but I refrained, because it is a young Society. It is a Society that can never grow old, for it is, if I may say so, already immortal. It is a Society which cultivates, and is a leader in, all the various branches of chemical science. I am well acquainted by contact with those who pursue this science, and with the purity of their researches, and yet I think those here this evening who are fellow guests with me will agree there is very good evidence that there is an applied chemistry which this Society also cultivates, a subtle chemistry that depends in part on decoctions and on distillation, and a chemistry that yields us what are sometimes known as the pleasures of the table, the very delightful table we are enjoying to-night. If I may allow myself a small play on words, it is a symbol of good taste.

An interesting feature in the history of this Society is that the first President of the Society was Thomas Graham, whom we may regard as the founder of that great and intricate and growing field of science which so much bears upon the studies of physiology. Well, chemistry is certainly a feature of life. One cannot help wondering whether life has not for its chief mechanism, and uses as its chief mechanism, chemical mechanism. If one pursues that thought, one feels at once that all that great domain of human interest, which is summed up in the two words health and disease, is fundamentally chemical, and that ultimately it is along chemical lines of research that the human intellect must solve the problems, practical and theoretical, which attach to those two great terms.

Of the many good works that the Society does there is one that has been long a source of admiration to me, the publications of the Society. More useful or more admirable issues I know of nowhere than the Journal of the Chemical Society, with its original papers and its valued abstracts, and the Annual Reports on the Progress of Chemistry, bringing together epitomes by experts, and containing each year a mine of information to which I have been only too glad and grateful often to refer. One never dips into those volumes without being struck by the circumstance that of all sciences chemistry and, in its name, your own Society, contributes in extraordinary measure to the growth of the English language. I refer to the number of new names that appear annually, not mere trifles, but words that are sixteen and seventeen syllables long! The poet once wrote of other poets as makers of "Jewels five words long that sparkle on the forefinger of time for ever." Well, as to jewels five words long, there are good chemical words of twenty syllables, and as for literary students adding to the language with such richness I think they must hide their heads abashed.

The successes of this Society are wide. We may congratulate it on the richness of its roll of membership, and on its being the recognised rallying point for all chemists engaged and interested in pure research. This Society can with truth consider itself as the parent Society of all our chemical societies. That alone is evidence of fecundity, and when we remember that its valued and exceptional library is placed at the disposal of other chemical societies, that is public-spirited work. When I dined as a guest here two years ago, your then President mentioned in his speech a scheme of federation with the other societies concerned in chemistry. I was much impressed, too, by his sketch of the advantages which would spring from it if you were all combined into one whole. Of course I know in these times it must be difficult to launch such a scheme, but he spoke in a very convincing way of the ultimate economy that would result.

In your own home you have had in the past year a notable ceremony. I had among others the privilege to be present at the unveiling of the most artistic memorial to the Fellows of this Society who, during the war, not only gave devotedly their scientific services to the public cause, the united cause, the Allied cause, but ultimately the supreme sacrifice of life itself. That typifies, and the memorial will typify for ever, the spirit of public service and patriotism that animates the Society, and, I am sure, ever will animate it.

I notice that among the acts of the Society has been the extending of help to our colleagues who are at present in distress in Russia—a work of fraternal good fellowship. Another exhibition of admirable co-ordination is the scheme in co-operation with the American Chemical Society and the Faraday Society to carry on jointly the "Journal of Physical Chemistry." This sets an example that I feel you are happy to be able to set.

I know, of course, that this Society has some four thousand members. Well, that is financial strength; it is at the same time much more than that, because it is an expression of the solidarity with which this Society represents chemistry throughout our land. The present occasion, this anniversary with its opportunity for renewing personal acquaintance and making fresh acquaintances, is an anniversary that has become a tradition, and a tradition that is carried on from year to year, from generation to generation, is all part, to my mind, of the important work of this Society.

Well, I must not detain you too long. If you will bear with me one moment more, I should like to add that among the admirers of this Society and its good work there is none I can assure you more cordial and sincere than that of the Society of which I have, at the present moment, the privilege of acting as Chairman. That is a venerable Society. I don't know whether you regard it as an elder sister or as an aged parent, but I can assure you that whether we may be regarded as your elder sister or as your parent, we feel justifiably proud of your existence and cordially admire your excellent management and success.

In wishing your Society continued prosperity and success, may I couple this toast with the name of your distinguished and devoted President, Sir James Walker. I believe it is a fact that he thinks nothing of travelling eight hundred miles in performing his services to you, I don't know how many times during his years of office. I should like also to wish success to your President-elect, Professor Wynne, who is to succeed him in the Chair.

Sir **James Walker**, in response, said :—

In responding to the toast of the Chemical Society, which has been so ably and in such flattering terms proposed by Sir Charles Sherrington, I cannot do better than adopt the excellent maxim of Bernard Shaw, "Never resist temptation," and succumb at once to the temptation which must beset every retiring President, the temptation, namely, to compare the state of his Society when he entered it with its state when he relinquishes office. It is just a third of a century since I was elected to the Fellowship of the Chemical Society. I had then seventeen hundred fellow-members: now I have four thousand—a most gratifying enlargement of one's circle. The chief business of the Society then, as now, was to hold scientific meetings and to publish scientific memoirs. I must confess that the ordinary meetings now do not appear to me quite so interesting as they did in the early 'nineties. No doubt the change is in myself, rather than in the character of the communications. My appetite for scientific communications is probably not quite so keen as it was thirty years ago. Besides the ordinary meetings, however, we now have informal meetings to bring the Fellows more closely together, and special lectures by men eminent in their own branch of research. These innovations are altogether admirable, and are highly appreciated.

With regard to publications, the volume of our journal has greatly swollen since 1890. The membership has more than doubled, but the number of papers has increased more than fivefold. When I entered the Society it took the efforts of 24 Fellows to produce a single paper; now the labours of 11 suffice. Again, if we measure our production against the production of the world as evidenced by the number of original papers in relation to abstracts we find that it is twice as great as it was in 1890. Quantitatively, then, the progress of our Society in research is most gratifying, but what of the qualitative aspect? Well, I have recently looked through the Transactions of the first year of my Fellowship of the Society and I can say with all honesty and all confidence that in quality there is no falling off. Interests have changed, and fashions have changed, but the contributions to chemical knowledge contained in our journal have suffered no diminution of significance. They are necessarily of widely varying merit, but the average is good. The communications as a rule have no immediate or tangible practical application; they have no market value. By no alchemy can these papers be turned into gold; even the superficially easier transmutation into Treasury notes is equally impossible. They are the products of a spirit of pure scientific inquiry, and originate for the most part in the laboratories of our universities and colleges which are still the main training grounds of research.

We chemists have been often urged of late not to stick so closely to our laboratories, but to come out and play a part in public life. The advice, if sound, is applicable to only a small fraction of our number. The common chemist, the "vulgar spagirist," cannot at will assume a legislative air and proceed to fashion the nation to his own mould. I confess I do not contemplate the prospect of a general migration from Burlington House to the Houses of Parliament with contentment or even equanimity. I have sat on a good many public boards, and I frankly own that I have not observed scientific societies to be conspicuously better managed than other bodies. Were our Council multiplied twentyfold I should not greatly care to see it supersede the House of Commons. I should even hesitate, if Sir Charles Sherrington will permit me to say so, to substitute the Royal Society for the House of Lords. Of course, from time to time, we have men like Lyon Playfair, or Roscoe, whose special gifts and qualities make them acceptable to the public, and whose opinions carry great weight. These men will, I fear, never be many, but perhaps if political parties become still more numerous—I notice that in Jugo-Slavia they have now reached 32—we may in time see in Parliament a National Spagiric Party furthering the interests of chemistry, and placing its expert knowledge at the service of the nation. This seductive vision, however, may not early be realised, but meantime there is an end which all chemists may do something to promote—whether they be industrial chemists, or analytical chemists, or academic chemists, or cash chemists—namely, the amalgamation or at least the co-operation of all those societies interested in chemistry or any branch of chemistry. Our separate voices may be feeble, but if we speak together with one voice, our words will be heard and our opinions cannot be neglected.

There is still another way of making ourselves more generally known. Lord Balfour spoke the other day of the interest which the public takes in laboratories. Could this interest not be fostered by throwing open to the inspection of the public our laboratories working under ordinary conditions? If our academic laboratories were known to be visible under the conduct of members of the staff, say at a fixed hour on a certain day of the week, I feel that in the course of the year many citizens would have taken advantage of the opportunity so afforded, and thus something would be done to make the public realise the kind of work we do and what we are useful for. I make the suggestion in all seriousness.

The most memorable event of my term of office has been alluded to by Sir Charles Sherrington, the erection in our rooms through the exertions of the Harrison Memorial Committee, of an expressive and beautiful memorial to Fellows who died in the service of their country during the war, pre-eminent amongst whom was Colonel Edward Harrison. His work in devising protective measures against the deadly poison gases will never be forgotten. Another event of great significance is the collaboration of our Society with the American Chemical Society and the Faraday Society in the publication of the Journal of Physical Chemistry. This, I trust, is only an earnest of closer relations between all the English-speaking chemical societies. For the rest we have enjoyed a period of peace and tranquillity, and I leave the Presidency in the hands of my successor, Professor Wynne, in the hope and expectation that his experience will be as pleasant as my own has been. Professor Wynne has already rendered many services to the Society in many offices. In the chief office he will render many more.

I cannot sit down without giving expression to the great gratification which I, in common with you all, feel in the presence of so many and so distinguished French colleagues. The names of Le Bel and Le Chatelier are associated with my earliest student recollections. These names had, I am afraid, in my mind come in process of time to represent almost mythological deities, and now to see their bearers sitting at this table in the flesh, so human, so fresh, and so genial, is a source of rare pleasure and content. Ladies and gentlemen, I thank you most cordially for the kind reception you have given to the toast of "The Chemical Society," proposed in such happy and such handsome terms by Sir Charles Sherrington.

Dr. ARTHUR W. CROSSLEY, C.M.G., C.B.E., F.R.S., then proposed the Toast of "Our French Guests" in the following words :—

Upon me falls this evening the honour of proposing the toast of our French guests.

I wish that it were possible for me to borrow for the occasion, and in order to do justice to it, some of that polished oratory for which our French neighbours are so justly distinguished. But as that is not practicable I must of necessity content myself with using such language as is at my command in endeavouring to convey to our guests an impression of the very sincere and genuine pleasure we are experiencing in having them with us this evening. English chemists have always had a very sincere regard and admiration for their French colleagues, an admiration which does not lessen as time advances. We chemists have, I think, sir, one great thing for which to be thankful, namely, a common meeting-ground where we can draw close together in our aims and ideals. This common meeting-ground is the search for the absolute truth regarding the substances and phenomena which we are investigating. Here there is no room for two opinions as to what is right, for though our views and interpretations of the laws which govern chemical truth may undergo slight modification as the result of experimental work in hand, the laws themselves remain as those of the Medes and Persians, unalterable. To satisfy truth is the sole endeavour of us all. And if this meeting-ground sometimes assumes, as this evening, a rather less serious aspect, this is all to the good, for it provides an opportunity of getting to know one another as men and as individuals, in addition to our knowledge of one another as chemists. This is one of the main reasons why we welcome our guests this evening. Their names are household words to all chemists, but we are glad of this opportunity of learning something of the personalities attached to the names.

When France gave to the chemical world the immortal Lavoisier, she set herself an uncommonly high standard, but I do not think the most critical of all France's critics can with justice say that she has failed to live up to that standard. I should like to direct attention to the names of those French chemists who have honoured this Society by accepting honorary Fellowships, and in so doing I purposely omit all names appearing in our present list. The first Honorary Fellow was appointed in the year 1847 and his name was Dumas. Then followed in 1849 Boussingault, Chevreul, Gay-Lussac, Laurent, Pelouze, Regnault, Thénard; in 1851 Balard; in 1856 Wurtz; 1857 Cahours; 1860 Berthelot, Frémy, Peligot, Deville. In 1862 Pasteur, surely a great chemist, but above all things a great humane man; in 1864 Dessaignes; in 1876 Friedel; in 1883 Debray; in 1888 Boisbaudran; in 1892 Schlœsing; in 1898 Troost, Raoult, Moissan; in 1904 Becquerel; in 1908 Gautier. Surely, sir, a country which can add to the list beginning with Lavoisier the names I have just mentioned cannot be said to have lowered her standard. These are names of which the whole world of chemists has just reason to be and is proud. And what of the little constellation of chemical stars which France has sent to us this evening? I single out two as being of particular brilliance, but I do not think that this will cause any heart-burnings in the breasts of our friends, for I do so for no other reason than that I have the pleasure of coupling their names with this toast. I refer to Professor Le Chatelier and to M. Paul Kestner. We welcome Professor Le Chatelier on many grounds, but first and foremost as the honoured representative of our great sister Society, La Société Chimique de France, and we would ask Professor Le Chatelier, when he returns to France, to convey to our sister Society our warmest greetings and good wishes. We welcome Professor Le Chatelier also as a very distinguished Honorary Fellow of this Society, and as a Davy Medallist and foreign member of the Royal Society. Last, we welcome him as one of the elder brethren of the great Fellowship of Chemists. He had made chemical history when I was but a student; he has continued to make chemical history, for his researches have illumined any and all of the branches of chemistry in which he has worked, no matter whether it be the principle of mobile equilibrium, the nature of gaseous explosions, or the setting of cements. M. Kestner we welcome in the first place as representing another great sister Society, La Société de Chimie Industrielle, which Society is also represented by its general secretary, M. Jean Gérard, and by a member of its Council, M. Maurice Deschiens. All three represent a class not very prominent in this country, namely, that of the chemical engineer. My duties a few years ago brought me into very close contact with many French chemical engineers, and I very soon learned to appreciate their skill and marked ability to adapt themselves to new or altered conditions. This country has much to learn from its neighbour in this respect. M. Kestner may be described as the ideal chemical engineer. His name is known all the world over in connection with his film evaporator, and the improvements which his skill has introduced into the sulphuric acid chamber process. Professor Le Bel we welcome as a very distinguished Honorary Fellow of this Society, and as a Davy Medallist and Foreign Member of the Royal Society. All chemists are grateful to him for his original conception of assigning to the carbon atom a tetrahedral sphere of influence, an idea which, perhaps more than any other, has been responsible for the brilliant advances which organic chemistry has made during the last forty-five years. Professor Urbain we welcome as another distinguished Honorary Fellow of this Society. His researches strike a line contrary to those of most other chemists, for he is only satisfied to have dealings with the rarest of the rare. His work on the rare earths is *the* work on the rare earths. We have also exceptional pleasure in welcoming Madame Urbain, and we are charmed to greet her as our guest this evening. If Madame Urbain is not an Honorary Fellow of this Society, she can at all events and with justice claim to be the better half of an Honorary Fellow.

Such, sir, is the little group of chemists which represents France here this evening. Surely a group worthy of France's great and best traditions. We are proud to have them with us; we shall greatly regret when the time comes to say *au revoir*. We hope that they will take away with them a pleasurable remembrance of good comradeship, as they will certainly take our earnest and sincere wishes for continued success in their life work, devoted as it is to the study of that science which we all hold so dear. I have pleasure in proposing the health of our French guests and in coupling the toast with the names of Professor Le Chatelier and M. Paul Kestner.

Professor **HENRY LE CHATELIER**, For.Mem.R.S., replied :—

Messieurs,—Au nom de la société chimique de France, je vous

remercie de l'aimable accueil que vous avez fait ce soir à ses délégués. De semblables réunions sont bien faites pour reserrer les liens de deux pays également fiers de marcher à la tête de la civilisation.

Le concours des bonnes volontés, la coopération des activités sont indispensables aux progrès de l'humanité; l'homme seul est impuissant. Mais pour produire tout son effet, il ne suffit pas que cette coordination des efforts soit réalisée à un seul instant et dans un seul pays; elle doit s'étendre dans le temps et dans l'espace. Les plus grandes découvertes scientifiques ont été la résultante d'idées développées par des générations successives de savants, et des échanges de vue incessamment renouvelés entre pays voisins.

L'Angleterre et la France ont joué un rôle particulièrement important dans la création de la Science. Leur action s'est entremêlée de telle sorte qu'il est parfois difficile de fixer la part revenant à chacun de ces pays.

A ses débuts, la Science a eu une origine essentiellement philosophique. Bacon, en Angleterre, Descartes, en France, ont jeté les bases de la Science expérimentale. Lavoisier, tout imprégné des doctrines Cartésiennes, a fondé la chimie scientifique par sa découverte des deux lois de la conservation de la masse et des éléments, bientôt complétées par les lois de Dalton sur les proportions définies et les rapports simples. A leur suite, les savants définitivement fixés sur l'objet essentiel de la Science, consacrent tous leurs efforts à démêler les lois qui enchaînent inexorablement toutes les transformations du monde matériel. Gay-Lussac formule les lois de la compressibilité et de la dilatation des gaz; Faraday, celles de la décomposition électrolytique. Sadi Carnot crée la thermodynamique et Joule la complète par la découverte du principe de conservation de l'énergie. Ampère donne les lois de l'électrodynamique sur lesquelles Lord Kelvin édifie toute la science électrique moderne.

La connaissance de ces lois, en nous donnant prise sur le monde matériel, nous permet de modifier l'orientation des phénomènes naturels de façon à les asservir à nos besoins. Cela a été l'origine de l'essor inouï de l'industrie pendant le siècle qui vient de finir. Des lois de la Thermodynamique, Sir William Siemens tire le four à récupération avec lequel Martin crée une nouvelle métallurgie de l'acier. En partant des lois de Joule, le même savant imagine le four électrique au moyen duquel Moissan institue toute l'électrométallurgie. C'est un rebondissement continuel entre les découvertes des savants Anglais et Français. Chaque découverte des uns inspire de nouveaux progrès aux autres.

La Science semblait avoir trouvé sa voie définitive; il n'en était rien. Des penseurs à l'imagination ardente, désireux de s'élever au dessus de la simple satisfaction de nos besoins matériels et sevrés de la contemplation des mystères divins par l'affaiblissement général du sentiment religieux, tournèrent leurs aspirations vers l'étude de la constitution de la matière. Des formules de constitution de Gerhardt et de l'atome insécable de Wurtz aux molécules de J. J. Thomson, d'une complexité semblable à celle du système solaire, aux mondes à quatre dimensions et aux systèmes physiques imaginaires la préoccupation a été la même, atteindre la connaissance de l'inconnaissable. Ces ambitions ont-elles été couronnées de succès ? La religion de l'Atomistique survivra-t-elle ? Sur un terrain échappant au domaine de l'expérimentation, nous devons être modestes et attendre le jugement de la postérité. Admirons cependant la poésie de ces rêves ; elle subsistera toujours ; ne lisons-nous pas encore avec plaisir la théorie du monde édifiée par Démocrite et mise en vers par Lucrèce dans le *de Natura Rerum ?*

Aujourd'hui, de nouveaux courants surgissent ; les démocraties demandent aux savants de travailler au bonheur immédiat de l'humanité, de prolonger l'action bienfaisante exercée jadis par les fondateurs de la Science expérimentale. Il est impossible de lutter contre ce mouvement d'opinion et personne ne songe à le faire. Mais, comme dans la gracieuse légende de Daphnis et Chloé, si la science et l'industrie sont disposées à s'aimer de l'amour le plus tendre, elles ne savent comment se le témoigner. La Science doit-elle revenir en arrière et se remettre simplement à l'étude des lois de la nature, ou doit-elle, comme beaucoup d'industriels le lui demandent, s'atteler à la recherche de faits nouveaux, sacrifiant ainsi la Science véritable à l'empirisme ?

Il est imprudent de vouloir prédire l'avenir. Certains symptômes indiquent cependant un retour vers les origines de la Science. Les principes d'organisation scientifique du travail de Taylor, la révolution qu'ils ont amenés dans les procédés de la construction mécanique ont jeté un jour tout nouveau sur l'utilité des principes mêmes de la méthode scientifique. La semence jetée par de grands penseurs : Bacon, Descartes, Pascal, Lavoisier, Auguste Comte, Stuart Mill, Herbert Spencer, Taine et Claude Bernard commence à porter ses fruits. Le culte de la méthode, de l'organisation se développe et tend à sortir des laboratoires de recherche. Le rôle des savants va être d'enseigner aux industriels, aux commerçants, aux politiques les moyens d'aborder scientifiquement les problèmes que posent journellement les fabrications, les échanges, l'administration. Dans la Science pure, on fait systématiquement abstraction de toutes les propriétés de la matière, sauf une, celle que l'on étudie spécialement. Dans l'industrie, au contraire, on doit prendre les phénomènes avec toute leur complexité ; les lois cherchées

s'expriment par des fonctions algébriques d'un grand nombre de variables, souvent plus d'une douzaine. On ne peut se reconnaître dans un semblable labyrinthe sans prendre la méthode scientifique comme fil d'Ariane.

Pour remplir ce rôle nouveau, la science devra redevenir philosophique. La France et l'Angleterre sont préparées à ce rôle; elles sauront travailler la main dans la main pour donner un nouveau lustre à la civilisation et assurer la paix du monde.

M. Paul Kestner responded :—

Mr. President, Ladies and Gentlemen, Professor Crossley and my eminent friend and master, Monsieur Henri Le Chatelier, have shown us how the history of chemistry is also the history of a close co-operation between English and French chemists. They have shown us how this co-operation has developed, through natural causes, into great friendship. This friendship of the English and French men of science in the pure and applied field is based on sure foundations. It is always good, however, to look after the foundations and see if they cannot be improved and strengthened, and such occasions as the present are very helpful to this desired end.

When we formed the Society of Applied Chemistry in France which, as President, I have the honour of representing here to-night, we had as our essential aims the gathering together of those who are interested in industrial chemistry, so that useful work might be accomplished; but—may I confess it here?—one of the main objects I, personally, had in view was to assist by all possible means the strengthening of the Anglo-French friendship.

I call, as witnesses, the many friends I have in this room, that much has already been accomplished in this way by the Société de Chimie Industrielle.

English friendship has been manifested by the invitations to this function sent to the French Societies. It has been manifested by the cordiality of your reception, and by the words which have been spoken.

French friendship has replied, and the delegation here to-night is, I believe, the largest that has attended any similar reunion.

But I also like to think, and in fact I know, that the invitation to the Société de Chimie Industrielle de France, to send a numerous delegation, is evidence of the affection of the oldest chemical society in Great Britain to the youngest of us—the very newest comer.

The Société de Chimie Industrielle is infinitely gratified. What greater encouragement could we receive, and what greater reward for the efforts we have made, than this invitation, which so greatly honours us?

I always experience a very sincere emotion when I, as a representative of a Society of Applied Chemistry, am the guest of an assembly of savants; but, to-day, by virtue of these surroundings, I experience these sentiments with special intensity. The men of science are our masters; they are our spiritual chiefs! They give themselves up to pure research which results in the prosperity of applied chemistry. Industry turns to its advantage all those laws which the men of science establish, which they often establish without any regard to their application, and simply with the intention of increasing our knowledge.

But, on the other hand, the manufacturers, and the industrial chemists, are glad that it is given to them to witness how frequently applied science has given to the pure savant an impulse or an idea which afterwards directs him in his researches.

The coincidence that the centenary of Pasteur occurs at the same time as the centenary of the discovery of racemic or paratartaric acid is worth mentioning on this occasion. This discovery was made by my great-uncle, Charles Kestner, in his works in Alsace.

An important discovery indeed it was. It aroused much attention and was the origin of remarkable work by the most prominent scientists of those days, Berzelius, Gay-Lussac, Mitscherlich, Biot, and many others.

But is this discovery, or rather is paratartaric acid, not also the seed from which twenty-five years afterwards sprang the chemical work of Pasteur, that portion of his work that dominates the whole of his career in the realm of pure chemistry, namely, his research on molecular asymmetry and the relation between this and optical activity?

The wonderful foresight and the great experimental skill of Pasteur provided the base upon which, many years later, Le Bel, my distinguished compatriot, present at this table, and Van't Hoff established the doctrine of the asymmetric carbon atom; the early work of Pasteur on the paratartaric acid obtained from the Alsatian factory in Thann thus proved the foundation of the whole great science of stereochemistry, to which my distinguished friend, Sir William Pope, has of recent years made such important contributions.

As to the biological work of Pasteur, this began at Lille, when a distiller of alcohol, Bigot, encountered difficulties in his fermentation and consulted the young Professor of the Faculty of Sciences of that town. Pasteur recognised that the troubles of the distiller were due to the presence in the vat, alongside the usual alcohol ferment, of other micro-organisms, and in particular certain bacilli which interfered with the fermentation and reduced the yield of alcohol. Pasteur was able to show that, in addition to the alcoholic fermentation, other fermentations developed, which destroyed the sugar without forming alcohol, and he showed that each fermentation corresponded to a characteristic ferment.

The study of the diseases of silkworms which Pasteur somewhat unwillingly undertook at the desire of Dumas and the Minister of Agriculture takes us still further away from pure chemistry, and leads us more into the world of biology and the study of the causes of infectious diseases.

Thus we can see how, driven on by problems which were submitted to him by industry, Pasteur came first to make his fine discoveries in pure chemistry, and, equally driven by other problems submitted by industry, he was obliged to depart more and more from what is properly described as chemistry, and found himself finally definitely engaged in the study of biological phenomena and infectious diseases. But the whole of Pasteur's work is a logical development from the first researches made on paratartaric acid, discovered by a chemical manufacturer.

In the name of the Société de Chimie Industrielle I most heartily thank the Chemical Society for this evidence of the affection shown to our young Association. I thank the Chemical Society for the courtesy and cordiality of the welcome which they have shown us this evening. I thank you in particular, Professor Crossley, for the kind words you have spoken of us. They will touch the hearts of all members of our Association.

In conclusion, I express the hope that the Chemical Society, when it receives our invitation to our meeting this year, will respond by sending a large delegation to visit us.

Professor W. P. WYNNE, D.Sc., F.R.S. (President-elect of the Chemical Society), in proposing the toast of "The Other Guests," said :—

Two years ago the Society was engaged in doing honour to several of its Presidents who had reached their jubilee as Fellows of the Society. On that occasion ladies were present for the first time, but so far as my recollection serves, no comment was made on that very welcome fact. This evening we have a number of ladies present, some of whom, while not Fellows of the Chemical Society, are sufficiently interested in the Society to give us the pleasure of their company. We thank them for their presence, which makes these gatherings so much more sociable than the austere banquets of the years before the war.

Among the other guests included in the toast there are not only the President of the Royal Society, of whose kind references to our work you, sir, have made acknowledgment, but also the Presidents of Societies which have cultivated intensively various departments of chemistry. Many of them are Fellows of this Society, but their presence in an official capacity may perhaps be construed as evidence that the Societies they represent look forward to and desire, as does this Society, that closer co-operation which, when achieved, will enable chemistry to speak with a united voice about all cognate matters which concern the public welfare. It is a matter of history that the grouping together of the scientific societies in Burlington House was due in no small measure to the beneficent activities of the Royal Society. Such provision for science, inadequate as it now is, made an abiding impression on the public mind. The time cannot be far distant when this Society, or the Federal Council for Pure and Applied Chemistry, in the foundation of which we played so prominent a part, will press forward to a solution the most urgent problem that confronts us at the present time, namely, the provision of a central building in which all British chemical societies will be housed, and thus achieve for Chemistry what the Royal Society was so largely instrumental in accomplishing for science in general.

During the war chemistry won for itself in this country a definite measure of recognition as one of the agencies vital to the maintenance and preservation of the State; but this belated appreciation may dwindle unless we first consolidate and then improve our position while opportunity serves. One step at least has been taken in this direction since the beginning of the present year: I refer to the founding of the new journal, "Chemistry and Industry," by the joint enterprise of the Federal Council and the Society of Chemical Industry. We admire the courage and initiative which have led to this development, for the journal is intended not only to be a chemical newspaper serving purely chemical interests, but under the guidance of its versatile editor, Dr. Miall, who is here this evening, will, we hope, carry conviction to the minds of those by whom we are governed—newspaper editors first and foremost; then perhaps, with their aid, local authorities, and it may be in time Whitehall—that neglect of chemistry is incompatible with national progress.

We are glad to welcome as our guests the President of the Association of British Chemical Manufacturers. We owe the members of that Association a very great debt of gratitude for the efforts they have made not only to maintain the heavy chemical industry, but also to provide those materials in small quantities which are so indispensable to research. From our point of view as investigators, they have put at the disposal of research laboratories something like three thousand chemical substances, many of them of a higher order of purity than could be obtained from abroad before the war. These research chemicals are indispensable for our investigations, and yet not a few are produced only in small quantities and probably without profit to those who manufacture them. It may interest the President of the Association to know that the Chemical Society has a Research Fund from which grants are made in aid of research, and it has expressed the wish that chemicals purchased out of these grants shall be of British origin so far as that is possible. If research laboratories follow this lead, it may be hoped the Association will be encouraged eventually to make us independent of foreign sources of supply.

Then we have present with us the President of the Pharmaceutical Society, whom, in view of my old association with pharmacy, I may be permitted specially to welcome. It will be noticed, however, that those who arranged the tables have not placed him next to the President of the Institute of Chemistry, so evidently they are not yet agreed about the use of the terms pharmacist and chemist. This reference to the Institute brings me back to my toast, which is that of the other guests, coupled with the names of Mr. Chaston Chapman and Sir Richard Gregory.

Mr. Chapman needs no introduction to Fellows of the Chemical Society, for not only is he one of ourselves, but as President of the Institute of Chemistry he has built truly and well on the foundation laid by his predecessors in office, so that the status of the profession of chemistry, which is the especial care of the Institute, never stood higher than now.

And of Sir Richard Gregory is it not true to say that through the journal "Nature" he so ably edits, touch is maintained with workers even in obscure fields of research? We do well to be grateful to anyone like him who by a wide outlook over the field of scientific inquiry, in these days of specialisation, enables us to follow progress made in other departments of science than our own. Sir James Walker, ladies and gentlemen, I give you the toast of "The Other Guests," coupled with the names of Mr. Chaston Chapman and Sir Richard Gregory.

Mr. CHASTON CHAPMAN, in reply, said :—

In responding to the toast of your guests to-night I find myself in a rather more difficult position than that of my distinguished friend Sir Richard Gregory, who is also, I see, to respond to this toast, for, unlike him, I am a Fellow of the Chemical Society, and have been a Fellow for a good many more years than I sometimes like to remember. Sir Richard Gregory, as a matter of fact, is appearing before you to-night in his true colours, whereas I feel rather like the wolf of the fable disguised in the sheep's clothing. The somewhat anomalous character I am sustaining here to-night reminds me of a very old story. The story is that of an inmate of a certain lunatic asylum. On one occasion a visitor was being taken round the asylum by an attendant, and in the course of his journey he said, "That is a very interesting man over there. Who is he?" and the attendant said, "Oh! that is a very bad case of monomania. He is all right on every subject but one, but when you get near that he is hopeless." The visitor said, "I should like to have a chat with him," and he did. For a time all went well. The man seemed lucid. Something was then said, and the inmate replied, "My dear sir, I don't think you know to whom you are speaking. Do you know I am the Czar of Russia?" The visitor passed on. A year or so later the same visitor was going through the same institution, and said, "There is my old friend the Czar of Russia. I should like to have a chat with him." The same thing happened. Everything went well at first, until something was said, and then, as before, the inmate said, "Do you know who I am? I am the Emperor of China." The visitor said to the man, "But, the last time I was here you were the Czar of Russia." "Oh, yes," replied the inmate, "but that was by another mother."

Ladies and gentlemen, I have attended a great many dinners of the Chemical Society, and on all those occasions I have been happy to associate myself with the proposers of this toast in drinking the health of our guests. That was as the Czar of Russia. To-night I find myself transformed into the Emperor of China, and in that capacity I have to respond to the very same toast. Well, the "other mother" in this case is quite clearly the Institute of Chemistry, and on behalf of the Institute, which I have the honour to represent to-night, I should like to offer you an expression of our deep appreciation and our cordial thanks. The Institute is at all times happy to be associated with the Chemical Society in anything that makes for the good of chemistry, and we are only too anxious to do anything we can in co-operation with the other societies to insure that chemistry shall take that position to which it is really entitled in the councils of the nation, and that it shall be able to speak with a firmer and stronger voice than has been the case in the past. Those of your guests for whom I have the honour of responding to-night, will feel, as I do, that we have spent an exceedingly interesting evening, and a very happy one, and I am confident it would be their wish that I should offer to you on their behalf our warmest thanks for the very kindly and hospitable manner in which you have received and entertained us.

Sir **Richard Gregory**, who also responded, said :—

It is my duty to pronounce the epilogue upon this most pleasant evening from the point of view, at any rate, of the guests of the Chemical Society. When I was asked to be one of the responders to this toast I derived a considerable amount of satisfaction from the fact that I was to be associated with Mr. Chaston Chapman in that honour. I felt in the position of the schoolboy who said that the mechanical advantage of a long pump handle was that you could get someone else to help you pump. And I have had this evening a very excellent assistant in exerting the amount of energy required to pump out to some extent the expression of our appreciation of the hospitality that has been offered to us.

I can say in the words of the announcement displayed in a French hotel, " The wines of this establishment leave the traveller nothing to hope for." We have as guests little to hope for after the generous hospitality which we have enjoyed this evening. But the formula at this late hour is for the speaker to say that he does not wish to detain the company by inflicting upon his hearers an additional amount of suffering to that to which they have been subjected.

There was once a man in the Wild West who was just about to be swung off on account of committing some act against the laws of the community. He was asked by the sheriff, when the crowd had assembled to witness the function, whether he would like to say anything for Press purposes before he was launched into the other world. He said, " No, thanks. Get on with the job." But an officious person, I think he must have been an editor, came forward and said that he would like to make a few remarks to the assembly, and the man who was about to be hanged was asked if he had any objection. His reply was, " No, not at all, only hang me first." Sometimes, ladies and gentlemen, I think the former alternative might be preferred to the latter in the case of some speakers. But I need scarcely say this does not apply to those that we have heard this evening.

In another vein, however, I may in response to what my friend Professor Wynne has been good enough to say about nature—that is, the journal " Nature "—that it also has its troubles. There was once a schoolboy who described the Press as the mouth-organ of the public. The journal I have the honour of editing tries to suppress the mouth-organ quality, yet we do occasionally get a stunt such as the announcement of a new element of atomic number 72.

My early interests were astronomical, but after thirty years' association, possibly of a superficial kind, with all the sciences, I am afraid that one loses that intensive interest which is essential for progress. And yet astronomy to-day really touches your science of chemistry at many points. A striking illustration of the development is, I think, contained in an article which we published a few weeks ago giving an account of the plant that has been erected in the United States for the production of helium gas. This gas was first discovered in the sun in 1868 by Lockyer, and was not isolated on the earth until twenty-seven years later. It is now being produced at the rate of from forty to fifty thousand cubic feet a day in the United States, and is being compressed and stored in steel cylinders in case of future needs for airships or other purposes. This is a most remarkable development of purely scientific work—linking up the work of the astronomer and the chemist, bringing, as it were, the light of the stars and of the sun down to the earth, and using it to discover a gas for inflating purposes. There is a law in the United States at the present time that no airship shall fly over American territory unless inflated with helium gas. To think that that development should come from a source not known on the earth until twenty-seven years after it had been discovered is an inspiring sign of the value of purely scientific work.

There is only one further point to which I should like to allude, and that is the general idea of the public that science represents only engines and powers of destruction. In this twentieth century of ours and these days of modern civilisation, it is associated in the minds of the people in general with the preparation of poison gases, with high explosives, and with all that these mean for destruction. With the history of helium and other elements in mind, one would like to say that really the voice of science is not in the bomb, is not in the high explosive or in the cloud of poison gas, but in the still small voice which comes from the recesses of the chemical laboratory.

Ordinary Scientific Meeting, Thursday, May 3rd, 1923, at 8 p.m., Professor W. P. WYNNE, D.Sc., F.R.S., President, in the Chair.

The President referred to the loss sustained by the Society in the death of Edward Williams Morley, on February 24th, 1923, who was elected an Honorary Fellow on May 18th, 1904.

Certificates were read for the first time in favour of:

William Norman Allison, 16, Rycroft Road, Fazakerley, Liverpool.
Percy Burgess Domone, 20, Vaughan Gardens, Ilford.
John Clarence Hogg, B.A., College House, Pennywell Road, St. John's, Newfoundland.
Victor Malwin, M.Sc.Tech., 12, Grove Street, Broughton Lane, Manchester.
Samuel Medsforth, M.Sc.Tech., A.I.C., 46, Panmuir Road, Wimbledon, S.W. 20.

Herbert Raymond Moody, A.M., Ph.D., S.B., 63, Hamilton Terrace, New York City.
Harald Nielsen, 13, Firs Avenue, Muswell Hill, N. 10.
Wilfred Alan Wightman, B.A., The University, Leeds.
George Henry Wray, 19B, Church Gate, Loughborough.

The following Certificate has been authorised by the Council for presentation to ballot under Bye-Law I (2):

Frederick William Ford, The Institute Bactériothérapique, Carouge, Geneva, Switzerland.

Messrs. E. E. Turner and E. E. Walker were elected Scrutators, and a ballot for the election of Fellows was held. The following were subsequently declared elected as Fellows:

Kundan Lal Aggarwal, M.Sc.
Sidney Hartley Bales, M.Sc., A.I.C.
Joseph Arthur Baume.
Thomas Vincent Blake.
Jyoti Prokash Bose, M.B.
Frank Arthur Boys.
Joseph Brown.
Richard Burtles, M.Sc.Tech.
Basil Elmsley Coke, O.B.E., B.A.
Ernest Alfred Coppen.
William Everard Davies.
John Dexter, B.A., B.Sc.
Hildyard John Eglinton Dobson.
Maxwell Bruce Donald, M.Sc., A.R.C.S., A.I.C.
Gordon William Dorrell, B.Sc.
Robert George Evans.
Hugh Findlay, F.I.C.
Mary Beatrice Ford, B.Sc.
Willis Alexander Gibbons, A.M., Ph.D.
George Philip Gibson, B.Sc.
Khwaja Habib Hassan, B.Sc.
Thomas Shirley Hele, M.A.
John Thomas Holden, B.Sc.
Robert Fergus Hunter.
Donald Bennett Huntingford, M.Sc., A.I.C.
Joseph Gilbert Jackson, B.Sc.
Robert Barry Johns.
William Hugh Jones, B.Sc.
Narain Das Kehar, B.Sc.
Mary Evelyn Laing, M.Sc.
Wilfrid Leslie Lamb, M.A.
Wilfrid Lawson, M.Sc., A.I.C.
Stephen Miall, LL.D., B.Sc.
Arthur Milnes Morley, B.Sc.Tech., A.I.C.
Kanwal Nain, L.M.S.
Charles Ashe Pelley.
Ronald Arthur Punter, B.Sc., A.I.C.
Ernest Avery Roff, B.Sc.
Albert Rose.
Eugene Rothstein.
Sidney Walter Saunders, B.Sc.
Victor Wallace Slater, B.Sc.
Christopher Caiger Smith, B.Sc.
Daniel Whitehead Steuart, B.Sc.
John Sunderland, B.Sc.
Harold George Turley, B.Sc.
Allan Miles Ward, B.Sc.
Charles Arthur Waters, B.Sc.
Norman Frederick Watterson, B.Sc., A.I.C.
Edward Johnson Wayne.
Edith Muriel Whincop, M.Sc.
Mahomed Yacob, M.B., B.S.

The following papers were read:

"Change of properties of substances on drying. Part II." By H. B. Baker.

"The sodium salts of phenolphthalein." By H. Bassett and P. Halton.

"The action of thiosulphates on cupric salts." By H. Bassett and R. G. Durrant.

"The conditions of reaction of hydrogen with sulphur. Part II. The catalytic effect of oxygen. Part III. On the mechanism of the reaction of hydrogen with sulphur and its catalysis by oxygen." By R. G. W. Norrish and E. K. Rideal.

"Studies of electrovalency. Part II. Co-ordinated hydrogen." By T. M. Lowry.

Meeting held in the Lecture Hall of the Institution of Mechanical Engineers, on Thursday, May 10th, 1923, at 8 p.m., Professor W. P. Wynne, President, in the Chair.

Professor W. H. Perkin delivered the Baeyer Memorial Lecture. A vote of thanks to the Lecturer, proposed by Professor H. E. Armstrong, and seconded by Dr. F. D. Chattaway, was carried with acclamation, Professor Perkin making acknowledgment.

Ordinary Scientific Meeting, Thursday, May 17th, 1923, at 8 p.m., Professor W. P. Wynne, D.Sc., F.R.S., President, in the Chair.

The following were formally admitted Fellows of the Chemical Society: F. Stanley Clarke, Ernest A. Dancaster, A. E. Goddard.

Certificates were read for the first time in favour of:

Alfred Bostock, B.Sc., School House, Lower Bebington, Birkenhead.
John Cleminson, B.Sc., Marionville, Etherley Lane, Bishop Auckland.
James Edward Corless, West Buckland School, South Molton, Devon.
Hans von Euler-Chelpin, Prof., The University, Stockholm.
Eric Hurst, B.Sc., Strathmore, Robinson Street, Chatswood, Australia.
Thomas Roger Lewis, 87, Boundary Road, Wood Green, N. 22.
Richard Arnold Shrewsbury, B.Sc., A.R.C.S., 2, Radnor Avenue, Harrow.

The meeting was then adjourned and the Informal Meeting declared open.

MEETINGS AND LECTURE.

The next Ordinary Scientific Meeting will be held on Thursday, June 7th, 1923, at 8 p.m.

On Thursday, June 14th, 1923, at 8.30 p.m., in the Society's Rooms, a Lecture will be delivered by Professor Charles Moureu, entitled: "Les Gaz Rares des Sources Thermales, des Grisous et Autres Gaz Naturels."

The last Ordinary Scientific Meeting this Session will be held on Thursday, June 21st, 1923, at 8 p.m., when there will be a ballot for the election of Fellows.

List of papers received between April 20th and May 17th, 1923 :

"Studies of electrovalency. Part II. Co-ordinated hydrogen." By T. M. Lowry.

"Investigations on the dependence of rotatory power on chemical constitution. Part XX. The rational study of optical properties: Refraction a constitutive property." By H. Hunter.

"The adsorption of the -B and -C members of the radium and thorium series by ferric hydroxide." By J. A. Cranston and R. Hutton.

"The so-called pre-pressure interval in gaseous explosions." By J. D. Morgan.

"The action of sodium hyposulphite on cupric chloride in aqueous solution." By J. B. Firth and J. Higson.

"Researches on phellandrenes. Part I." By H. G. Smith, E. Hurst, and J. Read.

"The action of sulphuryl chloride on organic substances. Part II." By T. H. Durrans.

"Substitution in vicinal trisubstituted benzene derivatives. Part I." By W. Davies.

"Investigations of the chromates of thorium and the rare earths. Part I. The system: thorium oxide–chromic anhydride–water, at 25°." By H. T. S. Britton.

"Benzopyrylium salts of distyryl ketones. Part II. Salts and metallic complexes of 4′-dimethylamino-2-styrylbenzopyrylium." By J. S. Buck and I. M. Heilbron.

"The freezing-point curve for mixtures of sodium nitrate and potassium nitrate." By H. V. A. Briscoe and W. M. Madgin.

"γ-Oxalyl derivatives of $\beta\beta$-dimethyl- and $\alpha\beta$-dimethylacrylic acids." By L. Higginbotham and A. Lapworth.

"Substitution in the pyrazole series. Haloid derivatives of 3 : 5-dimethylpyrazole." By G. T. Morgan and I. Ackerman.

"The protective action of potassium oleate in water alcohol solutions." By E. K. Rideal and L. L. Bircumshaw.

"Effect of hydrochloric acid on the enolising action of Grignard's reagent." By V. K. Bhagwat.

"Hydroxy-naphthoic acids. Part I." By F. A. Royle and J. A. Schedler.

"Hydroxy-naphthoic acids. Part II." By C. Butler and F. A. Royle.

"The properties of some silver organosols." By J. K. Giles and C. S. Salmon.

"Researches on indium. Part I. Diphenyl indium chloride and phenyl indium oxide." By A. E. Goddard.

"Notes on the quantity and properties of charcoal obtained from various kinds of Siamese woods." By G. Bossoni.

"The polysulphides of the alkali metals. Part IV. The polysulphides of ammonium." By J. S. Thomas and R. W. Riding.

"The isomerism of reduced derivatives of 1 : 4-benzdiazine. Part I. The four stereoisomeric 1 : 2 : 3 : 4-tetrahydro-2 : 3-diphenyl-1 : 4-benzdiazines." By G. M. Bennett and C. S. Gibson.

"The isomorphism of the amides and substituted amides of dichloro- and chlorobromo-acetic acids." By P. V. McKie.

"Reduction of ethyl ethylidenemalonate as affected by choice of reducing agent." By L. Higginbotham and A. Lapworth.

"Mixed crystals and double salts: a comparison of systems containing water, ammonium chloride, and a chloride of manganese, iron, cobalt, nickel, or copper." By A. C. D. Rivett and F. W. J. Clendinnen.

"The reversibility of additive reactions. Part I. The aldol reaction." By E. H. Usherwood.

"Intermittent current electrolysis. Part I. The influence of intermittent current on overvoltage." By S. Glasstone.

"The hydrolysis of the sulphoxide and sulphone of ββ′-dichloroethyl sulphide." By A. E. Cashmore.

"Esterification of oxalic acid." By P. K. Dutt.

"Note on the photosynthesis of amines." By O. W. Snow and J. F. S. Stone.

CERTIFICATES OF CANDIDATES FOR ELECTION AT THE BALLOT TO BE HELD AT THE ORDINARY SCIENTIFIC MEETING ON THURSDAY, JUNE 21ST, 1923.

N.B.—The names of those who sign from "General Knowledge" are printed in *italics*.

Allison, William Norman, 16, Rycroft Road, Fazakerley, Liverpool. British. Analytical Chemist and Technical Chemist. 1905 to 1919 with Messrs. Ayrton Saunders & Co., Ltd., Liverpool, wholesale mfg. Chemists and Druggists. From 1911 to 1919 manager of wholesale drug dept. with this firm. 1919 to 1921 senior works chemist to The Liverpool Borax Co.,

Ltd., Borax Street, Liverpool. 1921 to date, proprietor of The Fazakerley Pharmacy, 422, Longmoor Lane, Fazakerley, Liverpool. 1921 and 1922, assistant lecturer, Chemistry Dept., Holt Technical School, Higher Tranmere, Cheshire. (*Signed by*) George Tate, John Lea, George S. Irving.

Bhagwat, Vinayak Keshav, 528, Shanwar Peth, Poona City (India). Present address, College of Technology, Manchester. Hindoo, British subject. Sir Mangaldas Nathenbhai scholar of the Bombay University. (i) M.Sc. with distinction (Bombay), Moos Gold Medallist, 1919. (ii) A.I.I.Sc. (Bangalore). (iii) Joint author of (*a*) a paper on Alcoholysis (A., 1920, i, 364); (*b*) a paper on Enolisation of Carbonyl Comp. (A., 1920, i, 368). (iv) Professor of Chemistry in Baroda College (India), 1919–1921. (v) At present Research Student, College of Technology, Manchester. (*Signed by*) Frank Lee Pyman, John K. Wood, F. M. Rowe.

Bostock, Alfred, School House, Lower Bebington, nr. Birkenhead, Cheshire. British. Analytical Chemist. B.Sc. (London), 2nd Class Hons. in Chemistry. (*Signed by*) F. S. Kipping, F. C. Laxton, G. Green, B. D. Shaw, J. B. Firth, H. Baines.

Cleminson, John, Marionville, Etherley Lane, Bishop Auckland. British. Chemistry Master. B.Sc. (Durham). Trained at Armstrong College, Newcastle-upon-Tyne. 20 years' experience as a teacher. At present, Senior Chemistry Master at the County Secondary School, Chester-le-Street, Co. Durham. (*Signed by*) H. V. A. Briscoe, J. A. Smythe, P. L. Robinson.

Corless, James Edward, West Buckland Sch., South Molton, N. Devon. British. Teacher. Science Master at West Buckland School. (*Signed by*) Francis Arnall, F. H. Lowe, P. C. Haywood.

Domone, Percy Burgess, 20, Vaughan Gardens, Ilford, Essex. British. Chief Assistant to C. F. Cross (Cross & Bevan). 30 years with Messrs. Cross & Bevan and last 20 years working on cellulose investigations. (*Signed by*) C. F. Cross, E. R. Chrystall, D. R. Davey.

Euler-Chelpin, Hans von, Stockholm. Swedish. Professor of Chemistry at the University of Stockholm. "General Chemistry of the Enzymes," translated by Pope, London, 1912. Member Swedish Academy of Science, Stockholm. Member Biochemical Society, London. (*Signed by*) James Walker, E. F. Armstrong, Frederick Soddy, F. G. Donnan.

Hirst, Frederick Beaumont, "Walmore," Mackenzie St., Sharples, Bolton. British. Chemist to Bolton Co-operative Soc., Ltd. Laboratory Head and Director of Manufacturing Dept., Wholesale Drug Works. Sometime Demonstrator, Practical Chemistry, Manchester School of Pharmacy. Pharmaceutical Chemist. Fellow Worshipful Company of Spectacle Makers, London. Fellow National Association of Opticians. Freeman of the City of London. (*Signed by*) Harry Brindle, Charles Turner, Burke Rushworth.

Hogg, John Clarence, College House, Pennywell Road, St. John's, Newfoundland. English. Vice-Principal and Science Master, The Methodist College, St. John's, Newfoundland. Natural Sciences Tripos, Part I, Cambridge University. Responsible for Science (Chemistry and Physics) in Methodist College (over 600 pupils). On staff of Rugby School (Chemistry and Physics) in 1921 (Advent term). Three months' work on sugars in Chivers' Jam Factory, Histon, Cambs. Now anxious to keep in touch with progressive Chemistry. (*Signed by*) D. James Davies, William J. Pope, W. H. Mills.

Hurst, Eric, "Strathmore," Robinson St., Chatswood, S.W. Research Chemist to the Davis Gelatine (Australia), Ltd. "The Conversion of Allyl Alcohol to Glyceryl Chloro- and Bromo-hydrins," by John Read and Eric Hurst, *Trans. Chem. Soc.*, 1922, Vol. **121**. Two other papers have been accepted by the Chemical Society, but have not yet been published. "A Contribution to the Chemistry of the Phellandrenes," by Eric Hurst, Henry G. Smith, and John Read (read before the Royal Society of N.S.W., Nov. 1, 1922). B.Sc. (with Honours in Organic Chemistry, subjects of graduation being General Chemistry and Organic Chemistry, pure and applied). Two years post-graduate work as Demonstrator and Research assistant in Organic Chemistry Dept., University of Sydney. Also two years' experience with Messrs. Orr & Welch, 80, Hunter St., Sydney, Assayers and Analytical Chemists. (*Signed by*) Charles E. Fawsitt, George Harker, J. C. Earl, J. A. Schofield, Henry G. Smith.

KITA, GEN-ITSU, Institute of Chemical Technology, Imp. University, Kyoto, Japan. Japanese. Professor of Chemical Technology, Kyoto Imperial University, Kyoto, Japan. "Über die Enzyme des Aspergillus oryzae, Wochenschrift für Brauerie (Berlin)," **24**, 460, (1912), "Die Bedentung der technischen Auwendung des Oidium lupuli," Zeitschrift für Spiritusindustrie, **36**, 464, (1913) (*Signed by*) Masumi Chikashigé, Rokuro Nakaseko, Kotaro Shimomura, Akira Shimomura.

KOIZUMI, SHUNZO, Furukawa-cho, Sanjyo-minami, Kyoto, Japan. Japanese. Graduate student of Chemical Institute, College of Science, Kyoto Imperial University. Graduated in 1920 from Department of Chemistry, College of Science, Kyoto Imperial University, with dissertation on "Dialkyl derivatives of *p*-Phenetol Carbamide." Papers: "Electrolytic Oxidation of Alcohols. I. Isoamyl alcohol," Memoirs of the College of Science, Vol. V, No. 6, 1922. (*Signed by*) Masumi Chikashigé, Rokuro Nakaseko, Kotaro Shimomura, Akira Shimomura.

LEWIS, THOMAS ROGER, 87, Boundary Road, Wood Green, N. 2. Welsh. Analytical and Metallurgical Chemist. Very intimate association with the late D. T. Williams, F.C.S., for 25 years in joint collaboration with him in technical advice given to clients upon the merits or otherwise of industrial processes submitted to us by them, also as joint Public Analytical Chemists. (*Signed by*) G. Watson Gray, James Smith, C. Durham Garbutt.

M'CARDELL, ROBERT OSWALD, 11, Gladstone Road, Urmston, Manchester. British. Analytical and Works Chemist. 3 years Salford Technical Institute as a chemical student, instructor in gas defensive measures 1915 to 1918. Chemist at Messrs. Lovensteins prior to the war. At present engaged in soap manufacture and patent scouring agents, also investigating various chemical matters in connection with laundry work, and desirous of keeping in touch with up-to-date chemical literature. (*Signed by*) Ernest Clark, B. Prentice, G. James.

MALWIN, VICTOR, 12, Grove St., Broughton Lane, Manchester. British. Textile Chemist. M.Sc.Tech. (Manchester). Full technological certificate in City and Guilds in Textile Printing. Final certificate in Cotton Dyeing. Twelve months' research at Manchester College of Technology, joint author with Julius Huebner, M.Sc.Tech., F.I.C., F.C.S., of paper on "The Action of Metallic Salts, Soap, and Starch on the Tensile and Ripping Strain" (Transactions of the Society of Chemical Industry, Feb. 23, 1923). (*Signed by*) J. Huebner, Frank Lee Pyman, Edmund Knecht.

MEDSFORTH, SAMUEL, 46, Panmuir Road, W. Wimbledon, S.W. 20. British. Research Chemist. M.Sc.Tech. (Manchester), A.I.C. Research student and demonstrator, College of Technology, Manchester. Part author of papers on "The Sulphonation of Oils," J. S. Dyers and Colourists, and "The Estimation of Acetic Anhydride." Author of "The Promotion of Catalytic

Reactions," *J.C.S.* Research Chemist at the South Metropolitan Gas Co. (*Signed by*) E. V. Evans, Edith H. Pawsey, H. Hollings.

MITCHELL, DOUGLAS STEWART, 33, Loraine Rd., Holloway, N. British. Pharmacist. I have passed the minor examination of the Pharmaceutical Society, and have studied at the Battersea Polytechnic (Chemistry and Pharmacy Dept.) and South Western Polytechnic. (*Signed by*) C. Morton, F. Arnall, J. B. Coleman.

MOODY, HERBERT RAYMOND, 63, Hamilton Terrace, New York City. Professor of Chemistry, Director of the Laboratories College of the City of New York. I have been a Professor of Chemistry for 31 years. I am a graduate of tho Massachusetts Institute of Technology with the degree of S.B. (1892). A graduate of Columbia University, A.M., 1900, Ph.D., 1901. I have written two text-books and published many papers as shown in any published list under my name. My teaching is wholly with advanced students in Chem. Engineering and Research. This department has 1500 students over whom I have entire jurisdiction with the aid of a staff of twenty-five. (*Signed by*) Marston T. Bogert, L. F. Goodwin, Harold J. Roast, *W. R. Lang, J. L. McKee, Alfred E. Macintyre.*

NIELSEN, HARALD, 13, Firs Avenue, Muswell Hill, London, N. 10. Danish. Chemical engineer and gas consulting engineer (100, Victoria Street, London, S.W. 1.). Graduated at Copenhagen, 1910, designed and built gas and chemical plant, particularly nitrogen fixation plant, in this country and abroad. Am the author of many papers and articles on chemical engineering and carbonising matter: "The Ideal Absorption Tower in the Chem. Industry," "Standardisation of Chemical Stoneware," paper before the Ceramic Society of Great Britain on Chemical Stoneware and Plant, etc.; am Ass.M.I.M.E. London and Member of Danish Societies, etc. (*Signed by*) F. Mollwo Perkin, Henry Edward Aykroyd, Harold G. Colman.

NURSE, FREDERICK ALDIS, 30, Oakhill Road, Sutton, Surrey. British. Teacher. 2nd Class Honours B.Sc. (London University). Student in the Department of Chemistry at the Chelsea Polytechnic from Sept. 1918 to July 1922. (*Signed by*) J. B. Coleman, J. C. Crocker, E. H. Nurse.

OLIVER, CYRIL VERNON, 10, Hayle Road, Maidstone, Kent. British. Research Student. B.Sc., 2nd Class Honours in Chemistry, of London University. I desire to keep in touch with the modern progress of Chemistry, through the Society's publications and meetings. (*Signed by*) J. Kenyon, J. L. White, Robert H. Pickard.

PAKRASI, KALI CHARAN, Dakshineswar, Aridat P.O., Bengal. Bengali. Chem. Laby. Asstt., Govt. Test House, Alipore, Calcutta. Passed B.Sc. of the Calcutta University in 1915. (*Signed by*) R. N. Sen, N. Brodie, J. K. Adhya.

PONDER, ARTHUR OSBORNE, Montreal P.Q., Canada. British. Assistant to Vice-President, Dominion Tar and Chemical Co., Ltd., Montreal, Canada. B.A. (New Zealand), B.A. (Oxon). Formerly Lecturer of Balliol College, Oxford. (*Signed by*) H. Hartley, C. N. Hinshelwood, H. R. Raikes, J. M. Mullaly.

RANKIN, JOHN, Exeter College, Oxford. British (Scottish). Research Student in Organic Chemistry. B.Sc. (Applied Chem.), Glasgow. Diploma of the Royal Technical College, Glasgow. A.I.C. (*Signed by*) W. H. Perkin, N. V. Sidgwick, E. Hope, R. D. Haworth, H. R. Raikes.

SCOTT, HENRY RALPH CHAMPION, 5, Selwood Terrace, S. Kensington. British. Chemist and Druggist. Apprenticeship with Messrs. Hughes, of Bournemouth, 4 years. Assistant chemist with Messrs. Atkins of Bayswater, 2½ years. Assistant chemist with M. H. N. Davidge, F.C.S., Ph.C., of Shaftesbury Av., 4 years. Manager for M. Davidge, F.C.S., Ph.C., Central Pharmacy and Davidge Manufacturing, 4 years. Member of the Pharmaceutical Society of Gt. Britain. (*Signed by*) Frank Radcliffe, Samuel Gray Fenton, Leopold Louis Bacarese.

SHREWSBURY, RICHARD ARNOLD, 2, Radnor Avenue, Harrow. English. Junior chemist to manufacturing firm. A.R.C.S., B.Sc. (Lond.). (*Signed by*) James C. Philip, H. F. Harwood, M. A. Whiteley.

TROTMAN, EDWARD RUSSELL, 3, Wellington Circus, Nottingham. English. Student. B.Sc. (Hons. in Chemistry). (*Signed by*) F. S. Kipping, E. B. R. Prideaux, F. C. Laxton.

VEILLON, LOUIS, Brookside, Weston Rhyn, Salop. Swiss. Director and Works Manager, The Graesser Monsanto Chemical Works, Ltd., Ruabon, N. Wales. Diploma, Techn. Chem., Federal Polytechnic, Zurich. Ph.D. University, Zurich. Two years assistant to Prof. G. Lunge and R. Gnehm, Zurich. Formerly works manager and Vice-President, Monsanto Chemical Works, St. Louis, Mo., U.S.A. (*Signed by*) A. W. Titherley, Ernest J. Parry, Francis H. Carr.

WIGHTMAN, WILFRED ALAN, The University, Leeds. British. Demonstrator in Organic Chemistry in the University of Leeds. B.A. (Oxon.), First Class Hons., Chemistry. Position as above; also engaged in organic chemical research. (*Signed by*) J. B. Cohen, P. K. Dutt, S. Ellingworth.

WILLCOX, CYRIL MASON, 4, Worple Avenue, Wimbledon, S.W.19. British. Student of Chemistry. B.A. (Cantab), B.Sc. (Lond.). Scholar of Magdalene College, Cambridge. Preparing for Part II. Natural Science Tripos. (*Signed by*) W. J. Pope, W. H. Mills, Eric K. Rideal.

WILLIAMS, EDWIN, B.Sc. (Lond.), A.I.C., Arosfa, Risca, Mon. British. Director, The Risca Printing Works, Risca, Mon. B.Sc. London University. A.I.C. Now writing a book on " Oil and the Oil Countries." Two world tours visiting oilfields. Research Chemist to Messrs. Lewis & Tylor, Ltd., Cardiff, 1918–1923. (*Signed by*) G. R. Thompson, H. E. Cox, J. H. Canning.

WILLSON, FRANCIS GEORGE, " Langley," Westmount Road, Eltham, S.E.9. British. Research Chemist, Research Dept., Royal Arsenal, Woolwich. " Some Derivatives of Phorone," *J.C.S.*, 1913, p. 2238. " Über Keto-enol Tautomerie," *Berichte*, 1914, pp. 832 and 837. " Die Überführung Aromatische Sulphosäuren in Phenole," *Ber.*, 1914, p. 3160. Works chemist, etc., Ministry of Munitions, 1915–1918. Research chemist and works manager, Cooper Laboratory, Watford, 1919–1921. (*Signed by*) F. Fancis, J. W. McBain, M. Taylor, J. Reilly, R. C. Farmer.

WRAY, GEORGE HENRY, 19B, Church Gate, Loughborough. British. Analytical Chemist. Chief chemist, Brush Electrical Engineering Co., for past seven years, previous to that, nine years as assistant. Fellow of the Royal Microscopical Society. (*Signed by*) A. Bramley, S. F. Burford, C. W. Bailey.

A certificate has been accepted by the Council for presentation to ballot under Bye-Law I (2) in favour of the following:

FORD, FREDERICK WILLIAM, The Institute Bactériothérapique, Carouge, Geneve. British. Bacteriologist (Chemical and Pathological). Associate of the Royal Sanitary Institute. Student Associate of The Pharmaceutical Society of Great Britain. (*Signed by*) Alfred Greeves, R. H. A. Plimmer.

ADDITIONS TO THE LIBRARY.

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, June 7th, 1923, at 8 p.m., Professor W. P. WYNNE, D.Sc., F.R.S., President, in the Chair.

The PRESIDENT referred to the loss sustained by the Society, through death, of:

	Elected	Died
Vaughan Berkeley Harley	March 4th, 1897.	May 21st, 1923.
George Ward	April 21st, 1864.	April 10th, 1923.

Certificates were read for the first time in favour of:

Edward Bertram Anderson, Millhayes, Hemyock, Devon.
James Sinclair Standish Anderson, 15, Banbury Road, Oxford.
Stanley Boulter, B.A., The Oval, Oadby, Leicester.
Edward Sackett Dowing, Otley Rectory, nr. Ipswich.
Albert Thomas Fuller, B.Sc., 54, Trent Road, Brixton, S.W. 2.
Gustavus Charles Gidley, Brynmelyn College, Weston-super-Mare.
Albert Green, B.Sc., The Edward Davies Chemical Laboratories, Aberystwyth.
Digby Richard Lawson, M.A., Woodlea, Hartford, Cheshire.
Sudhindranarayan Ray, M.Sc., 19/4, Madan Mitra Lane, Calcutta.
Ernest Goulding Sharp, 52, Castle Street, Dover.
William Pearson Tervet, Waverley, Compton Park Road, Plymouth.
William Trick Thorne, 40, Canton Road, Shanghai.

The following were formally admitted Fellows of the Chemical Society: E. A. Coppen, H. J. E. Dobson, G. W. Dorell, J. T. Holden, W. J. Osborn, S. W. Saunders, and C. C. Smith.

The following papers were read:

"Investigations on the dependence of rotatory power on chemical constitution. Part XX. The rational study of optical properties. Refraction a constitutive property." By H. HUNTER.

"Researches on indium. Part I. Diphenyl indium chloride and phenyl indium oxide." By A. E. GODDARD.

"The properties of ammonium nitrate. Part VI. The reciprocal salt pair, ammonium nitrate and potassium sulphate." By E. P. **Perman** and W. J. **Howells.**

"Ring-chain tautomerism. Part VI. The mechanism of the keto-cyclol change in the propane series." By E. W. **Lanfear** and J. F. **Thorpe.**

"The reversibility of additive reactions. Part I. The aldol reaction." By E. H. **Usherwood.**

"Mechanism of the pinacone–pinacoline and Wagner–Meerwein transformations." By C. K. **Ingold.**

"Researches on antimony. Part I. Tri-*m*-xylylstibene and its derivatives." By A. E. **Goddard.**

Lecture, Thursday, June 14th, 1923, at 8.30 p.m., Professor W. P. **Wynne**, D.Sc., F.R.S., President, in the Chair.

Professor Charles Moureu, President, Société Chimique de France, delivered his Lecture entitled : "Les Gaz Rares des Sources Thermales, des Grisous et Autres Gaz Naturels." A vote of thanks to the Lecturer, proposed by Professor H. E. Armstrong, and seconded by Sir William Pope, was carried with acclamation.

Ordinary Scientific Meeting, Thursday, June 21st, 1923, at 8 p.m., Professor W. P. **Wynne**, D.Sc., F.R.S., President, in the Chair.

It was announced :

1. That the Council had sealed the following Address, which was presented on the occasion of the Pasteur Centenary Celebrations, May 24th to June 1st, 1923 :

> "The President, Council, and general body of Fellows of the Chemical Society welcome the opportunity afforded by the celebrations of the 100th Anniversary of the birth of Louis Pasteur, of paying their homage to the memory of this great and illustrious scientist.
>
> "It is true that Pasteur played a *rôle* in life of a far wider scope, both human and intellectual, than falls to the lot of the majority of chemists; they remember, however, with pride that Pasteur was originally trained as a chemist, and that it was his peculiar combination of rare experimental skill and consummate deductive reasoning which marked him out as the founder of modern stereochemistry. His researches on the tartaric acids must always stand out as one of the most prominent milestones in the advance of the science of chemistry.
>
> "It was not till his appointment to Lille in 1854 that his

researches took up a new line leading to his fundamental discoveries in fermentation, to be rapidly followed by his investigations dealing with the diseases of silk worms, chicken cholera, anthrax, and finally the masterpiece of his scientific genius, namely, anti-rabies inoculation.

"These discoveries opened out an entirely new realm, namely, that of micro-organisms, and consequently Pasteur is rightly regarded as the founder of the science of bacteriology.

"Though one of the greatest of all experimental scientists, it was perhaps the humane side of Pasteur's character which made him so generally beloved and reverenced. His great desire to advance knowledge for the benefit of humanity surely had a rich reward in that his labours have placed the study of infectious diseases on a truly scientific basis.

"It was Lavoisier who said that the scientist, in the quiet of his laboratory and of his study, can also exercise patriotic functions: he can hope to diminish by his labours the many ills which afflict the human species, and to increase human pleasure and prosperity. And if he should only contribute, by the new methods which he may have shown, to the lengthening of the mean age of man by a few years, or even by a few days, he also may aspire to the glorious title of benefactor of humanity.

"Surely no more striking example of Lavoisier's words could be found than was exemplified by the life and work of Louis Pasteur.

"Signed on behalf of the Council of
The Chemical Society.

W. P. Wynne, *President.*
J. F. Thorpe, *Treasurer.*
James C. Philip, }
Irvine Masson, } *Secretaries.*
Arthur W. Crossley, *Foreign Secretary.*

L.S.

"Sealed in Council this Twenty-first day of June, One thousand nine hundred and twenty-three."

2. That a communication had been received from the Committee of the Van't Hoff Fund for the endowment of research in pure and applied chemistry. The amount from this fund available for distribution during 1924 is about 1400 Dutch florins.

A Committee, consisting of Professor A. F. Holleman (President), Professor S. Hoogewerff, Professor A. Smits, and Mr. J. P. Wibaut (Secretary), has been appointed to award Grants. Applications should be sent before November 1st, 1923, by registered post to: "Het bestuur der Koninklyke Akademie van Wetenschappen; bestemd voor de Commissie van het 'Van't Hoff-fonds,' Trippenhuis, Kloveniersburgwal, te Amsterdam." Every applicant is requested to submit a detailed account of the manner in which he proposes to expend the grant and to state the reasons for which he makes his application.

Papers embodying the results of the research may be published in any journal, but acknowledgment must be made of the source of the grant. Copies of papers containing the results of the research must be forwarded to the Committee.

3. That the following letter signed by twenty Professors, Lecturers, and Assistants of the Oural University, Ekaterinbourg, had been received on the 6th June, 1923:

> To the President and the Council of the Chemical Society.
>
> We undersigned, professors, lecturers and assistants of Oural University Ekaterinbourg,—chemists, physicians, metalurgists and of other specialities, doing their work in connection with Department for Chemistry and Metallurgy, acknowledge hereby the obtaining of boots, clothing, etc., being a donation from the Chemical Society, as is stated in accompagning receipt. We send to the Chemical Society, and to all chemists of United Kingdom our best and kindest thanks for this good help in a very hard time for us and for our families.
>
> We accepted this donation gratefully as a sign of the humanity and a confirmation, once more, of the real international character of science.
>
> We thank also very hearthly for an exemplare of the "Journal of the Chemical Society," 1914—1920; by this rich present we became again participated to the European science, and could follow the great achievements done by chemistry and physics in U.K.
>
> We are sorry, we can answer on your generous sympathy and help by sending only of 2 volumes of the "Proceedings of Oural University" years 1921—1923, in three exemplares, one of which we beg you to accept and to forward two others to Royal Society and to Library of the British Museum. The "Proceedings" content the papers of the various parts of science and have an index in french.
>
> The circumstances in our country are steadily improving and we hope the "Proceedings" will be published more regularly in future. Very many of the researches done in 1914—1923 still await their turn of the print. In the hope

it will be realised in next time more quickly, we allow us to propose an unequal change of our "Proceedings" for your "Journal" years 1921, 1922, 1923, as from 1924 we hope to be able to be regular subscriptors, for our own money.

We thank also very much for your third donation—of £20 which brought for 18 of us a "red egg" for Easter, as we say in Russia.

Considering the continuous improving of the conditions we constate that the help by money or food parcels for the future time is becoming not exigent when not superflous.

With best thanks and wishes,
Yours gratefully and sincerely
(Here follow 20 signatures).

Mr. O. R. Howell was formally admitted a Fellow of the Chemical Society.

. Certificates were read for the first time in favour of:

George Fearnby, 60, Duckworth Lane, Bradford.
Albert Owen Jones, B.Sc., 1, Dark Gate, Carmarthen.
William Henry Sims, 2, Churchville, Radford, Nottingham.
Frank William Witcombe, 85, Holland Road, Maidstone.

The following Certificate has been authorised by the Council for presentation to Ballot under Bye-Law I (2):

Arthur Nicholas Kerry, Jose Cubas 4725, Buenos Aires, Argentine.

Dr. R. C. Farmer and Mr. W. E. Garner were elected Scrutators, and a ballot for the election of Fellows was held. The following were subsequently declared elected as Fellows:

William Norman Allison.
Vinayak Keshav Bhagwat, M.Sc.
Alfred Bostock, B.Sc.
John Cleminson, B.Sc.
James Edward Corless.
Percy Burgess Domone.
Hans von Euler-Chelpin.
Frederick William Ford.
Frederick Beaumont Hirst.
John Clarence Hogg, B.A.
Eric Hurst, B.Sc.
Gen-Itsu Kita.
Shunzo Koizumi.
Thomas Roger Lewis.
Robert Oswald M'Cardell.
Victor Malwin, M.Sc.Tech.
Samuel Medsforth, M.Sc.Tech., A.I.C.
Douglas Stewart Mitchell.
Herbert Raymond Moody, A.M., Ph.D., S.B.
Harald Neilsen.
Frederick Aldis Nurse, B.Sc.
Cyril Vernon Oliver, B.Sc.
Kali Charan Pakrasi, B.Sc.
Arthur Osborne Ponder, B.A.
John Rankin, B.Sc., A.I.C.
Henry Ralph Champion Scott.
Richard Arnold Shrewsbury, B.Sc., A.R.C.S.
Edward Russell Trotman, B.Sc.
Louis Veillon, Ph.D.
Wilfred Alan Wightman, B.A.
Cyril Mason Willcox, B.A., B.Sc.
Edwin Williams, B.Sc., A.I.C.
Francis George Willson.
George Henry Wray.

The following papers were read :

"The constitution of the higher oxide of nickel." By O. R. Howell.

"The relationship of the tautomeric hydrogen theory to the theory of induced alternate polarities." By F. Allsop and J. Kenner.

"Electron valency theories and stereochemistry." By S. Sugden.

"The relative influences of water vapour and hydrogen upon the combustion of carbon monoxide–air mixtures at high pressures." By W. A. Bone, D. M. Newitt, and D. T. A. Townend.

"Metallic hydroxy-acid complexes. Part I. Cuprilactates." By I. W. Wark.

"Metallic hydroxy-acid complexes. Part II. Cuprimalates, their formation, properties, and composition." By I. W. Wark.

"Ring-chain tautomerism. Part VII. The mutarotation of the sugars." By J. W. Baker, C. K. Ingold, and J. F. Thorpe.

LIST OF FELLOWS, 1923.

The List of Fellows for 1923 is being prepared, and changes of address received after July 31st, 1923, cannot be included therein. Fellows whose Christian names and degrees do not appear in full are particularly requested to notify the Assistant Secretary.

The List will be sent to those Fellows only who make application prior to August 31st, 1923.

REPORT OF THE INTERNATIONAL COMMITTEE ON CHEMICAL ELEMENTS.

Copies of this Report, which embodies a Table of Isotopes and a Table of the Radioactive Elements and their Constants, will be supplied to those Fellows only who make application to the Assistant Secretary before August 31st, 1923.

VACATION ARRANGEMENTS.

The Rooms of the Society will be closed for redecoration throughout the month of August, during which period the annual revision of the Library will take place.

Fellows are particularly requested to return all Library Books in their possession not later than Tuesday, July 31st.

During the two weeks September 3rd to 15th the Library will close daily at 5 p.m.

List of papers received between May 18th, 1923, and June 21st, 1923 : *

"The determination of the degree of hydration of salts by a radioactive method." By H. TERREY and V. G. JOLLY.

"Constitutional studies in the monocarboxylic acids derived from sugars. Part I. Tetramethyl galactonolactone and the structure of galactose." By J. PRYDE.

"The coupling of diazonium compounds with monoalkylated acids of the malonic and cyanoacetic series and the action of alkyl nitrites on the esters of monoalkylated cyanoacetic acids." By T. K. WALKER.

"The constitution of sulphur salicylic acid and of related substances." By A. N. MELDRUM and M. S. SHAH.

"The action of bromine on *p*-hydroxy- and *p*-methoxy-sulphonic acids." By A. N. MELDRUM and M. S. SHAH.

"The formation of derivatives of tetrahydronaphthalene from γ-phenyl fatty acids. Part III. The influence of substituents on ring closure." By A. J. ATTWOOD, A. STEVENSON, and J. F. THORPE.

"Phenols in Ajowen oil." By B. R SOBTI and P. SINGH.

"The oxidation of sabinene with hydrogen peroxide." By G. G. HENDERSON and A. ROBERTSON.

"Sintering : its nature and cause." By R. C. SMITH.

"Surface phenomena in sucrose solutions." By R. R. BUTLER.

"Electro-deposition of chromium. Part 1. Deposition from sulphate solution." By A. N. CAMPBELL.

"Studies in the anthracene series. Part V." By E. DE B. BARNETT, J. W. COOK, and M. A. MATTHEWS.

"Piperitone. Part V. The extraction of piperitone from essential oils and the racemisation of *l*-piperitone." By J. READ and H. G. SMITH.

"The refractive dispersion of *iso*eugenol." By G. THOMPSON.

"Cryoscopic measurements with nitrobenzene." By H. M. ROBERTS and C. R. BURY.

"The system ferric oxide–phosphoric acid–water; a new phosphate." By S. R. CARTER and N. H. HARTSHORNE.

"A note on the constitution of benzene. Part II." By R. FRASER.

"The preparation of *N*-derivatives in the carbazole series." By T. S. STEVENS and S. H. TUCKER.

"Catalysis. Part XXIII. Temperature coefficients of some reactions in tropical sunlight." By N. DHAR.

---

* This list does not include the titles of papers which have already been recorded as read at a Scientific Meeting.

"Note on the action of methyl sulphate on diphenylamine." By C. S. Gibson and D. C. Vining.

"The absorption spectra of the vapours of various quinones." By J. E. Purvis.

"The conversion of sabinol into thujene." By G. G. Henderson and A. Robertson.

"Studies on the dolomite system. Part II. An investigation of the conditions of formation of dolomite." By A. E. Mitchell.

"The low-temperature activation of hydrogen." By A. E. Mitchell and A. L. Marshall.

"The isomerism of the oximes. Part XII. Hydrochlorides." By O. L. Brady and F. P. Dunn.

"Photocatalysis. Part IV. The photochemical production of formaldehyde from carbonic acid." By E. C. C. Baly, I. M. Heilbron, and W. F. Barker.

"Complex formation in lead nitrate solutions. Part I. The ternary systems lead nitrate–sodium nitrate–water, and lead nitrate–potassium nitrate–water." By S. Glasstone and H. N. Saunders.

"Electrolytic generator for pure hydrogen." By Viscount Elveden and E. Sinkinson.

"The increased solubility of phenolic bodies in water on addition of a third substance." By C. R. Bailey.

"Cryptoisomerism in the stilbene series." By N. M. Cullinane.

"The odorous and bitter constituents of neem oil." By E. R. Watson, N. G. Chatterjee, and K. C. Mukerjee.

"Triazole compounds. Part I. Some substituted hydroxy-benzotriazoles and their methylation products." By O. L. Brady and J. N. E. Day.

"The estimation of alkalis in rocks by the indirect method." By F. Walker.

"The isomeric *l*-menthyl phenylchloroacetates." By A. McKenzie and I. A. Smith.

"The quinhydrone-electrode as an electrode of comparison." By S. Veiliel.

"New halogen derivatives of camphor. Part III. $\alpha'\beta$- and $\alpha'\pi$-Dibromocamphor." By H. Burgess and T. M. Lowry.

"The dissociation of complex cyanides." By G. J. Burrows.

"Resolution of the $\alpha\delta$-dihydroxy-α-methyl-δ-*iso*propyladipic acids." By T. A. Henry and H. Paget.

"The bromination of compounds containing the carbonyl group. Part I. The bromination of pyruvic acid." By C. F. Ward.

"The bromination of compounds containing the carbonyl grouping. Part II. The bromination of acetophenone." By C. F. WARD.

"The bromination of aliphatic acids." By B. D. SHAW.

"The action of chlorine on amines. Part I. The action of chlorine on aniline." By W. M. CUMMING and D. G. BROWN.

"The reduction of nitronaphthalenes. Part I. The reduction of α-nitronaphthalene." By W. M. CUMMING and J. K. STEEL.

"The hydroferrocyanides and hydroferricyanides of the organic bases. Part II." By W. M. CUMMING.

"Reduction products of the hydroxyanthraquinones. Part II." By J. HALL and A. G. PERKIN.

"The hydrates of potassium and lithium platinocyanides and the system potassium platinocyanide–lithium platinocyanide–water." By H. TERREY and V. G. JOLLY.

"The structure of the benzene nucleus. Part III. Synthetic formation of a bridged phase of the naphthalene nucleus. The constitution of naphthalene and anthracene." By W. A. P. CHALLENOR and C. K. INGOLD.

"The structure of the benzene nucleus. Part IV. The reactivity of bridged linkings." By C. K. INGOLD.

"The action of silica on electrolytes." By A. F. JOSEPH and J. S. HANCOCK.

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, October 4th, 1923, at 8 p.m., Professor W. P. Wynne, D.Sc., F.R.S., President, in the Chair.

The **President** referred to the loss sustained by the Society, through death, of:

	Elected.	Died.
John Bingley	Dec. 15th, 1881.	July 12th, 1923.
George Herbert Leader	June 18th, 1902.	Mar. 17th, 1923.
Herbert McLeod	Feb. 6th, 1868.	Oct. 1st, 1923.
Edmund Knowles Muspratt	Jan. 21st, 1869.	Sept. 1st, 1923.
Walter Tong	May 5th, 1904.	April 13th, 1923.
William George Twiney	Feb. 21st, 1907.	1923.
James Wilson	April 1st, 1875.	June 21st, 1923.

The following were formally admitted Fellows of the Chemical Society: W. B. Adam, R. F. Hunter, H. R. Procter, and A. M. Ward.

Certificates were read for the first time in favour of:

Gopaldas Dharmdas Advani, B.A., B.Sc., c/o S. J. Co-operative Society, Hyderabad, Sind, India.

Yasuhiko Asahina, Dr.Pharm., Pharmaceutical Institute, The University, Tokyo, Japan.

Ernest Edgar Aynsley, B.Sc., School House, Westmoor, Forest Hall, Newcastle-on-Tyne.

Francis Harrold Banfield, B.Sc., 40, Maryland Road, Wood Green, N. 22.

Charles Bateman, 77, Penhevad Street, Grangetown, Cardiff.

John Thomas Burdekin, B.Sc., 27, Crimicar Lane, Fulwood, Sheffield.

John Herbert Bushill, M.Sc., Ingleside, Arthur Road, Erdington, Birmingham.

Atmaram Chakravarti, B.Sc., 29, Ward Institution Street, Calcutta.

Har Sahai Chaturvedi, B.Sc., Colonel Ganj, Cawnpore.

Alfred Chick, 69, Fountain Road, Edgbaston, Birmingham.

Ginori Conti, 56, Via della Scala, Florence, Italy.

Moritz Adolf Dittmar, B.S., Ph.D., 774, Bergenline Avenue, W. New York, U.S.A.

George Thomas Randles Francis, 3, Tregarvon Road, Clapham Common, S.W. 11.

William Hans Gesell, 235, Christopher Street, Montclair, N.J., U.S.A.
Stanley Evans Francis Gooding, B.A., 5, St. Andrews Hill, Cambridge.
Frank Charles Happold, B.Sc., Ostley House, Barrow.
Francis Wood Hardy, B.Sc., Leefield House, Allerton, Bradford.
John Reader Hosking, Sefton St. Wadestown, Wellington, New Zealand.
Julian Michael Samuel Jacobs, B.Sc., 125, Goldhurst Terrace, N.W. 6.
Bennett Alexander Jacobson, 92, Jules Street, Johannesburg, S. Africa.
James Sowden Jennings, B.Sc., Worcester Villas, Godolphin Road, Helston.
William Ross Kane, B.Sc., 77, Glebe Road, Sheffield.
William Clifford Lewis, B.Sc., A.I.C., Inversnaid, Shoreham-by-Sea.
William Maw, B.Sc., 82, Holly Avenue, Newcastle-on-Tyne.
Pasupu Krishnaswami Rajamanikkam Naidu, 52, Pedariar Koil Street, Madras.
Charles Dudley Ryder, c/o Messrs. Lockwood, Magrath, Ltd., 163, Kent Street, Sydney, N.S.W.
Junzo Shinoda, Chemical Department, The University, Manchester.
Kishen Singh, B.Sc., College of Technology, Manchester.
James Muir Smith, B.Sc., 8, Hepscott Terrace, South Shields.
John George Sutherland, B.Sc., Boksburg, Transvaal, S. Africa.
Shoichi Terada, 20, Wakamiya Chō, Ushigome, Tokyo, Japan.
Arthur James Edward Thornton, 38, Battersea Park Road, S.W. 11.
Margaret Grosvenor Tomkinson, D.-ès-Sc., B.A., Chilton, Cleobury Mortimer.
Leslie Ernest Wakeford, 14, Woolstone Road, Catford, S.E. 6.
Isaac Ephraim Weber, B.Sc., 12, Claremont Road, Luton.
Donald Whitley Woodhead, B.Sc., 248, Claremont Road, Moss Side, Manchester.

The following papers were read:

"The direct union of oxygen and sulphur." By R. G. W. Norrish and E. K. Rideal.

"Note on aqueous formaldehyde solution." By W. R. Ormandy and E. C. Craven.

"The interaction of potassium tetroxide with ice and with dilute sulphuric acid." By H. Hawley and H. J. S. Sand.

"Ring-chain tautomerism. Part IX. The effect of the *cyclo*hexane nucleus on the carbon tetrahedral angle." By E. W. Lanfear and J. F. Thorpe.

"The formation of stable β-lactones." By L. Bains and J. F. Thorpe.

Ordinary Scientific Meeting, Thursday, October 18th, 1923, at 8 p.m., Professor W. P. Wynne, D.Sc., F.R.S., President, in the Chair.

The President referred to the loss sustained by the Society through death of:

	Elected.	Died.
John Allen Harker	Dec. 7th, 1916.	Oct. 10th, 1923.
William Brewin Shuttlewood.........	April 17th, 1890.	Oct. 7th, 1923.
William Thomson	Jan. 1st, 1872.	Oct. 4th, 1923.

It was announced that arrangements had been made whereby the publication of abstracts of papers in the domain of both pure and applied chemistry will be directed as from January next by a Bureau consisting of representatives of the Chemical Society and the Society of Chemical Industry, the members nominated by the former being Dr. Irvine Masson, Professor G. T. Morgan, Professor J. F. Thorpe, Professor W. P. Wynne. The Bureau will co-opt a ninth member as Chairman, and will proceed immediately to examine the position with a view to assimilating the abstracts prepared by the two societies into a single publication. In the meantime, however,—certainly until the end of next year—no change in the present format or method of preparing the abstracts was contemplated, apart from that announced at the last meeting.

The following were formally admitted Fellows of the Chemical Society: R. G. W. Norrish and R. A. Shrewsbury

Certificates were read for the first time in favour of:

Geoffrey Gordon Barker, B.Sc., 10, Wellington Terrace, Sutton Coldfield.
Louis Leighton Bircumshaw, B.A., M.Sc., 68, Southdown Road, West Wimbledon, S.W. 20.
Samuel Coffey, M.Sc., Ph.D., A.I.C., 6, St. Paul's Avenue, N.W. 2.
James Joseph Doolan, B.Sc., A.I.C., 46, Michael Street, Waterford.
Phani Bhusan Ganguly, M.Sc., 54, Amhurst Park, N. 16.
Frank Leslie Garton, B.A., A.I.C., 14, Craven Avenue, Ealing, W. 5.
Dwarkanath V. Gogte, B.Sc., Khamgaon, C.P., India.
Alfred Thomas Healey, 79, Pope's Avenue, Twickenham.
Cecil John May, 19, Tyndale Place, Islington, N. 1.
Henry Compton Mills, B.A., B.Sc., 25, Cape Road, Warwick.
Donald Powell, 73, Sedgeford Road, Shepherd's Bush, W. 12.
James Rushworth, 11, Smithy Carr Lane, Brighouse.
Colin Kenneth Taylor, B.A., 21, Cromwell Road, S. Kensington, S.W. 7.
Percival Elisha Turner, B.Sc., A.I.C., Bath Road, Beenham, Reading.
Oswald James Walker, B.Sc., 24, Buccleuch Place, Edinburgh.

The following Certificate has been authorised by the Council for presentation to ballot under Bye-Law I (2):

Robert Lissenborough, Sugar Works, Cawnpore.

The following papers were read:

"The chemistry of the glutaconic acids. Part XV. Three-carbon tautomerism in the *cyclo*propane series. Part II." By F. R. Goss, C. K. Ingold, and J. F. Thorpe.

"Studies of electrovalency. Part III. The catalytic activation of molecules and the reaction of ethylene and bromine." By R. G. W. Norrish.

"The preparation and properties of selenium trioxide and chloroselenic acid." By R. R. le G. Worsley and H. B. Baker.

"The chemistry of polycyclic structures in relation to their homocyclic unsaturated isomerides. Part V. Orientation in the *gem*-dimethyl*dicyclo*pentene series." By R. C. Grimwood, C. K. Ingold, and J. F. Thorpe.

NOTICES.

The attention of Fellows is drawn to the following important notices :

1. The Van der Waals Memorial Lecture will be delivered by Dr. J. H. Jeans, M.A., Sec.R.S., at the Institution of Mechanical Engineers, Storey's Gate, Westminster, S.W. 1., on Thursday, November 8th, 1923, at 8 p.m.

2. A meeting of the Research Fund Committee will be held in December next. Applications for Grants, to be made on forms obtainable from the Assistant Secretary, must be received on or before Saturday, December 1st, 1923.

All persons who received Grants in December, 1922, or December of any previous year, whose accounts have not been closed by the Council, are reminded that reports must be returned by December 1st.

3. The post-card issued with the circular letter *re* Publications for 1924 on July 30th should be filled in and returned without delay.

4. All papers submitted to the Chemical Society must now be accompanied by a short *précis*—not exceeding in general 300 words—setting out the broad results of the investigations. This *précis* will be utilised in the preparation of (1) the report of any meeting at which the paper is read, and (2) an official abstract which is to appear in the volume of Abstracts subsequent to the publication of the paper in the Journal of the Society.

5. The *Journal of Physical Chemistry* will be issued monthly from January, 1924, onwards, under the joint auspices of the American Chemical Society, the Chemical Society, and the Faraday Society. The price will be $10 to the public and $8, post free, to any member of the three Societies who subscribes direct. Any Fellow desiring to become a subscriber for 1924 should forward his application, together with a remittance for $8, to the *Journal of Physical Chemistry*, Ithaca, N.Y., U.S.A., before December 1st, 1923.

List of papers received between June 22nd and October 18th, 1923: (This list does not include the titles of papers which have

been read at a Scientific Meeting, or which have appeared in the Transactions).

"Metallic hydroxy-acid complexes. Part III. The constitution of cuprimalates and analogous compounds." By I. W. Wark.

"The catalytic decomposition of hydrogen peroxide solution by carbons prepared from carbohydrates." By J. B. Firth and F. S. Watson.

"Use of zinc amalgam in the evolution method for determination of sulphur in iron and steel." By T. Ashida.

"The oxidising properties of sulphur dioxide. Part V. Theoretical." By W. Wardlaw and N. D. Sylvester.

"Action of hydrazine hydrate on phenanthraquinone." By S. Dutt and N. K. Sen.

"Dyes derived from thiodiphenylamine. Part II." By B. K. Sen and S. Dutt.

"The adiabatic cooling of water and the temperature of its maximum density as a function of pressure." By N. A. Pushin and E. V. Grebenshchikov.

"Cholesterol and its *rôle* in the organism." By S. Minovici.

"Ring-chain tautomerism. Part VIII. The $\alpha\beta\beta$-trisubstituted glutaric acid type." By K. C. Pandya and J. F. Thorpe.

"Inorganic complex salts. Part III. Racemisation and the stability of complex ions." By W. Thomas and R. Fraser.

"A revision of the dissociation constant of weak inorganic acids. Part I. Boric acid." By E. B. R. Prideaux and A. T. Ward.

"The bromine compounds of phenanthrene. Part II." By H. Henstock.

"The action of ozonised oxygen on mercury." By V. O. J. Hodgson and H. B. Baker.

"The accurate determination of boiling-point elevation." By K. Jablczynski and S. Kon.

"The sulphonation of *p*-substituted phenylcarbamides." By J. R. Scott.

"Chloro-*o*-xylenols. Part I. (5-Chloro-*o*-3-xylenol)." By L. E. Hinkel.

"Chloro-*o*-xylenols. Part II. (6-Chloro-*o*-3-xylenol)." By L. E. Hinkel and W. T. Collins.

"Chloro-*o*-xylenols. Part III. (5-Chloro-*o*-4-xylenol)." By L. E. Hinkel and E. E. Ayling.

"A revision of the dissociation constants of weak inorganic acids. Part II. Phosphoric acid." By E. B. R. Prideaux and A. T. Ward.

"Intermittent current electrolysis. Part II. Overvoltage study of the lead electrode." By S. Glasstone.

"The influence of catalysts on the production of potassium perchlorate by the action of heat on potassium chlorate." By W. Farmer and J. B. Firth.

"The condensation of aromatic aminosulphonic acids with *iso*cyanic acid, phenyl *iso*cyanate, and cyanamide." By J. R. Scott and J. B. Cohen.

"Phenomenon of periodicity with reference to the heteromorphism of calcium carbonate. Preliminary note." By M. Copisarow.

"The partial pressures of sulphuric acid over concentrated aqueous solutions of the acid at high temperatures." By J. S. Thomas and A. G. Ramsay.

"Synthesis of substituted thianthrens. Part II." By S. Krishna.

"Quantitative measurements of the reactivity of the halogens in aromatic compounds." By A. H. Rheinlander.

"An examination of the variation in the degrees of hydrolytic dissociation of some oxime-hydrochlorides with dilution." By L. B. Tansley.

"Synthesis of derivatives of phenothioxin." By S. Krishna.

"*p*-Bromophenyltrimethylammonium perhalides." By T. H. Reade.

"*p*-Iodophenyltrimethylammonium perhalides." By T. H. Reade.

"Studies in nitrations. Part I. The mono-nitration of phenol." By F. Arnall.

"Studies in nitrations. Part II. The estimation of the nitrophenols. A new method of thermal analysis." By F. Arnall.

"Studies in nitrations. Part III. The velocity of nitration of phenol." By F. Arnall.

"Studies in nitrations. Part IV. The quantitative preparation of some derivatives of the nitrophenols." By F. Arnall.

"Unsaturation in some anilide derivatives of citraconic and mesaconic acids." By W. A. Joiner.

"Note on cadmium sulphide and the determination of cadmium." By A. C. G. Egerton and F. V. Raleigh.

"On the vapour pressure of cadmium and its alloys with zinc." By A. C. G. Egerton and F. V. Raleigh.

"Organic derivatives of silicon. Part XXIX. The preparation, properties, and condensation products of di-*p*-tolylsilicanediol. By H. S. Pink and F. S. Kipping.

"The reaction between *p*-dibromobenzene and magnesium." By H. S. Pink.

"Note on the reduction of *m*-methoxybenzyl bromide by hydrogen iodide." By J. B. Shoesmith.

"On a new type of reduction–oxidation system. Part I. Cystein and glutathione." By M. Dixon and J. H. Quastel.

"The properties of neighbouring hydroxy-groups attached to a benzene nucleus." By R. L. Alimchandani.

"The additive formation of four-membered rings. Part II. The conditions which confer stability on the dimethinediazidines." By C. K. Ingold and H. A. Piggott.

"On the preparation of 2 : 3-, 2 : 5-, and 3 : 4-dinitrotoluenes." By H. J. Page and B. R. Heasman.

"On the nitration of *p*-dichlorobenzene." By H. J. Page and B. R. Heasman.

"The melting-point (solidus) curve for mixtures of potassium nitrate and sodium nitrate." By W. M. Madgin and H. V. A. Briscoe.

"The polymorphism of potassium dichromate." By P. L. Robinson and H. V. A. Briscoe.

"Colour and molecular geometry." By J. Moir.

"Sodium 6-chloro-5-nitro-*m*-toluenesulphonate—a new reagent for potassium." By H. Davies and W. Davies.

"A new method for the resolution of asymmetric compounds. A reply." By J. B. Cohen.

"A condensation of aryldiazonium salts with monoalkylated malonic acids." By T. K. Walker.

"The preparation of glycollic acid from formaldehyde." By D. L. Hammick and A. R. Boeree.

"Substitution in vicinal trisubstituted derivatives. Part II." By W. Davies and L. Rubenstein.

"The sorption of iodine by carbons prepared from paraffin hydrocarbons, carbon dioxide, and from oxidation products of wood charcoal with fuming nitric acid." By J. B. Firth and J. Higson.

"Studies in organic polysulphides. Part I. The action of anhydrous potassium pentasulphide on some alkyl halides." By R. W. Riding and J. S. Thomas.

"The preparation and chlorination of αβ-alkylacylcarbamides." By E. Roberts.

"The cyanine dyes. Part VII. A new method of formation of the carbocyanines and the constitution of the thio*iso*cyanines and of kryptocyanine." By W. H. Mills and W. T. K. Braunholtz.

"A quantitative investigation of the photochemical interaction of chlorine and hydrogen." By M. C. C. Chapman.

"The calculation of curves of mixed acids from the constants, and a universal buffer mixture." By E. B. R. Prideaux and A. T. Ward.

"Note on the separation of octoic and decoic acids from cocoanut oil." By E. E. Walker.

"The dissociation of certain oxalato-salts." By G. J. Burrows and G. Walker.

"The relation between viscosity and vapour pressure of liquids.. Part I." By R. K. Sharma.

"Dyes derived from phenanthraquinone. Part IV. Anilinoflavindulines and phenanthraquinoneazo-dyes." By A. C. Sircar and D. C. Roy.

"Experiments on the synthesis of the polyacetic acids of methane. Part VIII. An improved synthesis of methanetriacetic acid." By M. H. Dreifuss and C. K. Ingold.

"Use of the quinhydrone electrode for the estimation of amino-acids of acidic and basic functions." By L. J. Harris.

"Some derivatives of the vinyldiacetonalkamines." By F. S. Kipping.

"A note on the action of hydrogen chloride on methyl alcohol." By S. R. Carter and J. A. V. Butler.

"The chemistry of Posidonia fibre. Part I." By J. C. Earl.

"The interaction of ββ′-dichloroethyl sulphide, sulphoxide, and sulphone with glycine ester and with potassium phthalimide." By A. E. Cashmore and H. McCombie.

"The diazo-transformations of some aminocoumarins and aminonaphthapyrones." By B. B. Dey and H. Dalal.

"Some bromonitrocoumarins and their reaction with alkalis." By B. B. Dey and K. K. Row.

"The action of sodium sulphite on coumarins." By B. B. Dey and K. K. Row.

"Note on Glasstone's discussion of overvoltage-measurement." By H. J. S. Sand and E. J. Weeks.

"Succinyl-fluorescein." By S. Biggs and F. G. Pope.

"ω-Trichloro- and ω-tribromoquinaldine and the preparation of quinaldinic acid." By D. L. Hammick.

"The interaction of bromine with acetic anhydride." By K. J. P. Orton, H. B. Watson, and J. E. Bayliss.

"The interaction of primary amines and 2-dithiobenzoyl." By E. W. McClelland and J. Longwell.

"The influence of added substances on the reduction of iodic acid by sulphurous acid." By F. W. Stoyle.

"The relationship between colour and constitution in the nitrobenzaldehyde hydrazones." By F. D. Chattaway and G. R. Clemo.

"Properties of mixtures of aniline, water, and some fatty acids." By J. R. Pound and R. S. Russell.

"The freezing-point curves of binary mixtures of some substituted acetanilides." By G. Owen.

"The influence of anions on the coagulation of negatively charged suspensoids." By J. N. Mukherjee and S. G. Chaudhuri.

"Electro-osmotic experiments on the reversal of the electrical charge of colloids and precipitates and the preparation of stable sols with a charge opposite in sign to that commonly obtained." By J. N. Mukherjee and B. C. Roy.

"Kinetics of the process of coagulation of colloids in the light of Smoluchowski's theory." By J. N. Mukherjee and S. K. Majumdar.

"The adsorption of acids by silica in its relation to the nature of soil-acidity." By J. N. Mukherjee and K. C. Bhattacharya.

"The corrosion of iron in water and in neutral salt solutions." By J. A. N. Friend.

"The density and viscosity of acetone at low temperatures." By E. H. Archibald and W. Ure.

"Piperitone. Part VI. The reduction of piperitone." By R. S. Hughesdon, H. G. Smith, and J. Read.

"The photochemical reactivity of ozone in presence of other gases. Part I." By R. O. Griffith and W. J. Shutt.

"The photochemical reactivity of ozone in presence of other gases. Part II." By R. O. Griffith and J. MacWillie.

"The solubility of the phenylenediamines and of their monoacetyl derivatives." By N. V. Sidgwick and J. A. Neill.

"The solubility of the hydroxybenzaldehydes and the hydroxytolualdehydes." By N. V. Sidgwick and E. N. Allott.

"Products of the destructive distillation of anthraquinone-α- and -β-sodium-sulphonates." By A. G. Perkin and W. G. Sewell.

"Substituted phenyldichloroamines." By K. J. P. Orton and J. E. Bayliss.

"Derivatives of (1) thionaphthacoumarin." By S. Smiles and L. R. Hart.

"Derivatives of the four isomeric sulphonic acids of *m*-tolyl methyl ether." By R. D. Haworth and A. Lapworth.

"Optical activation of racemic acid by *d*-malic acid." By A. McKenzie, H. J. Plenderleith, and N. Walker.

"The formation and stability of spiro-compounds. Part XI. Bridged spiro-compounds from *cyclo*pentane." By C. K. Ingold, E. W. Lanfear, and J. F. Thorpe.

"A new absorption pipette for gas analysis." By S. W. Saunders.

"The action of hydrogen sulphide on lithium ethoxide–lithium hydrosulphide." By J. H. Jones and J. S. Thomas.

"The condensation of aldehydes with cyanoacetamide." By R. H. Curtis, J. N. E. Day, and L. G. Kimmins.

"The action of highly concentrated hydrochloric acid on cellulose and on some derivatives of glucose and of xylose." By E. L. Hirst and D. R. Morrison.

ADDITIONS TO THE LIBRARY.

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

2 JAN 1924

Ordinary Scientific Meeting, Thursday, November 1st, 1923, at 8 p.m., Professor W. P. Wynne, D.Sc., F.R.S., President, in the Chair.

The **President** referred to the loss sustained by the Society, through death, of the following Fellows:

	Elected.	Died.
Walter Stanley Haines	Dec. 15th, 1892.	Jan. 27th, 1923.
John Edward Stead	Nov. 16th, 1882.	Oct. 31st, 1923.

The following were formally admitted Fellows of the Chemical Society: R. Child, B. W. A. Crutchlow, J. N. Dean, C. M. Willcox.

Certificates were read for the first time in favour of:

Charles Rowan Barker, 78, Liverpool Street, Paddington, Sydney, N.S.W.
The Rt. Hon. Viscount Exmouth, The Chemical Industry Club, 2, Whitehall Court, S.W. 1.
Stanley Thomas Henderson, B.A., B.Sc., 50, Cambridge Avenue, N.W. 6.
Thomas Hopkins, M.Sc., F.I.C., Glanwern, King George Avenue, Llanelly.
Francis Lions, B.Sc., 17, Lincoln Grove, Chorlton-on-Medlock, Manchester
Henry Oates Richardson, Ashworth House, Ashworth Road, Dewsbury.
Neil Gillies Ross, Caroni Estate, Caroni, Trinidad.
Harold Roberts Stevens, B.A., 9, Panton Street, Cambridge.
Russell Gibson Thin, B.Sc., A.I.C., 2, Chalmers Crescent, Edinburgh.

The following papers were read:

"The rapid admixture of hot combustible gases with air." By F. M. Gray and W. E. Garner.

"The determination of surface tension from the maximum pressure in bubbles. Part II." By S. Sugden.

"The variation of surface tension with temperature and some related functions." By S. Sugden.

"Muconic and hydromuconic acids. Part III. Valency interchange in the hydromuconic system." By E. H. Farmer.

"Experiments on the synthesis of substances possessing the Ladenburg formula. Part I. Derivatives of *cyclo*propyl*cyclo*propane." By E. H. Farmer.

Meeting held in the Lecture Hall of the Institution of Mechanical Engineers, on Thursday, November 8th, 1923, at 8 p.m., Professor W. P. WYNNE, F.R.S., President, in the Chair.

Dr. J. H. JEANS, Sec.R.S., delivered the Van der Waals Memorial Lecture. A vote of thanks to the Lecturer, proposed by Professor F. G. Donnan, and seconded by Dr. N. V. Sidgwick, was carried with acclamation, Dr. Jeans making acknowledgment.

Ordinary Scientific Meeting, Thursday, November 15th, 1923, at 8 p.m., Professor W. P. WYNNE, D.Sc., F.R.S., President, in the Chair.

The PRESIDENT referred to the loss sustained by the Society, through death, on October 9th, 1923, of John While Alcock, who was elected a Fellow on June 16th, 1892.

The PRESIDENT made the following announcements:

1. Fellows are reminded that in accordance with the circulars issued in July and November, replies regarding the publications of the Society for 1924 should be sent in as soon as possible, and the attention of Fellows is directed to the following resolution of Council passed at its meeting on November 15th, 1923:

"That no publications of the Society other than the Journal be sent to those Fellows who have not made application by the 31st December, 1923, this period to be extended at the discretion of the Officers in the case of Fellows resident abroad."

2. The Bureau of Chemical Abstracts, which, as Fellows are aware, has been formed on the basis of agreement between the Chemical Society and the Society of Chemical Industry, has now been completely constituted as follows:

Chairman: Professor J. C. Philip.

Representatives of the Chemical Society: Dr. I. Masson, Professor G. T. Morgan, Professor J. F. Thorpe, and Professor W. P. Wynne.

Representatives of the Society of Chemical Industry: Dr. E. F. Armstrong, Mr. Julian L. Baker, Mr. E. V. Evans, and Sir William J. Pope.

The Committee has already met and is making arrangements for the issue of Abstracts for 1924 in two sections, (*a*) Pure Chemistry, and (*b*) Applied Chemistry. So far as 1924 is concerned, these sections will be practically of the same form as the Abstracts at present issued by the Chemical Society and the Society of Chemical Industry, respectively.

As the result of negotiations between the Chemical Society and the Society of Chemical Industry, it has been agreed that Members of the Society of Chemical Industry may procure the Abstracts in pure chemistry for 1924 for the sum of £1 10*s*., and, further, that Fellows of the Chemical Society can obtain *Chemistry and Industry* for 1924 for the sum of £1 and the Abstracts in applied chemistry for 1924 for the sum of £1 10*s*., or, alternatively, both these publications for 1924 for £2.

Those Fellows of the Chemical Society desiring these publications of the Society of Chemical Industry must apply direct to the Society of Chemical Industry.

3. In accordance with the Trust Deed governing the Harrison Memorial Fund, a Selection Committee consisting of the Presidents of The Chemical Society, The Institute of Chemistry, The Society of Chemical Industry, and The Pharmaceutical Society will meet shortly to consider the first award of the Harrison Memorial Prize.

The Prize, of the value of about £150, is to be awarded to the chemist of either sex, being a natural born British subject and not at the time over thirty years of age, who, in the opinion of the Selection Committee, during the previous five years has conducted the most meritorious and promising original investigations in any branch of pure or applied chemistry and published the results of those investigations in a scientific periodical or periodicals.

Provided that in the opinion of the Selection Committee there is a candidate of sufficient distinction to warrant an award of the Prize, the first award is to be made in December, 1923.

The Selection Committee is prepared to receive applications, nominations, or information as to candidates eligible for the Prize. Any such communication must be received by the President of the Chemical Society not later than Monday, 10th December, 1923.

The following were formally admitted Fellows of the Chemical Society: N. K. Adam, H. Baines, C. S. Gibson, C. S. Grace, C. K. Ingold, J. F. Thorpe, and D. C. Vining.

Certificates were read for the first time in favour of:

Wilfrid Barnard S. Bishop, B.Sc., Tamar, Miller Street, Petersham, N.S.W.
Reginald Stanley Crowle, 38, Devonshire Road, Millom.
William Murdoch Cumming, B.Sc., F.I.C., 31, Mossgiel Road, Newlands, Glasgow.
John Dall, 42, Bruntsfield Place, Edinburgh.
Philip Eggleton, B.Sc., 45, King's Road, Kingston-on-Thames.
Paul Kestner, 38, Rue Ribera, Paris-Auteuil.
Frederick Measham Lea, M.Sc., A.I.C., 31, Greenway, Uxbridge.
James Ritchie Park, B.Sc., 164, Lessingham Avenue, Tooting, S.W. 17.
Roger Laurent Felix Robert, 43, Pine Road, Didsbury, Manchester.

*

Max Rubin, c/o P.O. Box 1140, Johannesburg.
Alexander Smith Russell, D.Sc., 4, Moreton Road, Oxford.
Harold Schofield, St. John's College, York.
Frank Percy Walton, 121, Culverley Road, Catford, S.E. 6.

A Certificate has been authorised by the Council for presentation to ballot under Bye-Law I (2), in favour of:

Lionel O. P. Walsh, 242, Westmount Boulevard, Montreal.

The following papers were read:

"Ring-chain tautomerism. Dynamical evidence relating to the mutarotation of the sugars." By J. W. BAKER, C. K. INGOLD, and J. F. THORPE.

"An *X*-ray investigation of certain organic acid esters and other long chain compounds." By G. SHEARER.

"Certain further *X*-ray measurements of long chain compounds and a note on their interpretation." By A MÜLLER and G. SHEARER.

"The constitution of the disaccharides. Part IX. Gentiobiose: its identity with amygdalin biose." By W. N. HAWORTH and B. WYLAM.

"The constitution of raffinose." By W. N. HAWORTH, E. L. HIRST, and D. A. RUELL.

List of papers received between October 19th and November 15th, 1923. (This list does not include the titles of papers which have been read at a Scientific Meeting, or which have appeared in the Transactions.)

"Reactions at the interface of two immiscible liquids and the part played by the vapour of each. The reaction between water and benzyl chloride." By G. HARKER.

"The life period of the overvoltage compounds." By E. NEWBERY.

"Alkyl hypochlorites." By F. D. CHATTAWAY and O. G. BACKEBERG.

"The chemical constitution of bacterial pigments. Part 1. The isolation of pyocyanine and the preparation of its salts." By H. McCOMBIE and H. A. SCARBOROUGH.

"Dihydropentindole and its derivatives. Part I." By W. H. PERKIN and S. G. P. PLANT.

"Yohimbine (quebrachine). Part III. Esterification of yohimbic acid." By E. FIELD.

"Ortho-, meta-, and para-substitution in the benzene ring." By H. G. RULE.

"The saponification of methyl and ethyl formates by water, the ionisation constant of water, and the dissociation constant of formic acid." By F. Bell and W. H. Patterson.

"The reaction between copper and nitrogen peroxide." By J. R. Park and J. R. Partington.

"The composite nature of zirconium." By G. Hevesy and V. T. Jantzen.

"The decomposition of substituted carbamic chlorides by hydroxy-compounds. Part I. The reaction between methyl phenyl carbamic chloride and ethyl alcohol at different temperatures." By T. W. Price.

"A thermostat refrigerator." By K. C. D. Hickman.

"A laboratory water motor." By K. C. D. Hickman.

"Optical rotation and the polarity of groups attached to the asymmetric atom. Part I." By H. G. Rule.

"Tautomerism of amidines. Part III. The alkylation of open-chain amidines" (*continued*). By F. L. Pyman.

"The additive formation of four-membered rings. Part III. A system of nomenclature for heterocyclic four-membered rings and the formation and properties of some derivatives of β-methylenedi-imineoxide." By C. K. Ingold.

"A synthesis of *m*-opianic acid." By W. H. Perkin and F. W. Stoyle.

"Some camphoryl-urethanes and their physiological action." By H. E. Fierz-David and W. Müller.

"Studies in fluorescence spectra. Part I. Some benzenoid hydrocarbons." By J. K. Marsh.

"An improved filter-pump." By K. C. D. Hickman.

"The diffusion potentials and ionic mobilities of benzoates and salicylates compared with the corresponding values in a membrane of parchment paper." By E. B. R. Prideaux and W. E. Crooks.

"The estimation of ferrocyanides." By W. M. Cumming.

"The constitution of polysaccharides. Part VII. Esparto cellulose." By J. C. Irvine and E. L. Hirst.

"A synthetic fat containing a methylglucoside residue." By J. C. Irvine and H. S. Gilchrist.

"The condensation of mannitol with olive oil." By J. C. Irvine and H. S. Gilchrist.

"Bactericidal action of the tellurium derivatives of aliphatic β-diketones." By G. T. Morgan, E. A. Cooper, and A. W. Burtt.

"Interaction of tellurium tetrachloride and the higher β-diketones. Part I." By G. T. Morgan and H. D. K. Drew.

"Interaction of tellurium tetrachloride and the higher β-diketones. Part II." By G. T. MORGAN and R. W. THOMASON.

"Interaction of tellurium tetrachloride and the higher β-diketones. Part III." By G. T. MORGAN and E. HOLMES.

"The dependence of polarisation-overvoltage on hydroxyl and hydrogen-ion concentration. Part I. Polarisation-overvoltage of an antimony cathode in aqueous alkaline solutions." By H. J. S. SAND and E. J. WEEKS.

"Tetrachloroiodides of organic bases." By F. D. CHATTAWAY and F. L. GARTON.

"The electrolysis of potassium oleate." By G. W. F. HOLROYD and J. E. W. RHODES.

"6-Methyl-1 : 2 : 8-trimethoxyanthraquinone and 7-methyl-1 : 2 : 8-trimethoxyanthraquinone." By J. L. SIMONSEN.

"The labile nature of the halogen atom in organic compounds. Part X. The halogenation of acetylsuccinic ester." By A. K. MACBETH and D. TRAILL.

"Preparation and reactions of the dihalogendinitromethanes." By R. A. GOTTS and L. HUNTER.

"The methoxyindoles and their derivatives." By K. G. BLAIKIE and W. H. PERKIN.

"Harmine and harmaline. Part VII. A synthesis of *apo*harmine and of certain carboline and copyrine derivatives." By W. LAWSON, W. H. PERKIN, and R. ROBINSON.

"Some substitution derivatives of aurin." By C. H. SPIERS.

"Some oxidation products of β-pinene." By G. G. HENDERSON and D. CHISHOLM.

"The chlorohydrins of β-pinene." By G. G. HENDERSON and C. A. KERR.

"The relation between the glow of phosphorus and the formation of ozone." By W. E. DOWNEY.

CERTIFICATES OF CANDIDATES FOR ELECTION AT THE BALLOT TO BE HELD AT THE ORDINARY SCIENTIFIC MEETING ON THURSDAY, DECEMBER 6TH, 1923.

N.B.—The names of those who sign from "General Knowledge" are printed in *italics*.

ADVANI, GOPALDAS DHARMDAS, c/o S. J. Co-operative Society, Hyderabad Sind), India. Lecturer. B.A., B.Sc. (Bomb.), A.I.I.Sc. Worked with Dr. J. J. Sudborough of the Indian Institute of Science, Bangalore, on the esterification of polymethylene monocarboxylic acids and corresponding open-chain acids; published a paper on the above in the Journal of the

Indian Institute of Science. (*Signed by*) H. E. Watson, Gilbert J. Fowler Fred Marsden, M. O. Forster, *F. L. Usher.*

ANDERSON, EDWARD BERTRAM, Millhayes, Hemyock, Devon. British. Inside manager and control chemist to Dried Milk Dairy Products, Co., Ltd., Hemyock, Devon. 7 Years research chemist to John Power & Sons, Ltd., John's Lane Distillery, Dublin; 2½ years chemist, nitroglycerine section, Royal Gunpowder Factory, Waltham Abbey; 5 years chemist, Technical Research Dept., British Dyestuffs Corporation, Blackley, Manchester. (*Signed by*) Leslie H. Lampitt, E. H. Rodd, C. Hollins.

ANDERSON, JAMES SINCLAIR STANDISH, 15, Banbury Road, Oxford. Research Student. Engaged in research at the Dyson Perrins Laboratories under Professor W. H. Perkin. (*Signed by*) W. H. Perkin, E. Hope, N. V. Sidgwick, S. G. P. Plant, W. Davies, A. F. Titley.

ASAHINA, YASUHIKO, Pharmaceutical Institute, University, Tokyo. Japanese. Professor of Pharmaceutical Chemistry. Yakugakuhakushi (Doctor of Pharmacy), Dr. Pharm., Tokyo University. (*Signed by*) George Barger, James C. Philip, Robert Robinson.

AYNSLEY, ERNEST EDGAR, B.Sc., School House, Westmoor, Forest Hall, Newcastle. English. Post-graduate Student. B.Sc. of Armstrong College, University of Durham; 1st Class Honours in Chemistry. (*Signed by*) W. N. Haworth, G. C. Leitch, H. V. A. Briscoe.

BANFIELD, FRANCIS HARROLD, B.Sc., 40, Maryland Road, Wood Green, London, N. 22. British. Research worker in Organic Chemistry. B.Sc., 1st Class Hons. Chemistry, London University. I desire through the medium of the Society's Journal to keep in touch with the trend of modern research work. (*Signed by*) Robert H. Pickard, J. Kenyon, F. C. Ray, A. Houssa.

BARKER, CHARLES ROWAN, 78, Liverpool Street, Paddington, Sydney, N.S.W. British. Assistant Chemist, Dept. Agriculture, Sydney, New South Wales. 20 Years Assistant Chemist, Dept. Agriculture, N.S.W. (*Signed by*) G. P. Darnell-Smith, W. M. Doherty, R. Grant.

BARKER, GEOFFREY GORDON, 10, Wellington Terrace, Sutton Coldfield. British. Technical Assistant to Messrs. George Barker & Brettell, Chartered Patent Agents, Birmingham. B.Sc., 2nd Class Honours, Birmingham, Chemistry principal subject. (*Signed by*) Chas. E. Wood, A. E. Goddard, W. J. Hickinbottom, H. D. K. Drew, E. Holmes.

BATEMAN, CHARLES, 77, Penhwad Street, Grangetown, Cardiff. British. Gas Engineer. Assistant engineer to the Cardiff Gas Light & Coke Co. Honours Certificate in gas manufacture. Student member of the Institute of Gas Engineers. (*Signed by*) J. H. Canning, Harold M. Royle, T. V. Blake.

BIRCUMSHAW, LOUIS LEIGHTON, 68, Southdown Road, West Wimbledon, S.W. 20. English. Physical Chemist. B.A. (Cambridge) by Research; M.Sc. (London). Engaged in research in Physical Chemistry at the National Physical Laboratory, Teddington. Contributions to *J.C.S.*, Trans, **122**, CII, 887; Trans. **123**, XI, 91; Trans. **123** CLXXV, 1566. (*Signed by*) T. M. Lowry, Ulick R. Evans, Eric K. Rideal, R. G. W. Norrish, Guy Barr.

BOULTER, STANLEY, B.A., The Oval, Oadby, Leicester. Chemistry Master, King William's College, I.O.M. Final Honour School of Natural Science (Shortened Course), 1921. Research work in Organic Chemistry, 1921—1923. (*Signed by*) S. G. P. Plant, Thos. H. Durrans, G. R. Clemo, Fredk. A. Mason, E. H. Stenning, E. Hope.

BURDEKIN, JOHN THOMAS, 27, Crimicar Lane, Fulwood, Sheffield. British. At present I have no occupation. I hope to become a works or research chemist. Entered Sheffield University with a Town Trust Scholarship in

Chemistry, Physics, and French. Student of Chemistry for three years at Sheffield University. Degree of B.Sc. (2nd Class Hons.) of that Institution. Wish to keep in touch with modern research in chemistry. (*Signed by*) W. P. Wynne, J. Kenner, F. G. Tryhorn, Thos. B. Smith, G. H. Christie.

Bushill, John Herbert, M.Sc., "Ingleside," Arthur Road, Erdington, Birmingham. British. Assistant Chemist, J. Lyons & Co. Joint author with Prof. Ling of "The estimation of calcium in blood," *Biochemical Journal*, 1922, and author of "The estimation of ethyl alcohol and of acetone in mixtures of the two" in the *Journal of the Society of Chemical Industry*, 1923. Student at Birmingham University, 1919—1923. (*Signed by*) Arthur R. Ling, Leslie H. Lampitt, G. T. Morgan, S. R. Carter, Wm. Wardlaw, C. E. Wood.

Chakravarti, Atmaram, 29, Ward Institution St., Calcutta. Bengalee Hindu. Analytical Chemist, Messrs. Shaw, Wallace, & Co., Calcutta. B.Sc. Calcutta University, with Chemistry as one of his subjects. At present working as Analytical Chemist and has to do a lot of Soil and Manure analyses. (*Signed by*) T. K. Ghose, J. B. Bhaduri, V. G. Dani.

Chaturvedi, Har Sahai, Colonelganj, Cawnpore, U.P., India. Indian (Vedic Hinduism). Research Student. Govt. Technological Institute, Cawnpore, India. B.Sc., Allahabad University. Desirous to remain in touch with the latest chemical research. (*Signed by*) N. G. Chatterji, S. C. Banerji, N. R. Dhar.

Chick, Alfred, 69, Fountain Rd., Edgbaston, Birmingham. British. Analytical Chemist. Have studied Chemistry (Inorganic and Organic) and particularly the manufacture of dyestuffs. Was for 3 years articled pupil to Mr. Lones, F.I.C., Public Analyst and Consulting Chemist. Now hold appointment as chemist to the City of Birmingham Corp. Electric Supply Dept. (4 years). Have carried out research on certain intermediates for dyestuffs, but have not yet completed same. (*Signed by*) J. H. Wood, Thos. J. Murray, Arthur Adams, Joseph Lones.

Coffey, Samuel, 6, St. Paul's Avenue, N.W. 2. British. Ramsay Memorial Fellow at University College, London. Research work for four years. M.Sc. (Lond.), Ph.D. (Leyden), A.I.C. Published numerous papers in Transactions on various subjects. Also in *Rec. trav. chim.* At present I am doing research work at University College, London. (*Signed by*) O. L. Brady, J. N. Collie, J. N. E. Day.

Conti, Ginori, Prince Piero, Senator of the Italian Kingdom, 58, Via della Scala, Florence, Italy. Chairman and General Manager of the Societa Boracifera di Larderello (Florence). (*Signed by*) William J. Pope, W. H. Mills, F. G. Mann.

Dewing, Edward Sackett, Otley Rectory, near Ipswich. British. Research Student, Cambridge University. Researching in Organic Chemistry. Assistant demonstrator in Chemistry and in Mineralogy, Cambridge University. (*Signed by*) W. J. Pope, C. T. Heycock, W. H. Mills.

Dittmar, Moritz Adolf, 774, Bergenline Avenue, West New York, New Jersey. American citizen. Director of Laboratory of Lehn and Fink, Bloomfield, New Jersey. B.Sc. in Pharmacy, Columbia University, 1920. Ph.D., University of Berne, 1922. Thesis: "Chemistry of the Phlobaphenes." (*Signed by*) H. V. Arny, Thomas J. Keenan, Virgil Coblentz.

Doolan, James Joseph, 46, Michael St., Waterford. British. Chemical Research. 1st Class Honours at B.Sc. (Lond.), 1921, in Chemistry. Associate of the Institute of Chemistry, by examination. Science Master, Waterford Technical Institute, Jan. 1915—Oct. 1920. Now engaged in post-graduate work at East London College, under the direction of Professor J. R. Partington, M.B.E., D.Sc. (*Signed by*) J. R. Partington, A. J. Prince, W. G. Shilling.

Exmouth, The Rt. Hon. Viscount, Chemical Industry Club, 2, Whitehall Court, S.W. British. Late Professor of Chemistry at Columbia University, U.S.A. (*Signed by*) W. P. Wynne, Irvine Masson, James C. Philip.

Fearnley, George, 60, Duckworth Lane, Bradford. English. Assistant to Consulting Technical Chemist. Conversant with the chemical analysis of textile materials, as used in the West Riding of Yorkshire. (*Signed by*) Robt. D. Abell, T. W. Price, Barker North.

Francis, George Thomas Randles, 3, Tregarvon Rd., North Side, Clapham Common, S.W. 11. British. Chemist. Qualified Chemist and Druggist. Privately taught in Chemistry by A. Evans, Esq., B.Sc. Science Master, County Schools, Wrexham. Received tuition at Westminster College of Chemistry, 190, Clapham Rd., S.W. 9. (1919—1920). Attended technical classes in Wolverhampton, 1913—1914. (*Signed by*) Alfred Thomas, J. S. Wilkes, P. H. Woodnoth.

Fuller, Albert Thomas, 54, Trent Road, Brixton, S.W 2. British (born in London). Chemical Research Student. 1st Class Honours Chemistry, B.Sc. (London), 1921. 18 Months Chemical Research at Battersea Polytechnic (part of Ph.D. course for which he has registered). (*Signed by*) Robert H. Pickard, J. Kenyon, Harold Hunter.

Ganguly, Phani Bhusan, Allahabad (India), (present address, 54, Amhurst Park, N. 16). Indian. Research Student, University College, London. Publications: "Coagulation of manganese dioxide sol by different electrolytes," Ganguly and Dhar (*Journ. Phys. Chem.*, **26**, 701—714, 1922). "Adsorption of ions by freshly precipitated manganese dioxide" (*ibid.* **26**, 836—844, 1922); "Kolloidflockung durch Sonnenlicht" (*Koll. Zeit.*, xxxi, 1922); "Beobachtungen über Wirkungen der oberflachenspannung" (Ganguly and Banerji, *Zeit. anorg. und allgemaine Chemie*, **124**, 1922). M.Sc. (1st Class, first), University of Allahabad, India. (*Signed by*) F. G. Donnan, W. E. Garner, A. E. Mitchell.

Garton, Frank Leslie, 14, Craven Avenue, Ealing, London, W. 5. British. Assistant Chemist. B.A. (Hons. Chem.), Oxon. A.I.C. (*Signed by*) Matthew Whittam, F. D. Chattaway, G. R. Clemo.

Gesell, William Hans, 235, Christopher Street, United States of America. General Manager of Laboratories and Works of Lehn and Fink, Inc., Bloomfield, N.J. Chemical Engineer, University of Michigan. Author of articles on Chemistry of Cellulose and on Production Pharmacy. I desire admission to the Chemical Society in order to keep abreast with progress in chemical science. (*Signed by*) H. V. Arny, Thomas J. Keenan, Virgil Coblentz.

Gidley, Gustavus Charles, Brynmelyn College, Weston-super-Mare. British. Senior and Science Master at above College. A student of Chemistry for past 10 years. Entered and opened up Science at Brynmelyn nearly 5 years ago, since when I have successfully prepared candidates for University local exams. and London Matric.; 50—60 successes. I always endeavour to do all I can in the interests of Chemistry. Working for F.I.C. examination. (*Signed by*) John Taylor, E. T. H. Bucknell, A. E. Mills.

Gogte, Dwarkanath V., Khamgaon, Central Provinces, India. Indian. C. P. Government Scholar at the Indian Institute of Science, Bangalore (India). B.Sc. of the Allahabad University in Chemistry. At present I am working on the hydrogenation of various Indian oils. (*Signed by*) M. O. Forster, H. E. Watson, Gilbert J. Fowler.

Gooding, Stanley Evans Francis, 5, St. Andrew's Hill, Cambridge. British. Research Student. B.A. Natural Science Tripos, Pts. I and II, Cambridge. (*Signed by*) W. J. Pope, W. H. Mills, Hamilton McCombie.

Green, Albert, The Edward Davies Chemical Laboratories, Aberystwyth. British. Assistant-lecturer in Chemistry. B.Sc. (Wales), with 1st Class Honours in Chemistry. Assistant-lecturer in Chemistry at the University College of Wales, Aberystwyth, since 1921. (*Signed by*) T. Campbell James, C. R. Bury, H. Medwyn Roberts.

Happold, Frank Charles, Ostley House, Barrow. British. B.Sc. (Honours, Manchester, 1923). Being desirous of obtaining the literature of the Society. (*Signed by*) Arthur Lapworth, Robert Robinson, D. H. Bangham.

Hardy, Francis Wood, Leefield House, Allerton, Bradford, Yorks. British. Senior and Organising Chemistry Master, Boys' Modern School, Leeds. B.Sc., London, 1913. Position held as above, and I desire admission because I am anxious to secure more intimate contact with recent research as a help in teaching Advanced Course work. (*Signed by*) T. Martin Lowry, Arthur Smithells, W. Lowson, H. M. Dawson, J. B. Cohen.

Healey, Alfred Thomas, 79, Popes Avenue, Twickenham. British. Student of chemistry at East London College, Mile End Rd., London, E. 1. I have passed the Inter-B.Sc. exam. and am sitting for B.Sc. Hons. Chem. in 1924. I wish to join the Society in order to keep in touch with the progress of chemical research. (*Signed by*) Eustace E. Turner, W. H. Patterson, J. R. Partington.

Henderson, Stanley Thomas, 50, Cambridge Avenue, London, N.W. 6. British. Research student. 1st Class Hons. in Chemistry in Cambridge Natural Sciences Tripos, 1922. B.A., 1922. 1st Class Hons. in Chemistry in London External B.Sc., 1922. Research studentship at Emmanuel College, Cambridge, 1922—1924. (*Signed by*) W. J. Pope, W. H. Mills, Hamilton McCombie, A. J. Berry.

Hopkins, Thomas, Glanwern, King George Avenue, Llanelly. British. Science Master at Barrow Junior Technical School. M.Sc. (Wales), B.Sc. (Lond.), F.I.C. Published paper *J.C.S.* 1920, May. 4 Years Manufacturing and Research Chemist at Messrs. Nobel's, Scotland. Science Master at Barrow Technical School. (*Signed by*) C. R. Bury, L. J. Hudleston, T. Campbell James.

Hosking, John Reader, Sefton St., Wadestown, Wellington, New Zealand. British. Student of Chemistry. 5 Years on Chemical Staff of Colonial Sugar Refining Co., Ltd., Sydney, Australia. At present time student of Chemistry at University College, Auckland, N.Z. (*Signed by*) Thomas H. Easterfield, W. Frank Short, A. H. Bowell.

Jacobs, Julian Michael Samuel, 125, Goldhurst Terrace, London, N.W. 6. British. Research Student. B.Sc., 1st Class Honours in Chemistry, London University, 1922. Since graduation engaged in research in organic chemistry. (*Signed by*) George Senter, F. Barrow, S. Sugden, Wm. W. Myddleton.

Jacobson, Bennett Alexander, 92, Jules St., Johannesburg, S. Africa. British. Chemist and Druggist, and Analytical Chemist. Member of the Pharmaceutical Soc. Gt. Brit. Late Assistant Analyst, Metallurgy Dept., Witwatersrand Mines, Transvaal. Demonstrator in Chemistry and Physics, Johannesburg University. Certificates of Merit, Chemistry and Physics, London College. (*Signed by*) P. H. Woodnoth, A. Thomas, C. Diamond.

Jennings, James Sowden, Worcester Villas, Godolphin Road, Helston, Cornwall. British Subject. Teacher of Chemistry and Mathematics at the County Secondary School, Helston. Trained Certificated Teacher. B.Sc. Chemistry. (*Signed by*) Arthur Smithells, W. Lowson, J. B. Cohen, H. M. Dawson.

JONES, ALBERT OWEN, 1, Dark Gate, Carmarthen, S. Wales. Chemistry Master. B.Sc. (University of Wales). Student from 1911—1914, and after demobilization, Feb. 1919—June 1920. Pursued Honours B.Sc. Course; prevented from taking examination owing to operation. At present Teacher of Chemistry at Birkenhead Institute. (*Signed by*) John H. Foulger, Herbert John Evans, James Smith.

KANE, WILLIAM ROSS, 77, Glebe Road, Sheffield. British. Chemistry Master, Penistone Grammar School. B.Sc. (Lond.) in Chemistry, Physics, Pure Maths. 15 Years' experience in teaching Science. (*Signed by*) W. P. Wynne, F. G. Tryhorn, J. Kenner, G. H. Christie.

LAWSON, DIGBY RICHARD, Woodlea, Hartford, Cheshire. British. Research Chemist. M.A. (Oxon.). Research Chemist, c/o Messrs. Brunner, Mond, & Co., Northwich. (*Signed by*) F. A. Freeth, W. H. Perkin, N. V. Sidgwick, T. W. J. Taylor, F. G. Donnan, S. G. P. Plant, E. Hope.

LEWIS, WILLIAM CLIFFORD, Inversnaid, Shoreham-by-Sea. British. Senior Master at the Grammar School, Shoreham, Sussex. B.Sc. (Hons.). At present engaged in research in Organic Chemistry. (*Signed by*) T. Campbell James, C. R. Bury, L. J. Hudleston.

LIONS, FRANCIS, 17, Lincoln Grove, Chorlton-on-Medlock, Manchester. British Subject (born in Australia). Research Student in Organic Chemistry at the Victoria University of Manchester. B.Sc. (Sydney), 1st Class Honours Chemistry and 1st Class Honours Organic Chemistry. 1851 Scholar for Australia, 1923. Engaged at present in Research in Organic Chemistry at the Victoria University of Manchester. (*Signed by*) Arthur Lapworth, R. Robinson, J. C. Smith, F. M. Irvine.

MAW, WILLIAM, B.Sc., 82, Holly Avenue, Newcastle-upon-Tyne. English. Research Student. B.Sc. of Armstrong College, University of Durham. 1st Class Honours in Chemistry. (*Signed by*) W. N. Haworth, G. C. Leitch, H. V. A. Briscoe.

MAY, CECIL JOHN, 19, Tyndale Place, Islington, London, N. 1. English. Student of Chemistry. (*Signed by*) H. F. Harwood, James C. Philip, H. B. Baker.

MILLS, HENRY COMPTON, 25, Cape Road, Warwick. British. Science Master. B.A. (Oxon.), 2nd Class Honours in Chemistry. B.Sc. (London). (*Signed by*) Allan F. Walden, Frederick Soddy, M. P. Applebey, N. V. Sidgwick.

NAIDU, PASUPU KRISHNASWAMI RAJAMANIKKAM, 52, Pedariar Koil Street, Madras, India. Hindu-Indian. Ag. Principal, Government Leather Trades Institute, Washermanpet, Madras, India. Underwent full course of training in Leather Chemistry and Leather Manufacture in Leather Sellers' College, London. Permanent Vice-Principal of the Govt. Leather Trades Institute, and now the Acting Principal. Member of the Society of the Leather Trades Chemists. (*Signed by*) A. K. Menon, P. S. Chowdary, M. Suhramania Sastry.

POWELL, DONALD, 73, Sedgeford Rd., Shepherd's Bush, W. 12. British. Assistant Chemist to the Research Association of the British Motor and Allied Manufacturers. Previously Assistant Chemist to Mr. Percy Edgerton, A.I.M.M., F.C.S., Nov. 1921 to Aug. 1923. (*Signed by*) Percy Edgerton, J. B. Coleman, Francis Arnall, F. H. Lowe.

RAY, SUDHINDRANARAYAN, 19/4, Madan Mitra Lane, Calcutta, India. Bengalee. Superintendent of Excise and Salt, Calcutta Distillery Branch.

1st Class M.Sc. (Calcutta University). In his official capacity, he is in charge of one of the biggest distilleries in India and four important bonded laboratories, where tinctures and other spirituous medicinal preparations are manufactured; deals with all matters connected with industrial use of alcohol. (*Signed by*) R. L. Jenks, B. M. Chakravarti, J. C. Ghosh.

Richardson, Henry Oates, Ashworth House, Ashworth Rd., Dewsbury, Yorks. British. Works and Analytical Chemist to Mark Day & Son, Dewsbury, Manufacturers of Dyewood, Tanning Extracts, Chemicals (6 years in this position as head). 6 Years Chemistry Student, Dewsbury Technical College. Final Certificate in Chemistry, Dewsbury Technical College. Member, Society of Leather Trades Chemists; member, Society of Dyers and Colourists; member, British Association of Chemists; National Certificate in Chemistry. (*Signed by*) H. J. Taylor, S. J. Hopkins, H. W. Gorbold.

Ross, Neil Gillies, Caroni Estate, Caroni, Trinidad, B.W.I. Scottish. Analytical Chemist. Chief chemist to The Trinidad Estates Co., Ltd., for past 3½ years and to date. Formerly assistant chemist with John Walker & Co., Greenock, 6 years. War service, 1914—1919. Attended Royal Technical College, Glasgow. I wish to join in order to receive the advantage of the literature issued by the Society. (*Signed by*) Angus Smith, Thomas Gray, F. J. Wilson.

Rushworth, James, 11, Smithy Carr Lane, Brighouse. Works Chemist, Messrs. T. F. Firth & Sons, Ltd., Carpet Manufacturers, of Brighouse and Heckmondwike. Student, Rastrick Grammar School, till 1919; student, Huddersfield Technical College, 1919—1922, at the latter place having been doing Research for 12 months. At present (for 12 months) Works Chemist in carpet manufacture. (*Signed by*) L. Gordon Paul, E. Norman Langham, James Bruce.

Ryder, Charles Dudley, Assoc. I.R.S.M. (Leoben), Clan William Street, Chatswood (Sydney). Naturalised Austrian (Australian). Manufacturing and Research Chemist and Consulting Engineer. *Education:* Viennese Grammar School; Associate of Imp. Royal School of Mines, Leoben, Styria (Austria); special courses in Organic Chemistry at Technical Colleges of Vienna, Universities of Marburg and Leipzig. *Practice:* From 1898—1903 with a number of firms in Austria and Hungary. Since 1904 practised on his own in South Africa (for three years) in Natal, Transvaal and Rhodesia. Since 1907 in Australia, engaged with various large concerns; invariably managing Technological Departments and in charge of chemical laboratories. Of later engagements may be mentioned: From 1917—1922 Chief Chemist and Consulting Engineer to F. A. Henriques, Ltd., Manufacturing Chemists, Importers and Exporters, Sydney, Brisbane, Melbourne, and Perth. At present Chief Chemist of Lockwood & Magrath, Ltd., 163, Kent Street, Sydney, Essential Oil Distillers, Synthetic Chemicals, etc., Manufacturing Chemists. *Travels:* Has visited (besides South Africa) Austria, Hungary, Italy, Spain, Germany, England, Scotland, U.S.A., India, and New Zealand; speaks and writes four languages. (*Signed by*) George Z. Du Pain, Francis L. Watt, F. H. Molesworth, Henry G. Smith.

Sharp, Ernest Goulding, 52, Castle St., Dover. British. Manufacturing Chemist. I have been engaged for some considerable time in extensive experimental work, with regard to the utilisation of Propyl Alcohol, in the manufacture of synthetic perfumes, and my reason for desiring to become a Fellow of the Chemical Society is that I desire the privilege of attending the Scientific Meetings. (*Signed by*) H. Lawrence, Jos. Cowper, Herbert B. Hammond.

Shinoda, Junzo, Chemical Dept., Victoria University, Manchester. Japanese. Research Student. Research Chemist, sent abroad by Japanese Government. (*Signed by*) Robert Robinson, Garfield Thomas, Leslie Randal Ridgway, Thomas Malkin.

Sims, William Henry, 2, Churchville, Radford, Nottingham. British. Assistant Chemist, Boots Pure Drug Co., Ltd., Nottingham. 6 Years' attendance at evening classes held at the Nottingham University College, in Mathematics, Chemistry, and Physics. For 7 years employed in the Fine Chemical Dept. of Boots Pure Drug Co., on the manufacture of Alkaloids, and for 3 years on the research and manufacture of Organic Arsenicals. (*Signed by*) Harold Calam, Harold B. Holthouse, Bertram A. Bull, H. Droop Richmond, W. J. Bowis.

Singh, Kishen, Hyderabad, Deccan, India. British Subject, Indian. Hyderabad (State) Scholar. H.E.H. The Nizam's Service. Research Department (Applied Chemistry), College of Technology, Manchester. B.Sc. in pure and applied chemistry, Punjab University. Science Master in Govt. High School in South India and North India (D.A.V.). Analytical chemist, with a Manufacturing Chemist. Submitted thesis on Sugar Manufacture in India; doing research at present. (*Signed by*) John K. Wood, F. M. Rowe, D. D. Kanga, Jul. Hübner.

Smith, James Muir, B.Sc., 8, Hepscott Ter., S. Shields. British. Research Student. 1st Class Honours in Chemistry at Armstrong College, Newcastle-on-Tyne, University of Durham. (*Signed by*) W. N. Haworth, D. Arthur Ruell, Birkett Wylam.

Stevens, Harold Roberts, 9, Panton St., Cambridge (Pembroke College). British. Research Student. 1st Class, Pt. II, Natural Sciences Tripos (Cambridge). Chemistry Scholar and Research Student of Pembroke College, Cambridge, B.A., 1921. (*Signed by*) W. J. Pope, W. H. Mills, Hamilton McCombie.

Sutherland, John George, Boksburg, Transvaal, S. Africa. British (Scots). Lecturer in Science, Boksburg Normal College. Hons. Degree in Maths. and Applied Maths. of Edinburgh. Studied chemistry at Edinburgh University under Prof. Crum Brown and at the Heriot-Watt Technical College for 4 years. Lecturer and Teacher of Chemistry for 12 years in Edinburgh, Rhodesia, and Transvaal. (*Signed by*) James Moir, J. McCrae, J. A. Wilkinson.

Taylor, Colin Kenneth, 21, Cromwell Road, South Kensington, S.W. 7. Anglo-Indian, British. Student. B.A. (Chemistry), Madras University, India. Is now studying Applied Chemistry at Battersea Polytechnic. (*Signed by*) Robert H. Pickard, J. Kenyon, Harold Hunter.

Terada, Shōichi, No. 20, Wakamiya Chō, Ushigome, Tokyo, Japan. Japanese. Bachelor of Pharmacology. Author of a paper on "The condensation of pyruvic acid with formaldehyde," in collaboration with Y. Asahina. Lecturer on Pharmacology in the Imperial University of Tokyo. (*Signed by*) Joji Sakurai, Rikō Majima, Hiroshi Nomura.

Tervet, William Pearson, "Waverley," Compton Park Road, Plymouth. Scottish. Engineer and Manager, Gas Works, Devonport. Student at People's Palace, Mile End Road, Inorganic and Organic Chemistry. Junior assistant for 6 years, Tottenham Gas Works, laboratory testing. Assistant engineer, Plymouth Gas Works, for 6 years, cyanide recovery. Engineer at Devonport, 14 years. (*Signed by*) James R. Thackrah, Philip G. G. Moon, J. T. Hewitt.

Thin, Russell Gibson, 2, Chalmers Crescent, Edinburgh. British.

Analytical and Consulting Chemist. B.Sc. (Edinburgh); Associate, Institute of Chemistry. Contribution to Transactions of the Chemical Society with Dr. A. C. Cumming in 1915 on "Estimation of Potassium by the Perchlorate Method." (*Signed by*) Alexander Scott, James Walker, Sydney A. Kay.

THORNE, WILLIAM TRICK, 40, Canton Rd., Shanghai. British. Pharmaceutical Chemist. Manager, Chemical Dept., Messrs. Allen & Hanbury's, Ltd., Shanghai. Major Diploma, Pharmaceutical Society. Interested in Analytical Chemistry and desirous of keeping in touch with current chemical literature. (*Signed by*) C. E. Corfield, F. W. Gamble, Frank Browne, Norman Evers.

THORNTON, ARTHUR JAMES EDWARD, 38, Battersea Park Rd., S.W. 11. British. Analytical Chemist (Air Ministry). King's College (Student), 1919—1921. Inter-B.Sc. (Chemistry and Physics). I desire to attend the meetings, etc., to keep in touch with current research. 1921 to date, Chemist employed by Air Ministry (Aeronautical Inspection Directorate). (*Signed by*) J. W. Farmery, J. Outram Cutter, P. C. Austin.

TOMKINSON, MARGARET GROSVENOR, Chilton, Cleobury Mortimer, Salop. Chemist. Camb. Univ., Nat. Sci. Tripos, Pt. I, 1914. Analytical Chemist at Messrs. Stewarts & Lloyds, Ltd., Halesowen, Birmingham, 1916—1919. Assistant Lecturer in Nat. Science, Girton College, Cambridge, 1919—1921. Associate of the Institute of Chemistry, 1920. Girton College Travelling Fellowship, 1921—1922. Research work with Prof. Paul Sabatier, University of Toulouse. Docteur ès Sciences, University of Toulouse, Dec. 1922. Note in *Comptes Rendus de l'Academies des Sciences*, Paris, Jan. 3rd, 1923. (*Signed by*) C. T. Heycock, W. H. Mills, W. G. Palmer.

TURNER, PERCIVAL ELISHA, Bath Road, Beenham, near Reading. British. Demonstrator in Chemistry, Imperial College of Tropical Agriculture, Trinidad. B.Sc., Hons. Chemistry, London (External). Associate, Institute of Chemistry. Associate, University College, Reading. Student Demonstrator in Chemistry, University College, Reading, 1922—1923. (*Signed by*) H. Bassett, J. W. Dodgson, R. G. Durrant, D. Roy Maxted.

WAKEFORD, LESLIE ERNEST, "Bisham," 14, Woolstone Rd., Catford, S.E. 6. British. Pupil assistant of Mr. Percy Edgerton, analytical chemist. Student of the Institute of Chemistry. Student at Sir John Cass Technical Institute. (*Signed by*) P. C. L. Thorne, Percy Edgerton, Henry J. S. Sand, Stephen B. Bowyer.

WALKER, OSWALD JAMES, 24, Buccleuch Place, Edinburgh. British. Lecture Assistant, Edinburgh University, Chemistry Department. Degree of B.Sc. with 1st Class Honours in Chemistry, Edinburgh University. (*Signed by*) James Walker, Sydney A. Kay, Leonard Dobbin.

WEBER, ISAAC EPHRAIM, B.Sc. (Lond.), 12, Claremont Road, Luton. British. Chief Chemist, Messrs B. Laporte, Ltd., Luton. Student at University College, London, 1914—1917. Chief Chemist, Messrs. B. Laporte, Ltd., 1919—1923. (*Signed by*) F. G. Donnan, S. Judd Lewis, S. Smiles.

WITCOMBE, FRANK WILLIAM, 85, Holland Rd., Maidstone. British. Analytical Chemist. 1913—1914, Pupil and assistant to Mr. Percy Edgerton, F.C.S. 1915—1917, Assistant chemist, Works Laboratory, Chatham Dockyard. (Service in Royal Air Force.) 1921—1923, Chemist in charge, Works Laboratory, Chatham Dockyard. (*Signed by*) Percy Edgerton, D. B. Butler, J. A. Smythe, P. L. Robinson.

WOODHEAD, DONALD WHITLEY, 248, Claremont Road, Moss Side, Manchester. British. Research Chemist. B.Sc. (Manchester). Twelve months' research at Manchester University on photographic analysis of gaseous explosions. Research Assistant to the Manchester Corporation Air Pollution Advisory Board at Manchester College of Technology. (*Signed by*) H. B. Dixon, A. Lapworth, Colin Campbell, H. Wood.

The following Certificates have been authorised by the Council for presentation to ballot under Bye-law I (2):

Kerry, Arthur Nicholas, Jose Cubas 4725, Buenos Aires. English. Asst. Analytical Chemist, Buenos Aires and Pacific Railway, Buenos Aires, Argentine Republic. 7 Years as Chief Assistant to Mr. A. Courtenay Luck, F.I.C., F.C.S., Calle 25 de Mayo 611, Buenos Aires. (*Signed by*) A. Courtenay Luck.

Lissenborough, Robert, Cawnpore. English. Manager, Cawnpore Sugar Works, Limited, Cawnpore. Analytical and Manufacturing Chemistry, Sugar Refining and Distilling. Manager, Refinery and Distillery, Cawnpore Sugar Works, Ltd. (*Signed by*) E. L. Watson, G. Peace.

Walsh, Lionel O. P., 242, Westmount Boulevard, Montreal. English. Vice-President and General Manager, Dominion Tar and Chemical Co., Limited, Montreal. (*Signed by*) Arthur O. Ponder.

ADDITIONS TO THE LIBRARY.

I. *Donations.*

Archiv der Pharmazie. Vols. 248—255. Berlin 1910—1917. (*For circulation.*) From Sir W. J. Pope.

Bearn, Joseph Gauld. The chemistry of paints, pigments, and varnishes. London 1923. pp. x + 278. ill. 30*s*. net. (*Recd.* 7/11/23.) From the Publishers: Messrs. Ernest Benn.

Bloxam, Charles Loudon. Chemistry, inorganic and organic. With experiments. 11th edition. Revised by Arthur George Bloxam and Samuel Judd Lewis. London 1923. pp. x + 832. ill. 36*s*. net. (*Recd.* 20/10/23.)
From the Publishers: Messrs. J. & A. Churchill.

Boulton, W. Gerard. Blasting with high explosives: a practical handbook for mining and civil engineers, farmers, and all interested in demolitions. London 1923. pp. viii + 108. ill. 5*s*. net. (*Recd.* 19/10/23.)
From the Publishers: Sir Isaac Pitman & Sons.

Lewis, Gilbert Newton. Valence and the structure of atoms and molecules. New York 1923. pp. 172. ill. $3·00 net. (*Recd.* 29/10/23.)

INSTRUCTIONS TO ABSTRACTORS,

GIVING THE

NOMENCLATURE AND SYSTEM OF NOTATION

ADOPTED IN THE ABSTRACTS.

THE object of the abstracts of chemical papers published elsewhere than in the Transactions of the Society is to furnish the Fellows with a concise account of the progress of chemical science from month to month. It must be understood that as the abstracts are prepared for the information of the Fellows in general, they cannot possibly be made so full or so detailed as to obviate on the part of those who are engaged on special investigations the necessity of consulting the original memoirs.

1. Titles of papers must be given literally.

2. Before beginning to write the abstract, the whole of the original paper must be read, in order that a judgment may be formed of its importance and of the scale on which the abstract should be made.

3. In the case of papers dealing with subjects not strictly chemical, the abstract should refer only to matters of chemical interest in the original.

4. The abstract should consist mainly of the expression, in the abstractor's own words, of the substance of the paper.

5. The abstract should be made as short as is consistent with a clear and accurate statement of the author's results.

6. A concise statement showing the general trend of the investigation should be given at the commencement of those abstracts where the nature of the original permits of it.

7. If an abstract of a paper on the same subject, either by the author of the paper abstracted, or by some other author, has already appeared, note should, as a rule, be made of this fact.

8. Matter which has appeared once in the *Abstracts* is not to be abstracted again, a reference being given to the volume in which the abstract may be found.

9. As a rule, details of methods of preparation or analysis, or generally speaking of work, are to be omitted, unless such details are essential to the understanding of the results, or have some independent value. Further, comparatively unimportant compounds, such as the inorganic salts of organic bases or acids, should be mentioned quite shortly. On the other hand, data such as melting and boiling points, sp. gr., specific rotation, &c., must be given in every case unless recorded in earlier papers.

Nomenclature.

10. Employ names such as *sodium chloride*, *potassium sulphate* for inorganic compounds, and use the terminals *ous* and *ic* only in distinguishing compounds of different orders derived from the same elementary radicle; such, for instance, as mercurous and mercuric chlorides, sulphurous and sulphuric acids.

11. Term compounds of metallic radicles with the OH-group *hydroxides* and not hydrates, the name hydrate being reserved for compounds supposed to contain water of combination or crystallisation.

12. Term salts containing an amount of metal equivalent to the displaceable hydrogen of the acid, *normal* and not neutral salts, and assign names such as sodium hydrogen sulphate, disodium hydrogen phosphate, &c., to the acid salts. Basic salts as a rule are best designated merely by their *formulae.*

13. Names in common use for oxides should be employed, for example: NO, nitric oxide; CO_2, carbon dioxide; P_4O_{10}, phosphoric oxide; As_4O_6, arsenious oxide; Fe_2O_3, ferric oxide.

14. In open chain compounds, Greek letters must be used to indicate the position of a substituent, the letter α being assigned to the first carbon atom in the formula, except in the case of CN and CO_2H, for example, $CH_3\cdot CH_2\cdot CH_2\cdot CH_2I$ α-iodobutane, $CH_3\cdot CH_2\cdot CH_2\cdot CN$ α-cyanopropane.

15. Isomeric open chain compounds are most conveniently represented as substitution derivatives of the longest carbon chain in the formula; for example,

$\begin{matrix}CH_3\\CH_3\cdot CH_2\end{matrix}\!>\!CH\cdot CH\!<\!\begin{matrix}CH_3\\CH_3\end{matrix}$ or $CH_3\cdot CH_2\cdot CHMe\cdot CHMe\cdot CH_3$ should be termed $\beta\gamma$-dimethylpentane not methylethyl*iso*propylmethane, and $\begin{matrix}CH_3\\CH_3\end{matrix}\!>\!CH\cdot CH\!<\!\begin{matrix}CH_3\\CO_2H\end{matrix}$ or $CH_3\cdot CHMe\cdot CHMe\cdot CO_2H$ should be termed $\alpha\beta$-dimethylbutyric acid, not $\alpha\beta\beta$-trimethylpropionic, or α-methyl*iso*valeric, or methyl*iso*propylacetic acid.

16. Use names such as methane, ethane, &c., for the normal paraffins or hydrocarbons of the C_nH_{2n+2} series of the form $CH_3\cdot[CH_2]_5\cdot CH_3$, &c. Term the hydrocarbons C_2H_4 and C_2H_2 ethylene and acetylene respectively (not ethene and ethine). Homologues of the ethylene series are to be indicated by the suffix *-ene*, and those of the acetylene series, wherever possible, by *-inene*. Adopt the name allene for the hydrocarbon $CH_2\colon C\colon CH_2$.

17. Distinguish all hydroxyl derivatives of hydrocarbons by names ending in *ol*. Alcohols should be spoken of as mono-, di-, tri-, or n-hydric, according to the number of OH-groups. Compounds which are not alcohols, but for which names ending in *ol* have been used, are to be represented by names ending in *ole*, if a systematic name cannot be given, thus anisole not anisol, indole not indol. Compounds such as MeONa, EtONa, &c., should be termed sodium methoxide, sodium ethoxide, &c.

18. The radicles indicated in the name of a compound are to be

given in the order fluoro-, chloro-, bromo-, iodo-, nitro-, nitroso-, amino-, imino-, cyano-, thiocyano-, hydroxy-, keto-.

19. Compounds analogous to the acids of the lactic series containing the OH-group should be termed *hydroxy*-derivatives, and not oxy-derivatives; for example, hydroxyacetic and not oxyacetic acid. Compounds containing the analogous groups OEt, OPh, OAc, &c., should in like manner be termed ethoxy-, phenoxy-, acetoxy- derivatives. Thus α-ethoxypropionic acid, $OEt{\cdot}CHMe{\cdot}CO_2H$, instead of ethyl-lactic acid; 3:4-diethoxybenzoic acid, $(OEt)_2C_6H_3{\cdot}CO_2H$, instead of diethylprotocatechuic acid; and α-acetoxypropionic acid, $OAc{\cdot}CHMe{\cdot}CO_2H$, instead of acetyl-lactic acid. Terms such as diethylprotocatechuic acid should be understood to mean a compound formed by the displacement of hydrogen atoms in the hydrocarbon radicle of protocatechuic acid by ethyl, thus, $C_6HEt_2(OH)_2{\cdot}CO_2H$, and not $C_6H_3(OEt)_2{\cdot}CO_2H$, just as dibromoprotocatechuic acid is understood to be the name of a compound of the formula $C_6HBr_2(OH)_2{\cdot}CO_2H$.

20. The term *ether* should be restricted to the oxides of hydrocarbon radicles and their derivatives, and the esters (so-called compound ethers or ethereal salts) should be represented by names similar to those given to metallic salts.

21. When a substituent is one of the groups NH_2, NHR, NR_2, NH or NR, its name should end in *ino*; for example, β-aminopropionic acid, $NH_2{\cdot}CH_2{\cdot}CH_2{\cdot}CO_2H$, β-anilino-acrylic acid, $NHPh{\cdot}CH{\vdots}CH{\cdot}CO_2H$, α-iminopropionic acid, $NH{\vdots}CMe{\cdot}CO_2H$.

22. Compounds of the radicle SO_3H should, whenever possible, be termed sulphonic acids, or failing this, sulpho-compounds; for example, benzenesulphonic acid, sulphobenzoic acid.

23. Basic substances should invariably be indicated by names ending in *ine*, as aniline instead of anilin, the termination *in* being restricted to certain neutral compounds, viz., glycerides, glucosides, bitter principles, and proteins, such as palmitin, amygdalin, albumin. The compounds of basic substances with hydrogen chloride, bromide or iodide should always receive names ending in *ide* and not *ate*, as morphine hydrochloride and not morphine hydrochlorate.

24. The Collective Index, 4th decade (1903–1912) should be adopted as the standard of reference on questions of nomenclature not provided for in the preceding sections.

Notation.

25. In empirical formulae the elements are to be given in the order C, H, O, N, Cl, Br, I, F, S, P, and the remainder alphabetically.

26. Equations should be omitted unless essential to the understanding of the results; as a rule, they should not be written on a separate line, but should "run on" with the text.

27. To economise space, it is desirable:

(a) That *dots* should be used instead of *dashes* in connecting contiguous symbols or radicles, whenever this does not interfere with the clearness of the formula.

(b) That formulae should be shortened by the judicious employment of the symbols Me for CH_3, Et for C_2H_5, Pr^α for $CH_2 \cdot CH_2 \cdot CH_3$, Pr^β for $CH(CH_3)_2$, Ph for C_6H_5, Py for C_5H_4N, Ac for $CO \cdot CH_3$, and Bz for $CO \cdot C_6H_5$.

(c) That formulae should be written *in one line* whenever this can be done without obscuring their meaning.

28. In representing the constitution of benzene derivatives, the relative positions of the radicles in the symbol of benzene should be indicated by numerals, instead of by means of the hexagon formula.

(a) The abbreviations *o*-, *m*-, and *p*-, should be used in place of 1 : 2- or ortho-, 1 : 3- or meta-, and 1 : 4- or para.

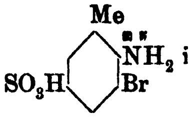
(b) In numbering positions in the case of substitution derivatives of phenol, aniline, benzonitrile, benzoic acid, benzenesulphonic acid, benzaldehyde, and toluene, the characteristic radicle of each of these parent substances is to be regarded as in position 1 (compare Collective Index).

(c) Names of substitution derivatives should be given in such a way that the position of the substituent is indicated by a numeral prefixed; for example :—

SO_3H

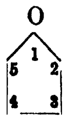
Br is 2 : 5-dibromobenzenesulphonic acid ;

Br

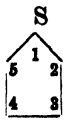


is 3-bromo-*o*-toluidine-5 sulphonic acid.

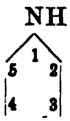
29. In representing the constitution of derivatives of other "closed chain" hydrocarbons, graphic formulae should not be employed, but the system of numbering positions indicated in Richter's *Lexikon der Kohlenstoff-Verbindungen* (3rd edition, 1910, pp. 14—26) should be used, of which the following schemes may be regarded as typical :—



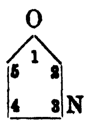
Furan.



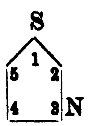
Thiophen.



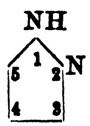
Pyrrole.



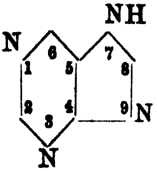
Oxazole.



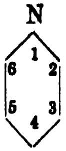
Thiazole.



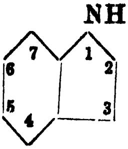
Pyrazole.



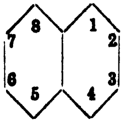
Purine.*



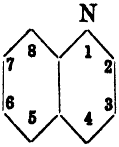
Pyridine.



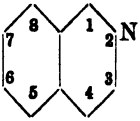
Indole.



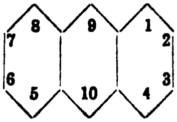
Naphthalene.



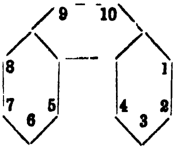
Quinoline.



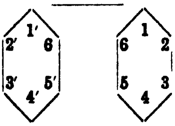
*iso*Quinoline.



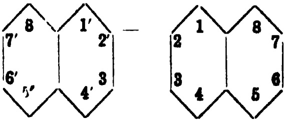
Anthracene.



Phenanthrene.



Diphenyl.



ββ-Dinaphthyl.

Manuscript.

30. In view of the difficulty of dealing with MSS. of widely varying sizes, abstracts cannot be accepted unless written on quarto paper (10 x 8 in.).

31. Not more than one abstract must appear on a sheet.

32. When an abstract exceeds a sheet in length, the sheets must be fastened together by means of gum at the top left-hand corner.

33. The name of the abstractor must be written diagonally at the top left-hand corner of the first sheet of the abstract.

Proofs.

34. Abstractors are expected to read and correct proofs carefully, and to check all formulae and figures against MSS.

35. All proofs, however small, must be returned to the Sub-Editor not later than 24 hours after receipt from the printers.

⁂ The Editor's decision, in all matters connected with the Abstracts, must be considered final.

---

* This numbering, proposed originally by E. Fischer, is adopted in the text of the *Lexikon*.

List of Symbols Recommended by the Working Committee of the International Commission for the Unification of Physico-chemical Symbols (1914). [See Trans., 1921, **119**, 502—512.]

1. *Mathematical Symbols.*

	Usual symbol.	Alternative symbol.
Base of natural (Napierian) logarithms ...	e	
Diameter	d	
Radius	r	
Ratio of circumference to diameter	π	
Summation..	Σ	
Variation	δ	
Total differential	d	
Partial differential	∂	

2. *Universal Constants.*

Acceleration due to gravity....................	g	
Mechanical equivalent of heat	J	
Avogadro's constant [number of molecules in 1 gram-molecule (mole)]	N	
Gas constant per mole	R	
Faraday's constant (number of coulombs per gram-equivalent of an ion)	F	
Charge on an electron	e	

3. *General Physics and Chemistry.*

Length	l	
Height..	h	
Mass	m	
Time	t	
Volume	v, V	
Density (mass per unit volume)	d	D
Pressure	p, P	
Concentration	c, C	
Mole fraction	x	
Critical constants: pressure, volume, temperature (centigrade), temperature (absolute), density	p_c, v_c t_c, T_c d_c	
Reduced quantities: pressure, volume, temperature, density	p_r, v_r t_r, T_r, d_r	
van der Waals's constants	a, b	
Fluidity	ϕ	
Viscosity	η	
Surface tension	γ	σ
Diffusion coefficient	Δ	
Atomic weight	A	
Molecular weight	M	
Velocity coefficient of reaction	k	
Equilibrium constant	$K, (K_c, K_p)$	
van't Hoff coefficient	i	
Degree of dissociation (electrolytic, thermal, etc.)	a	

4. *Heat and Thermodynamics.*

	Usual symbol.	Alternative symbol.
Temperature (centigrade)	t	θ
Temperature (absolute)	T	
Critical temperature	t_c, T_c	
Reduced temperature	t_r, T_r	
Critical solution temperature	t_{cs}, T_{cs}	
Quantity of heat	Q	
Entropy	S	
Specific heat	c	
Specific heat at constant pressure	c_p	
Specific heat at constant volume	c_v	
Ratio of specific heats, $c_p : c_v$	γ	
Molecular heat	C	
Molecular heat at constant pressure	C_p	
Molecular heat at constant volume	C_v	
Latent heat per gram	l	
Latent heat per mole	L	
Maximum work (diminution of free energy)	A	

5. *Optics.*

Wave-length of light	λ	
Refractive index	n	n_r
Specific refractive power (Gladstone and Dale)	r_G, $[r_G]^{t°}_{\lambda}$	
Specific refractive power (Lorentz and Lorenz)	r_L, $[r_L]^{t}_{\lambda}$	
Molecular refractive power	R_G, R_L $[R_G]^{t°}_{\lambda}$, $[R_L]^{t°}_{\lambda}$	
Angle of optical rotation	α	
Specific rotatory power	$[\alpha]$	
Molecular rotatory power	$M[\alpha]$	
Specific magnetic rotation	$[\omega]$	
Molecular magnetic rotation	$M[\omega]$	

6. *Electricity and Magnetism.*

Quantity of electricity	Q	
Current intensity	I	
Resistance	R	W
Electromotive force	E	
Electrode potential, or discharge potential of an ion	E	ϵ
Electrode potential referred to the normal hydrogen or normal calomel electrode respectively, the potential of which is taken as zero	E_h, E_c	ϵ_h, ϵ
Normal potential, *i.e.*, the electrode potential referred to the normal hydrogen or normal calomel electrode respectively, when the solution is molecular-normal in respect of all participating substances and ions of variable concentration	${}_0E_h$, ${}_0E_c$	${}_0\epsilon_h$, ${}_0\epsilon$
Dielectric constant	ϵ	
Conductivity (specific conductance)	κ	
Equivalent conductivity	Λ	
Equivalent conductivity at different dilutions—volumes in litres containing 1 gram-equivalent	Λ_{10}, Λ_v, Λ_∞	

6. *Electricity and Magnetism*—(continued).

	Usual symbol.	Alternative symbol.
Equivalent conductivity of kation and of anion	Λ_k, Λ_a	
Equivalent conductivity of specified ions...	$\Lambda_{K^\cdot}$ $\Lambda_{Cl'}$	
Molecular conductivity	μ	
Velocity of kation and of anion in cm./sec. when the potential gradient is 1 volt per cm.	U_k, U_a	
Transport number of kation and of anion ...	n_k, n_a	
Magnetic permeability	μ	
Magnetic susceptibility	κ	

List of Symbols, Arranged Alphabetically.

Symbol.	Name of quantity.
A	Atomic weight; maximum work.
a	Van der Waals's constant.
b	Van der Waals's constant.
C	Concentration; molecular heat.
c	Concentration; specific heat.
C_p, C_v	Molecular heat at constant pressure, and at constant volume.
c_p, c_v	Specific heat at constant pressure, and at constant volume.
D	Alternative symbol for density.
d	Diameter; total differential; density.
d_c	Critical density.
d	Reduced density.
E	Electromotive force; electrode potential.
e	Base of Napierian logarithms; charge on an electron.
E_h, E_c	Electrode potential referred to the normal hydrogen or the normal calomel electrode, respectively, the potential of which is taken as zero.
${}_0E_h$, ${}_0E_c$	Normal potential, that is, the electrode potential referred to the normal hydrogen or the normal calomel electrode respectively, when the solution is molecular-normal in respect of all participating substances and ions of variable concentration.
F	Faraday's constant (number of coulombs per gram-equivalent of an ion).
g	Acceleration due to gravity.
h	Height.
I	Current.
i	Van't Hoff's coefficient.
J	Mechanical equivalent of heat.
K	Equilibrium constant.
K_c, K_p	Equilibrium constant, when molar concentrations and partial pressures respectively are employed.
k	Velocity coefficient of reaction.
L	Latent heat per mole.
l	Length; latent heat per gram.
M	Molecular weight.
$M[\alpha]$	Molecular rotatory power.
$M[\omega]$	Molecular magnetic rotatory power.
m	Mass.
N	Avogadro's constant (Loschmidt's number) or number of molecules in 1 gram-molecule.
n	Refractive index.

List of Symbols, Arranged Alphabetically—(continued).

Symbol.	Name of quantity.
n_k, n_a	Transport number of kation and of anion.
n_r	Refractive index (alternative symbol).
P	Pressure.
p	Pressure.
p_c, p_r	Critical pressure : reduced pressure.
Q	Quantity of heat; quantity of electricity.
R	Gas constant per mole; electrical resistance.
R_G, R_L	Molecular refractive power, according to Gladstone and Dale, and to Lorentz and Lorenz respectively.
r	Radius.
r_G, r_L	Specific refractive power according to Gladstone and Dale, and to Lorentz and Lorenz respectively.
S	Entropy.
T	Absolute temperature.
T_c	Critical temperature (on the absolute scale).
T_r	Reduced temperature (absolute).
T_{cs}	Critical solution temperature (absolute).
t	Time; temperature (centigrade).
t_c	Critical temperature (centigrade).
t_{cs}	Critical solution temperature (centigrade).
t_r	Reduced temperature (centigrade).
U_k, U_a	Velocity of kation and of anion in cm./sec. when the potential gradient is 1 volt per cm.
V	Volume.
v	Volume.
v_c, v_r	Critical volume : reduced volume.
W	Electrical resistance (alternative symbol).
x	Mole fraction.
α	Degree of dissociation (electrolytic, thermal, etc.); angle of optical rotation.
$[\alpha]$	Specific rotatory power.
γ	Surface tension; ratio of specific heats.
Δ	Diffusion coefficient.
δ	Variation.
∂	Partial differential.
ϵ	Electrode potential (alternative symbol); dielectric constant.
ϵ_h, ϵ	Electrode potential referred to the normal hydrogen or the normal calomel electrode respectively, the potential of which is taken as zero (alternative symbols).
${}_0\epsilon_h$, ${}_0\epsilon_c$	Normal potential, that is, the electrode potential referred to the normal hydrogen or the normal calomel electrode respectively, when the solution is molecular-normal in respect of all participating substances and ions of variable concentration (alternative symbols).
η	Viscosity.
θ	Temperature (centigrade), (alternative symbol).
κ	Specific conductance (conductivity); magnetic susceptibility.
Λ	Equivalent conductivity.
Λ_{10}, Λ_v, Λ_∞	Equivalent conductivity at different dilutions (volumes in litres containing 1 gram-equivalent).
Λ_k, Λ_a	Equivalent conductivity of kation and of anion.
λ	Wave-length of light.
μ	Molecular conductivity; magnetic permeability.
π	Ratio of circumference to diameter.
Σ	Summation.
σ	Surface tension (alternative symbol).
ϕ	Fluidity.
$[\omega]$	Specific magnetic rotation.

JOURNALS FROM WHICH ABSTRACTS ARE MADE.

The following is a list of Journals from which abstracts are made (directly or indirectly) by the Chemical Society and the Society of Chemical Industry. The abbreviated titles printed in italics represent Journals abstracted by the Chemical Society, those printed in roman type being abstracted by the Society of Chemical Industry. Of the former Journals those indicated by an asterisk are also abstracted by the Society of Chemical Industry.

ABBREVIATED TITLE.	JOURNAL.
Abh. Böhm. Akad.	Abhandlungen der Böhmischen Akademie.
Abh. Deut Naturwiss. Med. Ver. Bohmen.	Abhandlungen der Deutschen Naturwissenschaftlichen und Medizinischen Verein, Böhmen.
Acta. Sci. Fennicae	Acta Societatis Scientiarum Fennicae.
Agric. Bull. F. M. S.	Agricultural Bulletin of the Federated Malay States.
Agric. J. India	Agricultural Journal of India.
Agric. Res. Inst., Pusa Rep. (Bull.)	Agricultural Research Institute, Pusa, Report and Bulletins.
Allgem. Z. Bierbrau. u. Malzfabr.	Allgemeine Zeitschrift für Bierbrauerei und Malzfabrikation.
Amer. J. Bot.	American Journal of Botany.
Amer. J. Dis. Children	American Journal of Diseases of Children.
Amer. J. Pharm.	American Journal of Pharmacy.
Amer. J. Physiol.	American Journal of Physiology.
Amer. J. Publ. Health	American Journal of Public Health.
**Amer. J. Sci.*	American Journal of Science.
Amer. Min.	American Mineralogist.
Anal. Asoc. Quim. Argentina	Anales de la Asociación Química Argentina.
Anal. Fis. Quim.	Anales de la Sociedad Española de Física y Química.
**Analyst*	Analyst.
Annalen	Justus Liebig's Annalen der Chemie.
Ann. Bot.	Annals of Botany.
Ann. di Bot.	Annali di Botanica.
Ann. Chim.	Annales de Chimie.
**Ann. Chim Analyt.*	Annales de Chimie Analytique et de Chimie Appliquée.
Ann. di Chim. Appl.	Annali di Chimica Applicata.
Ann. Falsif.	Annales des Falsifications.
Ann. hyg. pub. med. legale.	Annales d'hygiène publique et de médicine légale.
Ann. Inst. Pasteur	Annales de l'Institut Pasteur.
Ann. Physik	Annalen der Physik.
Ann. Physique	Annales de Physique.
Ann. R. Staz. Chim. Agrar. Sperim.	Annali della R. Stazione Chimico Agraria Sperimentale di Roma.
Ann. sci. Univ. Jassy	Annales scientifiques de l'Université de Jassy.
Ann. Soc. Geol. Belg.: Publ. rel. au Congo Belge	Annales de la Société géologique de Belgique: Publications relatives au Congo Belge.
Apoth. Zeit.	Apotheker-Zeitung.
Arb. Gebiet. Physik, Math. Chem.	Arbeiten aus dem Gebiete der Physik, Mathematik und Chemie.
Arch. Entw.-mech. Org.	Archiv für Entwicklungsmechanik der Organismen.
Arch. expt. Path. Pharm.	Archiv für experimentelle Pathologie und Pharmakologie.
Arch. Farm. sperim. Sci. aff.	Archivio di Farmacologia sperimentale e Scienze affini.

ABBREVIATED TITLE.	JOURNAL.
Arch. Fisiol.	Archivio di Fisiologia.
Arch. Int. Med.	The Archives of Internal Medicine.
Arch. ital. Biol.	Archives italiennes de Biologie.
Arch. Méd. Pharm. milit.	Archives de Médicine et de Pharmacie militaires.
Arch. Néerland.	Archives Néerlandaises de sciences exactes et naturelles.
Arch. Néerland. physiol.	Archives Néerlandaises de physiologie de l'homme et des animaux.
**Arch. Pharm.*	Archiv der Pharmazie.
Arch. Sci. phys. nat.	Archives des Sciences physiques et naturelles.
Arch. Suikerind. Ned. Indie	Archief voor de Suikerindustrie in Nederlandsch-Indië.
Arkiv Kem. Min. Geol.	Arkiv för Kemi, Mineralogi och Geologi.
Astrophys. J.	Astrophytical Journal.
**Atti R. Accad. Lincei*	Atti della Reale Accademia Nazionale dei Lincei.
Atti R. Accad. Sci. Torino	Atti della Reale Accademia delle Scienze di Torino.
Atti R. Ist. Veneto Sci.	Atti del Reale Istituto Veneto di Scienze, Lettere ed Arti.
Aust. Pharm. Notes	Australian Pharmaceutical Notes and News.
Beitr. Min. Japan	Beiträge zur Mineralogie von Japan.
Berg. Hüttenm. Rundsch.	Berg- und Hüttenmannisches Rundschau.
**Ber.*	Berichte der Deutschen chemischen Gesellschaft.
Ber. Deut. bot. Ges.	Berichte der Deutschen botanischen Gesellschaft.
**Ber. Deut. pharm. Ges.*	Berichte der Deutschen pharmazeutischen Gesellschaft.
Ber. Oberhess. Ges. Natur. Heilkunde.	Berichte der Oberhessischen Gesellschaft für Natur- und Heilkunde zu Giessen.
Ber. Ohara Inst. landw. Forsch.	Berichte des Ohara Instituts für landwirtschaftliche Forschungen.
Ber. Sächs. Akad. Wiss.	Berichte über die Verhandlungen der Sächsischen Akademie der Wissenschaften zu Leipzig.
Berlin. Klin. Woch.	Berliner Klinische Wochenschrift.
**Bied. Zentr.*	Biedermann's Zentralblatt.
**Biochem. J.*	Biochemical Journal.
**Biochem. Z.*	Biochemische Zeitschrift.
Bd. of Trade J.	Board of Trade Journal.
Bol. Acad. Nac. Ciencias, Cordoba.	Boletín de la Academia Nacional des Ciencias, Cordoba.
**Boll. Chim. farm.*	Bolletino Chimico farmaceutico.
Boll. Soc. Geol. Ital.	Bolletino della Società Geologica Italiana.
Boll. Soc. Med.-Chirurg.	Bolletino della Società Medico-Chirurgica, Pavia
Bot. Centr.	Botanisches Centralblatt.
Bot. Gaz.	Botanical Gazette.
Brass. Malt.	Brasserie et Malterie.
Brau- u. Malzind.	Brau- u. Malzindustrie.
Braunkohle	Braunkohle.
**Brennstoff-Chem.*	Brennstoff-Chemie.
Brewers' J.	Brewers' Journal.
Brit. J. Phot.	British Journal of Photography.
Brit. Med. J.	British Medical Journal.
Brit. Pat.	British Patent.
Buletinul Chim.	Buletinul Chimie.
Bul. Soc. Chim. România	Buletinul Societătei de Chimie din România.
Bul. Soc. Romane Stiin.	Buletinul Societatii Romane de Stiinte.
Bull. Acad. roy. Belg.	Academie royale de Belgique—Bulletin de la Classe des Sciences.
Bull. Acad. Sci. Roumaine	Bulletin de la Section Scientifique de l'Académie Roumaine.
Bull. Assoc. Chim. Sucr.	Bulletin de l'Association des Chimistes de Sucrerie et de Distillerie.

ABBREVIATED TITLE.	JOURNAL.
Bull. Bureau of Standards (U S.A.).	Bulletin of the Bureau of Standards (U.S.A.).
Bull. Com. Géol. Finlande.	Bulletin de la Commission Géologique de Finlande.
Bull. Forest Exp. Stat. Meguro.	Bulletin of the Forest Experiment Station, Meguro, Tokyo.
Bull. gén. Thérap.	Bulletin général de Thérapeutique médicale, chirurgicale, obstétricale.
Bull. Geol. d'Alsace.	Bulletin du Service de la Carte Geologique d'Alsace et de Lorraine.
Bull. Geol. Inst. Univ. Upsala.	Bulletin of the Geological Institution of the University of Upsala.
Bull. Geol. Soc. Amer.	Bulletin of the Geological Society of America.
Bull. Geol. Survey, U.S.A.	Bulletin of the U.S. Geological Survey.
Bull. Geol. Survey, West Australia.	Bulletin of the Geological Survey, West Australia.
Bull. Imp. Inst.	Bulletin of the Imperial Institute.
Bull. Indian Ind. Lab.	Bulletin of Indian Industries and Labour.
Bull. Inst. Phys. Chem. Res., Japan.	Bulletin of the Institute of Physical and Chemical Research, Japan (Rikwagaku Kerkyujo Ihō).
Bull. Johns Hopkins Hospital.	Bulletin of the Johns Hopkins Hospital.
Bull. School Mines and Met., Univ. Missouri	Bulletin of the School of Mines and Metallurgy, University of Missouri.
Bull. Sci. Pharmacol.	Bulletin des Sciences Pharmacologiques.
*_Bull. Soc. chim._	Bulletin de la Société chimique de France.
*_Bull. Soc. chim. Belg._	Bulletin de la Société chimique de Belgique.
Bull. Soc. Chim. biol.	Bulletin de la Société de Chimie biologique.
Bull. Soc. d'Encour.	Bulletin de la Société d'Encouragement pour l'Industrie Nationale.
Bull. Soc. franç. Min.	Bulletin de la Société française de Minéralogie.
Bull. Soc. Franç. Phot.	Bulletin de la Société Française de Photographie.
Bull. Soc. Géol. Belg.	Bulletin de la Societie Géologique de Belgique.
Bull. Soc. Ind. Mulhouse	Bulletin de la Société Industrielle de Mulhouse.
Bull. Soc. Ind. Nord.	Bulletin de la Société Industrielle du Nord de la France.
Bull. Soc. Oural. Sci. Nat.	Bulletin de la Société Ouralienne des Amateurs des Sciences Naturelles à Catherineberg.
Bull. Soc. Pharm. Bordeaux	Bulletin des Travaux de la Société de Pharmacie de Bordeaux.
Bull. Wellcome Trop. Res. Lab.	Bulletin of the Wellcome Tropical Research Laboratory.
Cairo Sci. J.	Cairo Scientific Journal.
Canada Dept. Mines Publ.	Canada Department of Mines Publications.
*_Canadian Chem. Met._	Canadian Chemistry and Metallurgy.
Canadian Med. Assoc. J.	Canadian Medical Association Journal.
Caoutchouc et Gutta-Percha	Le Caoutchouc et le Gutta-Percha.
Časopis. Math. Fysiky	Casopis pro pěstování Mathematiky a Fysiky.
Cellulosechem.	Cellulosechemie.
Centr. Min.	Centralblatt für Mineralogie, Geologie und Paläontologie.
Ch. of Comm. J.	Chamber of Commerce Journal.
Chem. App.	Chemische Apparatur.
Chem. Erde	Chemie der Erde.
Chem. Ind.	Chemische Industrie.
Chem. Listy	Chemické Listy pro Vědu a Průmysl. Organ de la "Ceská chemická Společnost pro Vědu a Průmysl."
*_Chem. and Met. Eng._	Chemical and Metallurgical Engineering.
*_Chem. News_	Chemical News.

ABBREVIATED TITLE.	JOURNAL.
Chem. Trade J.	Chemical Trade Journal.
Chem. Umschau	Chemische Umschau auf dem Gebiete der Fette, Oele, Wachse, und Harze.
*_Chem. Weekblad_	Chemisch Weekblad.
*_Chem. Ztg._	Chemiker-Zeitung.
*_Chem. Zentr._	Chemisches Zentralblatt.
Chem. and Drug.	Chemist and Druggist.
*_Chim. et Ind._	Chimie et Industrie.
Collegium	Collegium.
*_Compt. rend._	Comptes rendus hebdomadaires des Séances de l'Académie des Sciences.
Compt. rend. Soc. Biol.	Comptes rendus hebdomadaires de Séances de la Société de Biologie.
Comptes rend. Trav. Lab. Carlsberg	Comptes rendus des Travaux du Laboratoire Carlsberg.
D. R.-P.	Deutsches Reichs-Patent.
Dept. Chem. S. Australia, Bull.	Department of Chemistry, South Australia, Bulletins.
Deut. med. Woch.	Deutsche medizinische Wochenschrift.
Econ. Geol.	Economic Geology.
Econ. Proc. Roy. Dubl. Soc.	Economic Proceedings of the Royal Dublin Society.
Engineering	Engineering.
Eng. and Min. J.	Engineering and Mining Journal.
Exper. Stat. Rec.	Experiment Station Record.
Farben-Ztg.	Farben-Zeitung.
Fermentforsch.	Fermentforschung.
Feuerungstechnik	Feuerungstechnik.
Flora	Flora.
Földtani Közlöny	Földtani Közlöny.
Fr. Pat.	French Patent.
Gas J.	Gas Journal.
Gas World	Gas World.
*_Gazzetta_	Gazzetta chimica italiana.
Geol. För. Förh.	Geologiska Föreningens i Stockholm Förhandlingar.
Geol. Mag.	Geological Magazine.
Gerber	Gerber.
*_Giorn. Chim. Ind. Appl._	Giornale di Chimica Industriale ed Applicata.
Gummi-Ztg.	Gummi-Zeitung.
Handl. Vijft. Nat.	Handelingen van het Vijftende Natuur.
Hawaii Agric. Exp. Stat. Bull.	Hawaii Agricultural Experiment Station Bulletins.
Heart	Heart.
Helv. Chim. Acta.	Helvetica Chimica Acta.
Indian J. Med. Res.	Indian Journal of Medical Research.
India-rubber J.	India-rubber Journal.
*_Ind. Eng. Chem._	Industrial and Engineering Chemistry.
Int. Rev. Sci. Pract. Agric.	International Review of the Science and Practice of Agriculture.
Int. Sugar J.	International Sugar Journal.
Iron Steel Inst. Carnegie Schol. Mem.	Iron and Steel Institute, Carnegie Scholarship Memoirs.
Jahrb. Geol Reichsanst.	Jahrbuch der geologischen Reichsanstalt.
Jahrb. Min.	Neues Jahrbuch für Mineralogie, Geologie und Paläontologie.
Jahrb. Min. Beil.-Bd.	Neues Jahrbuch fur Mineralogie, Geologie und Palaeontologie, Beilage-Band.
Jahrb. Radioaktiv. Elektronik.	Jahrbuch der Radioaktivität und Elektronik.
Jahrb. wiss. Bot.	Jahrbuch für wissenschaftliche Botanik.

ABBREVIATED TITLE.	JOURNAL.
Jahresber. Ges. vaterl. Kultur.	Jahresbericht der schlesischen Gesellschaft für vaterländische Kultur.
Japan. J. Phys.	Japanese Journal of Physics.
Jernk. Ann.	Jern-kontorets Annaler.
**J. Agric. Res.*	Journal of Agricultural Research.
**J. Agric. Sci.*	Journal of Agricultural Science.
J. Amer. Ceram. Soc.	Journal of the American Ceramic Society.
* *J. Amer. Chem. Soc.*	Journal of the American Chemical Society.
J. Amer. Leather Chem. Assoc.	Journal of the American Leather Chemists' Association.
J. Amer. Med. Assoc.	Journal of the American Medical Association.
J. Assoc. Off. Agric. Chem.	Journal of the Association of Official Agricultural Chemists.
**J. Biol. Chem.*	Journal of Biological Chemistry.
J. Canad. Min. Inst.	Journal of the Canadian Mining Institute.
J. Chem. Ind. Tokyo	*See* Kōgyō-Kwagaku-Zasshi.
J. Chem. Met. Soc. S. Africa	Journal of the Chemical, Metallurgical, and Mining Society of South Africa.
J. Chem. Soc. Japan.	Journal of the Chemical Society of Japan. (Nippon Kwagaku Kwai Shi.)
J. Chim. physique	Journal de Chimie physique.
J. Coll. Agric. Hokkaido	Journal of the College of Agriculture, Hokkaido Imperial University, Japan.
J. Coll. Agric. Tokyo	Journal of the College of Agriculture, Imperial University of Tokyo, Japan.
J. Coll. Eng. Tokyo	Journal of the College of Engineering, Imperial University of Tokyo.
**J. Coll. Sci. Tokyo*	Journal of the College of Science, Imperial University of Tokyo.
J. Exp. Med.	Journal of Experimental Medicine.
**J. Franklin Inst.*	Journal of the Franklin Institute.
J. Gasbeleucht.	Journal für Gasbeleuchtung und Wasserversorgung.
J. gen. Physiol.	Journal of general Physiology.
J. Genetics	Journal of Genetics.
J. Geol.	Journal of Geology.
J. Geol. Soc. Tokyo	Chishitsugaku Zasshi (Journal of the Geological Society of Tokyo).
J. Hygiene	Journal of Hygiene.
J. Indian Ind. Lab.	Journal of Indian Industries and Labour.
**J. Indian Inst. Sci.*	Journal of the Indian Institute of Science.
J. Inst. Brewing	Journal of the Institute of Brewing.
J. Inst. Metals	Journal of the Institute of Metals.
J. Inst. Petroleum Tech.	Journal of the Institution of Petroleum Technologists.
J. Iron and Steel Inst.	Journal of the Iron and Steel Institute.
J. Landw.	Journal für Landwirtschaft.
J. Marine Biol. Assoc. U.K.	Journal of the Marine Biological Association of the United Kingdom.
J. Med. Res.	Journal of Medical Research.
J. Min. Agric.	Journal of the Ministry of Agriculture.
J. Path. Bact.	Journal of Pathology and Bacteriology.
J. Opt. Soc. Amer.	Journal of the Optical Society of America.
**J. Pharm. Chim.*	Journal de Pharmacie et de Chimie.
J. Pharm. Expt. Ther.	Journal of Pharmacology and Experimental Therapeutics.
J. Pharm. Soc. Japan	Journal of the Pharmaceutical Society of Japan (Yakugakuzasshi).
**J. Physical Chem.*	Journal of Physical Chemistry.
J. Physiol.	Journal of Physiology.

Abbreviated Title.	Journal.
J. Physiol. Path. gén.	Journal de Physiologie et de Pathologie générale.
J. Phys. Radium	Journal de Physique et le Radium.
*_J. pr. Chem._	Journal für praktische Chemie.
J. Proc. Asiatic Soc. Bengal.	Journal and Proceedings of the Asiatic Society of Bengal.
J. Proc. Roy. Soc. New South Wales.	Journal and Proceedings of the Royal Society of New South Wales.
J. Roy. Agric. Soc.	Journal of the Royal Agricultural Society.
J. Roy. Army Med. Corps	Journal of the Royal Army Medical Corps.
J. Roy. Hort. Soc.	Journal of the Royal Horticultural Society.
J. Roy. Soc. New South Wales.	Journal and Proceedings of the Royal Society of New South Wales.
J. Roy. Soc. West Australia	Journal of the Royal Society of West Australia.

Trans. Roy. Soc. Edin.	Transactions of the Royal Society of Edinburgh.
Trans. Roy. Soc. Sth. Africa.	Transactions of the Royal Society of South Africa.
Tsch. Min. Mitt.	Tschermak's Mineralogische Mitteilungen.
U.S. Bureau of Mines, Bull. and Tech. Papers.	United States Bureau of Mines, Bulletins and Technical Papers.
U.S. Bureau Plant Ind.	United States Bureau of Plant Industry.
U.S. Comm. Rept.	United States Commerce Reports, Daily Consular and Trade Reports.
U.S. Dept. Agric. Bull.	United States Department of Agriculture Bulletins.
U.S. Hyg. Labor. Bull.	United States Hygienic Laboratory Bulletins.
U.S. Pat.	United States Patent.
Univ. Illinois Bull.	University of Illinois Bulletins.
Utah Agric. Coll. Exper. Stat. Bull.	Utah Agricultural College Experiment Station Bulletins.
Verh. Geol. Reichsanst. Wien.	Verhandlungen der geologischen Reichsanstalt in Wien.
Verh. Ges. deut. Naturforsch. Aerzte.	Verhandlungen der Gesellschaft deutscher Naturforscher und Aertze.
Verh. Naturhist. med. Ver. Heidelberg.	Verhandlungen des naturhistorisch-medizinischen Vereins zu Heidelberg.
Verh. Naturhist. Rheinl.	Verhandlungen des naturhistorischen Vereins der preussischen Rheinlande und Westfalens.
Verh. Physiol. Ges. Berlin	Verhandlungen der Physiologischen Gesellschaft zu Berlin.
Verh. Schweiz. Nat. Ges.	Verhandlungen der Schweizerischen Naturforschenden Gesellschaft, Basel.
Vict. Mem. Mus. Geol. Survey, Canada.	Victoria Memorial Museum Geological Survey of Canada, Bulletin.
Videnskab. Skrifter	Skrifter udgivne af Videnskabsselskabet i Kristiania.
Wiener Klin. Woch.	Wiener Klinische Wochenschrift.
Wiss. Abhandl. Physikal-Tech. Reichsanst.	Wissenschaftliche Abhandlungen der Physikalisch-Technischen Reichsanstalt.

ABBREVIATED TITLE.	JOURNAL.
Wiss.Veröff. Siemens Konz.	Wissenschaftliche Veröffentlichungen aus dem Siemens-Konzern.
Wochbl. Papierfabr.	Wochenblatt für Papierfabrikation.
Woch. f. Brau.	Wochenschrift für Brauerei.
*_Yakugakuzasshi_ (_J. Pharm. Soc. Japan_).	Yakugakuzasshi (Journal of the Pharmaceutical Society of Japan).
Z. allg. Physiol.	Zeitschrift für allgemeine Physiologie.
*_Z. anal. Chem._	Zeitschrift für analytische Chemie.
*_Z. angew. Chem._	Zeitschrift für angewandte Chemie.
*_Z. anorg. Chem._	Zeitschrift für anorganische und allgemeine Chemie.
Z. Biol.	Zeitschrift für Biologie.
Z. deut. Geol. Ges.	Zeitschrift der deutschen Geologischen Gesellschaft.
Z. deut. Oel-Fett Ind.	Zeitschrift der deutschen Oel- und Fett- Industrie.
*_Z. Elektrochem._	Zeitschrift für Elektrochemie.
Z. exp. Path. Ther.	Zeitschrift für experimentelle Pathologie und Therapie.
Z. ges. Brauw.	Zeitschrift für das gesamte Brauwesen.
Z. ges. exp. Med.	Zeitschrift für die gesamte experimentelle Medizin.
Z. ges. Schiess- u. Sprengstoffw.	Zeitschrift für das gesamte Schiess- und Sprengstoffwesen.
Z. Hyg.	Zeitschrift für Hygiene und Infektionskrankheiten.
Z. Immunit.	Zeitschrift für Immunitätsforschung und experimentelle Therapie.
Z. Instrument.	Zeitschrift für Instrumentenkunde.
Z. Kryst.	Zeitschrift für Krystallographie.
Z. Leder. Gerb. Chem.	Zeitschrift für Leder-und Gerberei-Chemie.
Z. öffentl. Chem.	Zeitschrift für öffentliche Chemie.
Z. Physik.	Zeitschrift für Physik.
*_Z. physikal. Chem._	Zeitschrift für physikalische Chemie, Stöchiometrie und Verwandschaftslehre.
Z. physikal. Chem. Unterr.	Zeitschrift für den physikalischen und Chemischen Unterricht.
Z. physiol. Chem.	Hoppe-Seyler's Zeitschrift für physiologische Chemie.
Z. prakt. Geol.	Zeitschrift für praktische Geologie.
*_Z. Sauerstoff Stickstoff Ind._	Zeitschrift für Sauerstoff und Stickstoff Industrie.
Z. Spiritusind.	Zeitschrift für Spiritusindustrie.
Z. Unters. Nahr. Genussm.	Zeitschrift für Untersuchung der Nahrungs- und Genussmittel.
Z. Ver. deut. Zuckerind.	Zeitschrift des Vereins der deutschen Zucker-Industrie.
Z. wiss. Mikrosk.	Zeitschrift für wissenschaftliche Mikroskopie und mikroskopische Technik.
*_Z. wiss. Photochem._	Zeitschrift für wissenschaftliche Photographie, Photophysik und Photochemie.
*_Z. Zuckerind. Čechoslov._	Zeitschrift für Zuckerindustrie der Čechoslovakischen Republik.
*_Zentr. Bakt. Par._	Centralblatt für Bakteriologie, Parasitenkunde und Infektionskrankheiten.
Zentr. Zuckerind.	Zentralblatt für Zuckerindustrie.
